Bearing Inner Locknut — Manual Locking Hub. After tightening to specified torque, back off the nut 1/4 turn (90°). After backing off the nut, retighten to 1.8 Nm (16 lb-in).	47	35
Bearing Outer Locknut — Manual Locking Hub	203	150
Bearing Nut — Automatic Locknut Hub. After tightening to specified torque, back off the nut 1/4 turn (90°). After backing off the nut, retighte n to 1.8 Nm (16 lb-in).	47	35
Wheel Lugnuts. Torque specifications are for clean, dry bolt and nut threads. Never use oil or grease on studs or nuts.	135	100
Front to Crossmember Nut/Bolt	220-275	163-203
Bracket to Crossmember Bolt, Nut and Washer	210	155
Disc Brake Caliper Bracket-to-Front Wheel Spindle	100-130	74-96

Spring, Front

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Pitman Arm Puller	T64P-3590-F
Coil Spring Compressor	D78P-5310-A

Removal

1. **NOTE: Any time the steering linkage is disconnected from the steering knuckle, the steering system must be placed in the "on-center" position.**

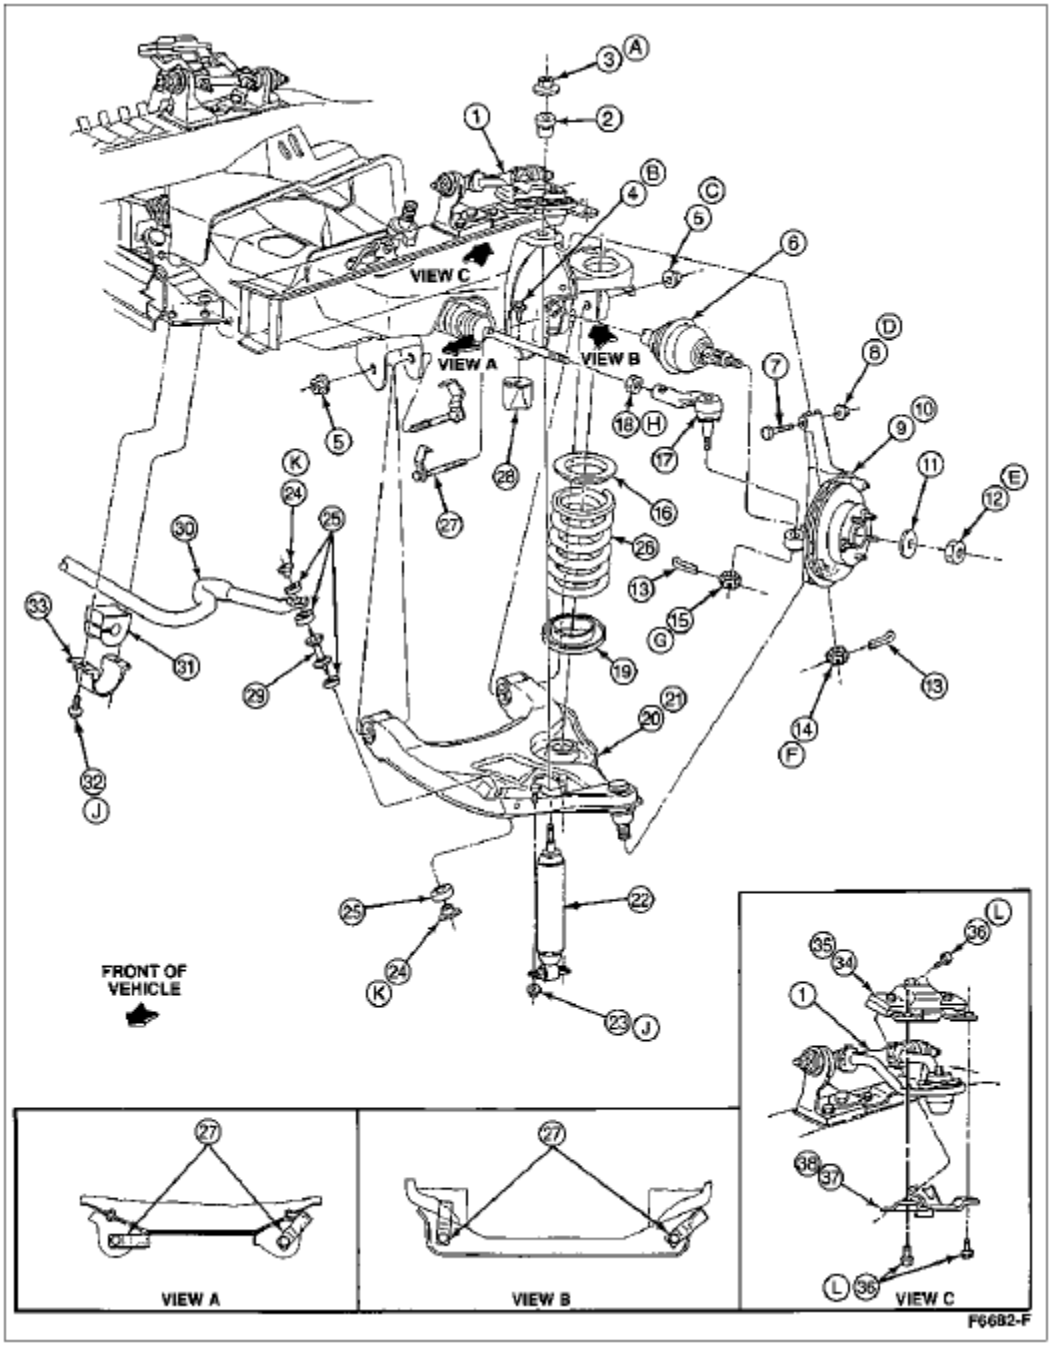
   Place the steering wheel and steering system in the "on-center" position.

2. Raise vehicle on a hoist. Remove wheel and tire assembly.

3. Disconnect stabilizer bar link nut from front suspension lower arm (3078).

4. Remove the front shock absorber as described in Removal and Installation, Shock Absorber, Front in this section.

Front Suspension, Aerostar E-4WD



Item	Part Number	Description
1	3083	Front Suspension Upper Arm
2	18198	Insulator
3	N805348-S56	Nut and Washer Assembly
4	N605905-S101	Bolt, M8-1.25 x 20
5	N800237-S101	Nut, M16-2.0
6	4A462	Shaft Assembly
7	N804806-S160	Bolt, M10-1.5 x 55

8	N801206-S2	Nut, M10-1.5
9	3B305	Steering Knuckle Assembly (RH)
10	3B306	Steering Knuckle Assembly (LH)
11	N801338-S101	Washer, M20-40 x 5.13
12	N804199-S191	Nut, M20-1.25
13	N642567-S36	Cotter Pin, 3.2 x 25
14	390924-S36	Nut, 9/16-18
15	N800895-S56	Nut, M14-1.5
16	5415	Upper Insulator
17	3A130	Tie Rod End
18	N803637	Nut, M14-1.5
19	5414	Lower Insulator
20	3078	Front Suspension Lower Arm (RH)
21	3079	Front Suspension Lower Arm (LH)
22	18045	Front Shock Absorber
23	N620481-S2	Nut, M8-1.25
24	5C491	Nut (Part of Stabilizer Bar Bushing Repair Kit)
25	N803702-S	Stabilizer Bar Bushing
26	5310	Front Coil Spring
27	N805537-S100	Bolt and Retainer, M16-2.0 x 117.5
28	3020	Front Suspension Bumper
29	5K483	Front Stabilizer Bar Link
30	5482	Front Stabilizer Bar
31	5484	Stabilizer Bar Insulator
32	N806497-S2	Bolt, M8-1.25 x 25.7
33	5486	Stabilizer Bar Bracket
34	3C156	Damper (RH)
35	3C157	Damper (LH)
36	N605905-S101	Bolt, M8-1.25 x 20
37	3C162	Clamp, Damper (RH)
38	3C163	Clamp, Damper (LH)
A	—	Tighten to 34-47 Nm (25-35 Lb-Ft)
B	—	Tighten to 17-23 Nm (13-17 Lb-Ft)
C	—	Tighten to 136-190 Nm (100-140 Lb-Ft)
D	—	Tighten to 37-50 Nm (27-37 Lb-Ft)
E	—	Tighten to 230-285 Nm(170-210 Lb-Ft)

F	—	Tighten to 80-110 Nm (59-81 Lb-Ft)
G	—	Tighten to 70-100 Nm (52-74 Lb-Ft)
H	—	Tighten to 61-88 Nm (45-65 Lb-Ft)
J	—	Tighten to 22-33 Nm (16-24 Lb-Ft)
K	—	Tighten to 8-12 Nm (71-107 Lb-In)
L	—	Tighten to 30-39 Nm (22-29 Lb-Ft)

5. If the vehicle is on a twin-post hoist, support the vehicle with safety stands under the jacking pads and lower the hoist but maintain working room.

6. Using Coil Spring Compressor D78P-5310-A, install one plate with the pivot ball seat facing downward into spring coils. Rotate the plate until flush with the upper surface of the front suspension lower arm.

7. Install the other plate with the pivot ball seat facing upward into spring coils.

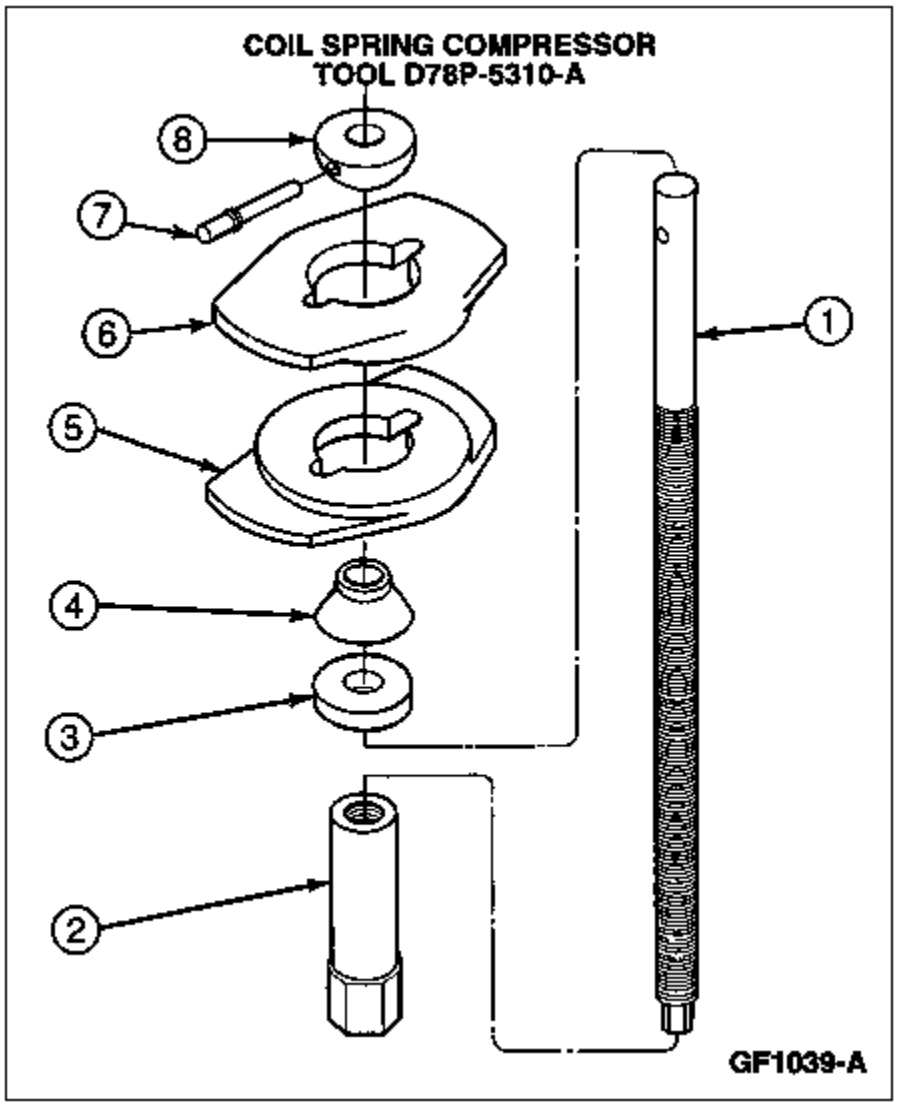
8. Insert the upper ball nut through the spring coil so nut rests in the upper plate.

9. Insert the compression rod into front suspension lower arm opening, through the upper and lower plate and upper ball nut.

10. Insert the securing pin through the upper ball nut and compression rod.

    - This pin can only be inserted one way into the upper ball nut because of a stepped hole design.

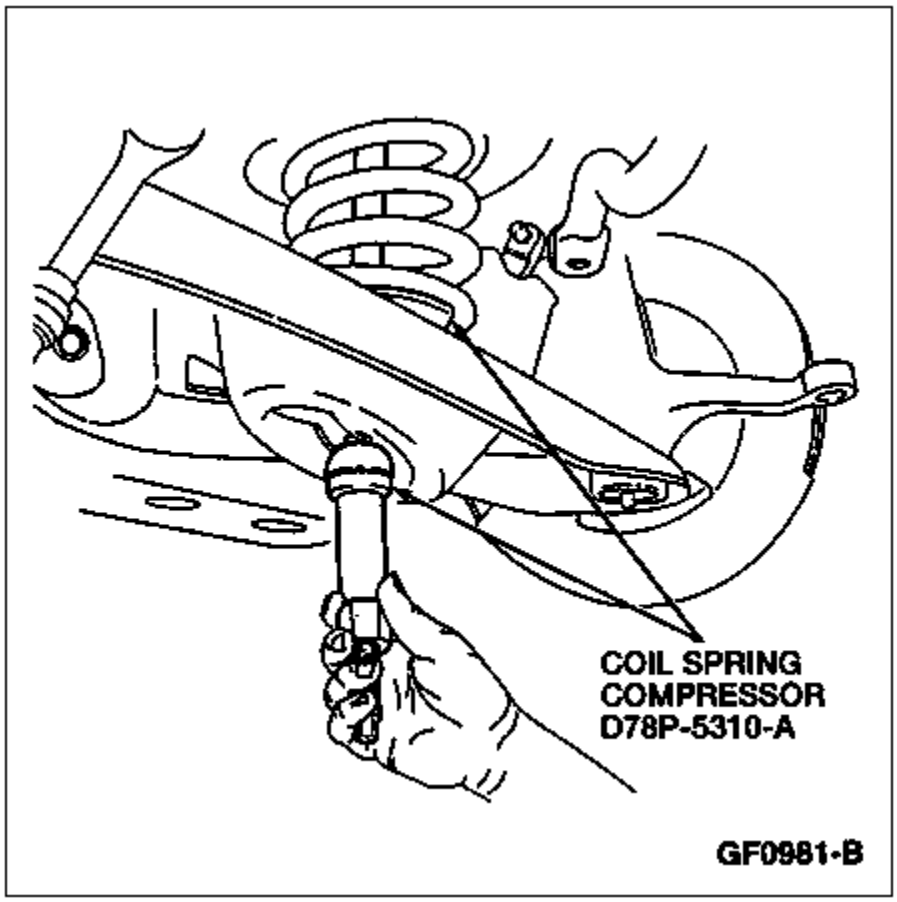
11. With the upper ball nut secured, turn the upper plate to walk up the coil until it contacts the upper spring seat; then, back off one-half turn.

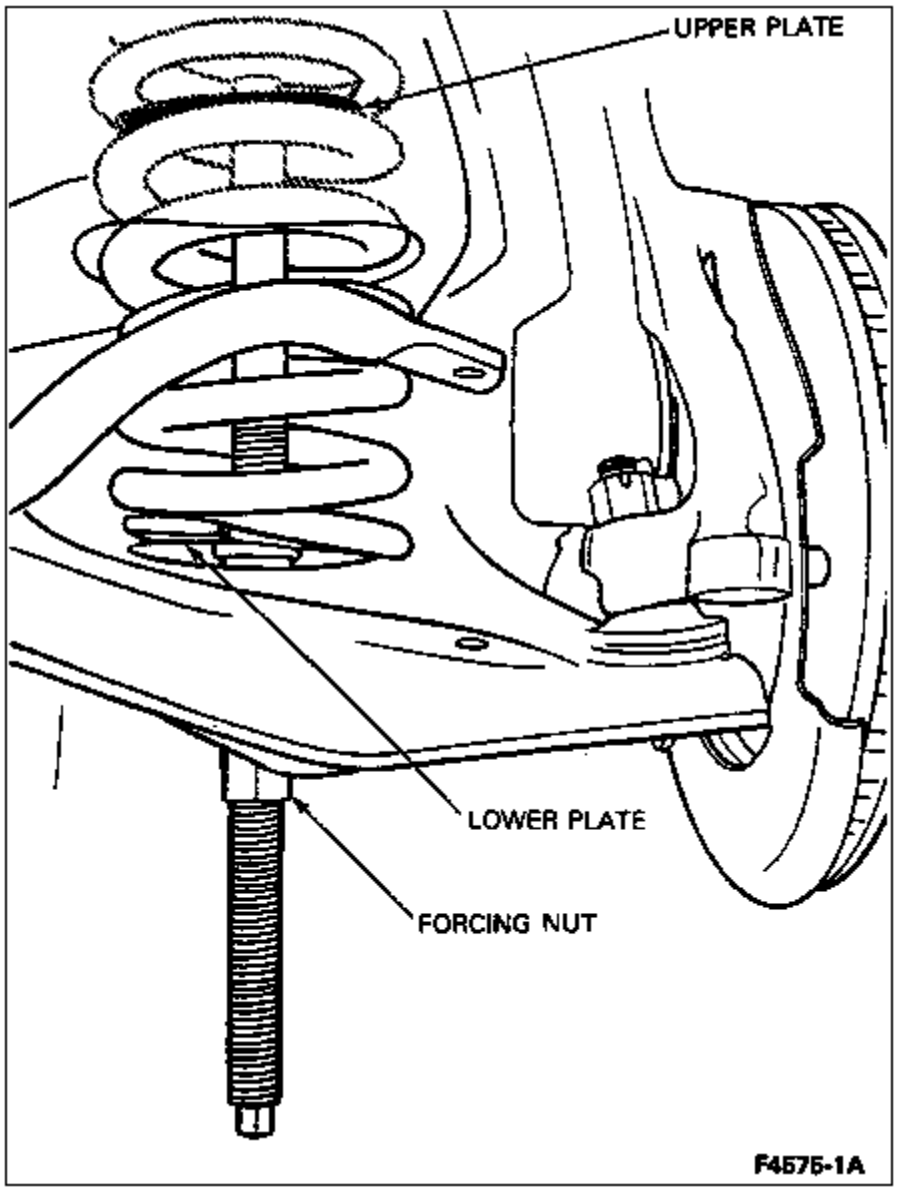


Item	Part Number	Description
1	—	Compression Rod (Part of D78P-5310-A)
2	—	Forcing Nut (Part of D78P-5310-A)
3	—	Thrust Washer (Part of D78P-5310-A)
4	—	Lower Ball Nut (Part of D78P-5310-A)
5	—	Lower Plate (Part of D78P-5310-A)
6	—	Upper Plate (Part of D78P-5310-A)
7	—	Pin (Part of D78P-5310-A)
8	—	Upper Ball Nut (Part of D78P-5310-A)

12. **NOTE: 4x2 shown in illustrations; E-4WD similar.**

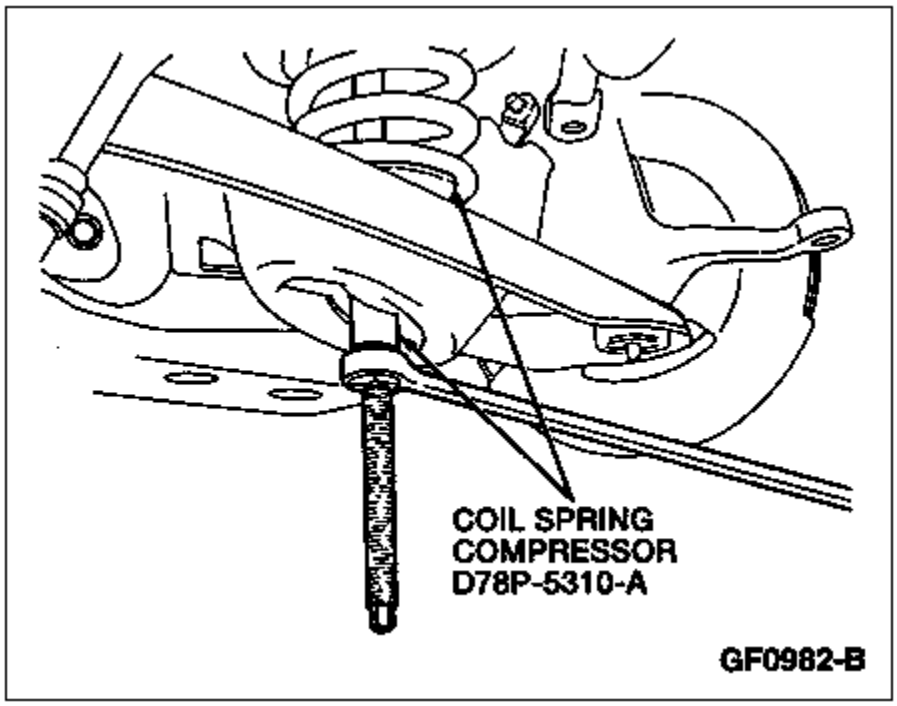
    Install lower ball nut and thrust washer to compression rod and screw on forcing nut.





13. **NOTE: 4x2 shown in illustration; E-4WD similar.**

    Tighten the forcing nut until the front coil spring (5310) is compressed enough to move in seat.



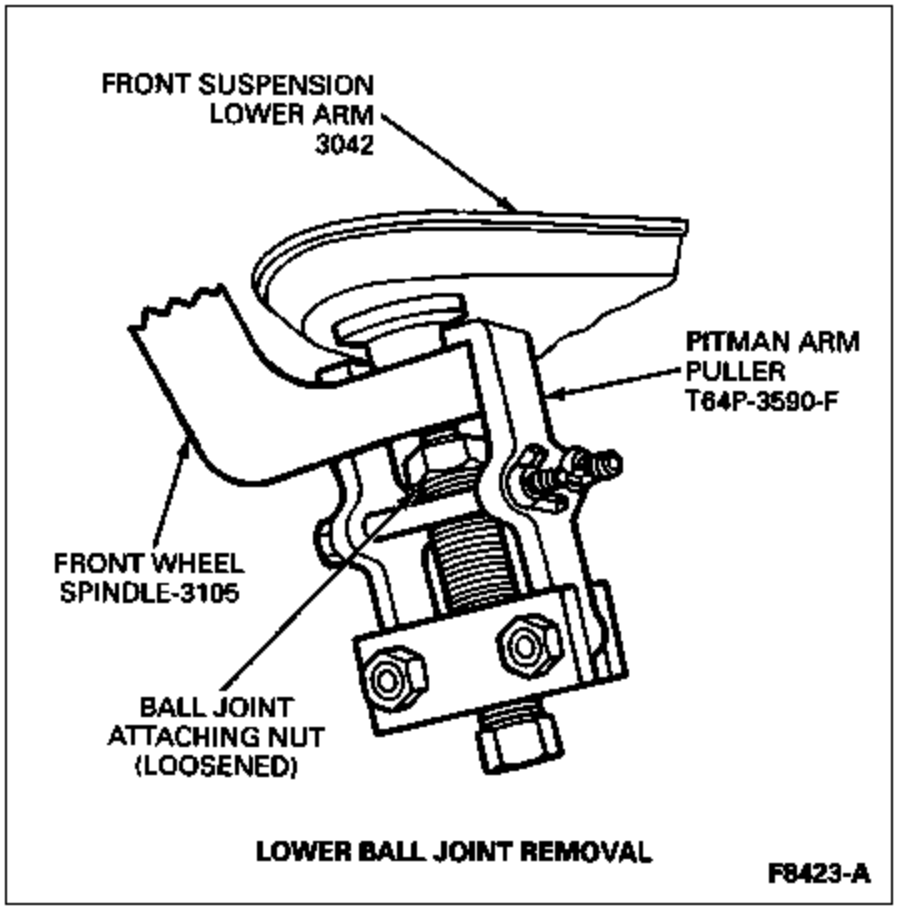
14. Loosen the two lower arm pivot bolts. Remove the cotter pin and loosen but do not remove the nut attaching the front suspension lower arm ball joint (3050) to the knuckle.

15. Using Pitman Arm Puller T64P-3590-F loosen the front suspension lower arm ball joint.

16. Remove the puller tool. Support the front suspension lower arm with a jack and remove the ball joint nut.

17. **NOTE: 4x2 shown in illustration; E-4WD must be pressed from bottom.**

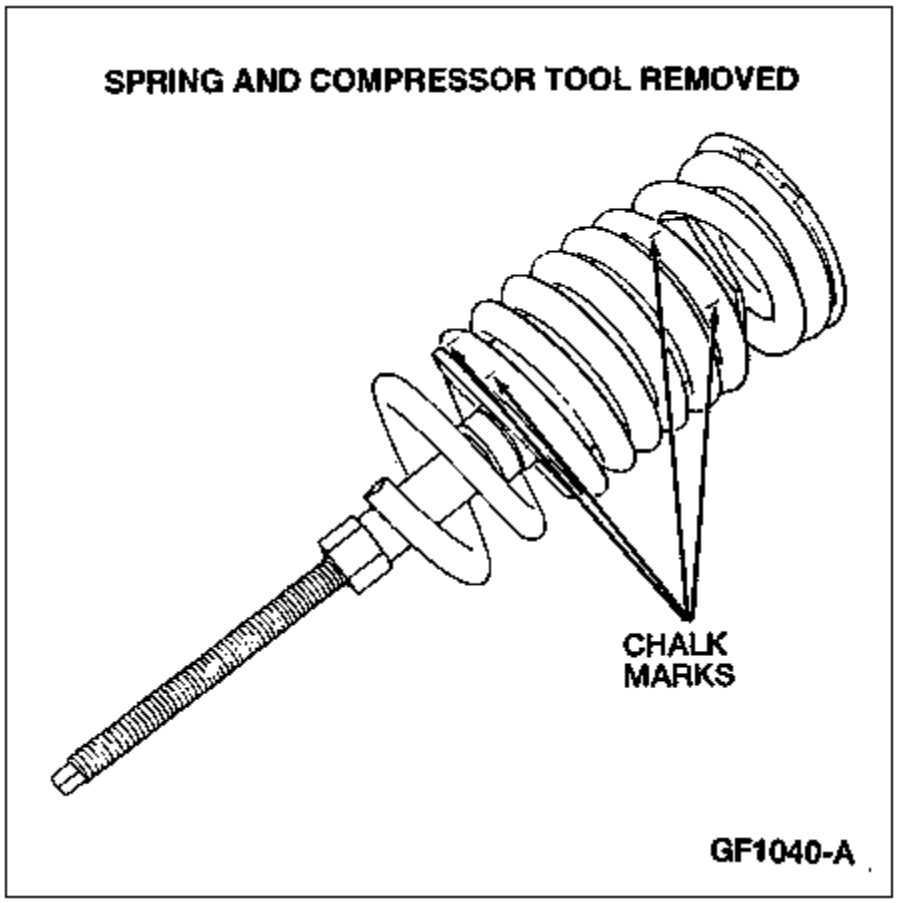
    Separate the knuckle from the front suspension lower arm ball joint, lower the control arm and remove the front coil spring.



18. If a new front coil spring is installed:

    a. Mark position of upper and lower plates on the spring with chalk.
    b. Measure the compressed length of the old front coil spring.

19. Loosen the forcing nut to relieve spring tension. Remove the tools from the front coil spring.

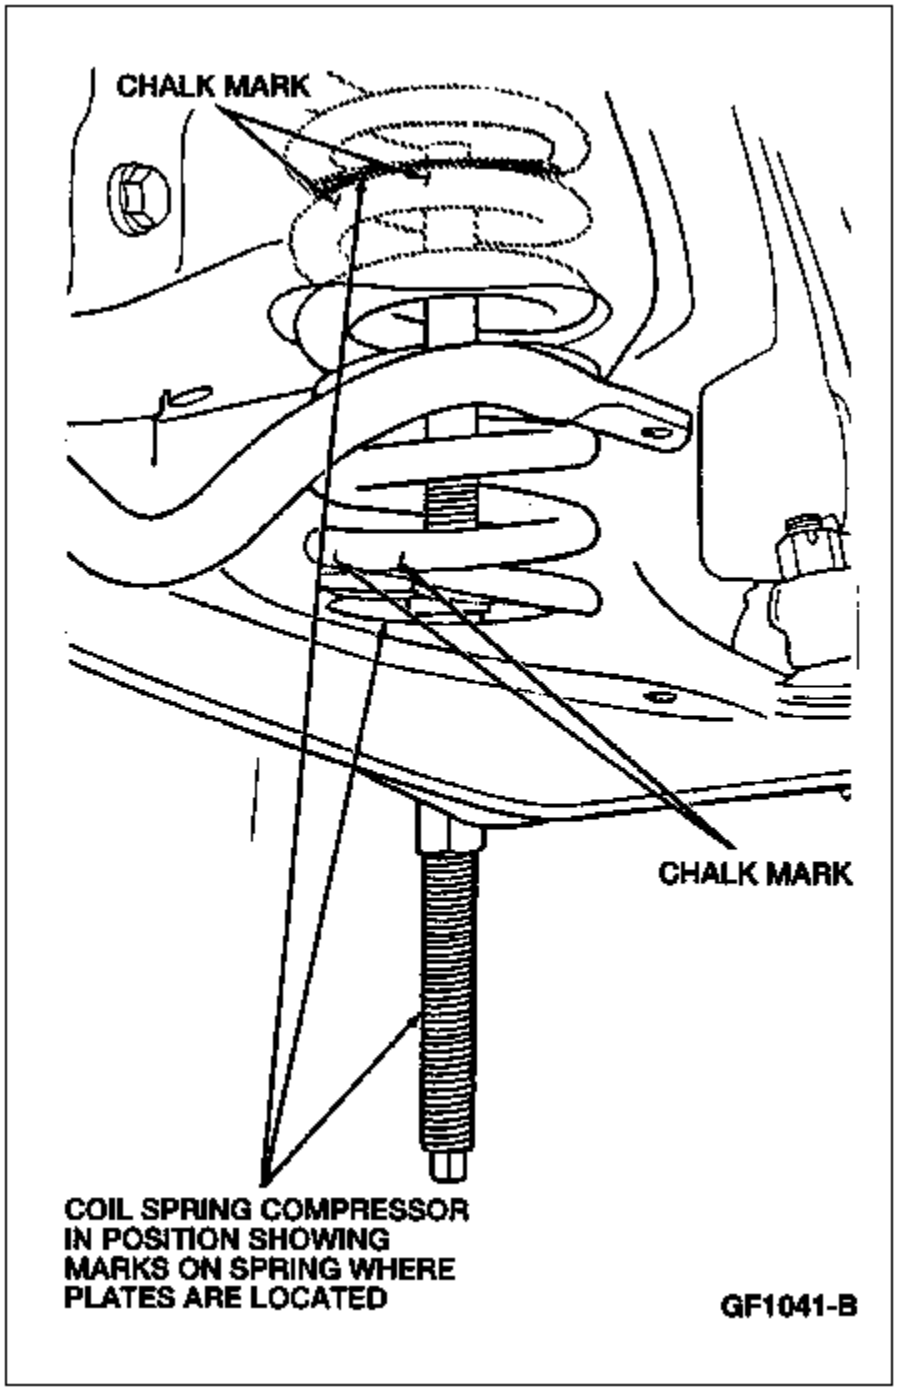


Installation

1. Assemble Coil Spring Compressor D78P-5310-A, and locate in the same positions indicated in Removal, Step 18a.
2. Before compressing the front coil spring, make sure upper ball nut securing pin is inserted properly.
3. Compress front coil spring until spring height reaches the dimension obtained in Removal, Step 18b.
4. Position the front coil spring assembly into the front suspension lower arm.
5. Verify the front coil spring is properly indexed in the front suspension lower arm.
6. To install front coil spring, reverse removal procedures.
7. **NOTE: Vehicle must be in the normal ride position.**

   NOTE: 4x2 shown in illustration; E-4WD similar.

   Tighten front suspension lower arm to No. 1 crossmember retaining nuts to 136-190 Nm (100-140 lb-ft).



CHALK MARK
CHALK MARK
COIL SPRING COMPRESSOR IN POSITION SHOWING MARKS ON SPRING WHERE PLATES ARE LOCATED
GF1041-B

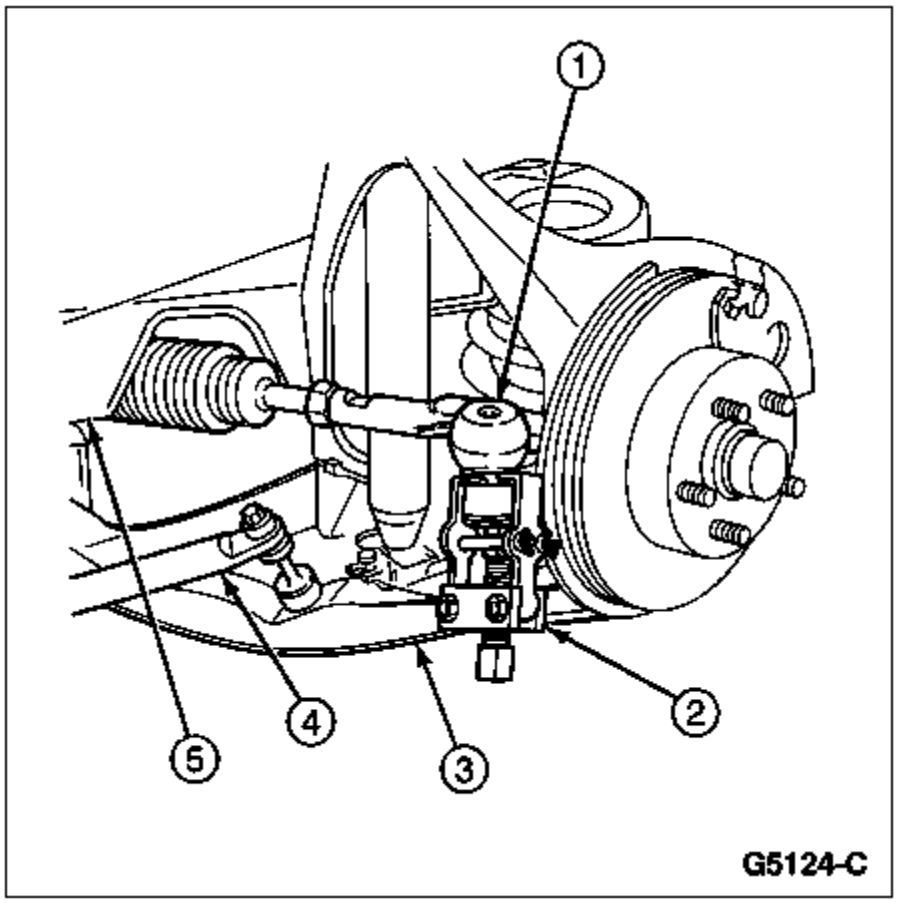
Knuckle, Front Wheel

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Pitman Arm Puller	T64P-3590-F
Front Hub Replacer	T81P-1104-A
Hub Remover Adapters Front Hub Bearing Service Set	T81P-1104-B, T86P-1104-A1
Front Hub Remover/Replacer	T81P-1104-C

Removal

1. Put steering gear in "on-center" position.
2. Put transmission in PARK and set hand brake.
3. Remove wheelcover.
4. Raise vehicle on hoist.
5. Remove wheel and tire.
6. Remove hub nut and washer.
7. Remove spring tension from upper and lower control arms. Compress spring using spring compressor tool until all spring tension is removed from control arms.
8. Remove brake rotor and disc brake caliper (2B120) as described in Section 06-03 . Do not let disc brake caliper hang by hose.
9. Remove cotter pin and tie rod nut. Using Pitman Arm Puller T64P-3590-F, disconnect tie rod end (3A130) from steering knuckle.



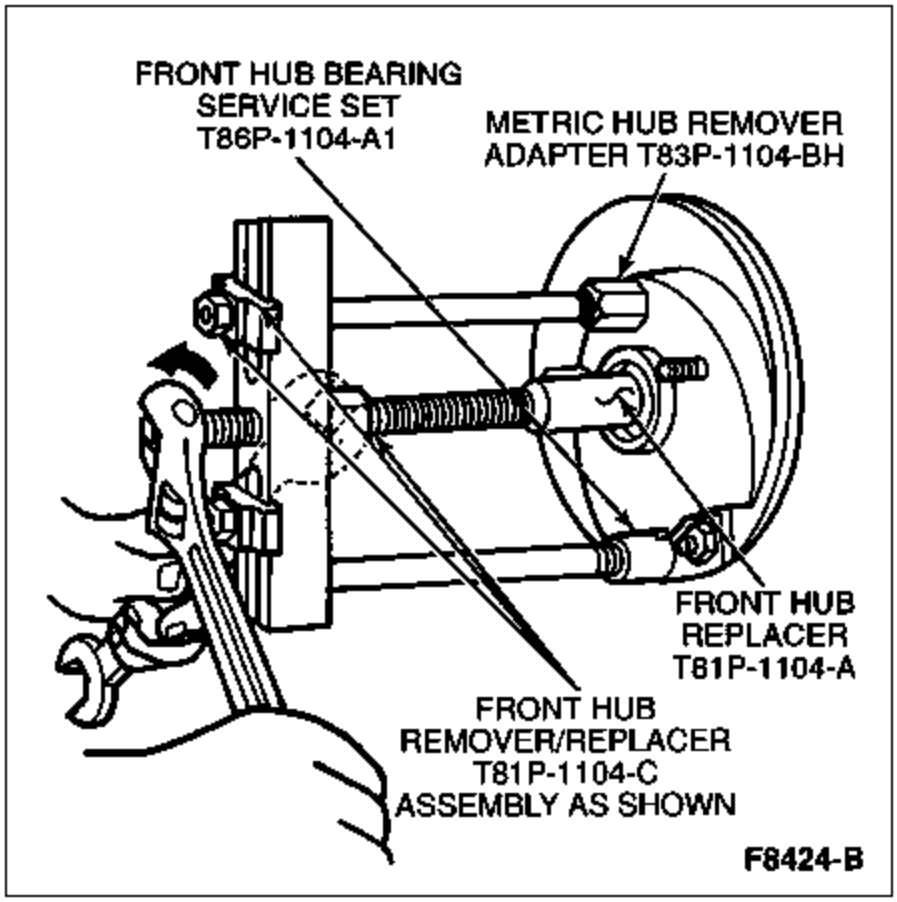
Item	Part Number	Description
1	3A130	Tie Rod End
2	T64P-3590-F	Pitman Arm Puller
3	3078	Front Suspension Lower Arm
4	5482	Front Stabilizer Bar
5	5019	Front Crossmember

10. **NOTE: Make sure adapters are fully threaded onto the hub studs and positioned opposite the other adapter.**

    Install Front Hub Remover/Replacer T81P-1104-C with Front Hub Replacer T81P-1104-A, Hub Remover Adapters T81P-1104-B and Front Hub Bearing Service Set T86P-1104-A1.

11. Free the hub, bearing, and knuckle assembly from the halfshaft by pushing in the CV joint outer shaft until it is loose from the assembly.

CV Joint-to-Hub Removal



12. Remove retaining nut and bolt and push up on front suspension upper arm (3083) until ball joint stud is out of knuckle.

13. Remove cotter pin and nut from front suspension lower arm ball joint (3050), using Pitman Arm Puller T64P-3590-F.

14. Remove ball joint stud from knuckle.

15. Remove knuckle from vehicle.

Installation

1. Put knuckle assembly onto lower and upper ball joint studs. Install nut and bolt clamping upper ball joint stud into knuckle and tighten to 37-50 Nm (27-37 lb-ft).

2. Install lower ball joint nut and tighten to 80-110 Nm (59-81 lb-ft). If necessary, advance nut to next slot. Install cotter pin.

3. Put CV joint shaft into hub and install washer and nut finger-tight.

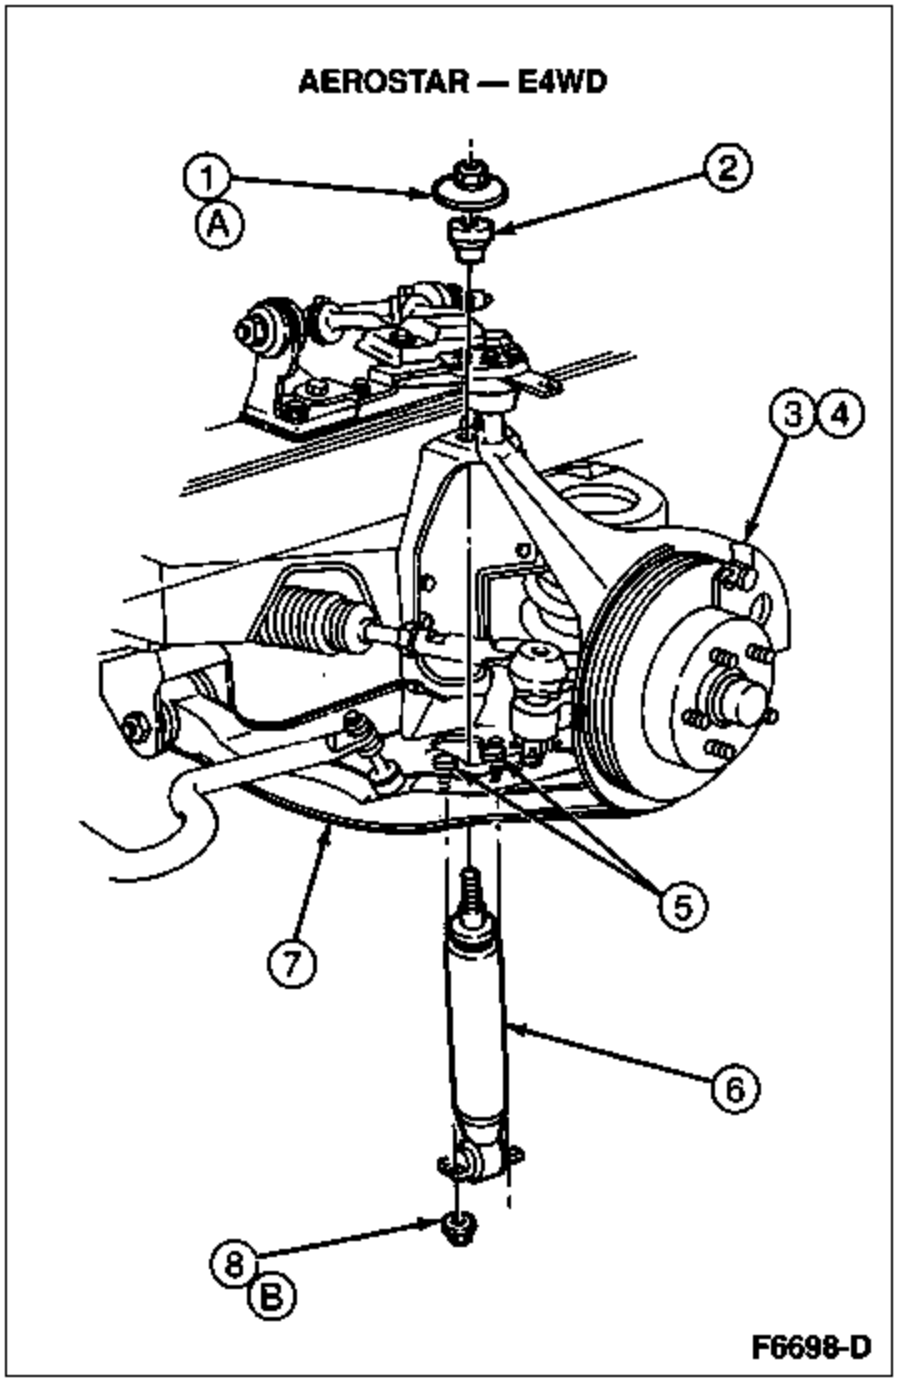
4. Install tie rod end and nut. Tighten nut to 70-100 Nm (52-74 lb-ft). If necessary advance nut to next slot. Install cotter pin.

5. Install disc brake caliper and front disc brake hub and rotor (1102) ; refer to Section 06-03 .

6. Install wheel and tire assembly.
7. Remove spring compressor.
8. Tighten hub nut to 230-285 Nm (170-210 lb-ft).
9. Check alignment; refer to Section 04-00 .
10. Install wheelcover and lower the vehicle.

Shock Absorber, Front

WARNING: THE LOW-PRESSURE GAS SHOCK ABSORBERS ARE CHARGED WITH NITROGEN GAS TO 930 KPA (135 PSI). DO NOT ATTEMPT TO OPEN, PUNCTURE OR APPLY HEAT TO THE SHOCK ABSORBERS.

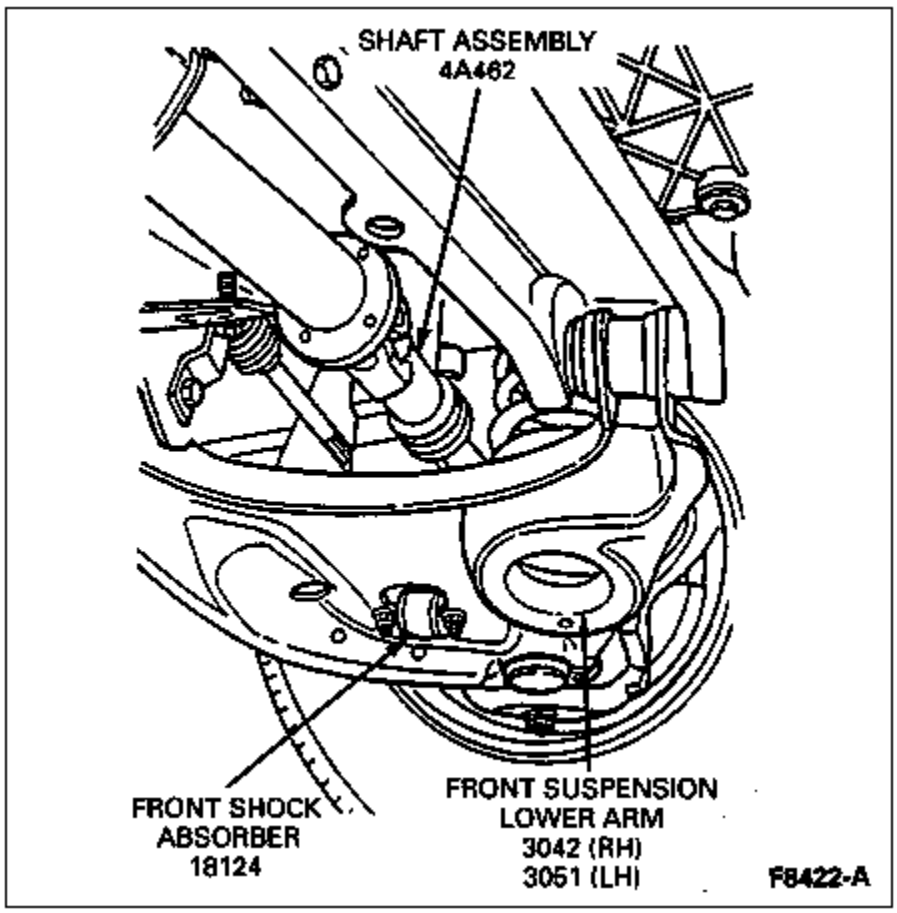


Item	Part Number	Description
1	N805348	Nut
2	18198	Insulator
3	3B305	Steering Knuckle Assembly (RH)
4	3B306	Steering Knuckle Assembly (LH)
5	N605905-S2	Shock Absorber Lower Mounting Studs
6	—	Front Shock Absorber

7	3078	Front Suspension Lower Arm
8	N620481	Nut
A	—	Tighten to 34-47 Nm (25-35 Lb-Ft)
B	—	Tighten to 22-33 Nm (16-24 Lb-Ft)

Removal and Installation

1. Remove the nut and washer assembly retaining the front shock absorber to the coil spring upper bracket.
2. Remove the two nuts retaining the front shock absorber to the bottom of the front suspension lower arm (3079).
3. Remove the front shock absorber through the front suspension lower arm.



4. Inspect the insulator in the coil spring upper bracket. If required, remove and replace the insulator.

For installation, follow removal procedures in reverse order. Tighten shock absorber-to-lower control arm nuts to 22-33 Nm (16-24 lb-ft). Tighten shock absorber-to-upper spring bracket nut to 34-47 Nm (25-35 lb-ft).

Ball Joint and Arm Assembly, Upper

Removal

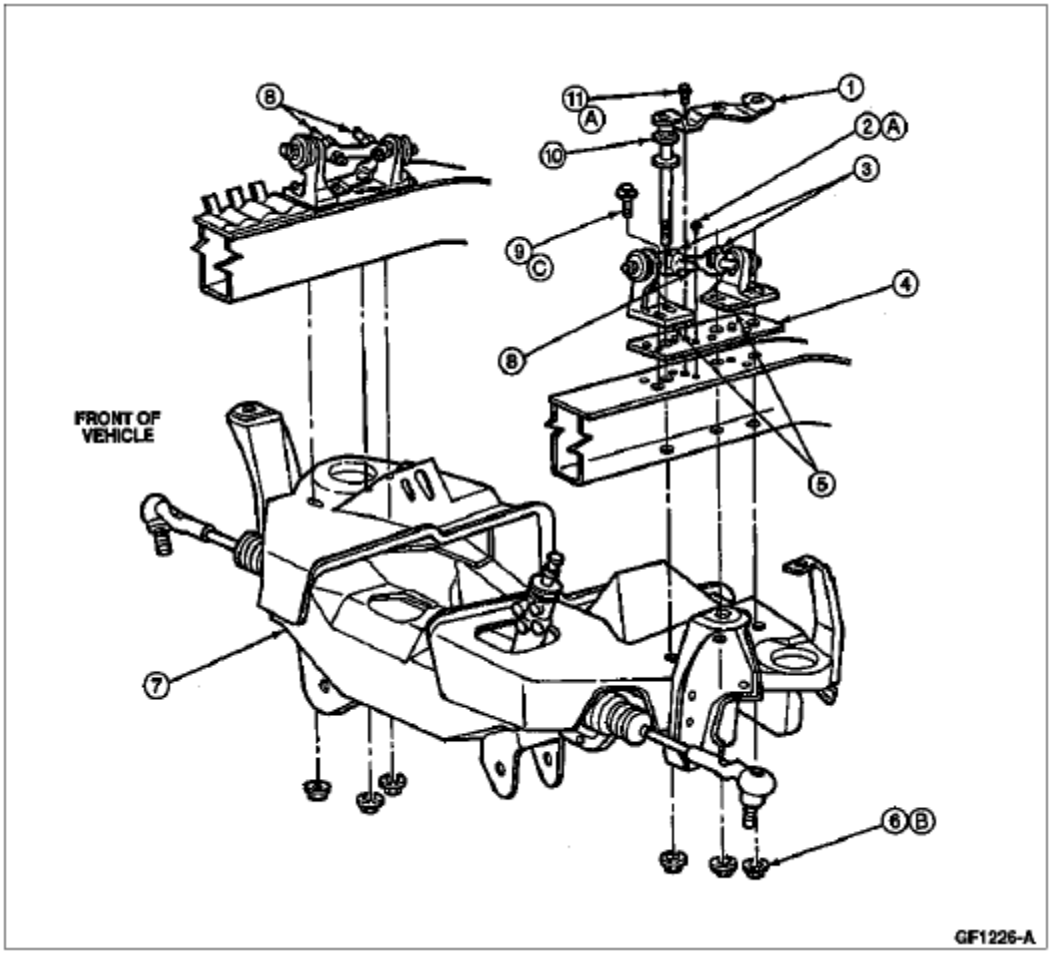
WARNING: WHEN SERVICING ANY COMPONENT IN THE UPPER CONTROL ARM AND BALL JOINT SYSTEM, ONLY ONE SIDE OF THE VEHICLE IS SERVICED AT A TIME. NEVER SERVICE BOTH SIDES AT THE SAME TIME.

1. **NOTE: Any time the steering linkage is disconnected from the steering knuckle, the steering system must be placed in the "on-center" position.**

   Place the steering wheel and steering system in the "on-center" position.

2. Raise the vehicle on a frame hoist. Place safety stands under the lower control arm. Slowly lower the hoist to maintain coil spring compression.

Front Drive Axle Crossmember and Control Arm Mounting



Item	Part Number	Description
1	38380	Bolt Bracket Retainer, If Equipped
2	N611175	Screw
3	—	Shim (Part of 3393)
4	3B204	Mounting Plate
5	—	Mounting Brackets (Part of 3393)
6	N804431	Nut
7	3C137	Front Drive Axle Crossmember Assembly
8	3083	Front Suspension Upper Arm
9	N804618	Bolt
10	N804386	Bolt
11	N611194-S	Screw
A	—	Tighten to 14-19 Nm (10-14 Lb-Ft)
B	—	Tighten to 196-264 Nm (145-195 Lb-Ft)
C	—	Tighten to 47-64 Nm

		(35-47 Lb-Ft)

3. Remove upper ball joint-to-knuckle bolt and nut. Disengage upper ball joint from knuckle.
4. Remove the bolt retainer plate screw. Remove plate.
5. Mark the position of the control arm mounting brackets on the flat plate.
6. Remove the front bolt and washer retaining the front mounting bracket to the mounting plate.
7. From beneath the rail, remove the three nuts from bolts retaining two front suspension upper arm mounting brackets to the body rail.
8. Remove the three long bolts retaining the mounting brackets to the body rail by rotating the front suspension upper arm (3083) out of position.
9. Remove the front suspension upper arm, mounting bracket assembly and mounting plate from the vehicle.
10. If required, remove and replace the upper ball joint boot seal.

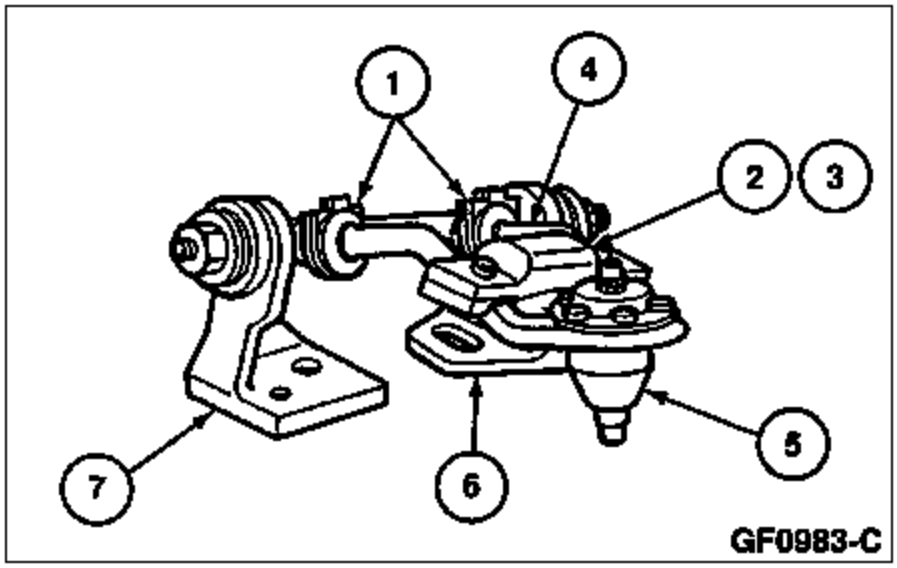
    Note the exact position and number of shims on each control arm stud. These shims control caster and camber.

11. **NOTE: The pivot shaft and mounting brackets are serviced as an assembly. The front suspension upper arm and front suspension upper ball joint (3049) are serviced as an assembly.**

    To service front suspension upper arm and front suspension upper ball joint assembly or the mounting brackets and adjusting arm assembly, remove the nuts retaining the front suspension upper arm to the adjusting arm.

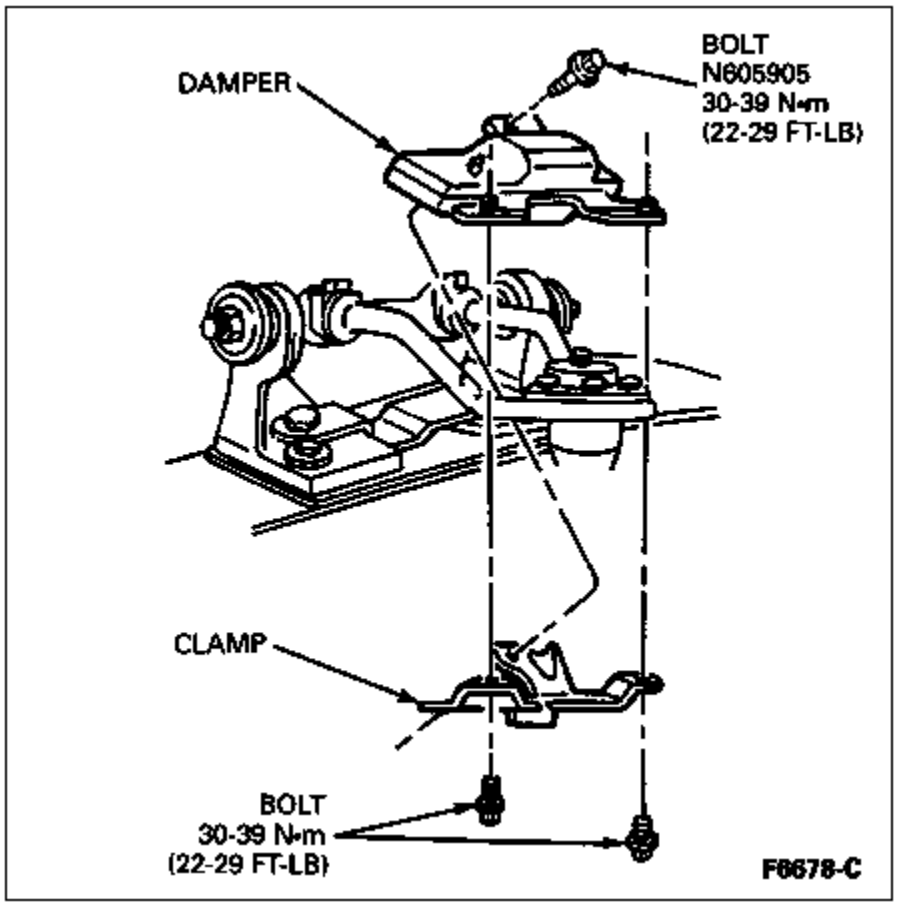
12. Remove the front suspension upper arm from the adjusting arm.

Control Arm Damper



Item	Part Number	Description
1	3043	Alignment Shims
2	3C156	Damper Assembly (RH)
3	3C157	Damper Assembly (LH)
4	3083	Front Suspension Upper Arm
5	3049	Front Suspension Upper Ball Joint
6	—	Rear Mounting Bracket (Part of 3393)
7	—	Front Mounting Bracket (Part of 3393)

13. If required, remove the damper assembly from the front suspension upper arm by removing the three retaining bolts.



Installation

1. If removed, install the front suspension upper arm and ball joint in the pivot shaft.
2. Install the shims on the control arm studs with the same number of shims in the exact position as marked during removal.
3. Install and tighten the nuts retaining the upper arm and ball joint plus the shims to the front suspension upper arm.
4. If removed, install the boot seal on the upper and/or lower ball joint and lubricate ball joint.
5. If removed, install the damper assembly to front suspension upper arm. Tighten damper retaining bolts to 30-39 Nm (22-29 lb-ft).
6. Place the flat plate for the mounting brackets in position on the body rail. Install screw and tighten to 14-19 Nm (10-14 lb-ft).
7. Place the mounting brackets and front suspension upper arm assembly in position on the flat plate.
8. Install the three long bolts and washers retaining the mounting brackets to the body rail.
9. Rotate or rock the front suspension upper arm and mounting bracket until the bolt heads rest against

the mounting bracket and the studs extend through the body rail.

10. **NOTE: Make sure the mounting brackets do not move from the marked positions on the flat plate. This minimizes corrections.**

    Move mounting brackets into position marked on mounting plate during removal.

11. **CAUTION: The torque required for the mounting bracket-to-body rail nuts and bolts is critical. They must be tightened to the specified torque.**

    If present, place the bolt retainer plate in position on the mounting bracket and flat plate assembly. Install and tighten the screw to 14-19 Nm (10-14 lb-ft).

12. Install and tighten the nuts retaining the mounting bracket bolts to the body rail to 196-264 Nm (145-195 lb-ft).

13. Install and tighten the front bolt retaining the front mounting bracket to the mounting plate, 47-64 Nm (35-47 lb-ft).

14. Connect the front suspension upper ball joint to steering knuckle. Install the bolt and nut and tighten to 37-50 Nm (27-37 lb-ft).

15. Check and if required, adjust caster, camber and toe-in as described in Section 04-00 . Use service adjustment shims as required for caster and camber revisions.

Arm, Lower

Removal

1. **NOTE: Any time the steering linkage is disconnected from the steering knuckle the steering system must be placed in the "on-center" position.**

   Place the steering wheel and steering system in the "on-center" position.

2. **WARNING: MAKE SURE THE VEHICLE IS SECURELY SUPPORTED ON THE SAFETY STANDS.**

   Raise the vehicle on a twin post hoist. Place safety stands under the frame to support the vehicle. During service procedures, the front post hoist is lowered to remove coil spring.

3. Remove the coil spring as described in Removal and Installation, Spring, Front this section.

4. **NOTE: Prior to removing the front suspension lower arm, the front post of the hoist should be rotated to support the vehicle under the No. 1 crossmember.**

   Remove the bolts and nuts retaining the front suspension lower arm to the No. 1 crossmember. Remove the front suspension lower arm.

5. Replace entire front suspension lower arm assembly to service bushings.

Installation

1. Position the front suspension lower arm in No. 1 crossmember.

2. Install but do not tighten the bolts in the direction shown in Views A and B in the illustration labeled Front Suspension, Aerostar E-4WD in the Removal and Installation portion of this section.

3. Inspect the lower ball joint boot seal for damage and replace if required.

4. Install the coil spring as described in this section.

5. With the vehicle in the normal ride position, tighten the front suspension lower arm-to-No. 1 crossmember retaining nuts to 136-190 Nm (100-140 lb-ft).

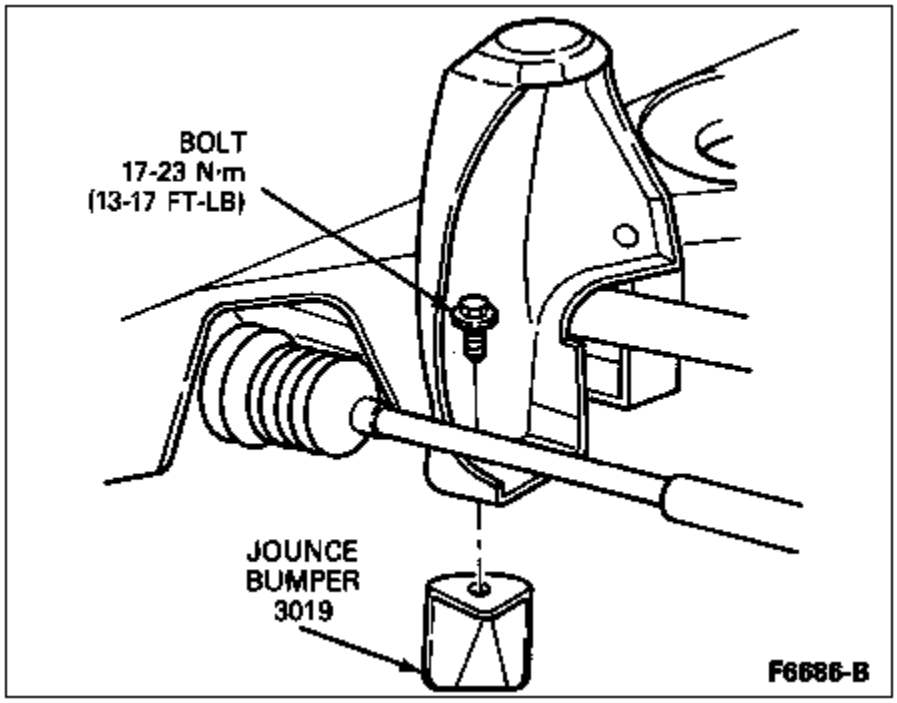
6. Remove safety stands and lower vehicle.

Bumper, Front

Removal and Installation

1. Remove the bolt retaining the front suspension bumper (3020) to the No. 1 crossmember. Remove the front suspension bumper.

2. Place the front suspension bumper in position on the crossmember. Install the bolt and tighten to 17-23 Nm (13-17 lb-ft).



SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	Lb-Ft	Lb-In
Crossmember to Frame Rail Bolts (M16 Bolts Through Front and Rear Upper Control Arm Mounts)	196-264	145-195	—
Front Mounting Bracket Bolt (M10 Bolts Through Front Upper Control Arm Front Mount Only)	47-64	35-47	—
Bolt Retainer Bracket to Frame Screw	14-19	10-14	—
Front Suspension Bumper to Frame Bolt	17-23	13-17	—
Lower Control Arm to No. 1 Crossmember Nut and Bolt. Tighten to the Specified Torque with the Vehicle in the Normal Ride Position with All Other Fasteners Tightened to Specifications.	136-190	100-140	—

Toe Set Jam Nut	61-88	45-65	—

FRONT SUSPENSION, AEROSTAR E-4WD

Symptom Chart — Rear Suspension

REAR SUSPENSION

Condition	Possible Source	Action
• Body "Rolls"	• Malfunction of rear shock absorber.	• REPLACE the rear shock absorber.
	• Worn or deteriorated rear stabilizer bar link/bushings (Ranger only).	• REPLACE the rear stabilizer bar link/bushings.
• Poor Riding Comfort	• Weak rear spring.	• REPLACE the rear spring.
	• Malfunction of rear shock absorber.	• REPLACE the rear shock absorber.
• Body Leans	• Malfunction of rear shock absorber.	• REPLACE the rear shock absorber.
	• Weak rear spring.	• REPLACE the rear spring.
• Abnormal Noise from Suspension System	• Looseness of component connections.	• TIGHTEN the component connections.
	• Malfunction of rear shock absorber or lateral shock absorber.	• REPLACE the rear shock absorber or lateral shock absorber. **NOTE: Forward and rearward motion (relative movement between rubber shock bushing and metal sleeve) at each end of the lateral shock is normal. Do not replace lateral shock if this condition exists. Relative movement between the metal shock sleeve and the frame/axle brackets is not normal. If necessary, check and tighten frame end bolt to 53-72 Nm (39-53 lb-ft) and axle end bolt to 68-92 Nm (50-68 lb-ft).**
	• Worn or deteriorated rear stabilizer bar/link bushings (Ranger only).	• REPLACE the rear stabilizer bar link/bushings (Ranger only).
• General Driving Instability	• Weak rear spring.	• REPLACE the rear spring.

tomsn048@gmail.com

	• Malfunction of rear shock absorber.	• REPLACE the rear shock absorber.
	• Worn or deteriorated rear stabilizer bar link/bushings (Ranger only).	• REPLACE the rear stabilizer bar link/bushings (Ranger only).
	• Damaged or unbalanced wheel.	• CHECK the wheel balance. BALANCE if necessary.
	• Damaged suspension arm bushing of rear axle assembly (Aerostar only).	• REPLACE bushings or suspension arms.

tomsn048@gmail.com

Component Tests

Rear Spring Squeak, Ranger

To correct a squeaking condition at the rear springs (5560):

- Determine whether it is the rear spring or the shackle bushings squeaking. If it is determined to be the bushings, replace them.
- If it is the rear springs, install new rear spring anti-squeak inserts (5586) to correct the squeak.
- If the original spring clip is damaged during removal, install a new service spring clip.

Rear Spring Anti-Squeak Insert

1. Raise the vehicle by the frame so rear axle hangs freely.

2. Bend the spring clip to provide clearance between the rear spring leaves, allowing insertion of the rear spring anti-squeak inserts. A pry-bar may be used between the leaves to provide additional clearance for insertion of rear spring anti-squeak inserts.

3. **NOTE: Do not attempt to install a rear spring anti-squeak insert between the lowest primary leaf and the short 12.70mm (0.50-inch) thick secondary leaf found at the bottom of the leaf stack on some assemblies.**

   Slide the rear spring anti-squeak insert between the leaves until the liner extends approximately 6.35mm (0.25 inch) beyond the tip of the lower leaf.

4. Set rear axle (4001) on a stand to load the rear leaf springs. Contact leaves at the clip locations.

5. **NOTE: On some of the rear spring anti-squeak inserts, sections of the edge used to center the liner on the spring leaves may need to be trimmed off to accommodate spring clip.**

   Reinstall production clips or install the replacement service clip.

Service Spring Clip Installation

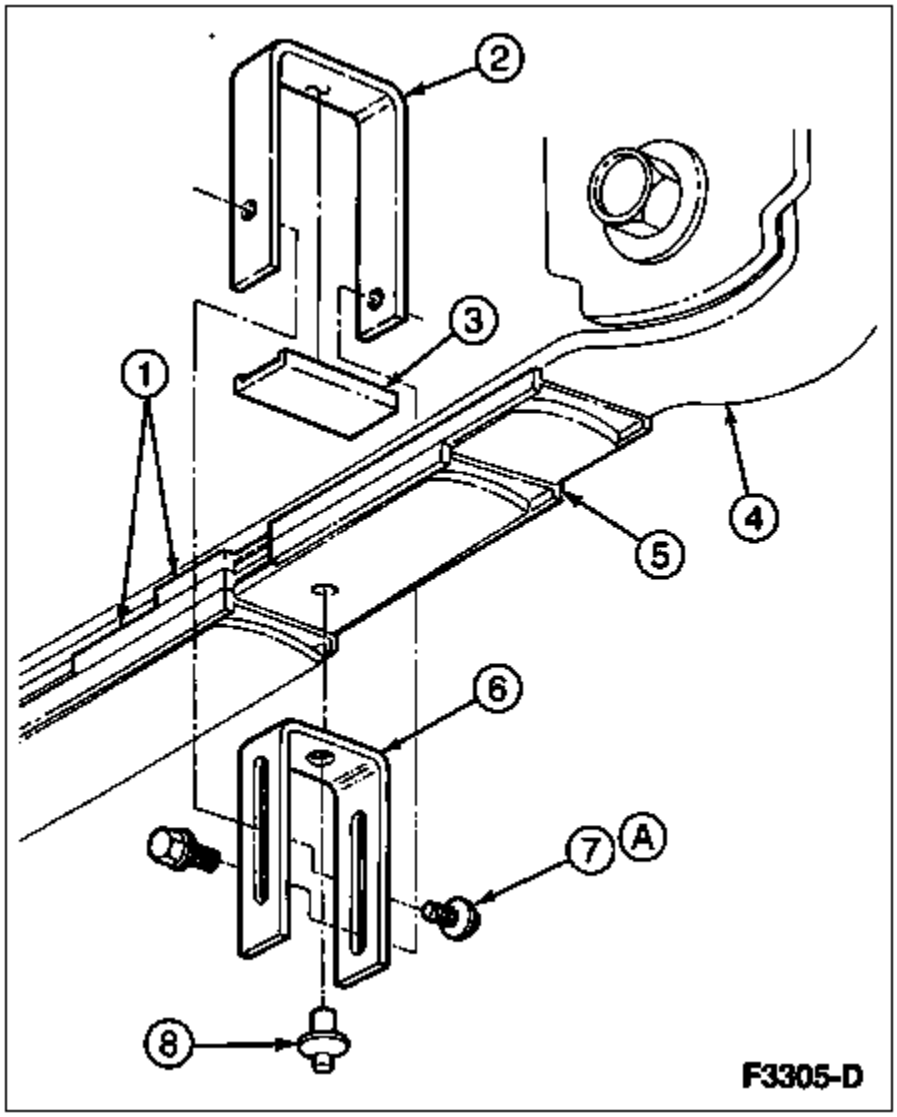
1. **NOTE: The spring leaves should contact at the clip location.**

   Load the rear leaf springs with rear of the vehicle supported either by the rear axle (4001) or by the tires.

2. Remove the damaged clip by prying back the ends of the clip which are folded across the rear spring (5560) until the clip can be freed from the rear spring. On some clips it is necessary to pry the locating pin out of the locating hole.

tomsn048@gmail.com

3. Make sure the locating hole is clean and free of debris.



Item	Part Number	Description
1	—	Tip Liner (Trimmed to Accommodate Rear Spring Clamp) (Part of 5586)
2	5724	Rear Spring Clamp (Upper Half)
3	—	Rubber Clamp Liner (Part of 5724)
4	5560	Rear Spring
5	—	Liner (Part of 5586)
6	5724	Rear Spring Clamp (Lower Half)

tomsn048@gmail.com

7	—	Screw (Part of 5724)
8	—	Rivet (Part of5724)
A	—	Tighten to 21-27 Nm (15-20 Lb-Ft)

4. Position the lower part of the service clip across the width of the underside of the rear spring, so clip holes align with the locating hole in the rear spring. The legs of the clip lower half should extend down from the bottom of the rear spring.

5. Insert drive rivet that comes with the clamp through the hole in lower service clip and hole in the rear spring. The flat face of the rivet flange should rest against the clip lower half.

6. **NOTE: If there is not enough room to hit the rivet directly with a hammer, a punch may be used.**

   Fully seat the rivet with a hammer.

7. The slotted legs of the clip lower half should extend downward so the outer surface of legs is flush with rear spring sides.

8. Place the rubber service clip liner across the top of the rear spring. Align with lower clip with the flat surface against the rear spring and the clip locating edges extending upward.

9. Place the clip upper half between the locating edges of the rubber liner.

10. Align threaded holes in clip upper half with lower clip slots.

11. **NOTE: The screw heads will be located under the rear spring, ultimately pressing against the clip lower half.**

    Hand start the two screws through the clip lower half slot into the clip upper half threaded hole.

12. Squeeze the clip to the rear spring with one hand while tightening the screws. Tighten to 21-27 Nm (15-20 lb-ft).

---

tomsn048@gmail.com

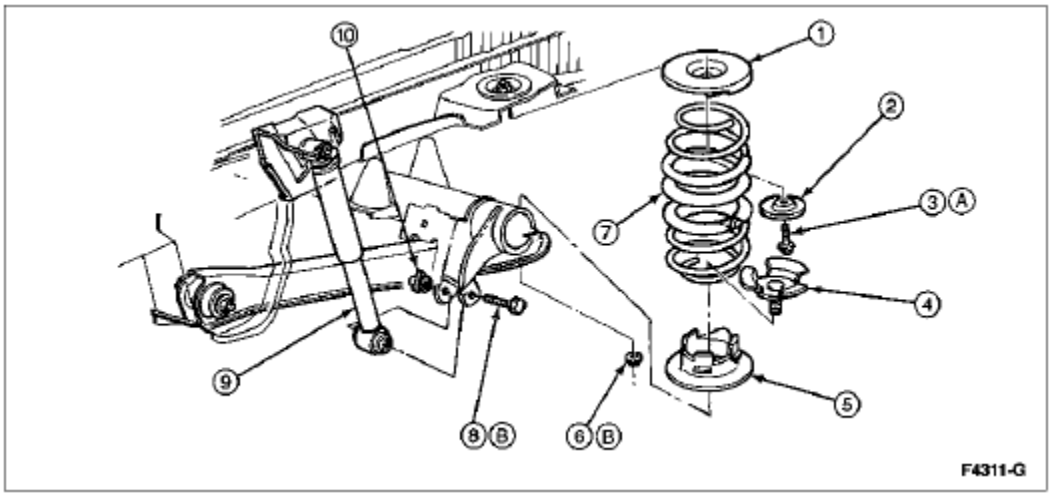
tomsn048@gmail.com

Spring, Rear, Aerostar

Removal

1. Using frame hoist, raise the vehicle and position tall jack under rear axle (4001). Raise jack until axle is raised slightly (load removed from shock absorber (18080)).

Rear Spring, Aerostar



Item	Part Number	Description
1	5536	Rear Spring Insulator
2	5A543	Rear Spring Upper Retainer
3	605919	Bolt

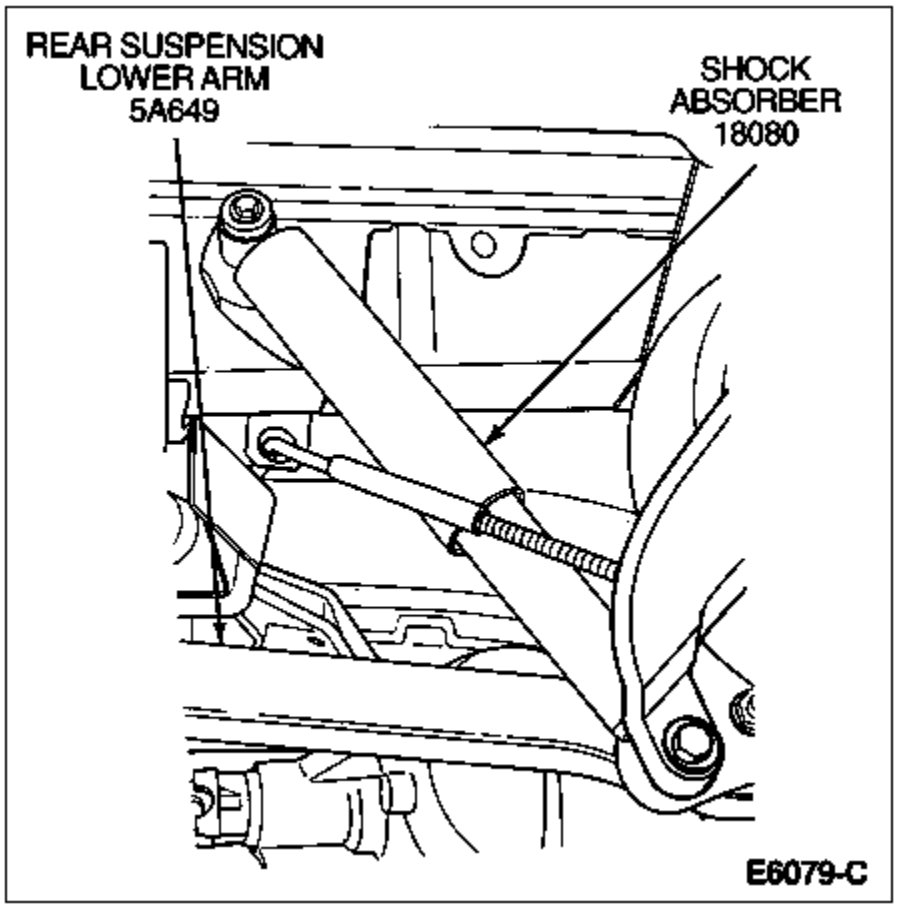
5	5741	Rear Spring Center Mounting Insulator
6	N620483	Nut
7	5560	Rear Spring
8	N801332	Bolt
9	18080	Shock Absorber
10	804220	Nut and Retainer
A	—	Tighten to 40-55 Nm (30-40 Lb-Ft)
B	—	Tighten to 60-80 Nm

tomsn048@gmail.com

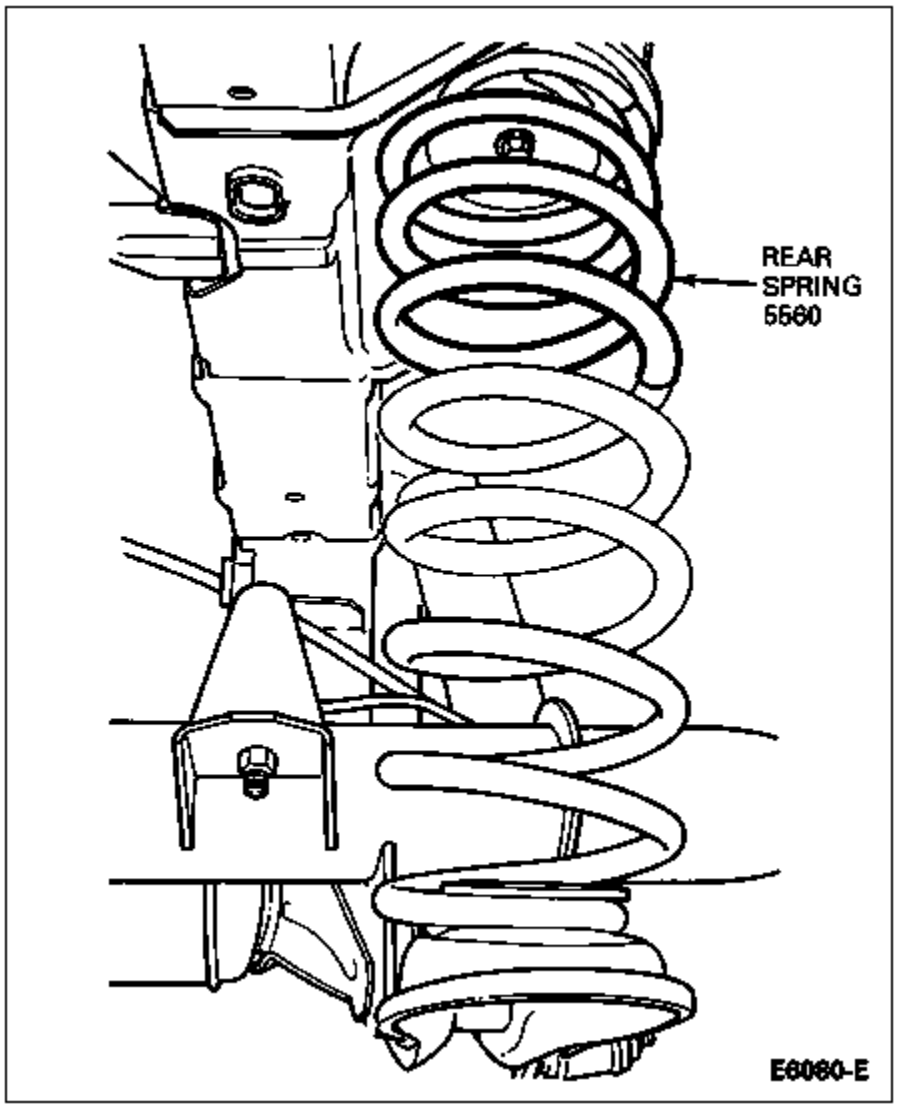
		(45-60 Lb-Ft)

2. Remove shock absorber-to-axle mount nut and bolt.
3. Disconnect the shock absorber from axle bracket.



4. Lower the rear axle until the rear springs (5560) are no longer under compression.
5. Remove lower retainer and spring-to-rear suspension lower arm nut.
6. Remove upper retainer and spring-to-frame bolt.
7. Remove the rear spring and retainers.
8. Remove the upper and lower insulators.

tomsn048@gmail.com



Installation

1. Make sure the rear axle is at the rear spring unloaded position. Place the rear spring center mounting insulator (5741) on the bottom of the rear spring. Place the rear spring insulator (5536) on top of the rear spring.

2. **NOTE: When installing the rear spring, the small diameter, tapered coils (with the insulating sleeve) must face upward with pigtail resting against the upper insulator rubber stop.**

   Install the coil spring in position between the shock absorber and frame (5005).

3. With the upper pigtail resting against the rubber stop, rotate spring with upper insulator until lower pigtail points in the three o'clock position. Install the upper retainer and bolt. Tighten the bolt to 40-55 Nm (30-40 lb-ft).

4. Install the lower retainer and nut. Tighten the nut to 60-80 Nm (45-60 lb-ft).

tomsn048@gmail.com

5. Raise the axle high enough to allow installation of shock absorber.

6. Position the shock absorber in the axle bracket. Install the bolt so the head is positioned outboard of the bracket. Install the nut and tighten to 60-80 Nm (45-60 lb-ft).

7. Remove the jack and lower the vehicle.

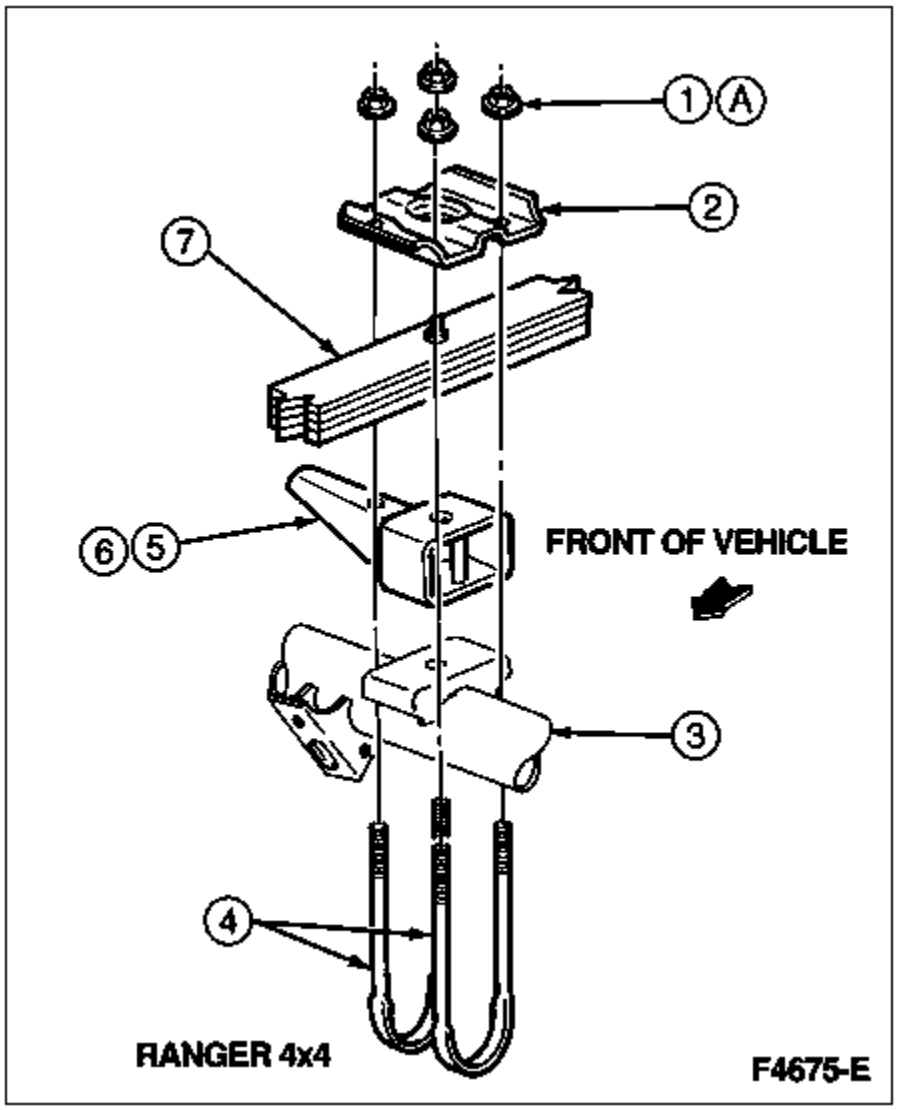
---

tomsn048@gmail.com

Spring, Rear, Ranger

Removal and Installation

1. Raise the vehicle on the frame hoist. Support rear axle (4001) on a jack without compressing springs.
2. Remove the nuts from spring U-bolts and drive the U-bolts from the rear spring plate (5796).



Item	Part Number	Description

Shock Absorber, Aerostar

WARNING: THE LOW PRESSURE GAS SHOCK ABSORBERS ARE CHARGED WITH NITROGEN GAS TO 930KPA (135 PSI). DO NOT ATTEMPT TO OPEN OR HEAT WITH A TORCH.

Removal and Installation

1. Raise the vehicle on a frame hoist. Place safety stands under the rear axle (4001) to take the load off the shock absorber (18080).

2. Remove the shock absorber lower attaching nut and bolt. Swing the lower end free of the mounting bracket on the axle housing.

3. Remove the attaching bolt and washer from the upper mounting bracket. Remove the shock absorber.

   For installation, follow removal procedures in reverse order.

   - Tighten shock absorber-to-lower bracket nut to 60-80 Nm (45-60 lb-ft).
   - Tighten upper mounting bracket bolt and washer to 60-80 Nm (45-60 lb-ft).

tomsn048@gmail.com

Shock Absorber, Ranger

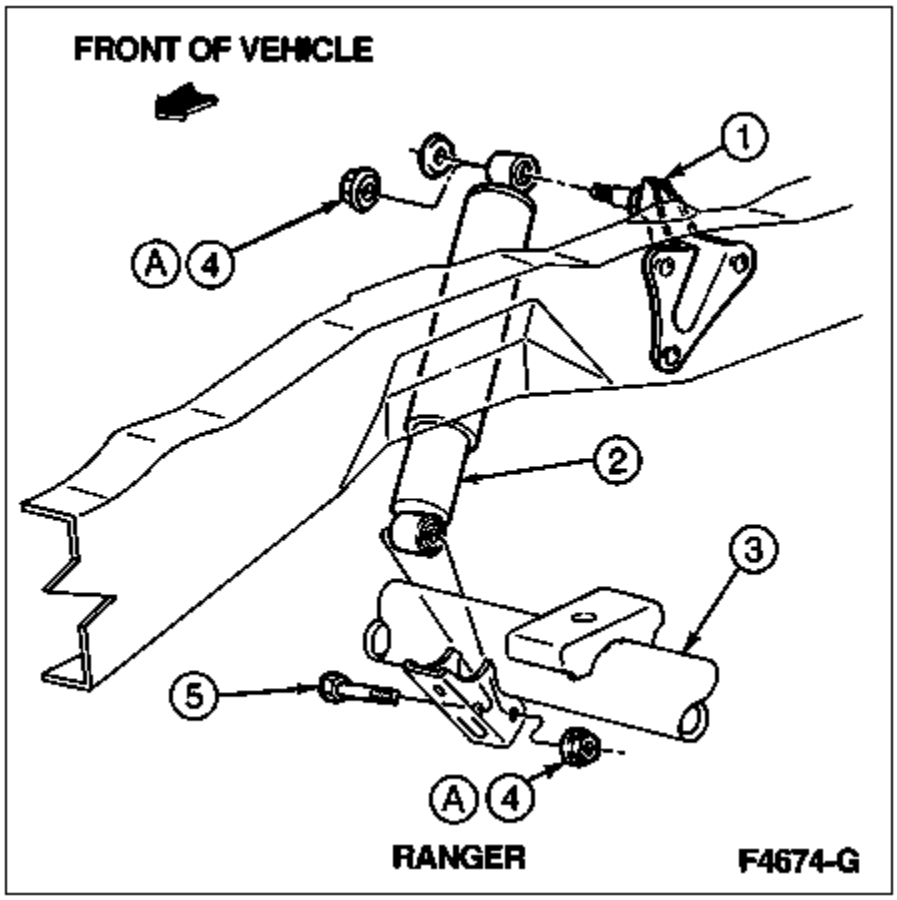
WARNING: THE LOW PRESSURE GAS SHOCK ABSORBERS ARE CHARGED WITH NITROGEN GAS TO 930 KPA (135 PSI). DO NOT ATTEMPT TO OPEN OR HEAT WITH A TORCH.

Removal and Installation

1. Raise the vehicle on a frame hoist. Place safety stands under the axle or wheel to take the load off the shock absorber (18080).
2. Remove the shock absorber lower attaching nut and bolt, and swing the lower end free of the mounting bracket on the axle housing.
3. Remove the attaching nut from the upper mounting bolt. Remove the shock absorber.

   For installation, follow the removal procedures in reverse order.

   - On Ranger, tighten shock absorber-to-axle housing mounting bracket nut to 53-72 Nm (39-53 lb-ft) and upper mounting bracket nut to 53-72 Nm (39-53 lb-ft).



tomsn048@gmail.com

A	—	Tighten to 53-72 Nm (39-53 Lb-Ft)

tomsn048@gmail.com

Rear Suspension Arm and Bushing, Aerostar

Removal

1. Raise the vehicle on a twin-post type hoist. Position jackstands on the frame rear lift points or under the rear bumper support brackets. If a frame hoist is used, raise the vehicle and position tall jackstands under the rear axle (4001).

2. Lower the hoist until the rear axle is in the normal ride height position.

3. Remove shock absorber-to-lower axle bracket nut and bolt.

4. Swing the lower end of the shock absorber (18080) free of the axle bracket.

5. **NOTE: If the vehicle is on a frame hoist, raise the vehicle until the coil springs are no longer under compression.**

   Lower the rear axle until the coil springs are no longer under compression.

6. **NOTE: To ease rear suspension arm and bushing removal, follow the exact sequence detailed in the following steps.**

   NOTE: Scribe reference mark on cam adjuster and axle bushing before removal.

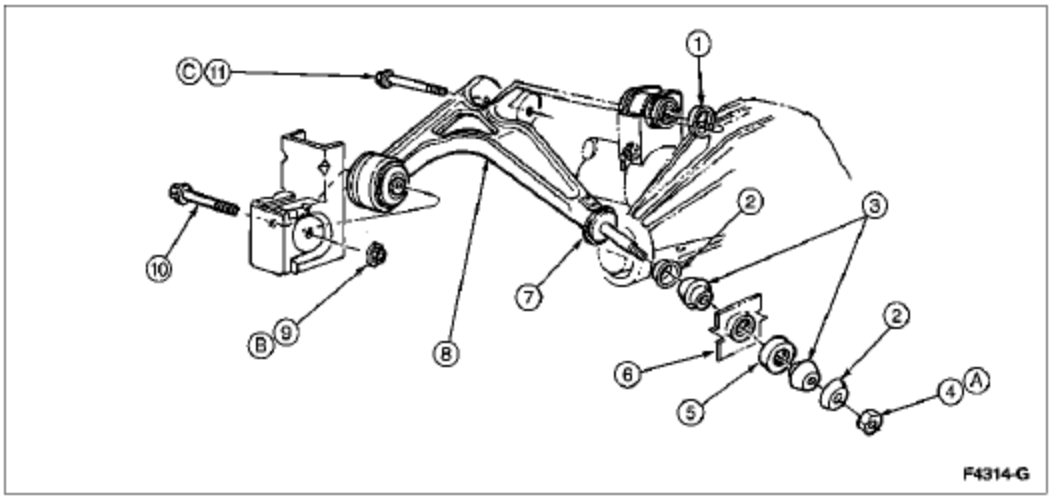
   Remove rear suspension arm-to-rear axle bolt and nut. Disconnect the rear suspension arm and bushing (5500) from the rear axle.

7. **NOTE: If the left bracket attachments are loosened prior to disengaging the rear suspension arm and bushing from the right bracket, the uncompressed left bushing will force the rear suspension arm and bushing against the right-hand bracket and make removal difficult.**

   Remove rear suspension arm-to-right frame bracket bolt and nut. Rotate the rear suspension arm and bushing to disengage from the body bracket.

Rear Suspension Arm and Bushing, Aerostar

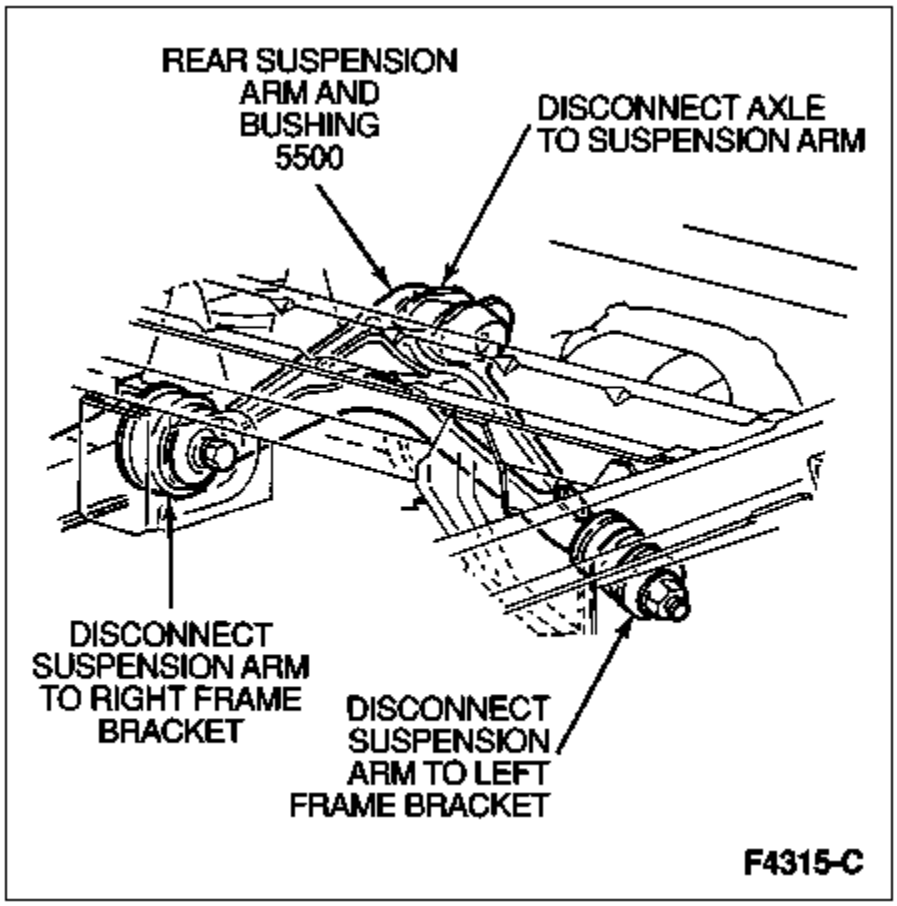
tomsn048@gmail.com



Item	Part Number	Description
1	5K679	Suspension Thrust Bushing
2	5A349	Spring Mounting Retainer
3	5K752	Body Insulator
4	801670	Nut
5	5K580	Suspension Outer Spacer
6	5546	Upper Body Bracket
7	—	Plastic Washer (Part of 5500)
8	5500	Rear Suspension Arm and Bushing
9	800237	Nut
10	804591	Bolt
11	N806946	Bolt
A	—	Tighten to 90-120 Nm (65-90 Lb-Ft)
B	—	Tighten to 135-170 Nm (100-125 Lb-Ft)
C	—	Tighten to 210-284 Nm (155-210 Lb-Ft)

8. Remove rear suspension arm-to-left frame bracket nut and washer. Remove the outer insulator and spacer. Remove the rear suspension arm and bushing from the bracket. Remove the inner insulator and spacer from the rear suspension arm stud.

tomsn048@gmail.com



Installation

1. **NOTE: To ease rear suspension arm and bushing installation, follow the exact sequence detailed in Steps 1 through 6.**

   Position the spacer and inner insulator on the rear suspension arm stud.

2. Install the rear suspension arm and bushing so the stud extends through the left frame bracket.

3. Install the outer spacer and outer insulator over the stud.

4. **CAUTION: When performing the following step, DO NOT TIGHTEN TO THE SPECIFIED TORQUE.**

   Install the nut and washer assembly and tighten until snug.

5. Position the rear suspension arm in right frame bracket. Install the bolt and nut and tighten until snug.

6. **CAUTION: When performing the following step, DO NOT TIGHTEN TO THE SPECIFIED TORQUE.**

   Align scribe marks on the cam adjuster and axle bushing and connect the rear suspension arm and

tomsn048@gmail.com

bushing to the rear axle.

7. Install the bolt and tighten until snug. DO NOT TIGHTEN TO THE SPECIFIED TORQUE AT THIS TIME.

8. Raise the rear axle to the normal ride position.

9. Position the shock absorber in the lower mounting bracket. Install the bolt so head is outboard of axle bracket. Install the nut and tighten to 60-80 Nm (45-60 lb-ft).

10. Tighten all rear suspension arm fasteners to the specified torque.

    - Tighten the bolt retaining the suspension arm to the axle to 210-284 Nm (155-210 lb-ft).
    - Tighten the nut and bolt retaining the suspension arm to the right frame bracket to 135-170 Nm (100-125 lb-ft).
    - Tighten the nut and washer assembly retaining the suspension arm to the left frame bracket to 90-120 Nm (65-90 lb-ft).

11. If required, check the driveline angularity or driveline angle check as described in Section 05-00 .

12. Remove the safety stands and lower the vehicle.

---

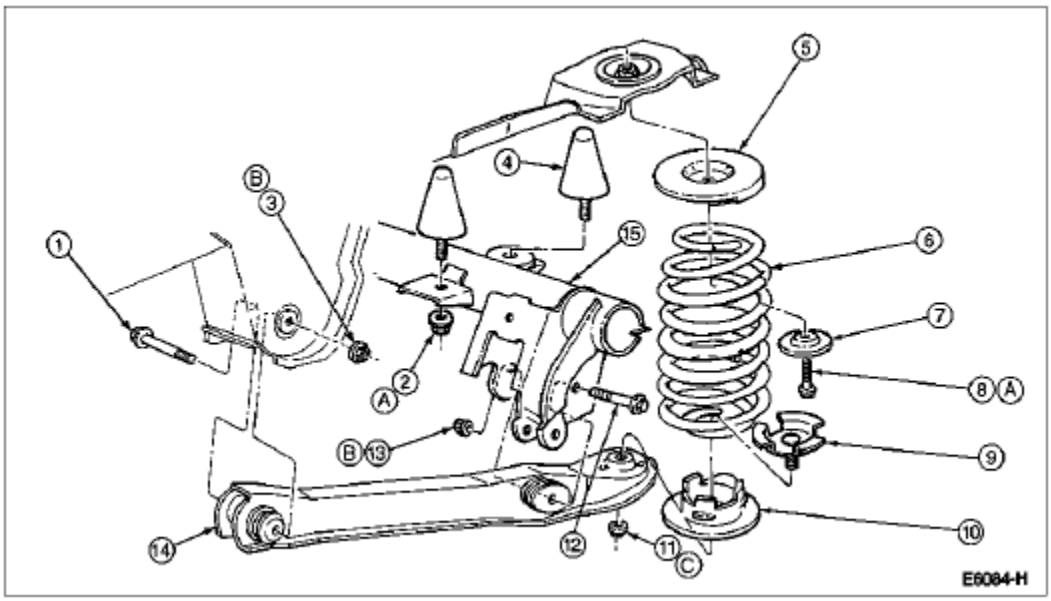
tomsn048@gmail.com

Rear Suspension Lower Arm, Aerostar

Removal

1. Use frame hoist to raise the vehicle and position tall jack under the rear axle (4001).
2. Raise the jack until the rear axle is slightly raised.
3. Remove shock absorber-to-axle bracket nut and bolt and swing the lower end of the shock absorber free of axle bracket.
4. Lower the rear axle until the coil springs are no longer under compression.
5. Remove lower retainer and coil spring-to-rear suspension lower arm nut. Remove the rear spring center mounting insulator (5741) from the rear suspension lower arm (5A649).
6. Remove rear suspension lower arm-to-axle housing bolt and nut.
7. Remove rear suspension lower arm-to-frame bracket nut and bolt. Remove the rear suspension lower arm.

Rear Suspension Lower Arm, Aerostar



Item	Part Number	Description

tomsn048@gmail.com

1	805791	Bolt

6	5560	Rear Spring
7	5A543	Rear Spring Upper Retainer
8	605919	Bolt
9	5A569	Rear Spring Lower Retainer
10	5741	Rear Spring Center Mounting Insulator
11	620483	Nut
12	N803923	Bolt
13	N801670	Nut
14	5A649	Rear Suspension Lower Arm
15	4001	Rear Axle
A	—	Tighten to 40-55 Nm (30-40 Lb-Ft)
B	—	Tighten to 130-170 Nm (95-125 Lb-Ft)
C	—	Tighten to 60-80 Nm (45-60 Lb-Ft)

Installation

1. Position the rear suspension lower arm in the frame bracket. Install the bolt so the head is inboard on the frame bracket. Install the nut but do not tighten at this time.
2. Position the rear suspension lower arm in the bracket on the axle housing. Install the bolt so the head is inboard on the axle bracket. Install the nut but do not tighten at this time.
3. Install the rear spring center mounting insulator on the lower end of the coil spring.
4. With the rear axle in the spring unloaded position, install the coil spring and lower retainer on the rear suspension lower arm.
5. Install spring-to-lower arm attaching nut. Tighten the nut to 60-80 Nm (45-60 lb-ft).
6. Raise the rear axle to the normal load position. Tighten rear suspension lower arm-to-axle housing nut and bolt to 130-170 Nm (95-125 lb-ft). Tighten rear suspension lower arm-to-frame bracket nut and bolt to 130-170 Nm (95-125 lb-ft).
7. Position the shock absorber (18080) in the lower axle mounting bracket. Install the bolt so head is outboard of the axle bracket. Install the nut and tighten to 60-80 Nm (45-60 lb-ft).

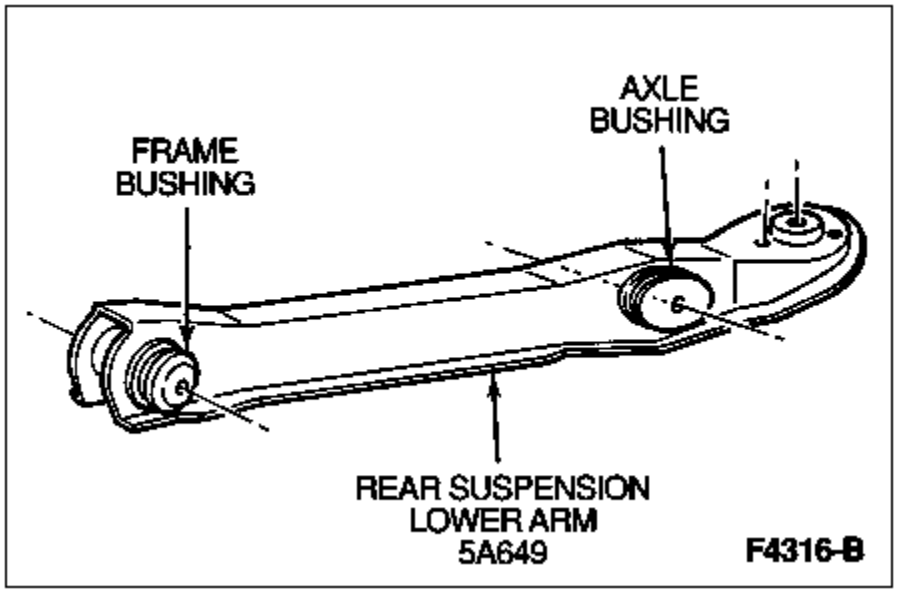
Bushings, Rear Suspension Lower Arm, Aerostar

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Oval Bushing Remover	T85T-5638-AH1
Oval Bushing Spacer	T85T-5638-AH7
Oval Bushing Receiver Cup	T85T-5638-AH2
Forcing Screw	T78P-5638-A1
Round Bushing Remover	T85T-5638-AH4
Round Bushing Spacer	T85T-5638-AH8
Round Bushing Receiver Cup	T85T-5638-AH6
Round Bushing Replacer	T85T-5638-AH5

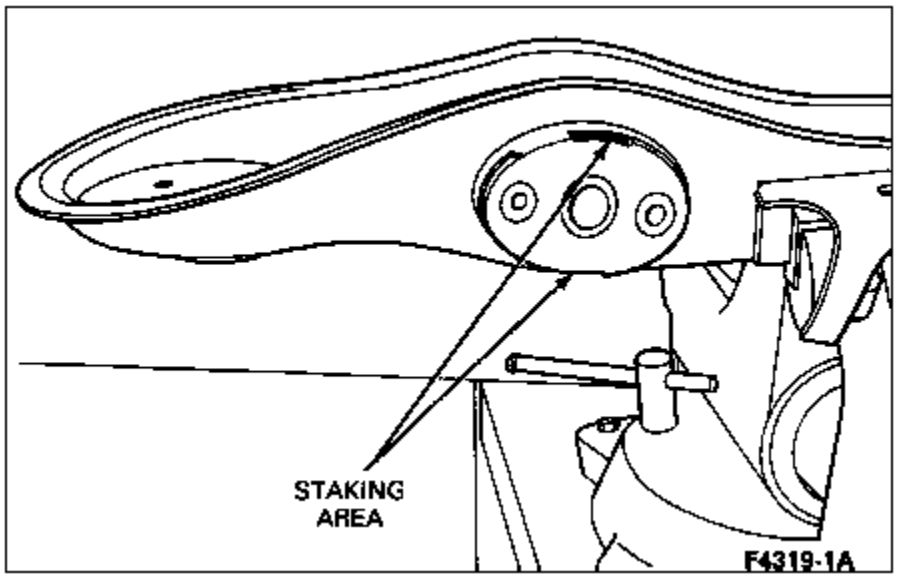
Removal

1. Remove the rear suspension lower arm (5A649) as described in this section. Clamp the rear suspension lower arm into a vise.

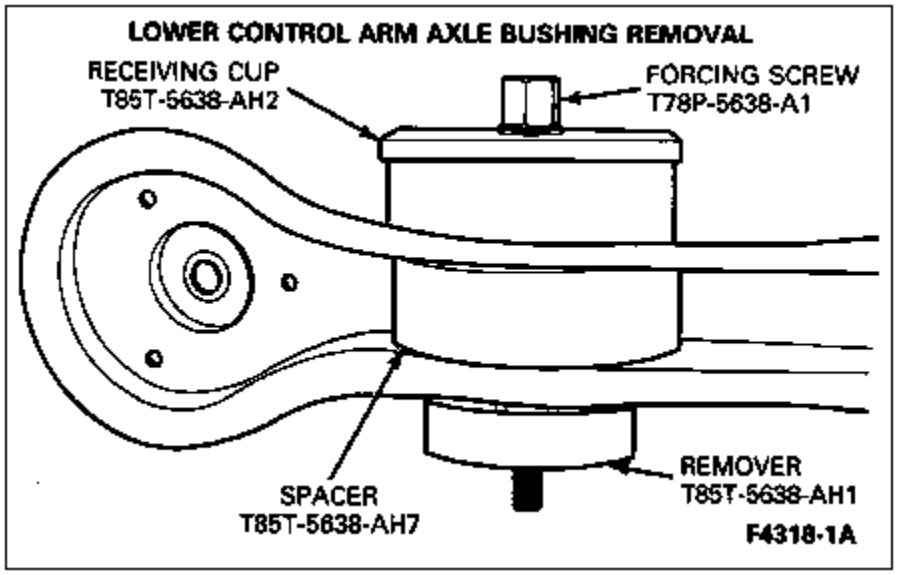


2. Unstake the lower control arm axle (oval) bushing.

tomsn048@gmail.com

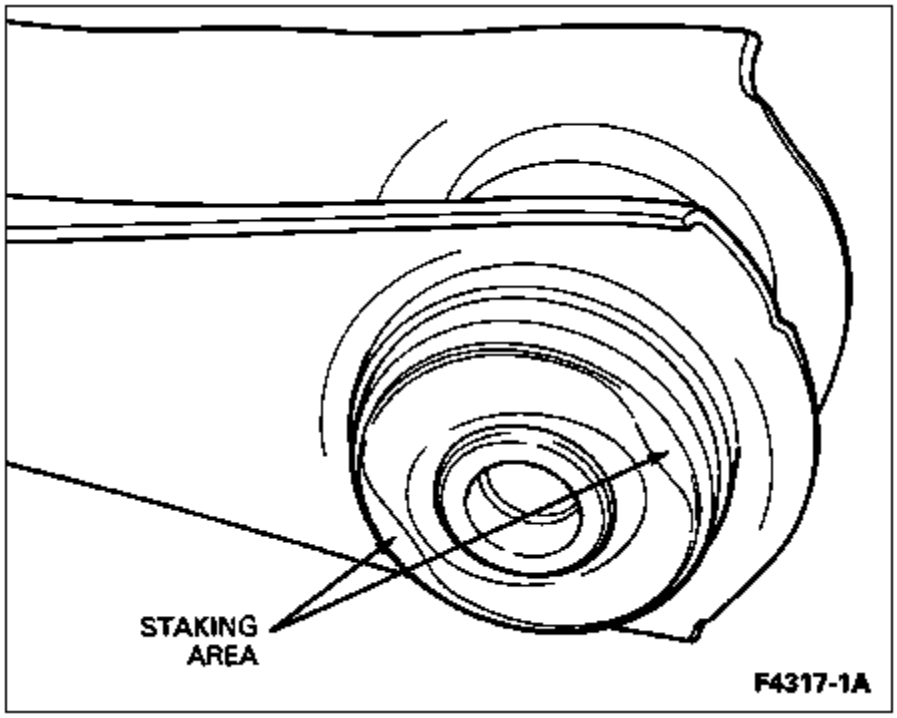


3. Press the axle bushing from the rear suspension lower arm using Bushing Remover T85T-5638-AH1, Spacer T85T-5638-AH7, Receiving Cup T85T-5638-AH2 and Forcing Screw T78P-5638-A1.



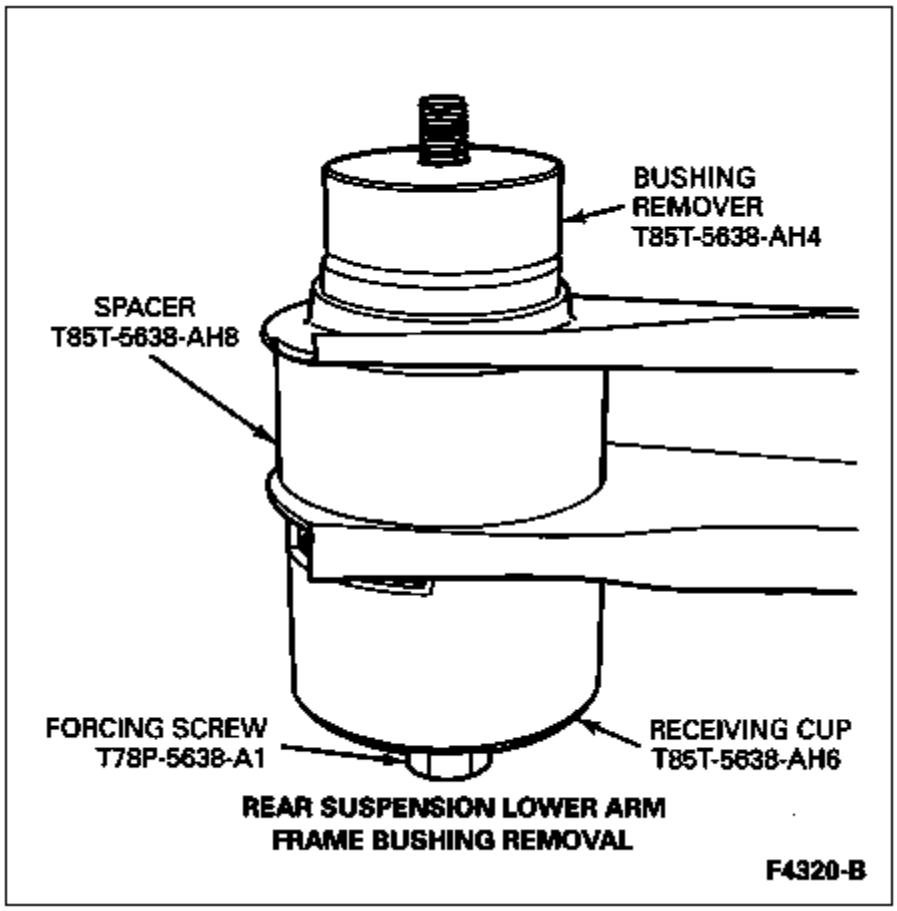
4. Unstake the rear suspension lower arm frame (round) bushing.

tomsn048@gmail.com



5. Press the frame bushing from the rear suspension lower arm using Bushing Remover T85T-5638-AH4, Spacer T85T-5638-AH8, Receiving Cup T85T-5638-AH6 and Forcing Screw T78P-5638-A1.

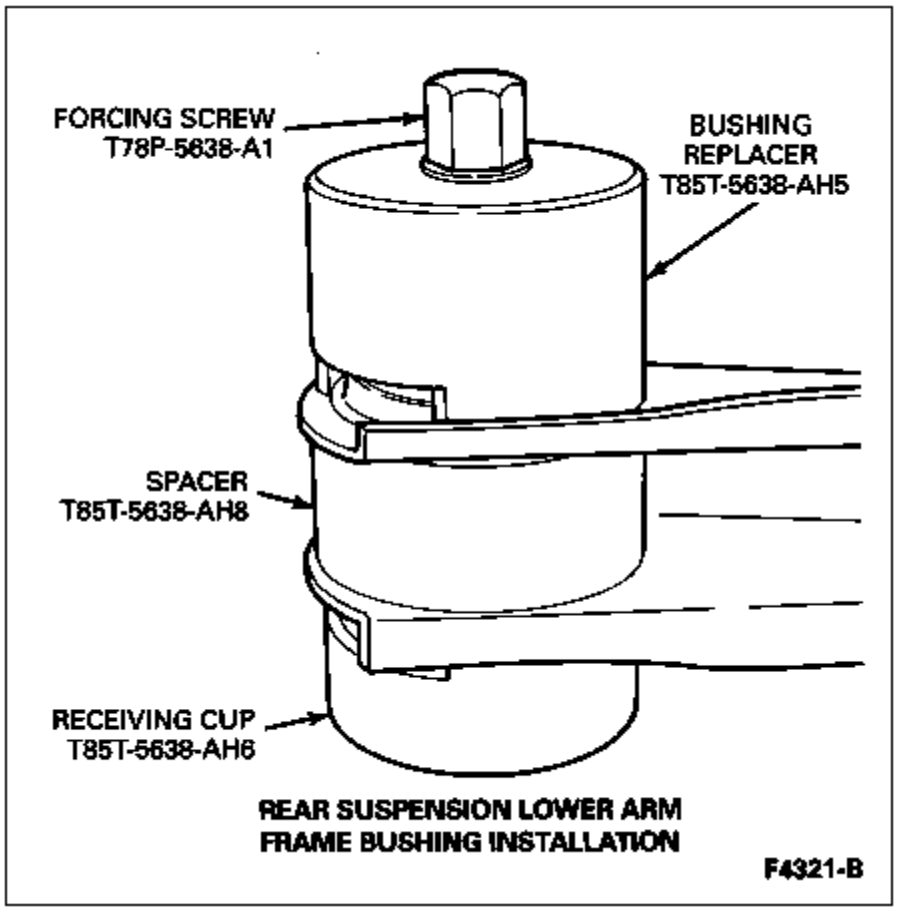
tomsn048@gmail.com



Installation

1. Press a new frame bushing in the rear suspension lower arm using Receiving Cup T85T-5638-AH6, Spacer T85T-5638-AH8, Bushing Replacer T85T-5638-AH5 and Forcing Screw T78P-5638-A1. Install bushing with notch in bushing flange toward the rear of vehicle.

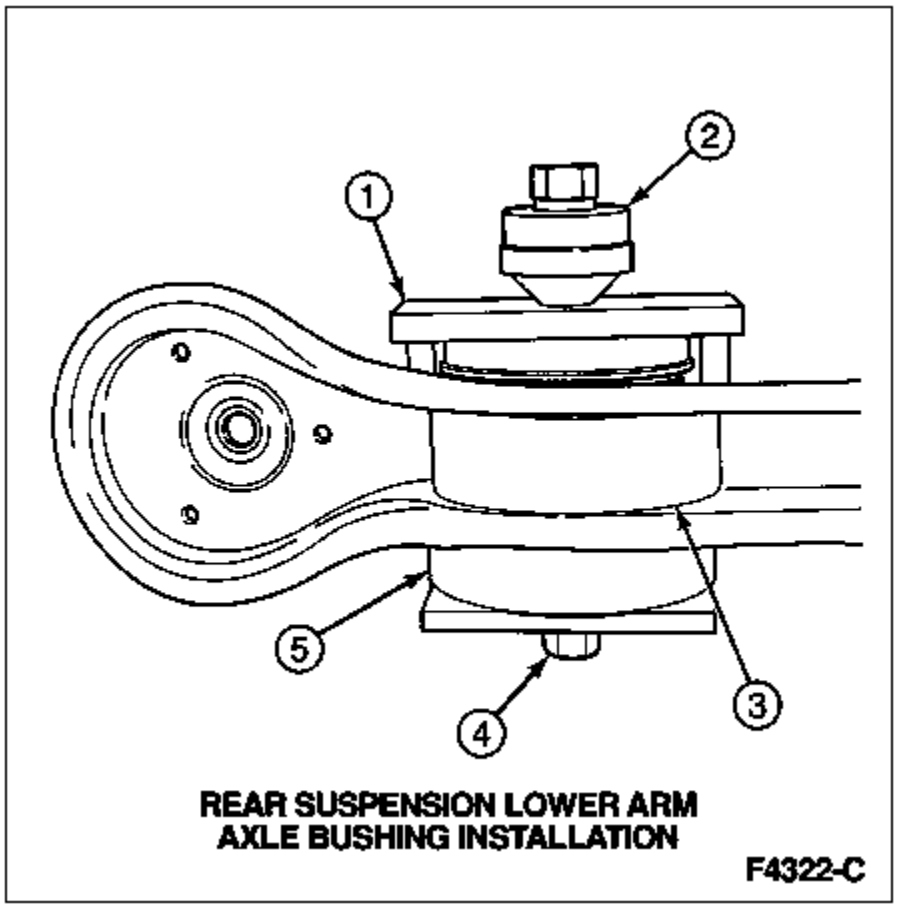
tomsn048@gmail.com



2. Stake the frame bushing in the rear suspension lower arm.

3. Press a new axle bushing in the rear suspension lower arm using Nut T78P-5638-A5, Bushing Replacer T85T-5638-AH3, Spacer T85T-5638-AH7, Receiving Cup T85T-5638-AH2 and Forcing Screw T78P-5638-A1. Install the bushing with notch in bushing flange toward the rear of vehicle.

tomsn048@gmail.com



Item	Part Number	Description
1	T85T-5638-AH3	Bushing Replacer
2	T78P-5638-A5	Nut
3	T85T-5638-AH7	Spacer
4	T78P-5638-A1	Forcing Screw
5	T85T-5638-AH2	Receiving Cup

4. Stake the axle bushing in the control arm.
5. Install the rear suspension lower arm as described in this section.

tomsn048@gmail.com

tomsn048@gmail.com

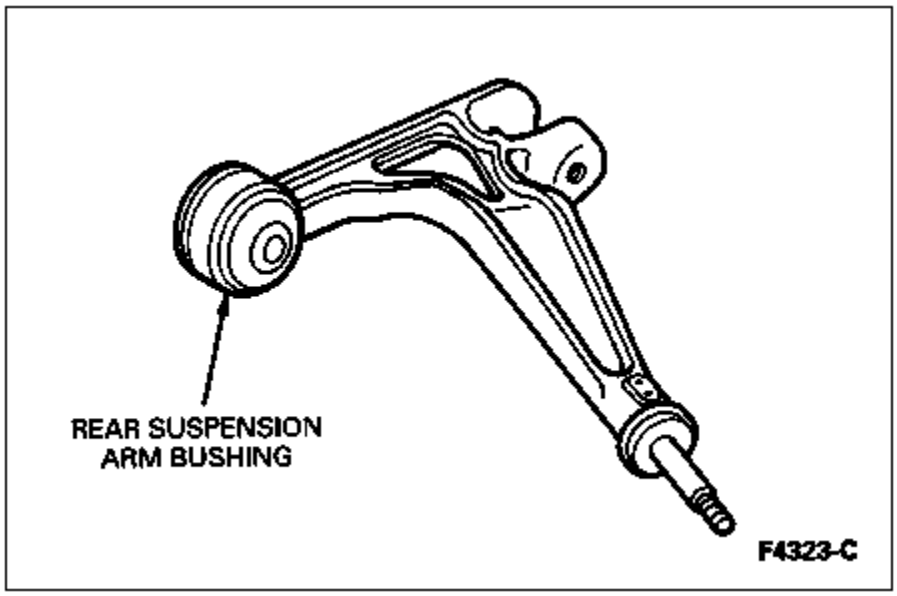
Bushing, Rear Suspension Arm, Aerostar

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Bushing Remover	T85T-5638-AH4
Receiving Cup	T85T-5638-AH6
Forcing Screw	T78P-5638-A1

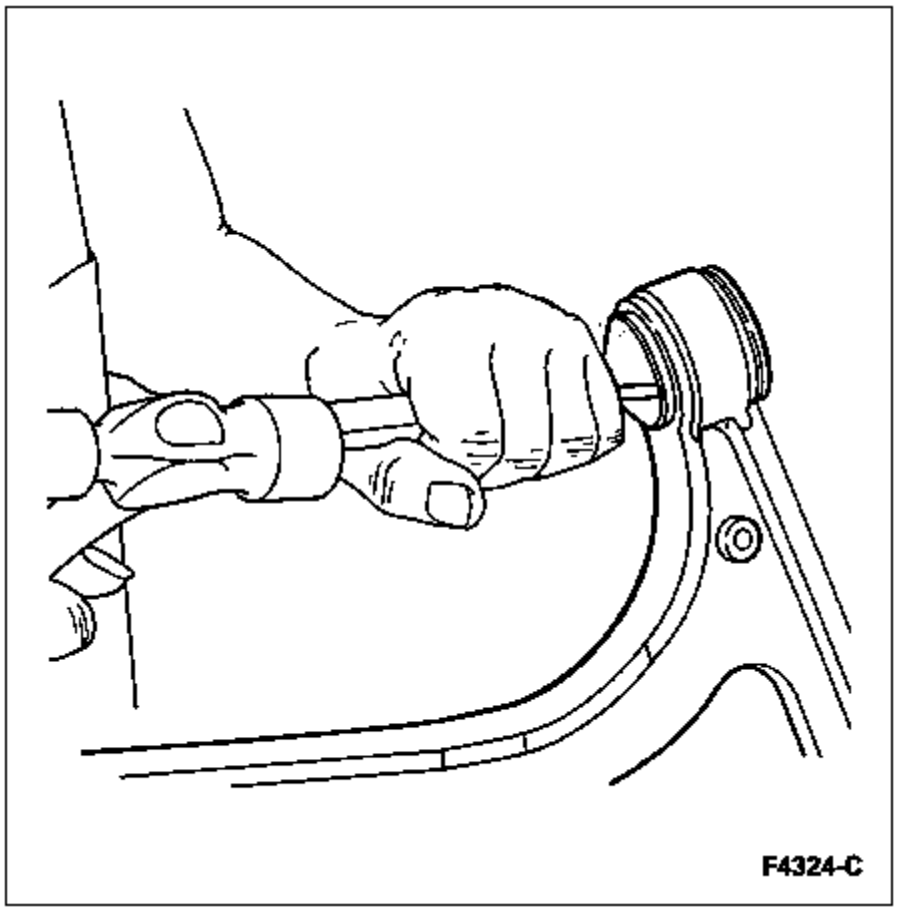
Removal

1. Remove the rear suspension arm and bushing (5500) as described in this section. Clamp the arm in a vise.



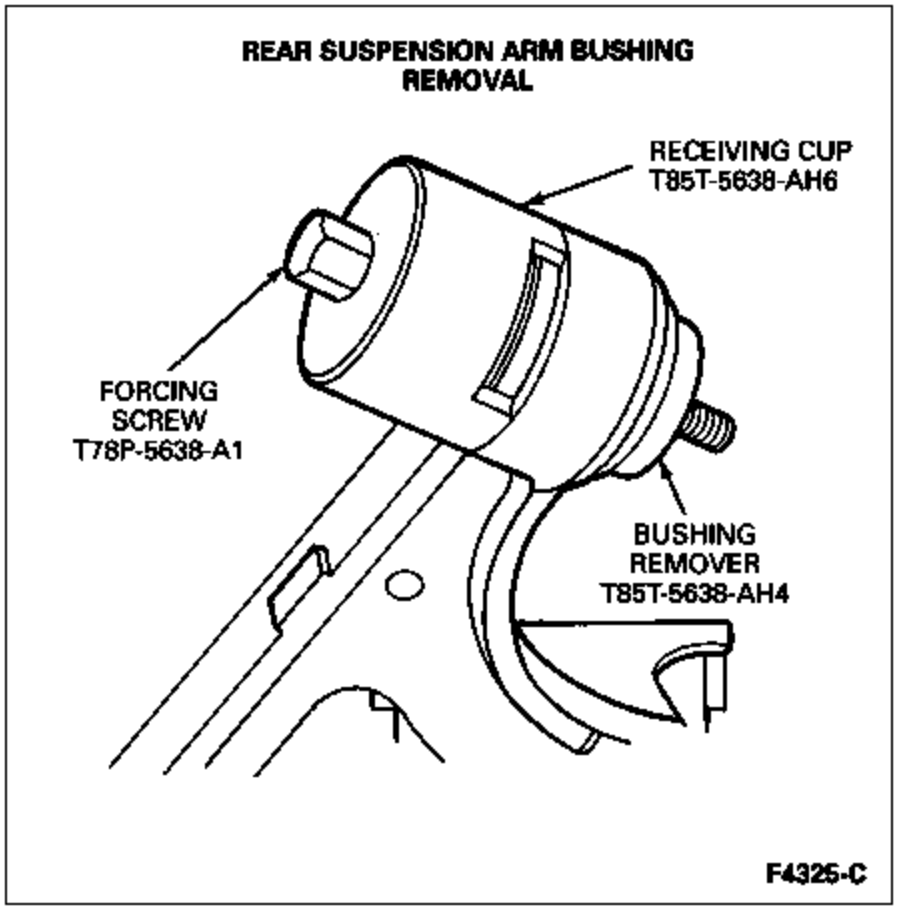
2. Unstake the bushing in the rear suspension arm as shown.

tomsn048@gmail.com



3. Press the bushing from the rear suspension arm using Bushing Remover T85T-5638-AH4, Receiving Cup T85T-5638-AH6 and Forcing Screw T78P-5638-A1. Discard the bushing.

tomsn048@gmail.com



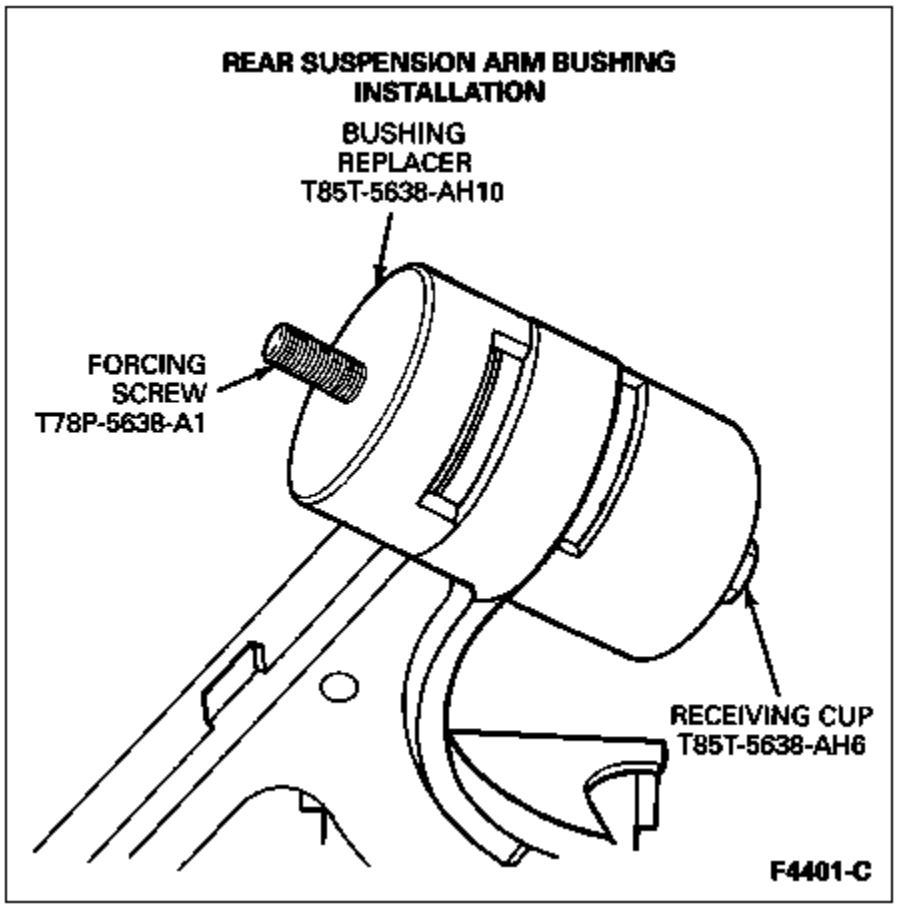
Installation

1. Press a new bushing in the rear suspension arm using Receiving Cup T85T-5638-AH6, Bushing Replacer T85T-5638-AH10 and Forcing Screw T78P-5638-A1. Install the bushing with notch in flange up.

2. Stake the bushing in the rear suspension arm.

3. Install the rear suspension arm and bushing as described in this section.

tomsn048@gmail.com



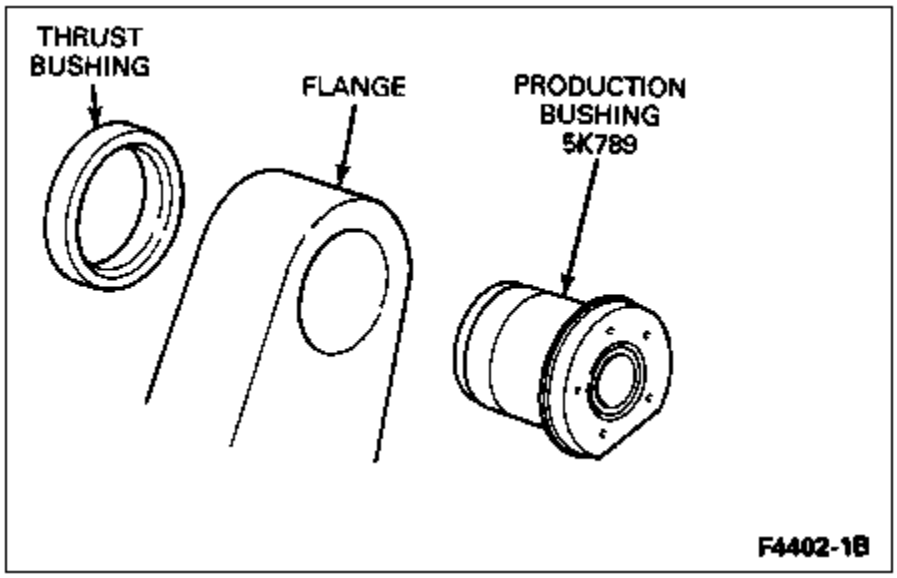
tomsn048@gmail.com

Bushing, Axle Housing-to-Rear Suspension Arm, Aerostar

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Axle Housing Bushing Mounting Adapter	T85T-5638-AH11
Forcing Screw	T78P-5638-A1
Axle Housing Bushing Remover	T85T-5638-AH12
Axle Housing Bushing Replacer	T85T-5638-AH13

NOTE: In service, the pinion angle adjustment is changed using an eccentric service bushing F09Z-5K789-B. If the bushing is being replaced due to damage or wear only, use standard production bushing F09Z-5K789-A. For pinion angle measurement procedures, refer to Driveline Angle Check in Section 05-00 .



Removal

1. **CAUTION: The axle must be securely supported on the hoist or stands. If more axle-hoist travel is required, disconnect the shock absorbers (18080) from the rear suspension lower arms.**

   Raise the vehicle on a twin-post hoist. Position jackstands on the frame rear lift points or under the rear bumper support brackets. If a frame hoist is used, raise the vehicle and position tall jackstands under the rear axle (4001). Lower the hoist until the axle is in the normal ride height position.

tomsn048@gmail.com

2. Remove rear suspension arm-to-axle housing nut and bolt.

3. With the vehicle securely supported on safety stands, slowly lower the rear axle until the rear suspension arm and bushing (5500) disengages from the rear axle. If a frame hoist is used, raise the hoist until the rear suspension arm disengages from the rear axle.

4. On the inboard side of the flange, insert a flat-blade screwdriver between the thrust bushing and flange. Pry the thrust bushing end off the bushing and flange without damaging any surfaces.

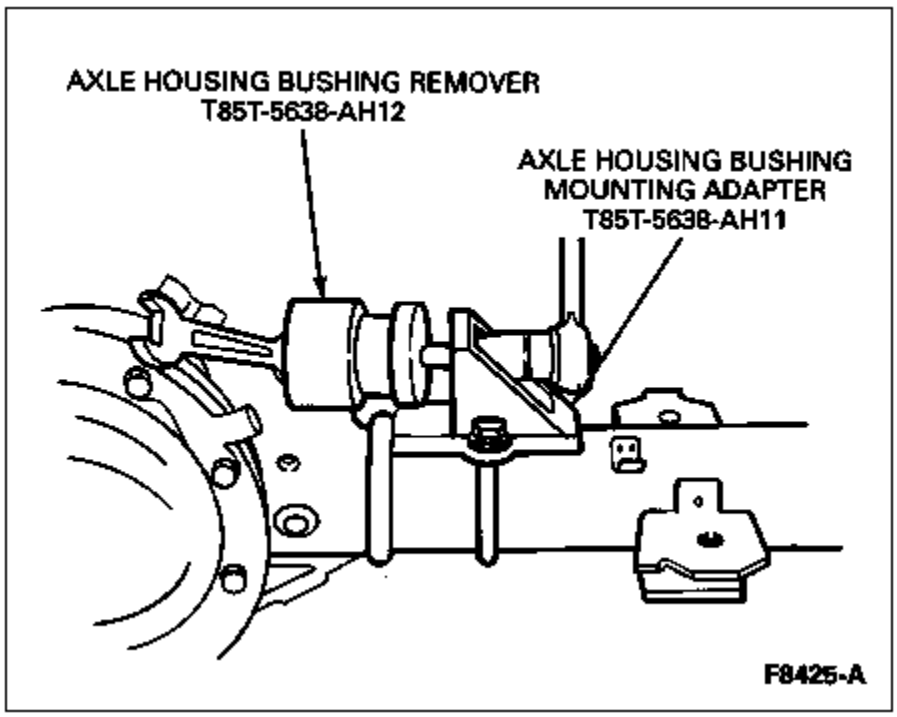
5. Attach Axle Housing Bushing Mounting Adapter T85T-5638-AH11 to the axle housing tube by using the U-bolt.

6. Place the Forcing Screw T78P-5638-A1 through the axle housing bushing to be removed.

7. Place the Axle Housing Bushing Remover T85T-5638-AH12 onto the forcing screw and thread a 7/16-20 nut onto the forcing screw.

8. Tighten the forcing screw to pull the bushing out of the axle housing.

9. Remove the forcing screw, bushing remover and mounting adapter.

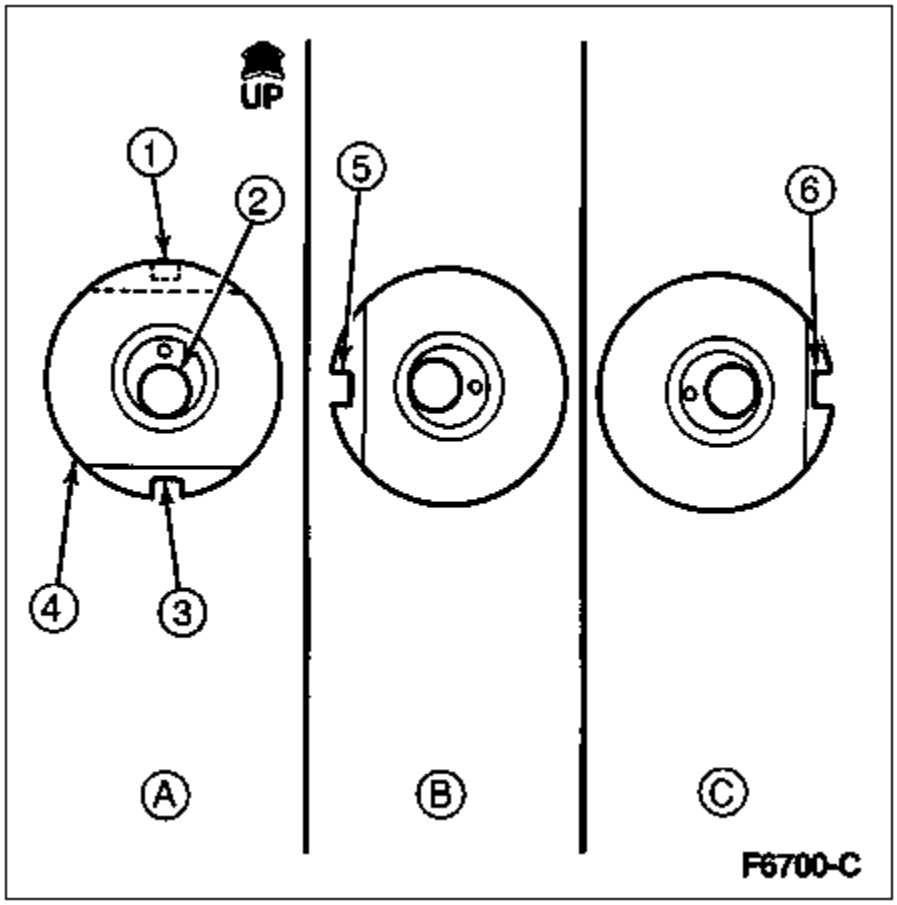


Installation

1. **NOTE: The notch on the bottom of the bushing must point in a 6 or 12 o'clock position for zero pinion angle adjustment, 3 o'clock position for 1.25° pinion angle up adjustment and 9 o'clock position for -1.25° pinion angle down adjustment.**

   Lubricate the bushing to be installed and place the bushing into the axle housing bushing bore.

tomsn048@gmail.com

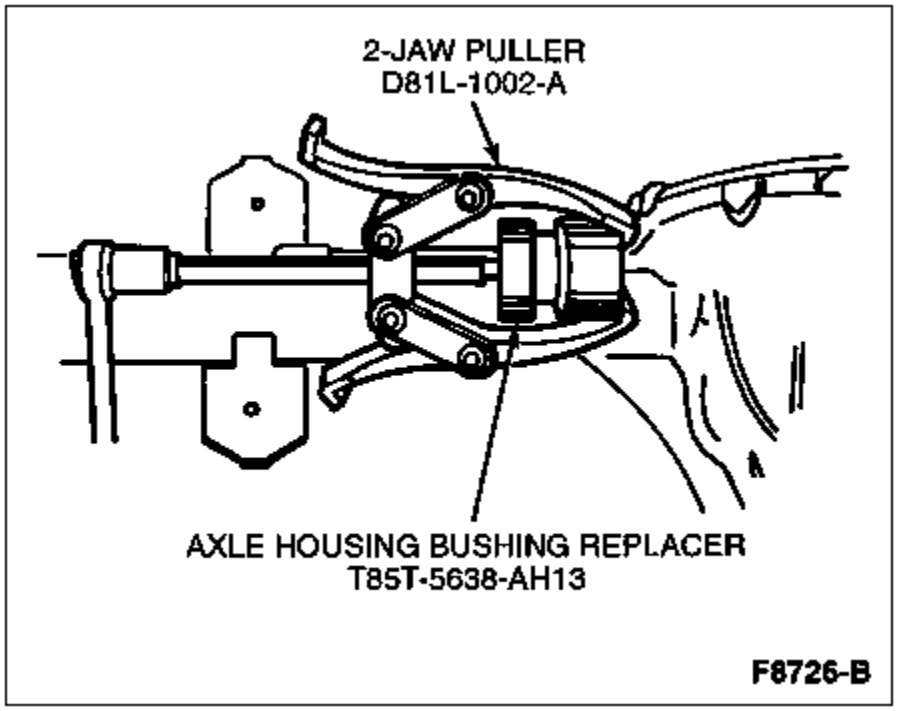


Item	Part Number	Description
1	—	12 o'Clock Position (Part of 5K789)
2	—	Bolt Hole (Part of 5K789)
3	—	6 o'Clock Position (Part of 5K789)
4	5K789	Eccentric Service Bushing
5	—	9 o'Clock Position (Part of 5K789)
6	—	3 o'Clock Position (Part of 5K789)
A	—	Nominal Position
B	—	Pinion Nose Down Position 1.25°
C	—	Pinion Nose Up Position 1.25°

2. Position 2-Jaw Puller D81L-1002-A or equivalent around the axle housing bushing bracket with Axle Housing Bushing Replacer Adapter T85T-5638-AH13 between the forcing screw and the flanged end of the bushing.

tomsn048@gmail.com

3. Turn the forcing screw to push bushing into position. Remove the installation tools.



4. On the inboard side of flange, install thrust bushing so steel washer faces the flange.
5. With the vehicle body securely supported on safety stands, raise the rear axle until the rear suspension arm engages the flange on the axle housing. If a frame hoist is used, lower the vehicle until the rear suspension arm and bushing engages the flange on the axle housing.
6. Install the nut and bolt retaining the rear suspension arm and bushing to the flange and tighten until snug. Do not tighten to the specified torque at this time.
7. If removed, connect the shock absorber to the lower axle bracket. Install and tighten the retaining nut to 60-80 Nm (45-60 lb-ft).
8. Position the rear axle in the normal ride position. Tighten the nut and bolt retaining the rear suspension arm and bushing to the flange to 210-284 Nm (155-210 lb-ft).
9. If required, check and adjust the driveline angularity or driveline angle check as described in Section 05-00 .
10. Remove the safety stands and lower the vehicle.

tomsn048@gmail.com

tomsn048@gmail.com

Stabilizer Bar, Rear, Ranger

Removal and Installation

1. Raise the vehicle on a hoist.
2. Remove the nuts, bolts and washers. Disconnect the rear stabilizer bar (5A772) from the links.
3. Remove bolts and nuts from the stabilizer bar brackets and retainers. Remove the stabilizer bar brackets, retainers and rear stabilizer bar.

   For installation, follow removal procedures in reverse order.

   Tighten the stabilizer bar bracket bolts to 34-46 Nm (25-34 lb-ft).

   Tighten the stabilizer link nuts to 60-80 Nm (44-59 lb-ft).

Rear Stabilizer Bar, Ranger

B	—	Tighten to 60-80 Nm (44-59 Lb-Ft)

tomsn048@gmail.com

Axle Bumper, Rear

Removal and Installation

1. Raise vehicle on a hoist. Refer to Section 00-02 .
2. Remove nut and rear axle bumper (4730).

   For installation follow the removal procedure in reverse order.

   - For Ranger, tighten the rear axle bumper nut to 32-39 Nm (24-29 lb-ft).
   - For Aerostar, tighten rear axle bumper nut(s) to 40-55 Nm (30-40 lb-ft).

tomsn048@gmail.com

Wheel Hub Bolt, Rear

SPECIAL SERVICE TOOL(S) REQUIRED

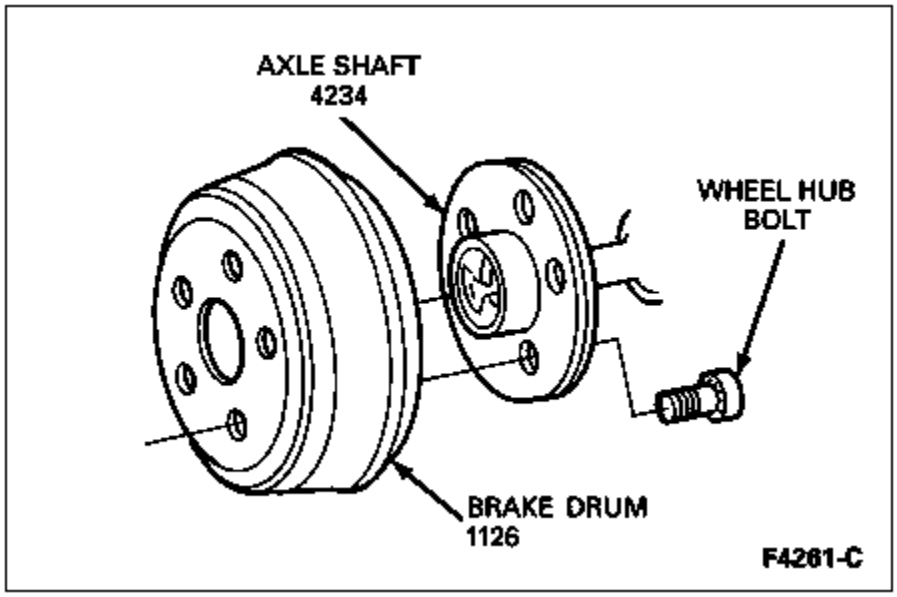
Description	Tool Number
C-Frame and Clamp Assembly Tool	T74P-3044-A1

CAUTION: Never use a hammer to remove the wheel hub bolt nut. Damage to the axle shaft flange or rear wheel bearing may result.

Removal

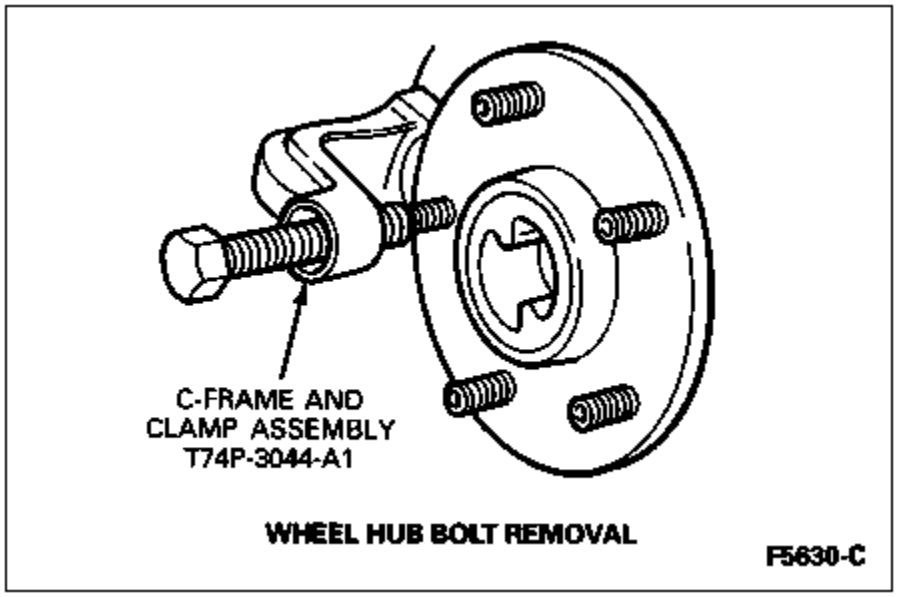
1. Raise the vehicle and install safety stands.
2. Remove the wheel and tire assembly.
3. Remove the brake drum (1126). Refer to Section 06-02 .

Rear Brake Drum Removal (Ranger, Aerostar)



4. Using C-Frame and Clamp Assembly Tool T74P-3044-A1, press the lug bolt (1107) from its seat in the axle flange. The lug bolt may also be removed by pressing it out using an appropriate sized socket and C-clamp. Discard the lug bolt.

tomsn048@gmail.com



Installation

1. Insert new lug bolt in hole in flange. Rotate lug bolt slowly. Make sure serrations are aligned with those made by the original bolt.
2. Place four flat washers over the outside end of the stud and thread the lug nut (1012) with the flat side against the washers.
3. **CAUTION: DO NOT use air tools as the serrations may be stripped from the stud.**

   Tighten the lug nut until the bolt head seats against the back side of the flange.
4. Remove lug nut and washers.
5. Install brake drum. Refer to Section 06-02 .
6. Install wheel and tire assembly.
7. Lower the vehicle

Inspection and Verification

1. To maximize tire performance, inspect for signs of improper inflation and uneven wear, which may indicate a need for balancing, rotation, or front suspension alignment.

2. Check tires for:

    - cuts
    - stone bruises
    - abrasions
    - blisters
    - embedded objects

3. More frequent inspections are recommended when rapid or extreme temperature changes occur, or where road surfaces are rough or occasionally littered with debris.

4. Tread wear indicators are moulded into bottom of thread grooves. Replace tire when indicator bends become flush with tread.

Wheel and Tire Checking Procedure

Tire Wear Diagnosis

Inspect tires for wear. Abnormal or excessive wear may be caused by incorrect wheel alignment, wheel and tire imbalance, or improper tire pressure.

Symptom Chart — Wheel And Tire Diagnosis

WHEEL AND TIRE DIAGNOSIS

Condition	Possible Source	Action
• Cracked or Broken Wheel Discs. Cracks Develop in the Wheel Disc from Hand Hole to Hand Hole, from Hand Hole to Wheel, or from Hand Hole to Wheel Bolt. Wheel Bolt Holes Become Worn, Elongated or Deformed. Metal Builds Up Around Wheel Bolt Hole Edges, Cracks Develop from Wheel Bolt Hole to Wheel Bolt Hole. Related Driver Complaints; Unusual Operating Noise or Vibration and on the Road Failures	• Metal fatigue resulting from abusive handling.	• REPLACE wheel. CHECK position of wheel on vehicle for working load specifications.
	• Vehicle operated with loose wheel mounting.	• REPLACE wheel and CHECK for: Installation of correct wheel bolts and lug nuts, and recommended exact specifications.Cracked or broken wheel bolts, and REPLACE.Worn hub face. MACHINE if not excessive, or REPLACE if severe.Broken or cracked hub barrel, REPLACE.Worn wheel bolt holes, REPLACE or INSTALL recommended serrated bolts.CLEAN mounting surfaces and RETIGHTEN lug nuts at specified schedule.
• Cracks Develop in Wheel Base Back (Wheel Bead Seat) Flange or the Gutter Area (Drop Well Radii)	• Overloading or abusive use.	• REPLACE wheel. CHECK loading and operating conditions. AVOID overinflation of tires. CHECK specs for wheel load capacity, working loads, tire size, ply rating and tire construction.
	• Improper use of tools.	• CHECK mounting, demounting, and maintenance procedures.
• Loose Drum/Hub	• Wheel bolt too	• REPLACE wheel bolt with proper

Wheel	long. • Improper torque.	length wheel bolt. • TIGHTEN to specifications. CHECK for and repair any damage.
• Broken Wheel Bolts	• Loose lug nuts. • Overtightened lug nuts or use of lubricant. • Overloading.	• REPLACE wheel bolts. FOLLOW proper torque procedure. • REPLACE wheel bolts. COMPARE actual load against vehicle load ratings.
• Stripping Threads	• Excessive torque or use of wrong or damaged nuts.	• REPLACE wheel bolts. FOLLOW proper torque procedure. Do not use lube.
• Rust Streaks from Wheel Bolt Holes	• Loose lug nuts.	• CHECK complete assembly. REPLACE damaged parts. FOLLOW proper torque procedure.
• Damaged Lug Nuts	• Loose wheel assembly.	• REPLACE lug nuts. FOLLOW proper torque procedure. CHECK for damaged components (i.e., wheel bolts, wheel, hub, etc.). REPLACE any damaged components.
• Frozen Lug Nuts	• Corrosion or galling.	• If corrosion is slight, WIRE BRUSH away corrosion. If corrosion is excessive, REPLACE wheel bolts and nuts. **CAUTION: Do not PERMIT lubricant to get on ball seats of wheel bolt holes or on ball face of lugnuts.**
• Tires Show Excess Wear on Edge of Tread	• Underinflated tires. • Vehicle overloaded. • High-speed cornering. • Incorrect toe or camber setting. • Tire/wheel condition out of specification.	• ADJUST air pressure in tires. • CORRECT as required. • ADVISE vehicle owner of adverse effects. CORRECT as required. • SET toe or camber to specification. • GO to Pinpoint Test A .
• Tires Show Excess Wear in Center of Tread	• Tires overinflated. • Tire/wheel condition out of specification.	• ADJUST air pressure in tires according to the Safety Compliance Certification Label. • GO to Pinpoint Test A .
• Other Excessive Tire	• Improper tire	• ADJUST air pressure in tires according

Wear Problems	pressure.	to Safety Compliance Certification Label.
	• Incorrect tire/wheel usage.	• INSTALL correct tire and wheel combination.
	• Loose or leaking shock absorbers.	• TIGHTEN or REPLACE as necessary. REFER to Section 04-01A , Suspension and Wheel Hubs, Front, 4x2; Section 04-01B , Suspension and Wheel Hubs, Front, 4-Wheel Drive; Section 04-01C , Suspension and Wheel Hubs, Front, Aerostar E-4WD.
	• Front end out of alignment.	• ALIGN front end.
	• Front wheel bearings out of adjustment.	• ADJUST front wheel bearings. REFER to Section 04-01A , Suspension and Wheel, Front, 4x2; Section 05-03A , Wheel Hubs and Bearings, Front Wheels, 4-Wheel Drive.
	• Loose, worn or damaged suspension components, bushings and ball joints.	• INSPECT, REPAIR or REPLACE as required.
	• Wheels and tires out of balance.	• BALANCE wheels and tires.
	• Excessive lateral and/or radial runout of wheel or tire.	• CHECK, REPAIR or REPLACE as required. USE dial indicator to accurately DETERMINE runout.
	• Tires need rotating according to schedule.	• ROTATE tires. REFER to Cleaning and Inspection in this section.
	• Tire/wheel condition out of specification.	• GO to Pinpoint Test A .
• Excessive Vehicle Vibration, Rough Steering, or Severe Tire Wear	• Loose or improper attaching parts.	• TIGHTEN or REPLACE.
	• Overloading or unbalanced loads.	• CHECK wheel and tire specs against work load requirements. RECOMMEND correct tire and rim. CHECK on loading procedure. GO to Pinpoint Test B .
• Vehicle Vibrations	• Loose or worn driveline or suspension parts.	• IDENTIFY location of vibration carefully as it may be transmitted through frame making a rear end vibration appear to come from the front. REPAIR or REPLACE loose and worn parts.

	• Improper front end alignment.	• ALIGN front end.
	• Excessive lateral runout (wheel or tire).	• USE a dial indicator to accurately VERIFY runout reading. REPLACE wheel or tire as required.
	• Bent or distorted wheel disc from overloading, road impact hazards or improper handling.	• REPLACE wheel. Attempts to straighten wheel can result in fractures in the steel and weakening of the disc or the weld between disc and wheel. CHECK loading and operating conditions and shop practices.
	• Loose wheel mountings — damaged bolts, lug nuts, enlarged wheel bolt holes, worn or broken hub face or foreign material on mounting surfaces.	• TIGHTEN or REPLACE worn or damaged parts. CLEAN mounting surfaces.
	• Out-of-balance wheel or tire or hub and drum assembly.	• DETERMINE the out-of-balance component and BALANCE or REPLACE.
	• Out-of-round wheel or tire or excessive wheel bolt/pilot runout (excessive radial runout).	• USE a dial indicator to accurately VERIFY runout reading. REPLACE the wheel, tire, hub or axle shaft and CHECK for overloading and unbalanced loads, rugged operating conditions, proper wheel and tire specifications.
	• Water in tires.	• REMOVE water.
• Mounting of Wheels Is Difficult	• Improper application or mismatched parts, including wheel bolts and lug nuts.	• FOLLOW manufacturer's specifications.
	• Corroded or worn parts.	• CLEAN or REPLACE.
	• Damaged components.	• CHECK for damaged components (e.g., wheel, wheel bolts, lug nuts, etc.). REPLACE any damaged component.
• Rust or Corrosion on Wheels	• Poor maintenance.	• KEEP clean.

Pinpoint Tests

NOTE: On vehicles equipped with all-terrain type tires, a vibrating, drumming or beating noise is often misdiagnosed as a driveline vibration. For noise, vibration and harshness diagnosis, refer to Section 00-04 . If condition is still present, refer to the procedure below.

PINPOINT TEST A: TIRE/WHEEL CONDITIONS

A1 EXCESSIVE WEAR OR CUPPING

- Check tires for excessive wear or cupping.

Are tires OK?

Yes	No
GO to A2 .	REPLACE severely worn tires. CHECK tire inflation, vehicle alignment and suspension. REPAIR, REPLACE or ADJUST as required. GO to A2 .

A2 WHEEL BEARING END PLAY

- Check wheel bearing end play.
- Rotate wheel and check for roughness.

Is wheel bearing end play OK?

Yes	No
GO to A3 .	REPLACE rear wheel bearings or front wheel bearings, if required. ADJUST to correct end play. ROAD TEST to VERIFY correction. REFER to Group 04 for front wheel bearings or Group 05 for rear wheel bearings.

A3 TIRE WHEEL BALANCE

- Check tire/wheel balance.

Is balance OK?

Yes	No
GO to **A4** .	BALANCE tire/wheel assembly. If assembly cannot be balanced, REPLACE wheel and/or tire. ROAD TEST to VERIFY correction.

A4 TIRE RUNOUT

- Check tire runout.

Is tire runout within specifications?

Yes	No
GO to **A7** .	GO to **A5** .

A5 REINDEX TIRE

- Reindex tire 180 degrees and rebalance on wheel.

Is balance OK?

Yes	No
ROAD TEST to VERIFY correction.	GO to **A6** .

A6 WHEEL BOLT RUNOUT

- Check wheel bolt runout.

Is wheel bolt runout within specifications?

Yes	No
GO to **A7** .	REPLACE hub or axle shaft. ROAD TEST to VERIFY correction. REFER to appropriate section in Group 05.

A7 ALIGNMENT, SUSPENSION, DRIVELINE, BRAKES, ENGINE/TRANSMISSION MOUNTS

- Check front end alignment if not done during Step 1. Refer to Group 04.
- Check suspension components for looseness or wear if not done during Step 1. Refer to appropriate section in Group 04.
- Check U-joint condition. Refer to Section 05-01 .
- Check driveshaft for runout or imbalance. Refer to Section 05-01 .
- Check drums/rotors for imbalance. Refer to appropriate section in Group 06.

Are all systems operating properly?

Yes	No
GO to **A8** .	REPAIR, REPLACE, or ADJUST as required. ROAD TEST to VERIFY correction.

A8 WHEEL RUNOUT

- Check wheel runout.

Is wheel runout within specifications?

Yes	No
REPLACE tire. ROAD TEST to VERIFY correction.	REPLACE wheel and rebalance. ROAD TEST to VERIFY correction.

PINPOINT TEST B: TIRE MISMATCH CHECK

B1 TIRE MISMATCH CHECK

NOTE: On vehicle drift concerns, it may be necessary to measure tire circumference and place a matched set of tires on the rear axle.

- Compare the installed tires and wheels with the equipment listed on the certification label.

Do the tires match?

Yes	No
GO to **B2** .	INFLATE tires to the correct pressure. SWAP known good tires and wheels as specified by certification label or RPO list for evaluation only. GO to **B2** .

B2 SWAP FRONT TIRES SIDE TO SIDE

- Unlock front hubs if 4x4. Raise front tires off the ground. Spin front tires. If hubs are unlocked, the axle shaft will not rotate with the wheels.
- Swap the front tires from side to side.
- Road test the vehicle.

Is the concern corrected?

Yes	No
Bad tires or wheels should be replaced.	GO to **B3** .

B3 SWAP REAR TIRES SIDE TO SIDE

- Swap the rear tires from side to side.
- Road test the vehicle.

Is the concern corrected?

Yes	No
Bad tires or wheels should be replaced.	GO to **B4** .

B4 SWAP FRONT AND REAR TIRES

- Swap the front tires with the rear tires.
- Check tire pressure and adjust as required.
- Road test the vehicle.

Is the concern corrected?

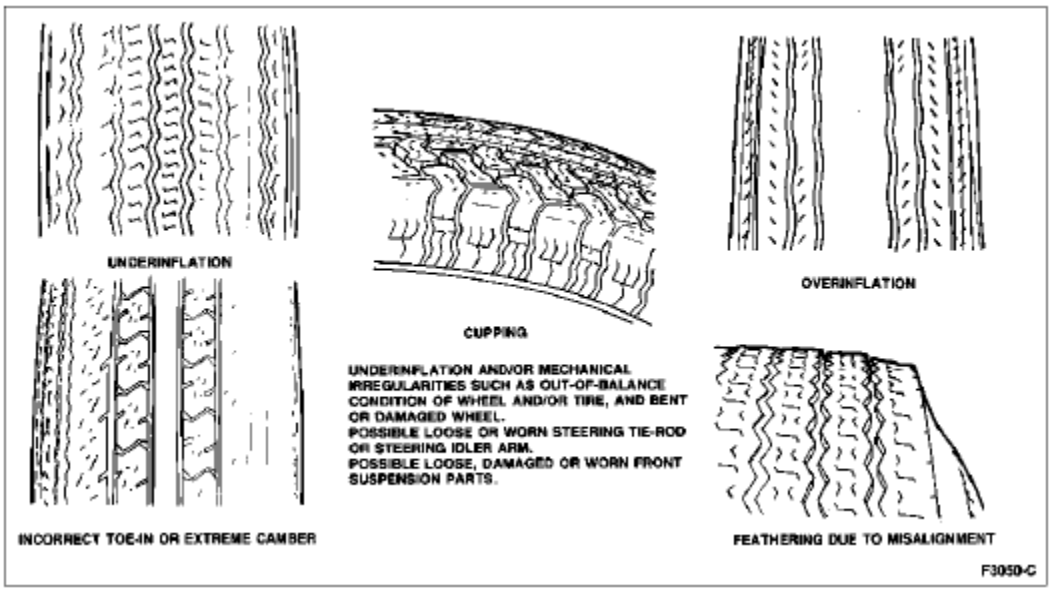
Yes	No
Bad tires or wheels should be replaced.	REFER to Section 00-04 for noise, vibration and harshness diagnosis.

Component Tests

Vibration

If vehicle vibration persists after the wheels have been balanced, it may be caused by either tire or wheel runout. The vibration may also be caused by damage to the tire tread or sidewall. Refer to Section 00-04 .

Tire Wear



Wheel and Tire Runout

Excessive radial and lateral runout of a wheel and tire assembly can cause roughness, vibration, wheel tramp, tire wear, and steering wheel tremor.

Before checking runout and to avoid false readings caused by temporary flat spots in the tires, check runout only after the vehicle has been driven far enough to warm tires.

The extent of the runout is measured with a dial indicator, Rotunda Radial Runout Gauge 007-0056A or equivalent. All measurements are made on the vehicle with the tires inflated to recommended inflation pressures and with the front wheel bearings (1215) adjusted to specifications.

Tire Runout

Using Rotunda Radial Runout Gauge 007-0056A or equivalent, measure radial runout of the tire at the center and outside ribs of the tread face. Measure lateral runout of the tire just above the buffing rib on the tire sidewall. Mark the high points of lateral and radial runout for future reference. Radial runout should not

exceed 1.02mm (0.040 inch) and lateral runout should not be more than 1.52mm (0.060 inch).

If tire runout is greater than specifications, check wheel runout, as described below. Replace the defective component if reindexing the tire does not resolve runout.

Match Mounting Tires

Match mounting is a technique used to reduce radial runout and tire spring rate on tire and wheel assemblies. Excessive runout is a source of ride complaints and match mounting can be used to minimize the runout. There are two ways to use match mounting: positioning of the tire on the wheel and positioning the wheel on the hub.

1. Measure total indicated runout on center of the tire tread rib, and record it. Mark the tire and wheel (1007) at the center of the tread rib, and record reading. Mark tire at location of the valve and cap (1700) for reference.

2. Break down tire and remount it 180 degrees on the wheel so valve and cap reference mark is opposite the valve and cap on the wheel.

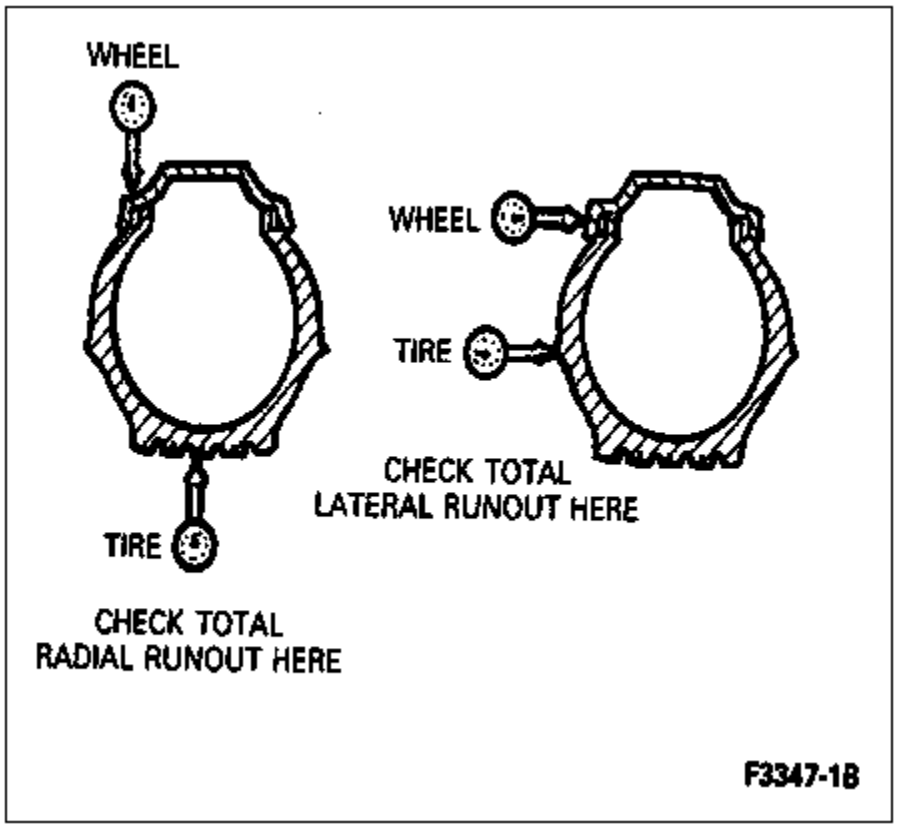
3. Reinflate tire and measure total indicated runout, and again mark the high spot.

4. If runout is reduced to acceptable guidelines the tire is ready to be put back into service. If runout is still excessive, one of the following steps must be performed:

    - If high spot is within 100mm (4 inches) of the first high spot on the wheel, the wheel may be out of tolerance, check wheel for runout.
    - If high spot is within 100mm (4 inches) of the first high spot on the tire, and is still outside of guidelines, replace tire.

Wheel Runout

Measure radial and lateral wheel runout at positions shown. Runout should not exceed 1.14mm (0.045 inch) radial or lateral.



Wheel Bolt Runout

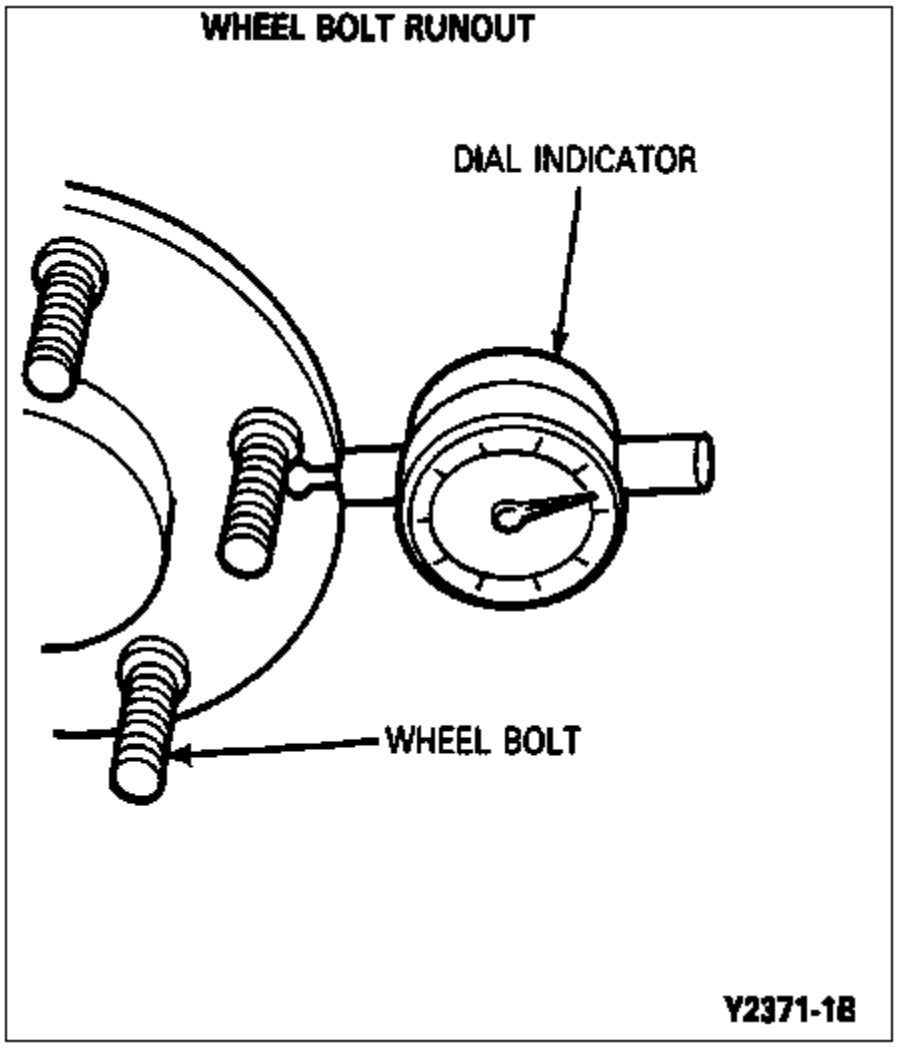
Wheel bolt runout can affect wheel runout. When measuring the runout on the wheel bolts, the feeler will not be in contact with the bolts at all times. Only the measurements taken at the high point of contact of each bolt should be considered.

1. Using a broad point indicator, locate the feeler perpendicular to the bolt as close to the flange face as possible.

2. Zero the indicator so the pointer can deflect either way, for accurate reading at lowest and highest contact point.

3. Rotate the axle shaft flange until the next bolt is contacted.

4. Again, record and continue until you have one reading for each point of contact (each bolt). The absolute difference between the maximum and minimum contact reading will be the total indicator reading (or total runout). Wheel bolt circle runout should not exceed 0.50mm (0.020 inch) TIR (Total Indicated Runout).



Tire Lead Diagnosis

"LEAD" is the movement or drift to one side of the vehicle from a straight path on a level road with no pressure on the steering wheel.

Lead is usually caused by:

- Incorrect wheel alignment.
- Uneven brake adjustment.
- Uneven or incorrect tire inflation pressures.
- Damaged/worn tire or construction of tire.

The way in which a tire is constructed can produce lead. An example of this is placement of the radial belts. Off-center belts on a radial tire can cause the tire to develop a side force while rolling straight down the road. If one side of the tire is a little larger diameter than the other, the tire will tend to roll to one side. This will develop a side force which can produce lead.

Wheel and Tire

WARNING: NEVER RUN THE ENGINE WITH ONE WHEEL (1007) OFF THE GROUND, SUCH AS WHEN CHANGING A TIRE. THE WHEELS STILL ON THE GROUND COULD CAUSE THE VEHICLE TO MOVE.

CAUTION: Replace wheels if they are bent, cracked, leaking air or heavily rusted or if the lug nuts (1012) often become loose. Do not use bent wheels that have been straightened and do not use inner tubes in leaking wheels. Do not replace wheels with used wheels. Wheels that have been straightened, are leaking air, or are used, may have structural damage and could fail without warning. Check for damage that could affect the runout of the wheels. Wobble or shimmy will eventually damage the wheel bearings.

Removal

1. Set parking brake and block diagonally opposite wheel.
    - On vehicles equipped with an automatic transmission, place selector lever in the PARK position.
    - On vehicles equipped with a manual transmission, place the shift lever in reverse.
2. If equipped, remove the wheel cover (1130) or hub cap.
3. With the weight of the vehicle still on the tires, break the lug nuts loose. DO NOT REMOVE AT THIS TIME.
4. Raise the vehicle with a jack until the wheel and tire clear the floor and support the vehicle on a jackstand. Remove the lug nuts. Remove the wheel and tire assembly.

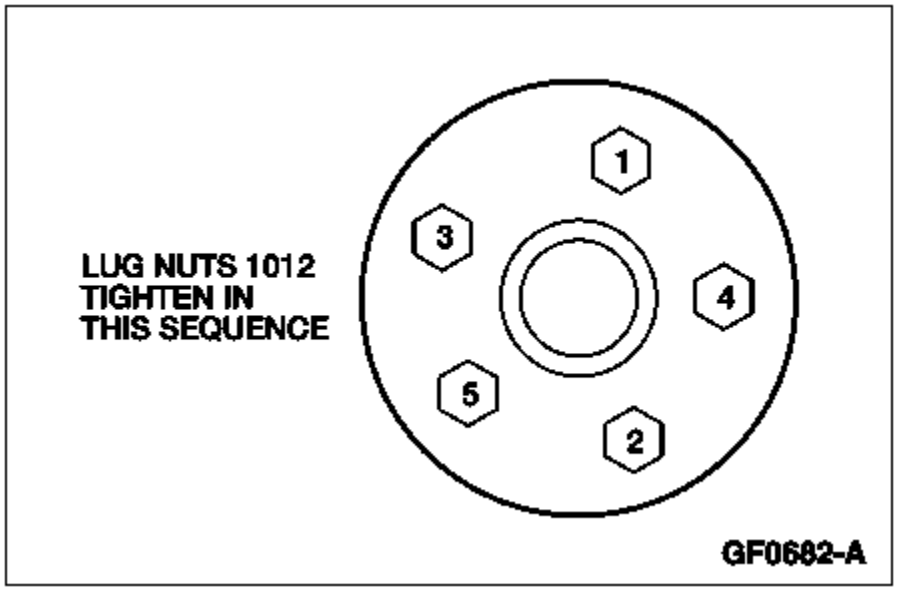
Installation

WARNING: WHENEVER A WHEEL IS INSTALLED, ALWAYS REMOVE ANY CORROSION, DIRT OR FOREIGN MATERIAL THAT MAY BE PRESENT ON THE MOUNTING SURFACES OF THE HUB, DRUM OR ROTOR THAT CONTACTS THE WHEEL. INSTALLING WHEELS WITHOUT PROPER METAL-TO-METAL CONTACT AT THE WHEEL MOUNTING SURFACES CAN CAUSE THE LUG NUTS TO LOOSEN AND COULD ALLOW THE WHEEL TO COME OFF WHILE THE VEHICLE IS IN MOTION CAUSING LOSS OF CONTROL.

1. Position the wheel on the hub and rotor or the axle flange 4W disc brakes.
2. Install the lug nuts making sure the cone end of the nuts faces inward.
3. With the lug nuts loosely installed. Tighten each lug nut until snug using sequence shown below.
4. In a criss-cross pattern, tighten the remaining lug nuts until snug to minimize runout.
5. Remove the jackstand and lower the vehicle.

6. **WARNING: IMPROPERLY TIGHTENED LUG NUTS COULD ALLOW THE WHEEL TO COME OFF WHILE THE VEHICLE IS IN MOTION, CAUSING LOSS OF CONTROL. DO NOT USE A LUBRICANT ON THE LUG NUTS TO FACILITATE FUTURE REMOVAL OF THE WHEEL ASSEMBLY.**

   Evenly tighten the lug nuts in the torque sequence shown below to 135 Nm (100 lb-ft).



7. Advise customer that wheels need to be retightened at 800 km (500 miles) after any wheel change or any other time the lug nuts have been loosened. This is required to permit the wheel clamping system to seat properly so that the lug nuts will hold a uniform clamp load and remain fully tightened.

Tires, Tubeless

Demounting and Mounting

NOTE: The air tank should incorporate a moisture trap when used with drop-center tubeless rims in order to reduce the moisture in contact with the metal wheel surfaces.

NOTE: When a tire is replaced, use the tire and wheel combination recommended on the Safety Compliance Certification Label decal attached to the vehicle or one offered as an OEM option for the specific vehicle.

Use the Rotunda Deluxe Tire Changer Model 104-00110 or equivalent to mount or demount tires. Follow the equipment manufacturer's instructions.

Wheel bead seats (steel wheels (1007) only) should be cleaned with a wire brush or coarse steel wool to remove lubricants, old rubber, and light rust.

Aluminum wheel bead seats should be cleaned with a non-abrasive cleaner to remove tire mounting lubricants and old rubber.

Before mounting or demounting a tire, the bead area should be well lubricated with Rubber Lubricant D9AZ-19583-A or equivalent meeting Ford specification ESA-M1B6-A tire lubricant. The approved Ford supplier is McGear Rohco, Inc. under trade mark McEase Tire Lube 33.

After mounting, inflate the tire to completely seat beads. Do not exceed 275 kPa (40 psi) during this operation. Install the valve core, and inflate the tire to the proper pressure as specified on the Safety Compliance Certification Label. Balance each wheel and tire assembly.

Tire Rotation

CAUTION: If the vehicle is equipped with a temporary spare tire, do not include it in the rotation of the other four tires.

NOTE: Tire tread wears fastest in the first 8,000 km (5,000 miles). Therefore it is very important to perform the first rotation within the specified mileage range to minimize uneven tire wear.

Rotate tires every 8,000 to 12,000 km (5,000 to 7,500 miles); more often if the vehicle sees a lot of turning as with city driving or if tires have an aggressive tread pattern.

A typical rotation pattern is shown. Many other rotation patterns are acceptable. However, a single pattern, once established, should be used to maximize the life of the set of tires.

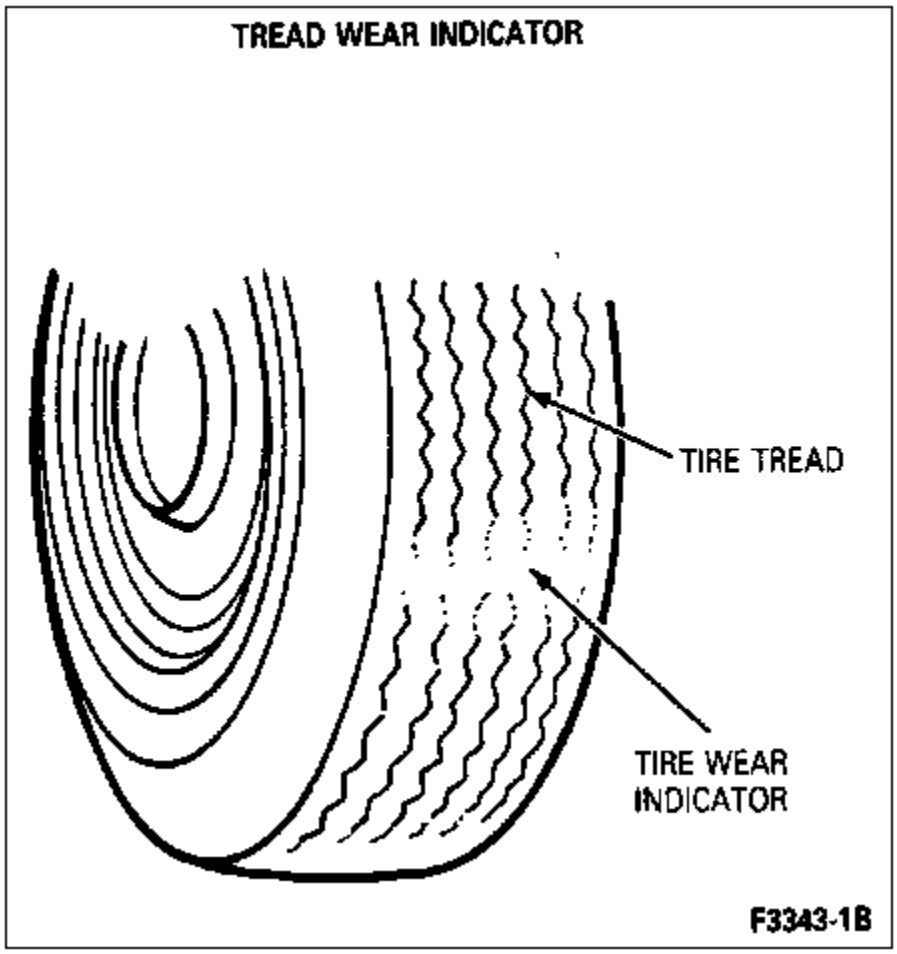
Tread Wear Indicators

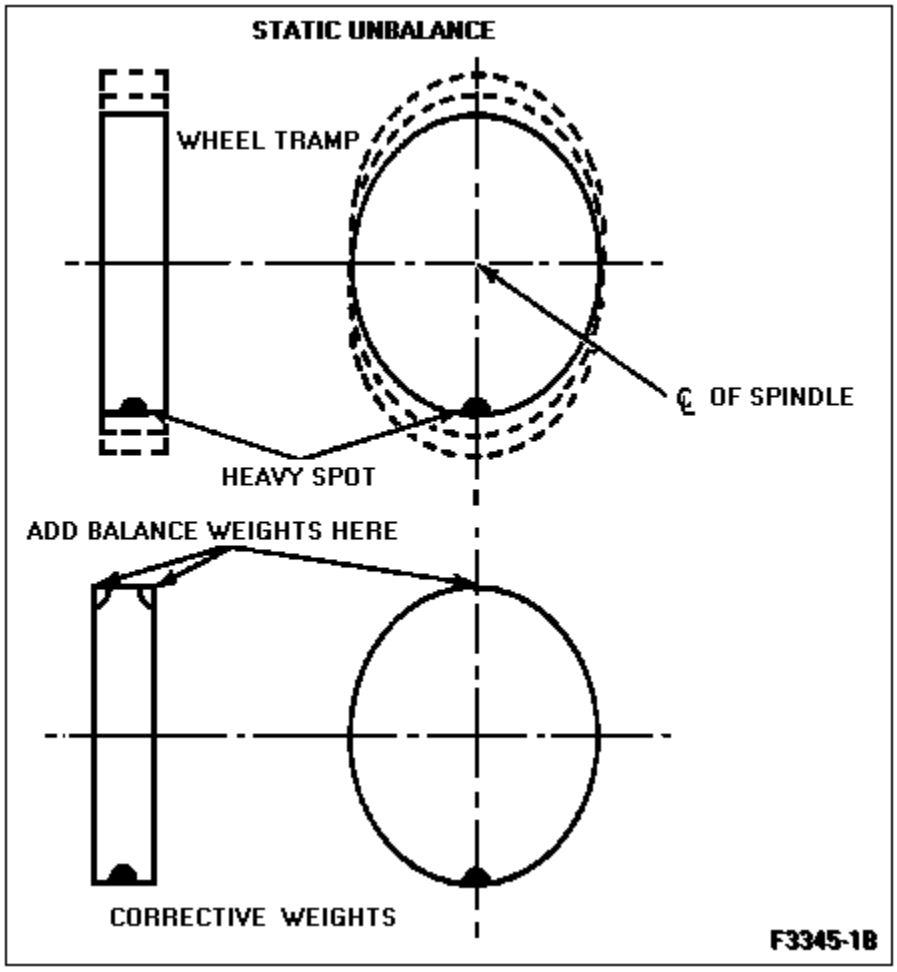
The original equipment tires have built-in tread wear indicators to show when tires need replacement. These indicators will appear as 13mm (1/2-inch) wide bands when the tire tread depth becomes 1.60mm (1/16-inch). When the indicators appear in two or more adjacent grooves, at three locations around the tire, or when cord or fabric is exposed, tire replacement due to tread wear is required.



Tire and Wheel Balance

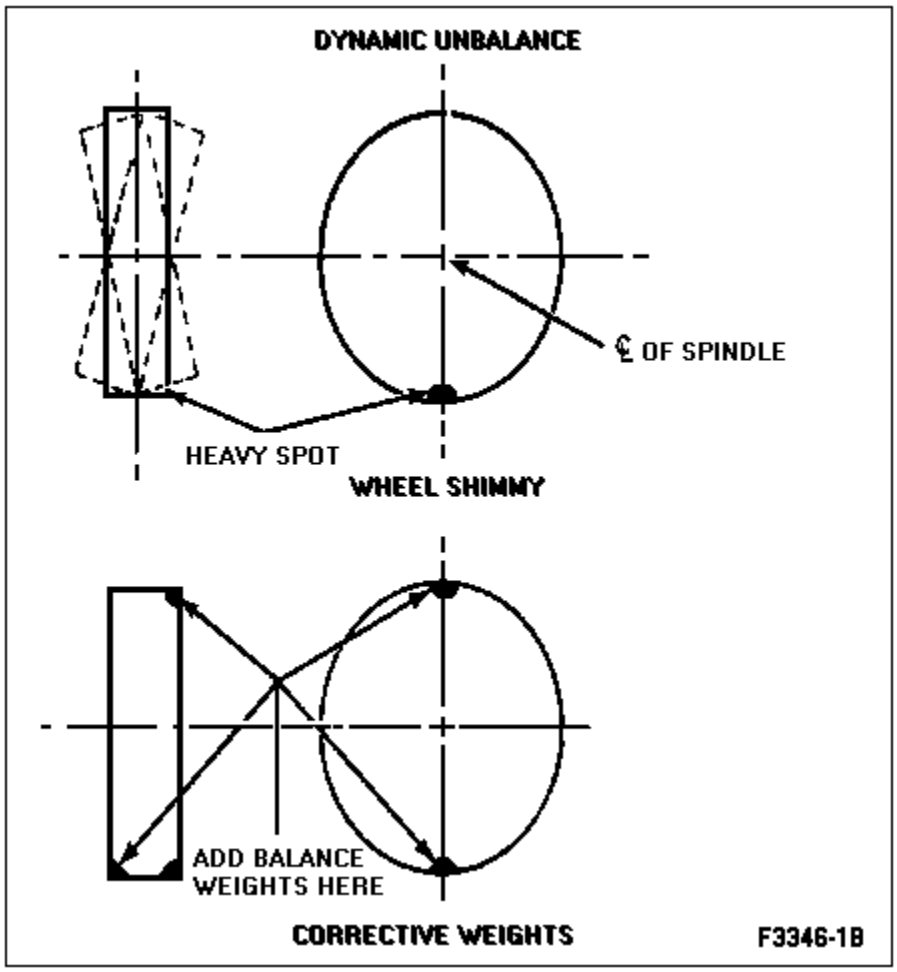
Static Balance

A static balance is the equal distribution of weight around the wheel. Wheels that are statically unbalanced cause a bouncing action called wheel tramp. This condition will eventually cause uneven tire wear.



Dynamic Balance

A dynamic balance is the equal distribution of weight on each side of the centerline, so that when the tire spins there is no tendency for the assembly to move from side to side (wobble). Wheels that are unbalanced may cause wheel shimmy.



Deposits of mud, etc., must be cleaned from the inside of the wheel. Stones should be removed from the tread. The tire should be inspected for any damage, then balanced according to the equipment manufacturer's instructions.

Refer to Section 00-04 for tire and wheel balancing procedures.

Off-Vehicle

When balancing wheels (1007) off the vehicle, use a balancer which pilots the wheels the same way the wheel is piloted on the vehicle. If the wheel tramp and vehicle vibration is not corrected by the off-vehicle balance, refer to Section 00-04 .

Vibration

If vehicle vibration persists after the wheels have been balanced, it may be caused by either tire, wheel or wheel bolt runout or other components or vehicle systems. Refer to the Diagnosis and Testing portion of this section.

Torque Specifications

Description	Nm	Lb-Ft	Lb-In
Screw-On Type Wheel Hub Ornament	1.9-2.4	—	17-21
Lug Nuts 1/2-20	135	100	

CAUTION: Torque specifications are for clean, dry bolt and nut threads. Never use oil or grease on wheel bolts or nuts.

Inspection and Verification

Certain rear axle assembly (4006) and driveline trouble symptoms are also common to the engine (6007), transmission (7003), rear wheel bearings (1225), tires, and other parts of the vehicle. For this reason, be sure that the cause of the trouble is in the rear axle assembly before adjusting, repairing, or replacing any of its parts. See Section 00-04 in the Body, Chassis Manual.

Certain trouble symptoms may be caused by limited slip differentials. Check the vehicle certification and axle ratio tag to determine the type of differential.

Universal (U)-Joint Inspection

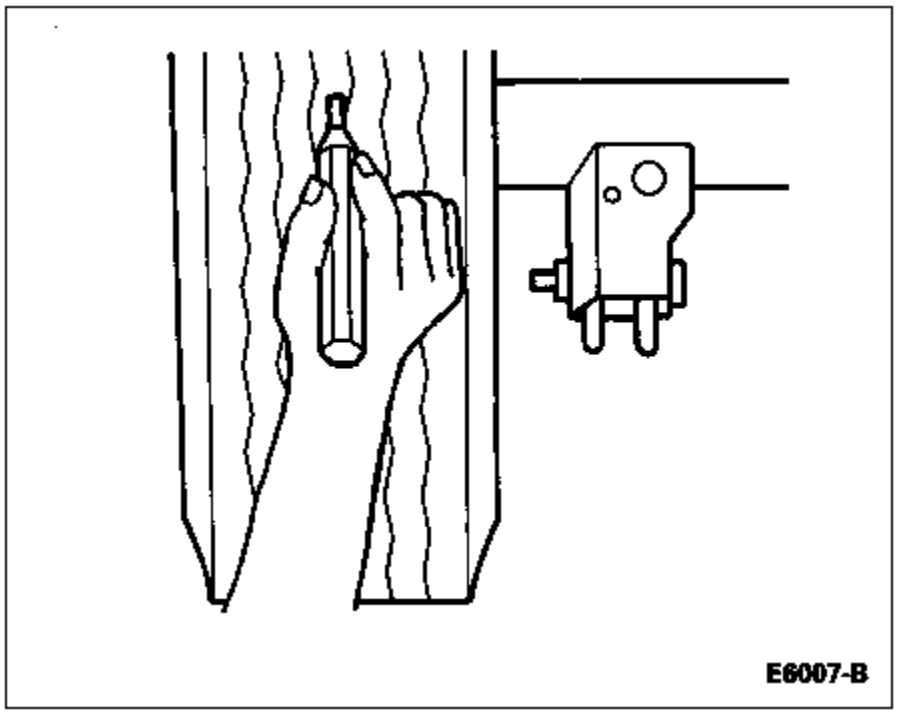
Prior to checking driveline angularity, inspect the universal joints for proper operation.

Place the vehicle on a frame hoist and rotate the driveshaft (4602) by hand. Check for rough operation or seized universal joints. If the universal joint shows signs of seizure, excessive wear or improper seating, scribe alignment marks on the driveshaft and rear axle companion flange. On Aerostar E-4WD front driveshaft, scribe alignment marks on the driveshaft and the transfer case. Remove the driveshaft and remove and replace the universal joint. Install the driveshaft in the marked original position.

CAUTION: Universal joint components from different manufacturers and new and used universal joints are never to be mixed. Universal joint kits are to be serviced as complete assemblies only.

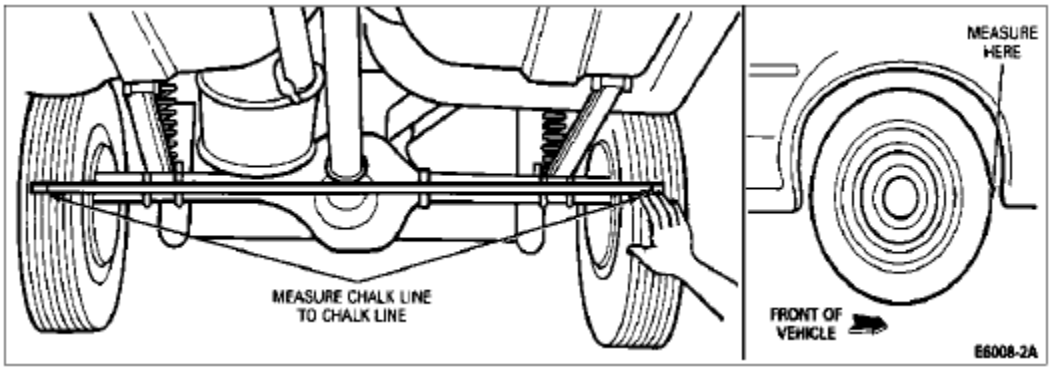
Alignment Inspection, Rear Axle

1. Raise the vehicle on a hoist to allow the rear axle assembly to be freely suspended.
2. Using white chalk or paint, mark a small area at the center of each rear tire and scribe a vertical line on it.



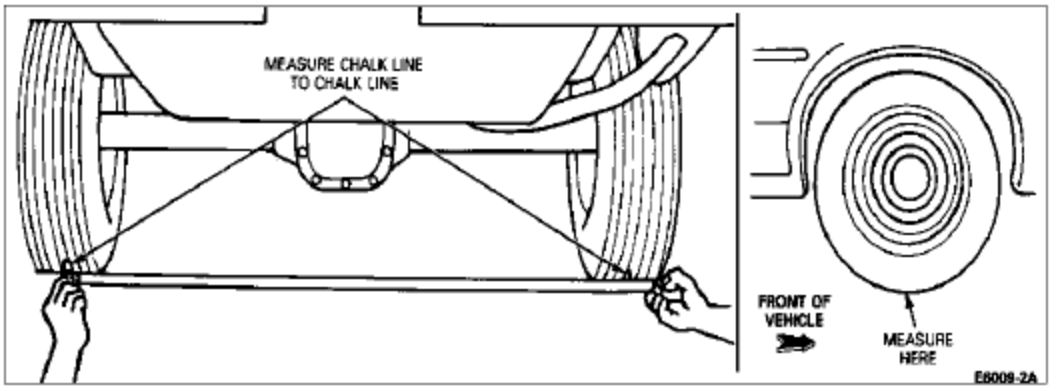
3. Adjust both wheels so that the markings face the front of the vehicle. Using a tape measure, measure the distance between scribe marks and record this reading (front reading).

Rear Axle Alignment Inspection



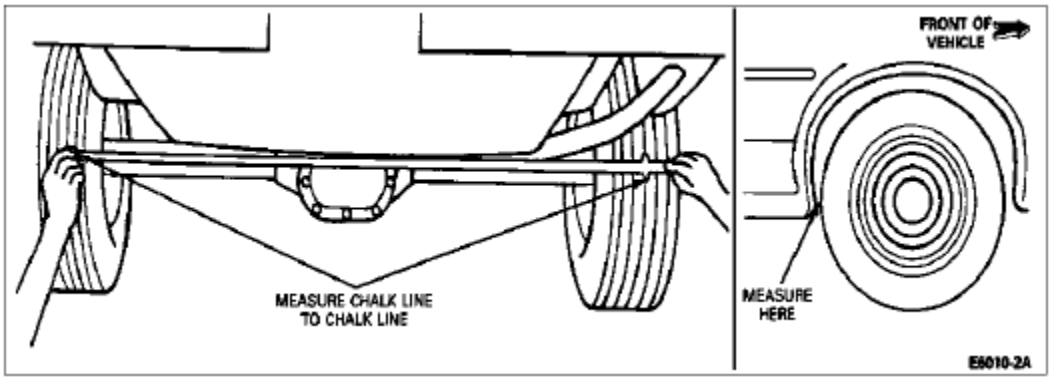
4. Rotate the rear wheels so the markings are directly underneath the vehicle. Measure the distance between the scribe marks and record this reading (bottom reading).

Bottom Reading



5. Rotate the rear wheels so the markings face the rear of the vehicle. Again, measure and record the distance between scribe marks (rear reading).

Rear Reading



6. The difference between the front and rear readings is the toe-out or toe-in condition of the axle housing (Steps 3 and 5).

   All numbers are for example only. Front reading: 52-3/16 inch Rear reading: 52-1/16 inch Toe-out: 2/16 inch or 1/8 inch Toe-in occurs when the front reading is less than the rear reading.

7. To determine camber, find the average of the front and rear readings (obtained in Steps 3 and 5). Then, subtract the bottom reading from this (obtained in Step 4).

   Average of front and rear readings: 52-2/16 inch Bottom reading: 52-2/16 inch Difference or camber: 0 inch Positive (+) camber is when the bottom reading is less than the average of the front and rear readings. Negative (-) camber is when the bottom reading is greater than the average of the front and rear readings.

8. Results of the measurements taken must conform to the following specifications: Tape measure specification: Camber: 0 ± 5/32 inch Toe-in: 0-1/16 inch Toe-out: 0-3/16 inch If the axle housing does not meet this specification, it must be replaced.

9. If the axle housing is replaced, repeat Steps 2 through 7.

Noise Acceptability

A gear-driven unit, especially an automotive drive axle, will produce a certain amount of noise. Some noise is acceptable and may be audible at certain speeds or under various driving conditions such as a newly paved blacktop road. The slight noise is not detrimental to operation of the rear axle and must be considered normal.

With the Traction-Lok® limited slip differential axle, slight chatter noise on slow turns after extended highway driving is considered acceptable and has no detrimental effect on the locking axle function.

Preliminary Diagnosis

Question the Customer

The preliminary diagnosis begins with the service technician asking the customer enough diagnostic questions, especially for conditions of noisy operation and/or vibration.

Always ask the customer about:

1. The exact nature of the symptom. If it is a vibration, how is it felt? If a noise, what kind? Is it high-pitched, a rumbling noise or some other concern?

2. The driving conditions in which the symptoms appear: road speed, drive or coast, on turns or on a grade only.

3. Whether the condition is constant or variable. Does a noise increase in pitch with speed or some other factor?

   All information should be written on the service order so that the technician will know where to start looking. The technician doing the diagnosis must be able to identify the axle concern from what is written on the order following the road test.

   It is, of course, preferable to have the customer demonstrate the symptoms in a road test whenever possible.

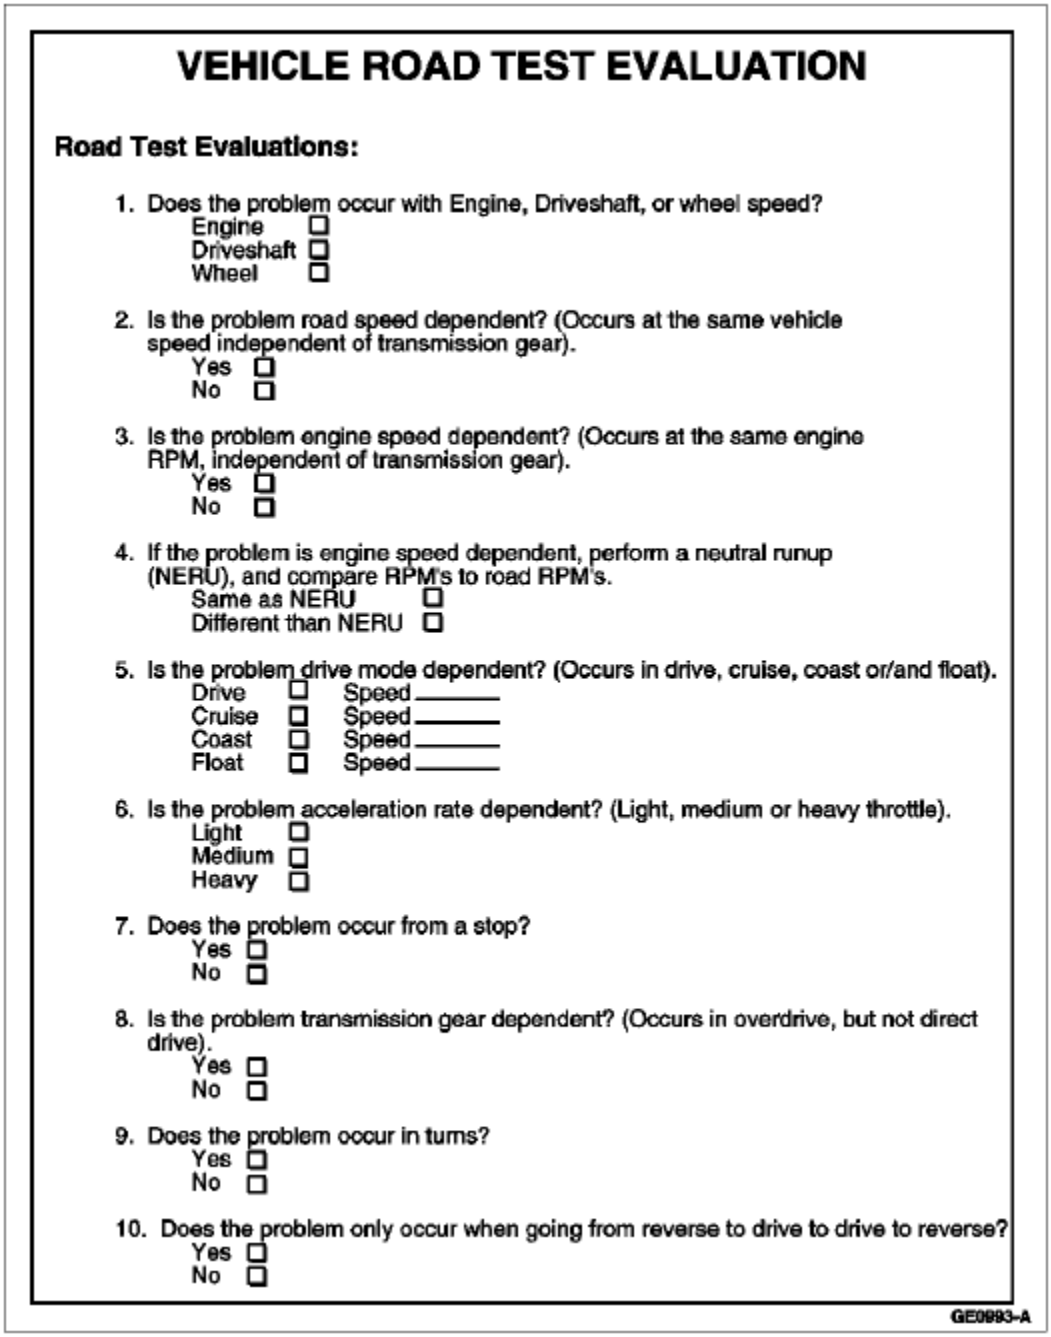
Road Test

A road test is mandatory for any customer concern of noise and/or vibration that is not eliminated by the on-hoist check of chassis components. The Road Test Form is arranged to record the conditions that may be heard or felt during this test.

The Road Test Form lists four operating conditions or modes in which some axle noises come and go: Drive, Cruise, Coast and Float.

Mode	Conditions
DRIVE	Accelerating the vehicle; a definite throttle depression applying engine torque.
CRUISE	Maintaining a constant speed with the throttle applied.
COAST	Decelerating with the throttle closed.
FLOAT	Controlled deceleration; backing the throttle continually to prevent either braking or accelerating torque from the engine.

To perform a good diagnostic check it is important to operate the vehicle in all four modes and check off those in which the noise occurs. The modes are defined in the preceding chart. Write down the kilometers-per-hour (miles-per-hour) range at which both noise and vibration occur. On vehicles equipped with overdrive transmissions, evaluate rear axle noise with the transmission in DIRECT DRIVE and not in OVERDRIVE. Transmission noise can be mistaken for rear axle noise when in overdrive.



VEHICLE ROAD TEST EVALUATION

Road Test Evaluations:

1. Does the problem occur with Engine, Driveshaft, or wheel speed?
   - Engine ☐
   - Driveshaft ☐
   - Wheel ☐
2. Is the problem road speed dependent? (Occurs at the same vehicle speed independent of transmission gear).
   - Yes ☐
   - No ☐
3. Is the problem engine speed dependent? (Occurs at the same engine RPM, independent of transmission gear).
   - Yes ☐
   - No ☐
4. If the problem is engine speed dependent, perform a neutral runup (NERU), and compare RPM's to road RPM's.
   - Same as NERU ☐
   - Different than NERU ☐
5. Is the problem drive mode dependent? (Occurs in drive, cruise, coast or/and float).
   - Drive ☐ Speed _____
   - Cruise ☐ Speed _____
   - Coast ☐ Speed _____
   - Float ☐ Speed _____
6. Is the problem acceleration rate dependent? (Light, medium or heavy throttle).
   - Light ☐
   - Medium ☐
   - Heavy ☐
7. Does the problem occur from a stop?
   - Yes ☐
   - No ☐
8. Is the problem transmission gear dependent? (Occurs in overdrive, but not direct drive).
   - Yes ☐
   - No ☐
9. Does the problem occur in turns?
   - Yes ☐
   - No ☐
10. Does the problem only occur when going from reverse to drive to drive to reverse?
    - Yes ☐
    - No ☐

GE0993-A

Analysis of Leakage

Most rear axle leakage conditions can be corrected without a teardown. However, it is important to clean up the leaking area enough to identify the exact source.

A plugged or seized rear axle housing vent (4022) will cause excessive flange yoke seal lip wear due to internal pressure buildup. When a leak occurs, check cap by pressing down on it with index finger. If the cap moves up and down freely, it is working properly. If it does not move freely, it must be replaced.

Make sure axle lubricant level is 6-14 mm (1/4-9/16 inch) below bottom of fill hole.

Flange Yoke Seal

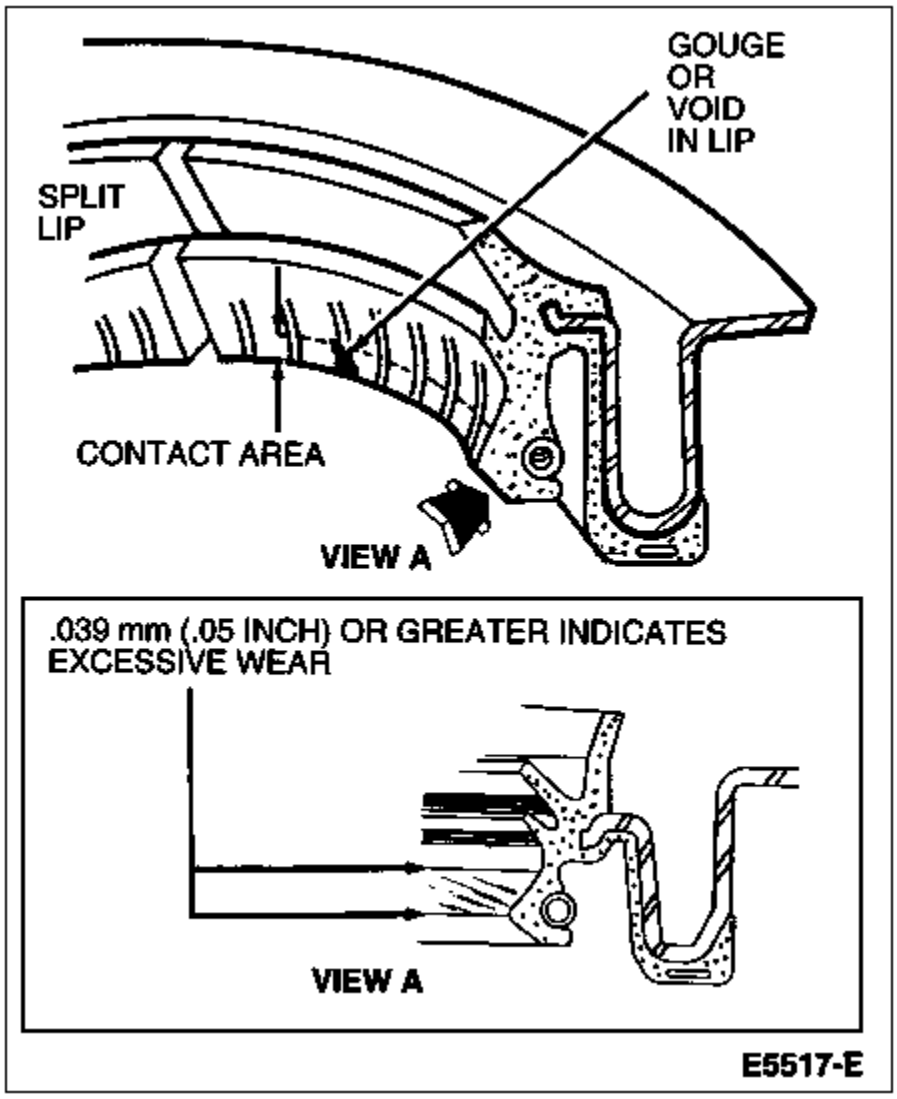
When the rear axle drive pinion seal (4676) leaks, it is usually because it was not installed carefully or properly, or because of poor quality on the seal journal surface.

Any damage to the seal bore (dings, dents, gouges or other imperfections) will distort the seal casing and allow leakage past the outer edge of the rear axle drive pinion seal.

The rear axle drive pinion seal can be torn, cut or gouged if it is not assembled carefully. The spring that holds the rear axle drive pinion seal against the rear axle universal joint flange (4851) may be knocked out and allow leakage past the lip.

The rubber lips can occasionally become hard (like plastic) with cracks at the oil lip contact point. The contact point on the rear axle universal joint flange is usually black, indicating excessive heat. Marks, nicks, gouges or rough surface texture on the seal journal of the rear axle universal joint flange will also cause leaks. Excessive rear axle drive pinion seal wear will be noted. The rear axle universal joint flange should be replaced if any of these conditions exist.

Metal chips or sand trapped at the sealing lip also may cause oil leaks. This can cause a wear groove on the rear axle universal joint flange and heavy flange yoke seal wear.



Drive Pinion Nut

On some high-mileage units, there have been instances of oil leaking past the threads of the pinion nut. The condition can be corrected by removing the nut and applying Pipe Sealant With Teflon® D8AZ-19554-A or equivalent meeting Ford specification WSK-M2G350-A2 on the threads and nut face.

NOTE: Be sure to follow the correct procedure for setting the bearing preload when the nut is installed.

Axle lubricant level should be 6-14 mm (1/4-9/16 inch) below bottom of fill plug hole. Make sure rear axle housing vent is not plugged with dirt or debris.

Axle Shaft Seals

Axle shaft inner wheel bearing oil seals (1177) are susceptible to the same kinds of damage as rear axle drive pinion seals if improperly installed. The seal bore must be clean and the lip handled carefully to avoid cutting or tearing it. Axle shaft journal surface must be free of nicks, gouges and rough surface texture.

Differential Seals

Refer to Section 05-02A .

Casting Porosity (Holes in Casting)

Occasionally there will be a rear axle housing (4010) leak through small pockets in the metal. These pockets (casting leakage) are caused by gas bubbles in the casting process and are known technically as a porous condition or porosity.

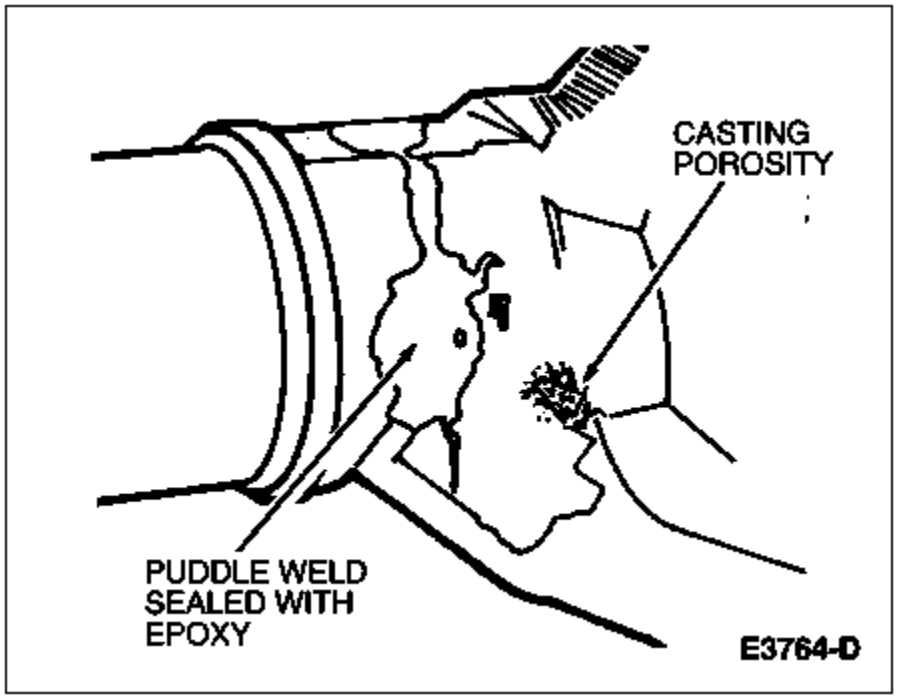
Because there is always the danger of changing the axle's sound characteristics if torn down to replace the carrier, service is preferable. There are two recommended types of service:

1. Peen in a small amount of body lead. Seal the pocket with epoxy sealer that meets Ford specification M-3D35AE.

2. In larger pockets, drill a shallow hole and tap it for a small setscrew. Install the setscrew and seal it over with epoxy sealer that meets Ford specification M-3D35AE.

Weld Leaks

Most minor weld leaks can be corrected with epoxy sealer that meets Ford specification M-3D35AE. This includes the "puddle" or fill welds that join the axle shaft tube to the rear axle housing on integral axles. They sometimes leak and can be sealed easily. If a weld is broken, the rear axle housing must be replaced. The alignment is too critical for field service.



Axle Vent

There have been some occurrences of lubricant leaking through the rear axle housing vent. This may be caused by a clogged or sticking axle vent cap. The rear axle housing vent should then be replaced, using Stud and Bearing Mount E0AZ-19554-BA or equivalent meeting Ford specification WSK-M2G349-A1 on threads to ensure retention.

Analysis of Vibration

Few vibration conditions are caused by the rear axle assembly. On a vibration concern, follow the diagnosis procedure in Section 00-04 unless there is a good reason to suspect the axle.

Most vibration in the rear end is caused by tires or driveline angle.

Traction-Lok® Differential

WARNING: A VEHICLE EQUIPPED WITH A TRACTION-LOK® DIFFERENTIAL WILL ALWAYS HAVE BOTH WHEELS DRIVING. IF, WHILE THE VEHICLE IS BEING SERVICED, ONLY ONE WHEEL IS RAISED OFF THE FLOOR AND THE REAR AXLE ASSEMBLY IS DRIVEN BY THE ENGINE, THE WHEEL ON THE FLOOR COULD DRIVE THE VEHICLE OFF THE STAND OR JACK. BE SURE BOTH REAR WHEELS ARE OFF THE FLOOR.

Tires

WARNING: DO NOT BALANCE THE REAR WHEELS AND TIRES WHILE THEY ARE MOUNTED ON THE VEHICLE. POSSIBLE TIRE DISINTEGRATION AND/OR DIFFERENTIAL FAILURE COULD RESULT, CAUSING PERSONAL INJURY AND/OR EXTENSIVE COMPONENT DAMAGE. USE OFF-VEHICLE WHEEL AND TIRE BALANCER ONLY.

Vibration is a definite concern with modern, high-mileage tires if they are not "true" both radially and laterally. They are more susceptible to vibration around the limits of radial and lateral runout of the tire and wheel assembly. They also require more accurate balancing. Wheel and tire runout checks, truing and balancing are normally done before axle inspection.

Sometimes a vibration concern can be corrected by properly rotating or inflating the tires. The **best tires** should be **on the rear** to minimize vibration, especially on vehicles with rear springs (5560).

Driveline Angle

An incorrect driveline (pinion) angle can often be detected by the driving condition when vibration occurs.

1. A vibration during coasting from 56 to 72 km/h (35 to 45 mph) is often caused by a high pinion angle.

2. A vibration during acceleration, again around 56 to 72 km/h (35 to 45 mph), may indicate a lower than specified pinion angle. Refer to Section 00-04 for pinion angle procedure.

   When it is certain that the tires and driveline angle are not the cause, inspect the axle. Refer to Section 00-04 .

U-Joint Wear

Prior to checking driveline angularity, inspect the universal joints on the driveshaft for proper operation.

Place the vehicle on a frame hoist and rotate the driveshaft by hand. Check for rough operation or seized U-joints. If the U-joint shows signs of seizure, excessive wear or improper seating, scribe alignment marks on the driveshaft and rear axle companion flange. Remove the driveshaft and remove and replace the U-joint. Install the driveshaft in the marked original position.

U-Joint Phasing

When assembling a slip between center driveshaft, the universal joint yokes must be assembled to the driveshaft on the same plane. If not, the assembly may be out of balance, causing a driveline vibration. Scribe alignment marks on the slip yoke and the driveshaft tube before removal to ensure correct phasing of

universal joints.

Axle Shaft Runout

NOTE: If the axle shaft (4234) assembly is removed, check runout of the shaft itself. The forged (unmachined) part of the shaft is allowed to have as much as 3.0 mm (0.120-inch) runout. This alone will not cause a vibration condition.

Runout of the axle shaft at either end is an infrequent, but possible, cause of rear end vibration. It is advisable to check the axle shaft for runout of:

1. the pilot (radial)
2. the flange face (lateral)
3. the bolt circle (radial)

   Refer to Section 00-04 for the checking procedures and special service tool for axle shaft runout.

Drive Pinion Stem and Rear Universal Joint Flange

Rear axle universal joint flange runout should be checked when all other checks have failed to show the cause of vibration.

Another cause of excessive rear axle universal joint flange runout is improper installation of the rear axle drive pinion seal. If the spring on the seal lip is dislodged, it will jam up and cock the flange. Check that possibility before replacing the differential ring gear and pinion (4209) because of excessiverear axle universal joint flange runout.

Two-Piece Driveshaft

The two-piece driveshaft used in longer wheelbase light truck models introduces some special considerations to diagnosis and testing. As compared with a one-piece installation, the two-piece design includes a front, or "coupling" shaft, a rubber-insulated frame-mounted driveshaft center bearing bracket, a splined slip joint and an intermediate universal joint at the front of the rear driveshaft.

Axle Noise

Non-Axle Noise

There are a few other conditions that can sound just like axle noise and have to be considered in prediagnosis.

The three most common are exhaust, tires and trim mouldings.

1. In certain conditions, the pitch of the exhaust may sound very much like gear whine. At other times, it can be mistaken for a wheel bearing rumble.
2. Tires — especially snow tires — can have a high-pitched tread whine or roar similar to gear noise. Radial tires, to some degree, have this characteristic. Any non-standard tire with an unusual tread construction may also emit a roar or whine-type noise.
3. Trim, grille and mouldings can also cause whistling or whining noises.

Make sure that none of these are the cause of the noise before proceeding with an axle teardown and diagnosis.

Analysis of Gear Noise

Gear Howl and Whine

Before disassembling the axle to diagnose and correct gear noise, eliminate the tires, exhaust, trim items, roof racks, axle shafts and rear wheel bearings as possible causes.

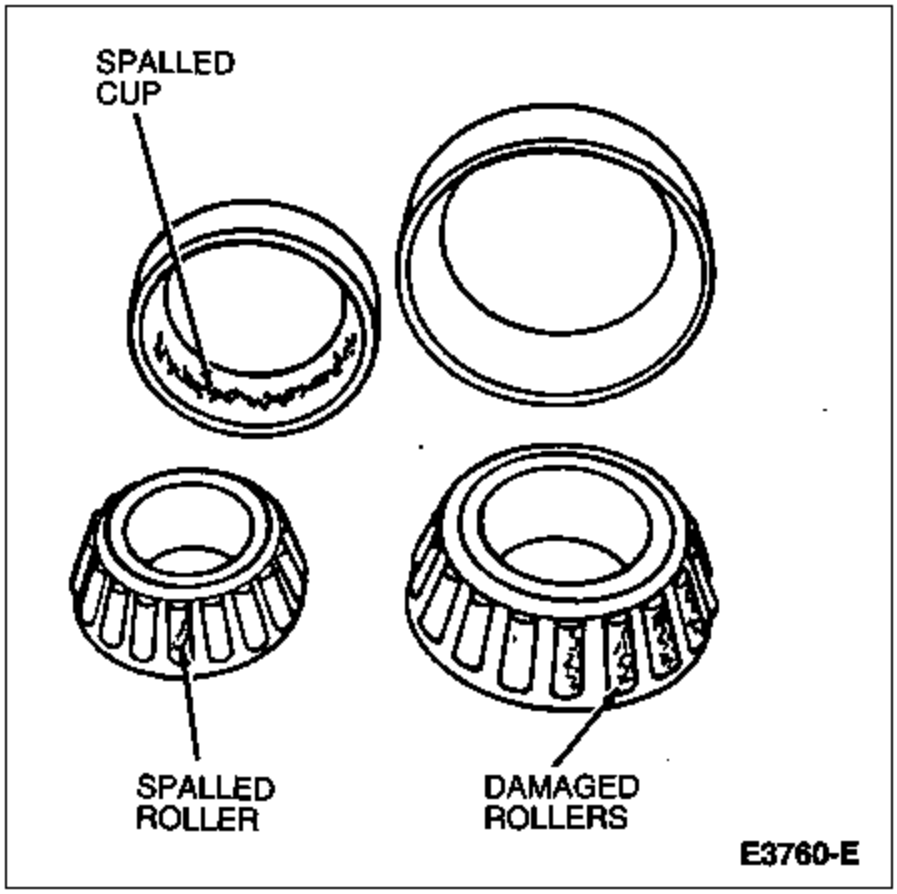
The noises described under Road Test in this section usually have specific causes that can be diagnosed by observation as the unit is disassembled. The initial clues are, of course, the type of noise heard on the road test and the driving conditions.

Bearing malfunctions will normally be obvious at disassembly. As noted earlier, differential pinion bearings (4630) make a high-pitched, whistling noise, usually at all speeds. However, if there is only one differential pinion bearing that is malfunctioning, the noise may vary in different driving phases.

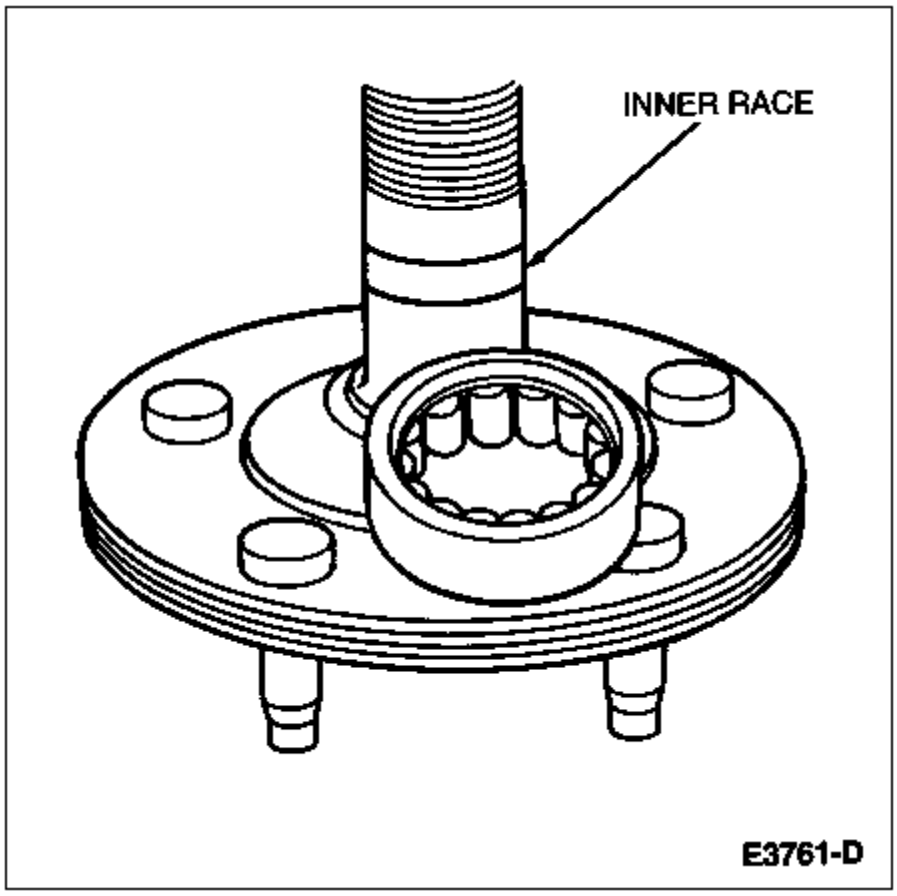
Differential pinion bearings are frequently replaced unnecessarily on axles with low mileage under 24,139 km (15,000 miles) when correcting gear noise. They should not be replaced unless they are actually scored or damaged, or there is a specific differential pinion bearing noise. Examine the large end of the rollers for wear. If the differential pinion bearings original blend radius has worn to a sharp edge, the differential pinion bearing should be replaced.

Remember that the low-pitched rumble of a malfunctioning wheel bearing can also be caused by the exterior luggage rack or tires.

Rear wheel bearing noise might be mistaken for pinion bearing noise. Look at the rear wheel bearing carefully before tearing down the axle.



Rear wheel bearings are pressed into the axle housing tubes, making them more difficult to check. However, the axle shaft is the inner race for the bearing. If the bearing is damaged, the roller surface on the axle shaft may also be damaged. The rollers run approximately on the center of the polished surface.



Chuckle

Chuckle that occurs on the coast driving phase is usually caused by excessive clearance between the differential gear hub and the differential case bore. It can also be caused by a damaged tooth on the coast side of the pinion or ring gear.

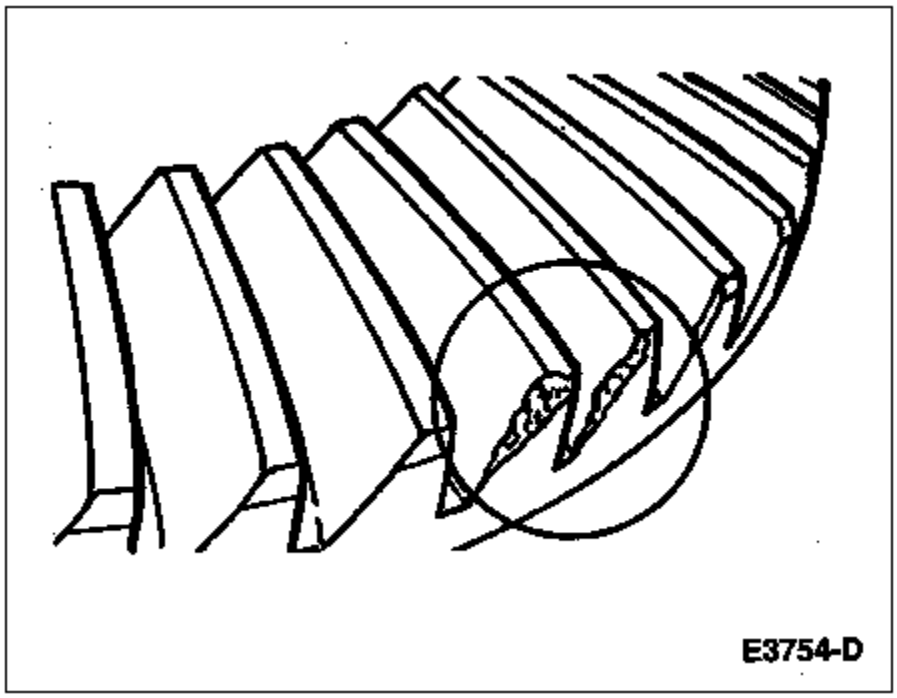
Any damage to a gear tooth on the coast side can cause a noise identical to chuckle. Even a very small tooth nick or ridge on the edge of a tooth is enough to cause the noise.

You can often correct this condition and eliminate the noise simply by cleaning up the gear tooth nick or ridge with a small grinding wheel. If the cleaned up or damaged area is larger than 3.2mm (1/8 inch), it is advisable to replace the gearset.

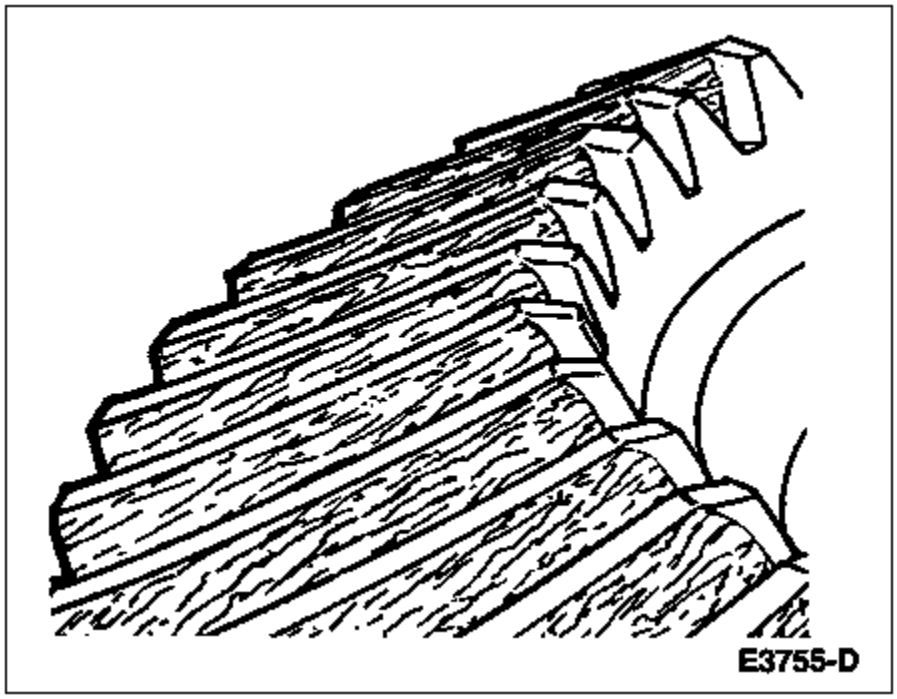
To check the differential ring gear and pinion, remove as much lubricant as possible from the gears with clean solvent. Wipe the gears dry or blow them dry with compressed air. Look for scored or damaged teeth. Also look for cracks or other damage.

If either gear is scored or damaged badly, the differential ring gear and pinion must be replaced. If there is metal broken loose, the rear axle housing must also be cleaned to remove particles that could cause damage later. Any other damaged parts in the rear axle housing must be replaced.

Damaged Gear Teeth



Scored Gear Teeth



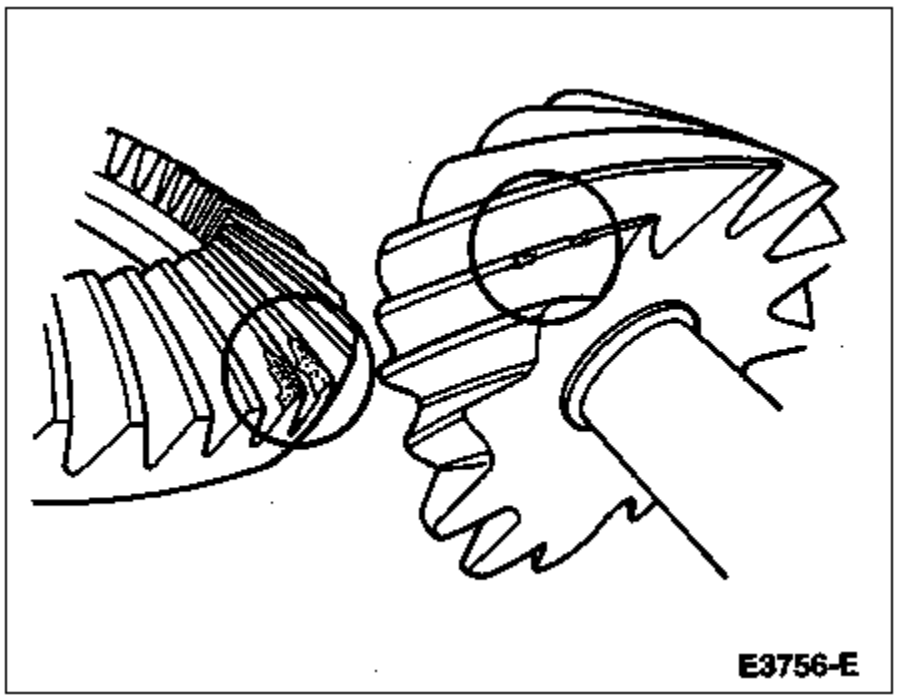
Knock

Knock, which can occur on all driving phases, has several causes. In most cases, the technician will

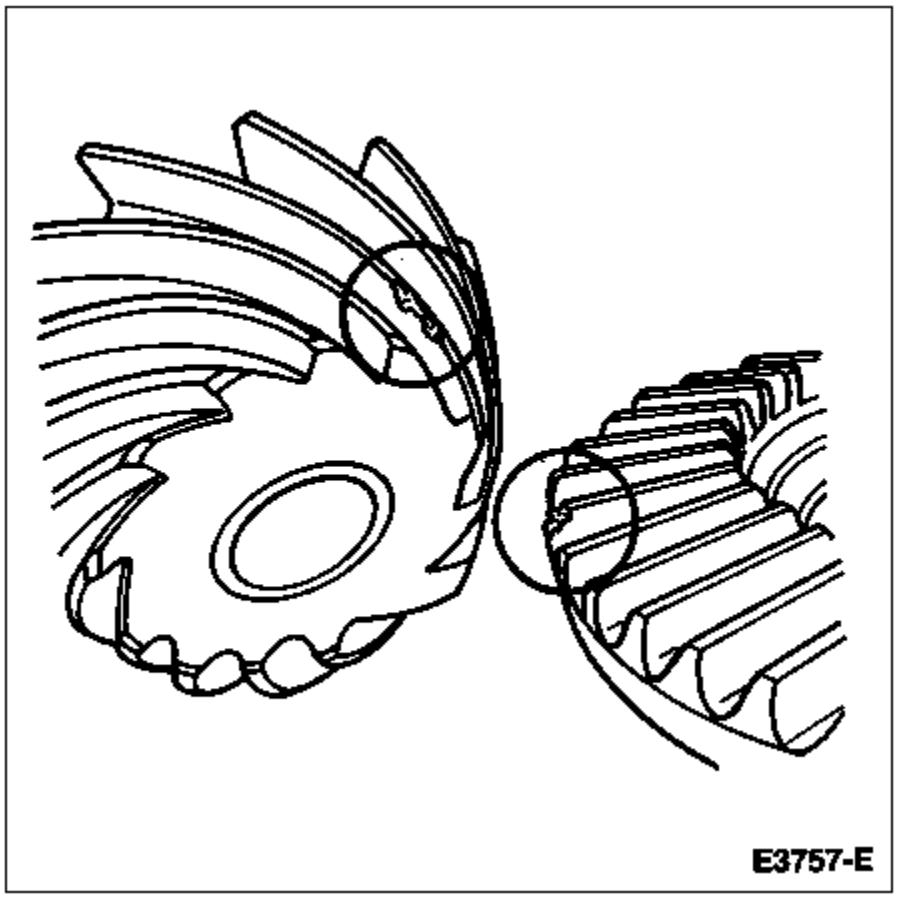
discover one of the following conditions:

1. A gear tooth damaged on the drive side is a common cause of the knock. This can usually be corrected by grinding the damaged area.

Damaged Teeth or Gearset



Drive Side Knock



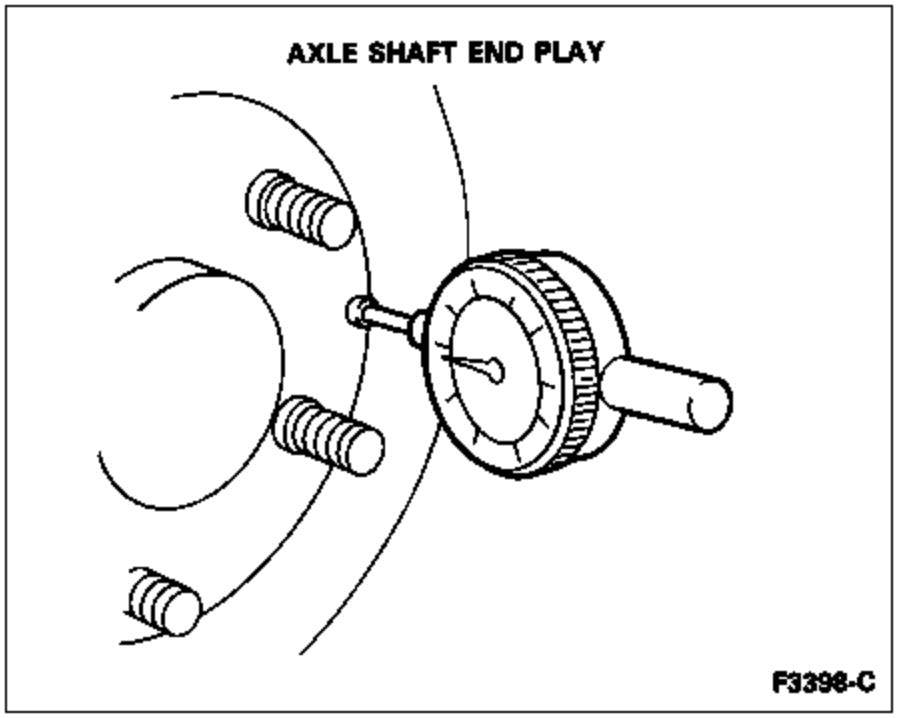
2. Occasionally, the rear axle differential gear case bolts (4216) will knock against the inside of the rear axle housing casting. The cause may be too little clearance due to casting flash or bumps. In this case, the differential case (4204) can be removed and the interference points ground out.

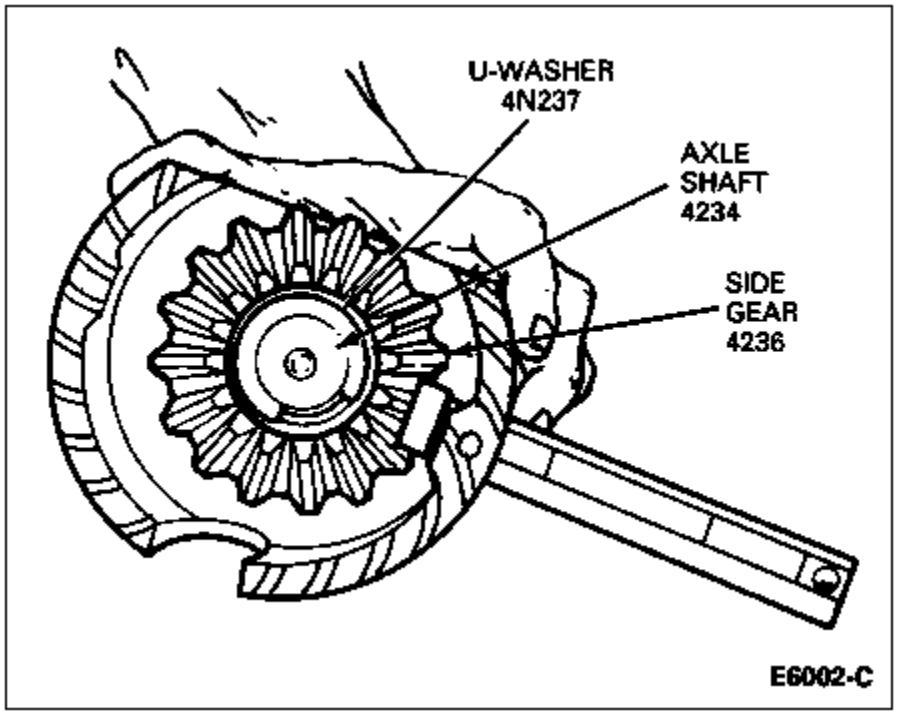
   Another possibility is simply that one or more rear axle differential gear case bolts are slightly backed-out. Remove, replace and properly tighten the rear axle differential gear case bolts using Stud and Bearing Mount E0AZ-19554-BA or equivalent meeting Ford specification WSK-M2G349-A1 on the threads.

3. **NOTE: Be sure to measure the end play with a dial indicator and not by feel. Guessing is inaccurate. The axle end play should be 0.030 in.**

   Knock is also characteristic of excessive end play in the axle shafts. The frequency of knock will be less because the axle shaft speed is slower than the driveshaft. To reduce the clearance, fabricate shims as necessary.

4. Reduce axle shaft end play by replacing differential parts as required.





Clunk

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number

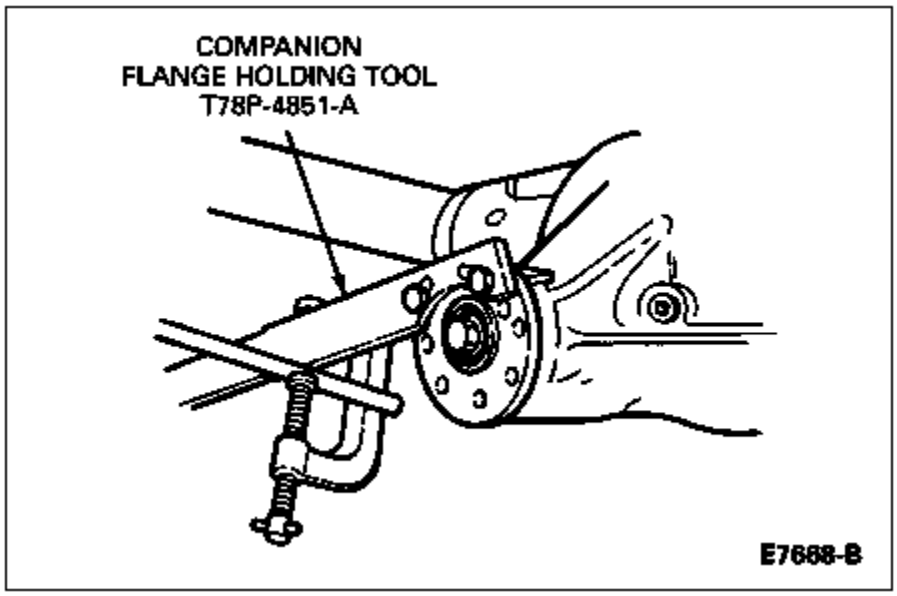
Companion Flange Holding Tool	T78P-4851-A

1. **NOTE: Remove driveshaft when performing this procedure on circular rear axle companion flange application.**

   Raise vehicle on hoist.

2. Use a rigid bar or pipe of suitable length and clamp one end to the rear axle companion flange using Companion Flange Holding Tool T78P-4851-A.

3. Clamp the other end to the frame or body member in order to prevent movement of the rear axle companion flange.



4. Lower the vehicle so that one rear wheel is resting on a wheel chock to prevent it from turning. The other rear wheel will then be used to measure total rear axle (4001) backlash.

5. Rotate the free wheel slowly, by hand, until a feel of driving the rear axle is encountered. Position a crayon or chalk firmly on the side of the tire 305mm (12 inches) from the center of the wheel. Rotate the wheel slowly in the opposite direction until the feel of driving the rear axle is encountered again.

6. Measure the length of the crayon or chalk mark on the tire. If the length of the mark is 25.4 mm (1 inch) or less, the rear axle backlash is within allowable limits.

7. If the chalk mark is greater than 25.4 mm (1 inch), check for these conditions:

   a. Elongation of the differential pinion shaft (4211) holes in the differential case.
   b. Missing differential (4026), pinion, or differential side gear thrust washer (4228).
   c. Galling of the differential pinion shaft and bore.
   d. Excessive ring gear and pinion backlash. Follow procedure for type of rear axle, to check backlash.

Bearing Whine

Bearing whine is a high-pitched sound similar to a whistle. It is usually caused by malfunctioning pinion bearings, which are operating at driveshaft speed. Bearing noise occurs at all driving speeds. This distinguishes it from gear whine which usually comes and goes as speed changes.

Chatter on Corners

Chatter on corners is a condition where the whole rear end vibrates only when the vehicle is moving. The vibration is plainly felt and heard. In conventional axles, extra differential thrust washers cause a condition of partial lockup that creates this chatter. Chatter noise on Traction-Lok® axles can usually be traced to erratic movement between adjacent clutch plates and can be corrected with a lubricant change that includes friction modifier additive.

Click at Engagement

Click at engagement is a condition on axles of a slight noise, distinct from a "clunk," that happens in REVERSE or DRIVE engagement. It can be corrected by installing a rear axle drive pinion shaft oil slinger (4670) between the rear axle universal joint flange and differential pinion bearing.

Axle Shaft Noise

Axle shaft noise is similar to gear noise and differential pinion bearing whine. However, axle shaft bearing noise will normally distinguish itself from gear noise by occurring in all driving modes (drive, coast and float), and will persist with transmission in NEUTRAL while vehicle is moving at problem speed. If the vehicle makes this noise, remove suspect axle shafts, replace rear wheel bearings and install a new set of axle seals. Re-evaluate vehicle for noise before removing any internal components.

Bearing Rumble

Bearing rumble sounds like marbles being tumbled. This condition is usually caused by a malfunctioning wheel bearing. The lower pitch is because the wheel bearing turns at only about one-third of driveshaft speed. Wheel bearing noise also may be high-pitched, similar to gear noise, but will be evident in all four driving modes.

Analysis of Inoperative Conditions

If the axle fails to operate, there will be broken or jammed-up parts. Analyze why the parts have broken to prevent the condition from recurring.

Broken Axle Shaft

Inspect a broken axle shaft (4234) for a twist in the spline next to the break.

Breaks that occur away from the spline or that are not accompanied by a twist in the spline may be caused by forging flaws and/or fatigue of the axle shaft.

Conditions that can cause a broken axle shaft include forging flaws or excessive impact load to the axle shaft as a result of a collision or other factors.

Broken Pinion Stem

The drive pinion stem can break at any time if the differential pinion bearing preload is not set up properly. If there is no preload, the differential pinion bearing (4630) will turn relative to the axle shaft. This galls the roller shaft and generates heat which can draw the temper away from the shaft.

Too much preload also generates bearing heat with the same result. The break normally occurs between the two differential pinion bearings.

Broken Welds

Rear axle housing welds, if completely broken, call for replacement of the rear axle housing (4010).

Wheel Bearing Malfunctions

Because of the severe loads they must handle, rear wheel bearings (1225) may require replacement at high mileage. If a rear wheel bearing fails at low mileage, it is often caused by overloading.

Axle Lockup

Lockup or seizure of the axle shaft usually indicates inadequate lubrication. The lubricant prevents friction and helps cool the parts as they heat up. Without enough lubricant, the heated parts get soft and may eventually weld together. Check for lubricant leaks after servicing.

Symptom Chart — Axle And Driveshaft Service

AXLE AND DRIVESHAFT SERVICE

Condition	Possible Source	Action
• Excessive Rear Axle Assembly Noise	• N.V.H. problem. (Noise, vibration and harshness.)	• PERFORM the N.V.H. tests to determine whether the noise is a N.V.H. caused by a rear axle problem. REFER to Section 00-04 .
	• Worn or damaged rear wheel bearing.	• PERFORM rear wheel bearing noise test. REFER to Section 00-04 . REPLACE rear wheel bearings if required.
	• Rear axle differential.	• ROAD TEST vehicle to ensure problem is rear axle noise rather than other system noise. REFER to Preliminary Diagnosis . REPAIR and REPLACE parts as required.
• Loud "Clunk" in the Driveline When Shifting from Reverse to Forward	• High idle speed.	• ADJUST idle speed.
	• Loose engine mounts.	• INSPECT, REPAIR as required.
	• Loose or worn driveshaft components, rear axle companion flange attaching nut below specs.	• RAISE vehicle, ROTATE driveshaft by hand to isolate problem as driveshaft or rear axle problem. REPAIR or REPLACE as required.
	• Rear axle shafts or differential.	• REMOVE and INSPECT. REPAIR as necessary.
	• Inoperative shock absorbers or loose rear springs or suspension arms.	• INSPECT, REPAIR or REPLACE as required.
	• Excessive backlash in axle, or transmission.	• PERFORM total backlash check of rear axle assembly. REPAIR or REPLACE as necessary.
	• Insufficient lubrication.	• ADD lubricant as required.
• Driveline "Clunk" as Vehicle Starts to Move Following a Brake Stop (Two-Piece Driveshaft)	• Loose rear spring U-bolts.	• TIGHTEN U-bolts to specification.

	• Worn or galled output driveshaft and coupling shaft splines. • Worn or galled driveshaft slip yoke splines. • Damaged driveshaft slip yoke seal. • Insufficient lubrication in driveshaft slip yoke.	• REMOVE the driveshaft from the vehicle. CLEAN the male splines and INSPECT for worn or galled splines. REPLACE if necessary. • CLEAN and INSPECT the female splines of the driveshaft slip yoke for worn or galled condition. REPLACE if necessary. • REPLACE seal. • Using a long handle (stencil type) brush, APPLY long life lube evenly on all the splines of the driveshaft slip yoke. REINSTALL driveshaft. **NOTE: INSTALL the driveshaft slip yoke making sure that the coupling shaft and driveshaft are in phase.**
• On Turns, the Rear Axle Has a High-Pitched Chattering Noise (Limited Slip Rear Axles Only)	• Improper lubricant. Refer to Maintenance Schedule in Section 00-03 for complete information. • Differential.	• ROAD TEST vehicle — DRIVE in tight circles, 5 clockwise and 5 counterclockwise. If chatter is still evident, FLUSH and REFILL — with specified rear axle lubricant, and dosage of friction modifier additive. (SEE Lubricant Specifications at the end of this section.) • REMOVE differential, REPAIR as required.
• Limited Slip Rear Axle Assembly Does Not Work in Snow, Mud or on Ice	• Differential.	• PERFORM Limited Slip Differential Operation Check in this section. REPAIR as required per Section 05-02C , Section 05-02D .
• Driveline Concerns	• Rear spring U-bolt loose. • Universal joint worn or improperly installed. • Coupling shaft driveshaft center bearing bracket improperly installed. • Excessive runout in rear axle companion flange or damaged universal joint. • Excessive lateral and radial tire and wheel runout.	• RETIGHTEN U-bolt. • REINSTALL or REPLACE universal joint. • Correctly INSTALL driveshaft center bearing bracket and REPLACE if damaged. • ROTATE rear axle companion flange 180 degrees and REINSTALL. RECHECK and if not acceptable, REPLACE rear axle companion flanges or rear axle shaft universal joint and REPAIR as required. • REFER to Section 04-04 .

	• Excessive driveshaft runout.	• REPLACE driveshaft or ROTATE driveshaft 180 degrees and CHECK for out-of-balance condition.
	• Driveshaft out of balance.	• REBALANCE driveshaft.
	• Driveline and pinion angles out of specification.	• ADJUST to specifications.
	• Binding, damaged or galled splines on driveshaft slip yoke.	• CHECK transmission for proper lubricant, and CLEAN and LAP splines. LUBRICATE splines with Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B.
• Noise Is the Same on Drive or Coast	• Road noise.	• Normal condition.
	• Tire noise.	• REBALANCE or REPLACE tire.
	• Front wheel bearing noise.	• ADJUST or REPLACE wheel bearings.
	• Improper driveline angles or phasing.	• ADJUST or CORRECT as required.
• Loud Clunk in the Driveline When Shifting from Reverse to Forward	• Loose or worn driveshaft components, rear axle companion flange attaching nut below specifications.	• INSPECT, REPAIR, REPLACE as required.
• Lubricant Leaking from the Pinion Seal, Axle Shaft Oil Seals or Support Arm to Housing	• Dirt or other debris is blocking vent.	• CLEAN rear axle housing vent.
	• Observe end yoke dust shield for damage in seal contact area or dust slinger.	• REPLACE end yoke and pinion seal if damage is found.
• Noise Tone Lowers as Vehicle Speed Is Lowered	• Tire noise.	• REBALANCE or REPLACE tire.
• Similar Noise Is Produced with Vehicle Standing and Driving	• Engine noise.	• REFER to Section 03-00 .
	• Transmission noise.	• REFER to appropriate transmission section.
• Vibration	• Refer to Section 00-04 .	• REFER to Section 00-04 .

• Noise Most Pronounced on Turns	• Differential side gears and pinion gears.	• REPLACE gears.
• Drive Noise, Coast Noise or Float Noise	• Wheel bearings or differential side bearings.	• ADJUST or REPLACE wheel or differential side bearings.
	• Ring gear and pinion.	• CHECK ring gear and pinion. ADJUST or REPLACE.

Component Tests

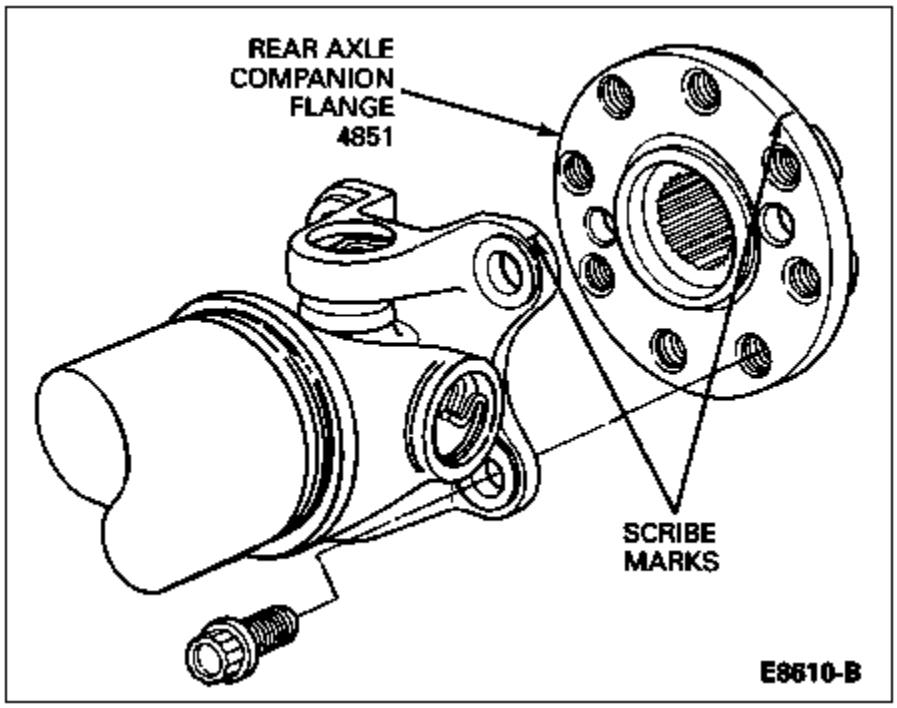
Driveline Vibration

Driveline vibration exhibits a higher frequency and lower amplitude than does high-speed shake. Driveline vibration is directly related to the speed of the vehicle and is usually noticed at speeds of 72 km/h (45 mph) or higher. Driveline vibration can be perceived as a tremor in the floor pan or is heard as a rumble, hum or boom. Driveline vibration can exist in all drive modes, but may exhibit different symptoms depending upon whether the vehicle is accelerating, decelerating, floating or coasting. If the vibration is particularly noticeable during acceleration or deceleration, especially at lower speeds, then driveline angle should be checked. Driveline vibration can be duplicated by supporting the axle upon a hoist or upon jackstands, though the brakes may need to be applied lightly in order to simulate road resistance.

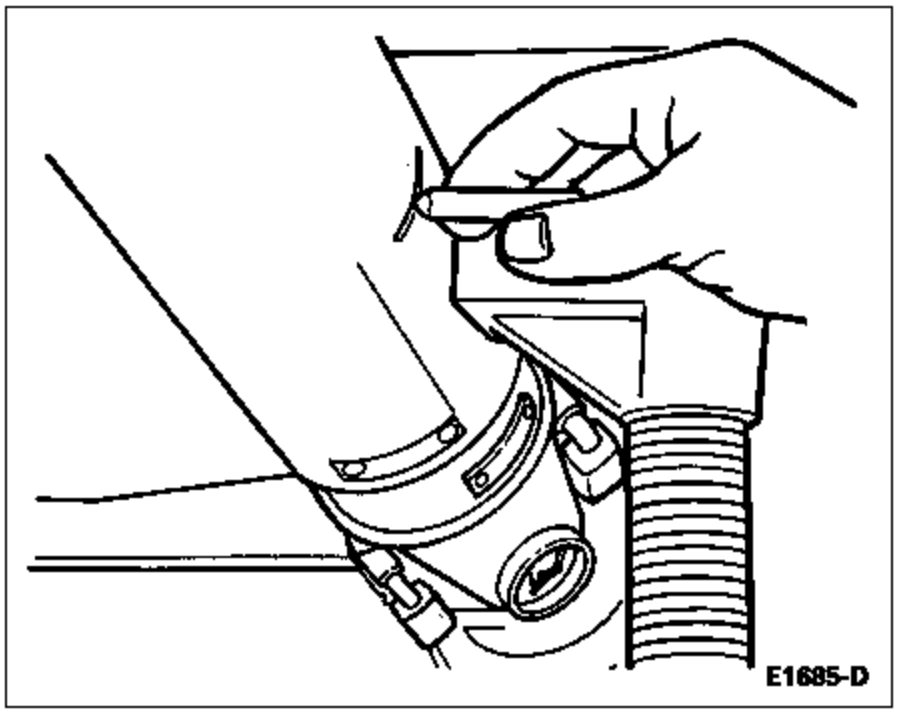
1. Raise vehicle promptly after road-testing, on twin-post hoist or jackstands, to prevent tire flat-spotting. Engage drivetrain and run-up to observed road test speed to verify presence of vibration. If not evident, check non-driving wheels with wheel-balancer spinner to rule out imbalance as a possible cause. On 4x4's, unlock front hubs or remove hub covers before spinning wheels. If required, balance non-driving wheels and repeat road test. If vibration is still evident, proceed to Step 3.

2. If vibration appeared in road-speed hoist test, mark relative position of drive wheels on rear axle assembly (4006) or hub lugs to permit reinstallation in original position, and remove wheels. Secure brake drums, if present, by installing all lugnuts in reversed position and repeat road-speed run-up. If vibration is gone, see drive wheel runout and balance procedures in Section 04-04 . If vibration persists, proceed to Step 3.

3. Inspect driveshaft (4602) for signs of physical damage, missing balance weight, undercoating, or improperly seated, worn, or binding universal joints. Check the index marks (paint spots) on rear of driveshaft and rear axle companion flange. If these marks are more than 45 degrees apart, disconnect driveshaft and reindex to align marks as close as possible. Clean driveshaft and replace universal joints as necessary, or replace driveshaft if damaged. After any corrections are made, recheck vibration at road test speed. If gone, reinstall wheels and road test. If vibration persists, proceed to Step 4.



4. With vehicle on hoist and wheels off, measure runout at front, center, and rear of driveshaft with indicator, rotating driveshaft by turning a brake drum or rotor. On a one-piece driveshaft, if runout exceeds 0.89 mm (0.035 inch) at front or center, the driveshaft must be replaced. If front and center are within this limit, but rear runout is not, mark the rear runout high point and proceed to Step 5. If runout is within limits at all points, proceed to Step 7 or Adjustments, Driveshaft Balancing .

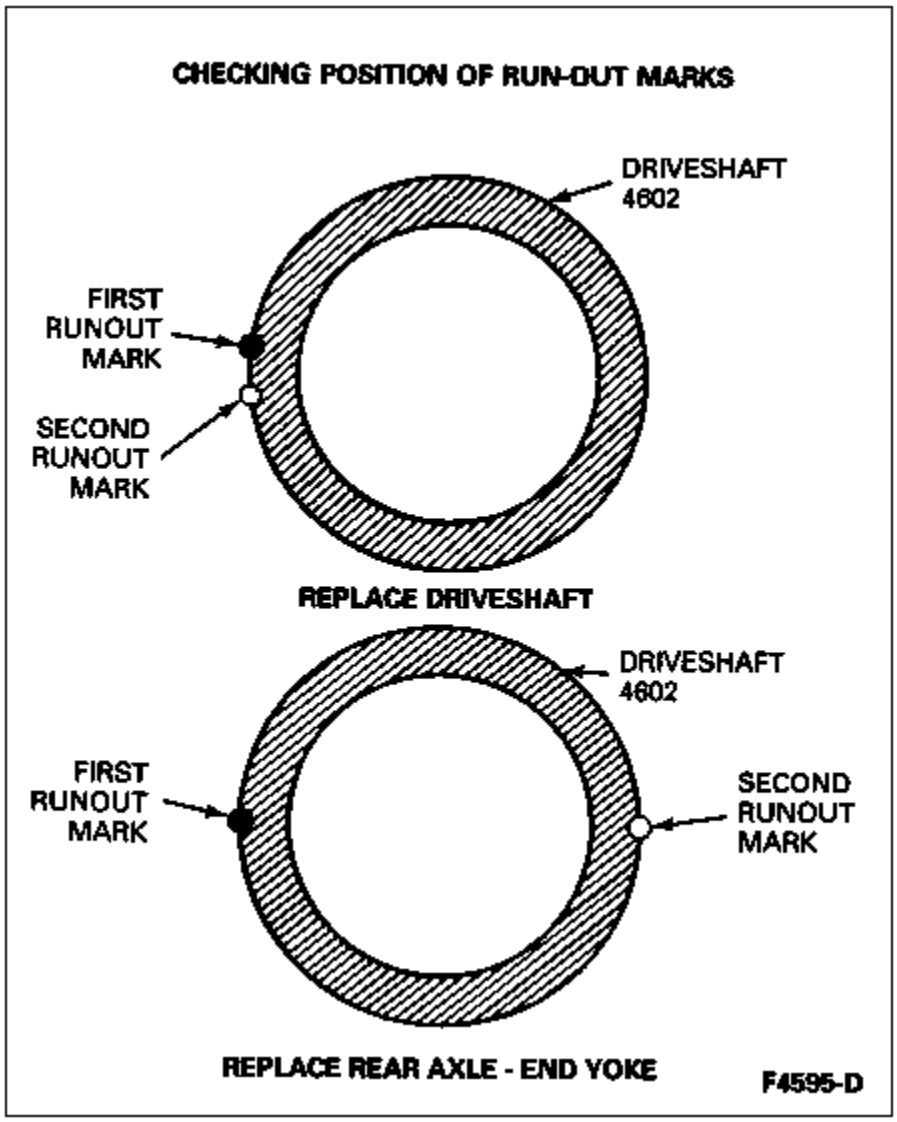


5. **NOTE: Move universal joints in each direction of rotation during reindexing. If a universal joint**

feels stiff or has a gritty feel in any direction, replace the rear axle shaft universal joint (4249).

Circular rear axle companion flanges can be indexed in 45-degree increments to fine tune the runout condition. Check runout at rear of driveshaft, and if still over 0.89 mm (0.035 inch), mark high point and see Step 6. If runout is no longer excessive, check for vibration at road test speed, and, if still present, reindex the driveshaft slip yoke (4841) on the transmission output shaft 180 degrees and road test the vehicle. If the vibration persists, proceed to Step 7 or Adjustments, Driveshaft Balancing .

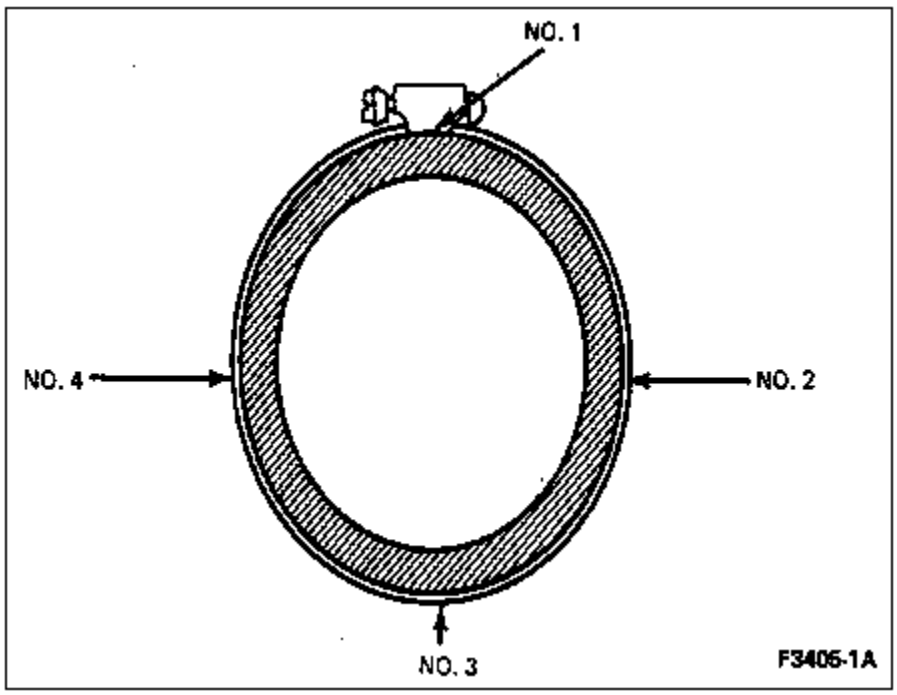
6. Excessive driveshaft runout may originate in the driveshaft itself or in the rear axle companion flange. To determine which, compare the two high points marked in Steps 4 and 5. If the marks are close together, within about 25mm or 1 inch, the shaft is eccentric, and should be replaced and checked for vibration. If the marks are on opposite sides of the driveshaft, about 180 degrees apart, the yoke or rear axle companion flange is responsible. After replacing, check for runout. When replacing a rear axle companion flange, driveshaft runout should not exceed 0.89 mm (0.035 inch). When runout is within limits, recheck for vibration at road speed. If vibration persists, balance the driveshaft.



7. Driveshaft balancing involves installing one or two hose clamps on the driveshaft, near the rear end of

a one-piece driveshaft. Best positioning of the hose clamp head(s) can be determined by trial-and-error, if special balancing equipment is not available.

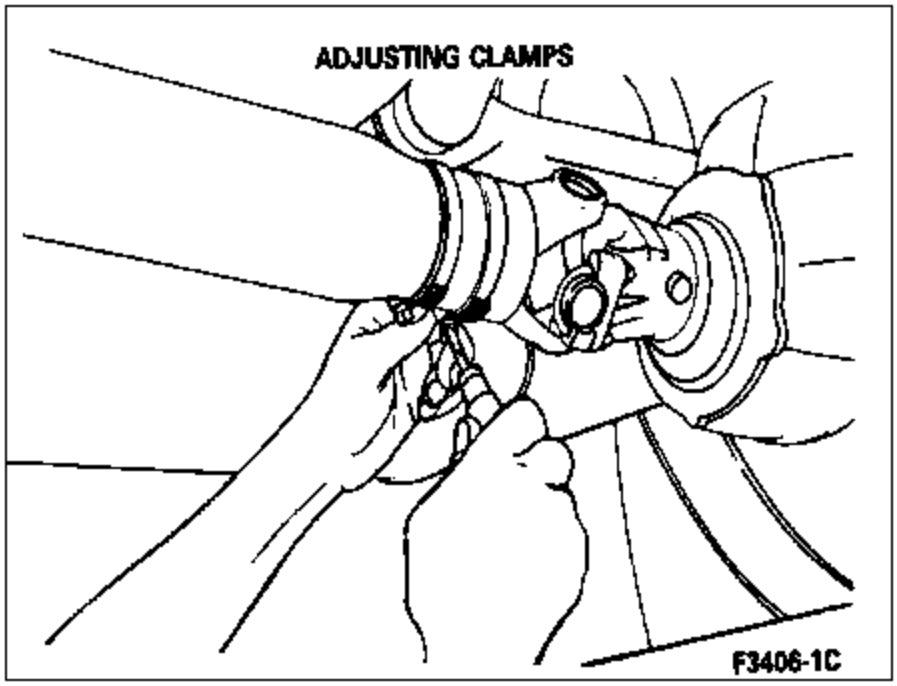
8. Mark off the rear of the driveshaft into four approximately equal sectors, and number the marks 1 through 4. Install a hose clamp on the driveshaft with its head at position No. 1. Check for vibration at road speed. Recheck with the clamp at each of the other positions, to find the position for minimum vibration. If two adjacent positions show equal improvement, position the clamp head between them.

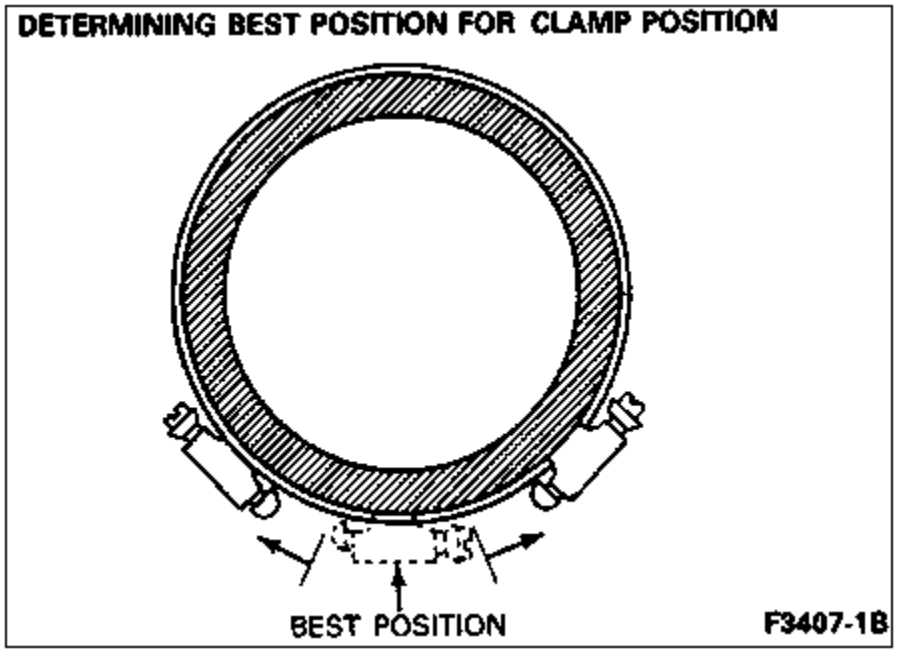


9. If condition is still not acceptable, add a second clamp at the same position and recheck vibration. If no improvement is noted, rotate the clamps in opposite directions, equal distances from the best position determined in Step 8. Initially, separate the clamp heads about 12 mm (1/2 inch), and recheck vibration at road speed.

   Repeat the process with increasing separation until the best combination is found, or vibration is reduced to an acceptable level.

10. Install wheels and road test, since vibration noticeable on the hoist may not be evident during the road test. If vibration is still not acceptable, replace the rear axle drive line vibration damper, if so equipped. If road test is not acceptable, replace ring gear and pinion.





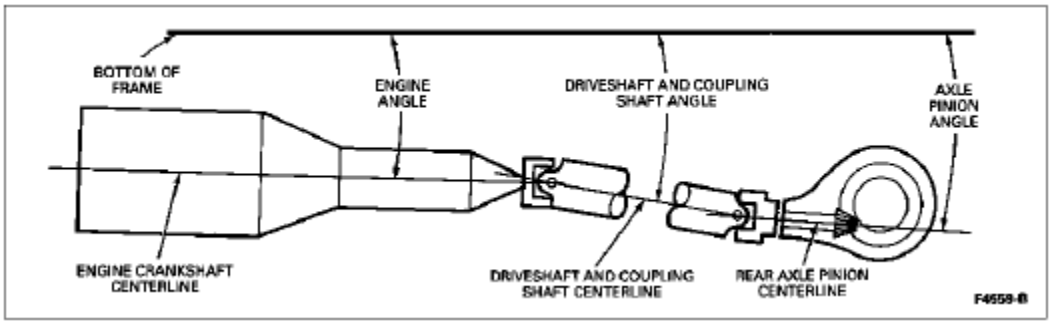
Driveline Angularity

Driveline angularity is the angular relationship between the engine crankshaft (6303), the driveshaft and the rear axle pinion. Factors determining driveline angularity include ride height (rear spring (5560)), and engine mounts.

Low speed vibration, less than 72 km/h (45 mph), especially when the vehicle is subjected to heavy acceleration or deceleration, is an indication of improper driveline angles. When these conditions exist,

check the universal joints for proper seating, mounting and operation.

Driveline Angularity



Driveshaft Vibrates

1. Road test vehicle to determine critical vibration points. Note road speed, engine rpm and shift lever positions at which vibration occurs.

2. Stop vehicle and run engine with clutch depressed (automatic transmission in neutral) through critical speed ranges determined in Step 1.

3. If vibration is gone, the driveshaft must be balanced as described in this section.

Limited Slip Differential

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Traction-Lok Torque Tool	T59L-4204-A

Bench Check

With Traction-Lok Torque Tool T59L-4204-A check the torque required to rotate one differential side gear (4236) while the other is held stationary. The initial breakaway torque should be no less than 27 Nm (20 lb-ft).

In-Vehicle Check

WARNING: A VEHICLE EQUIPPED WITH A LIMITED SLIP DIFFERENTIAL (4026) WILL ALWAYS HAVE BOTH WHEELS DRIVING. IF, WHILE THE VEHICLE IS BEING SERVICED, ONLY ONE WHEEL IS RAISED OFF THE FLOOR AND THE REAR AXLE (4001) IS DRIVEN BY THE ENGINE (6007), THE WHEEL ON THE FLOOR COULD DRIVE THE VEHICLE OFF THE STAND OR JACK.

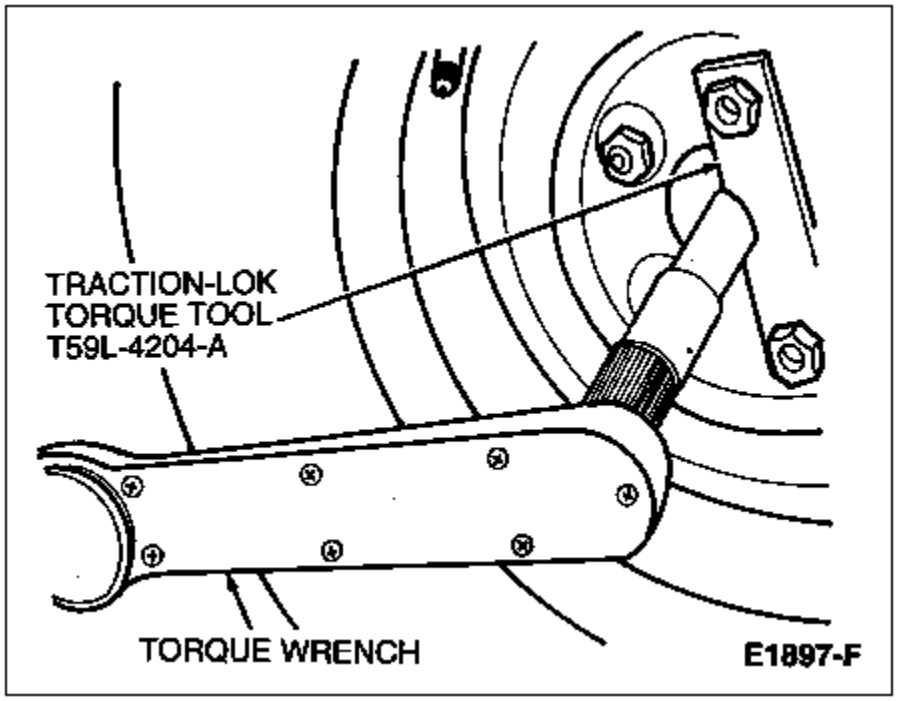
WARNING: AEROSTAR E-4WD VEHICLES WILL DRIVE OFF A JACK OR HOIST IF ANY WHEEL IS LIFTED OFF THE FLOOR, WITH THE ENGINE RUNNING AND THE TRANSMISSION (7003)

ENGAGED IN GEAR, OR MAY ROLL AWAY IF ANY WHEEL IS RAISED OFF THE FLOOR WITHOUT SETTING THE PARKING BRAKE.

A Limited Slip differential can be checked for proper operation without removing the differential case (4204) from the rear axle housing (4010).

Jack up one rear wheel and remove the wheel cover. Transmission must be in neutral and parking brake not applied.

Install Traction-Lok Torque Tool T59L-4204-A on the axle shaft flange studs as shown.



Using a torque wrench, rotate the axle shaft (4234). Be sure that the transmission is in neutral, one rear wheel is on the floor, and the other rear wheel is raised off the floor. The breakaway torque required to start rotation should be at least 27 Nm (20 lb-ft). The initial breakaway torque may be higher than the continuous turning torque, but this is normal. The axle shaft should turn with even torque throughout the check without slipping or binding. If the torque reading is less than specification, service the differential.

Differential Runout Check

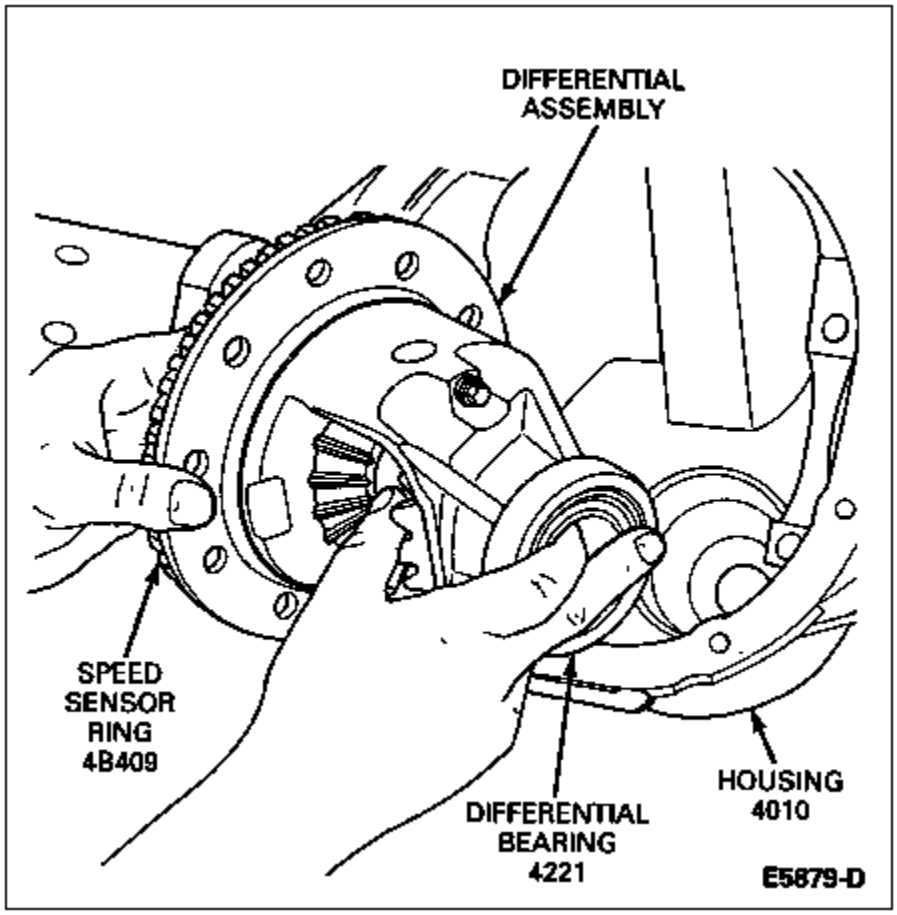
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Differential Side Bearing Replacer	T57L-4221-A1

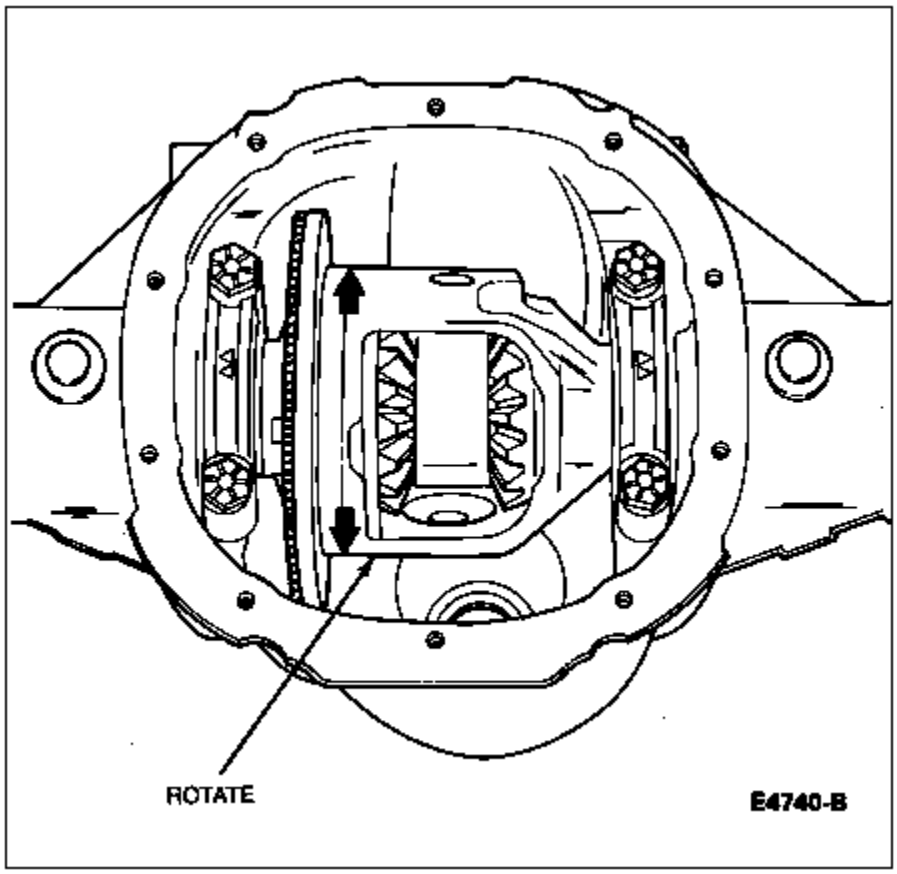
If the ring gear runout check (before disassembly) exceeds specification, the condition may be caused by a warped ring gear, a damaged differential case (4204), excessively worn differential bearings or foreign material between mating surfaces (burrs, shavings, etc.). To determine the cause of excessive runout, proceed as follows:

1. Remove the differential case from the axle housing (refer to Differential Case and Drive Pinion Removal in 05-02A or 05-02B) and remove the bolts that attach the ring gear to the differential case. Remove the ring gear from the differential case with a hammer and a drift.

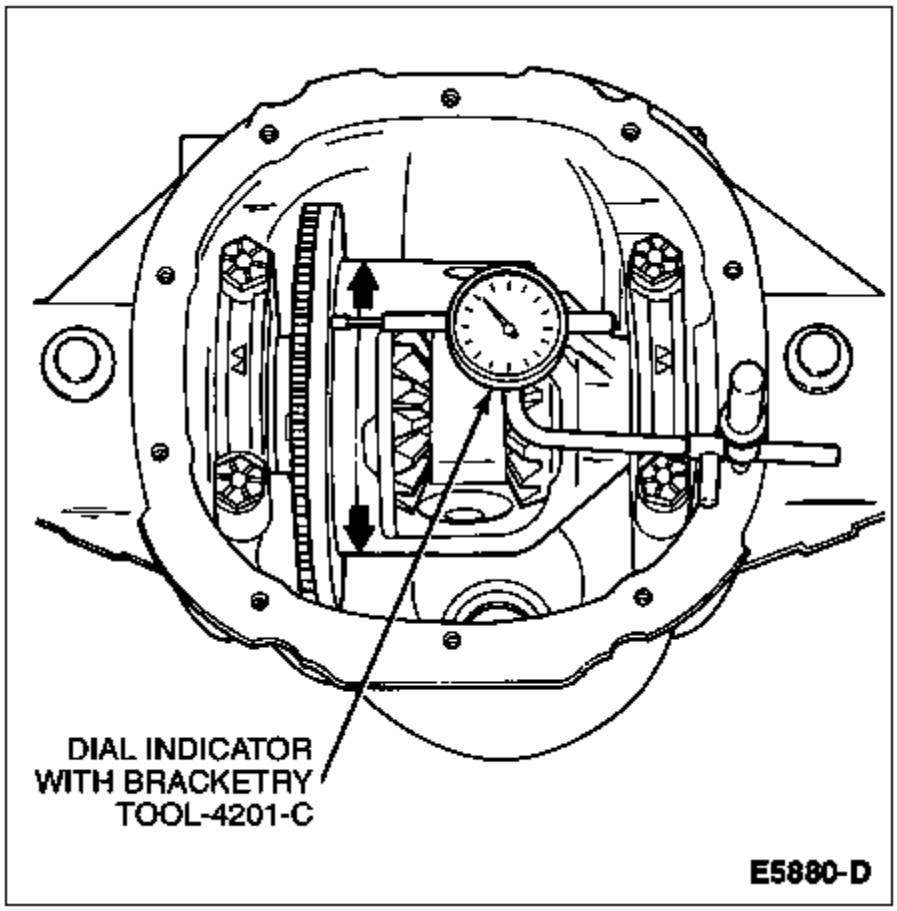
2. Install the differential assembly including the differential bearing cups (4222) and shims in the axle housing. Tighten the bearing cap bolts to 95-115 Nm (70-85 lb-ft).



3. Rotate assembly to ensure proper seating of differential bearings.



4. Check the runout of the differential case flange with a Dial Indicator with Bracketry TOOL-4201-C or equivalent. If the runout is within specification, a maximum of 0.076mm (0.003 inch), install a new ring and pinion gear. If the runout exceeds specification, the ring gear is true and the trouble is due to either a damaged differential case or differential bearings (4221). Visually inspect the differential bearings. If differential bearings are not damaged,replace both the differential case and differential bearings. Recheck the runout with new parts (differential case and differential bearings).



5. **NOTE: Press against the bearing cone only.**

   Install new differential bearings on the case hubs using Differential Side Bearing Replacer Tool T57L-4221-A1 and install the differential assembly in the carrier without the ring gear.

6. Check the differential case runout again with the new differential bearings. If the runout is now within limits, use the new differential bearings for assembly. If the runout is still excessive, the differential case is damaged and should be replaced.

Universal Joint Flange Runout Check, Rear Axle

Circular

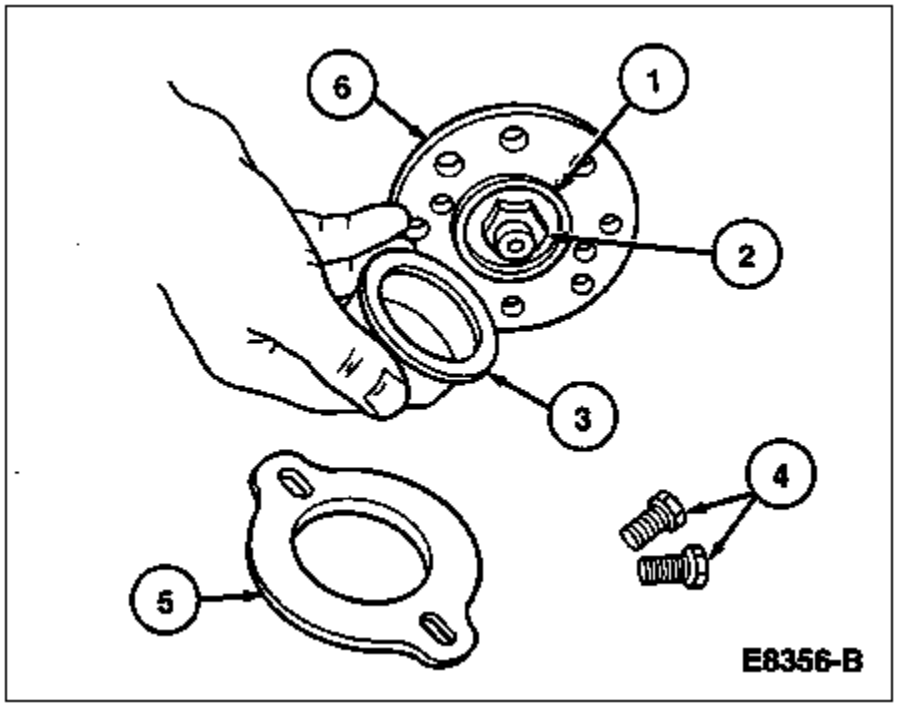
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Companion Flange Runout Gauge	T92L-4851-B
Clamp Plate	T92L-4851-C

1. **CAUTION: This operation disturbs the pinion bearing preload. Pinion bearing preload must be reset if the pinion nut has been loosened or removed for rear axle universal joint flange (4851) reindexing or replacement.**

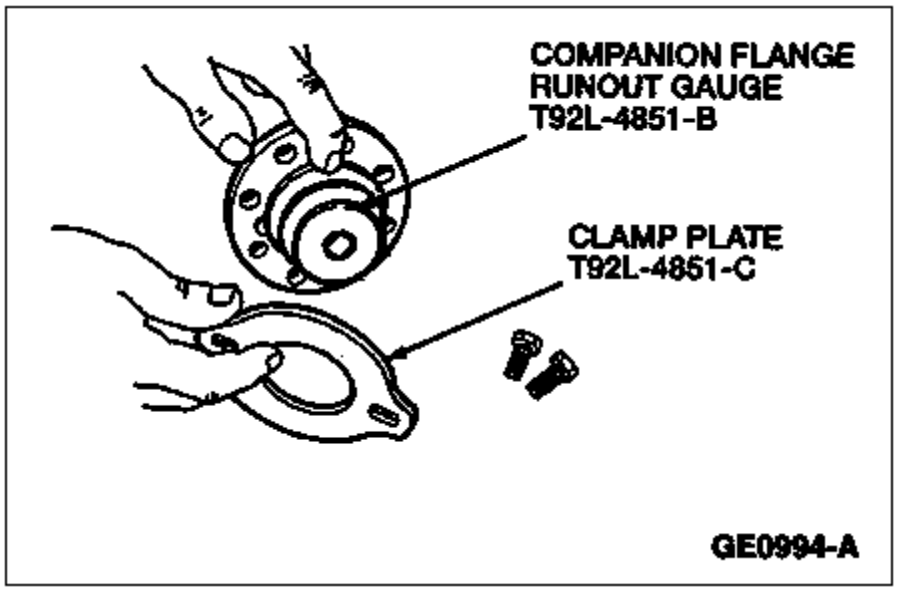
Raise the vehicle on a hoist that supports the rear axle (twin-post hoist). Refer to Section 00-02 .

2. Remove the driveshaft (4602) assembly. Refer to Section 05-01 .
3. Check the rear axle universal joint flange for damage.
4. Position Companion Flange Runout Gauge T92L-4851-B on rear axle universal joint flange.

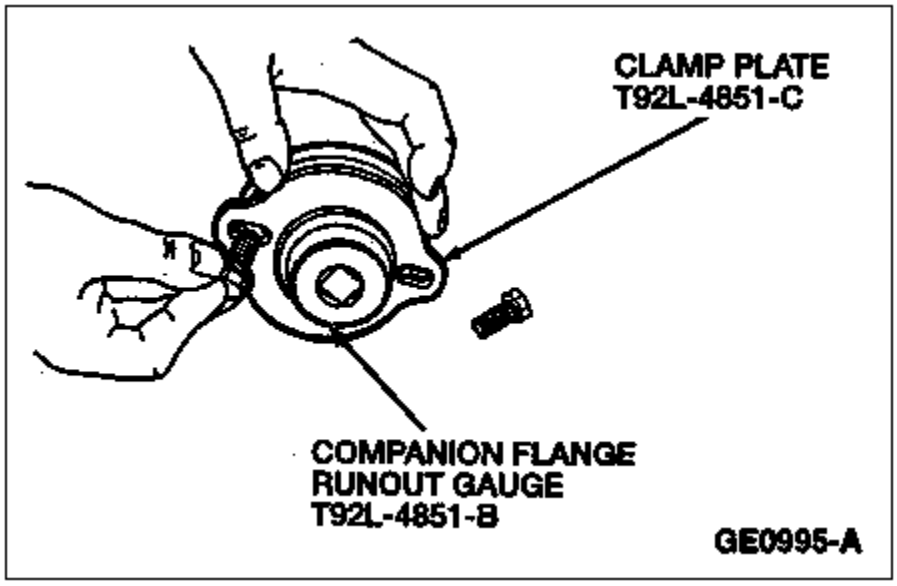


Item	Part Number	Description
1	—	Pilot (Part of 4851)
2	354845	Pinion Nut
3	T92L-4851-B	Companion Flange Runout Gauge
4	—	Bolts (2 Req'd) (Part of T92L-4851-C)
5	T92L-4851-C	Clamp Plate
6	4851	Rear Axle Universal Joint Flange

5. Install Clamp Plate T92L-4851-C on runout gauge.

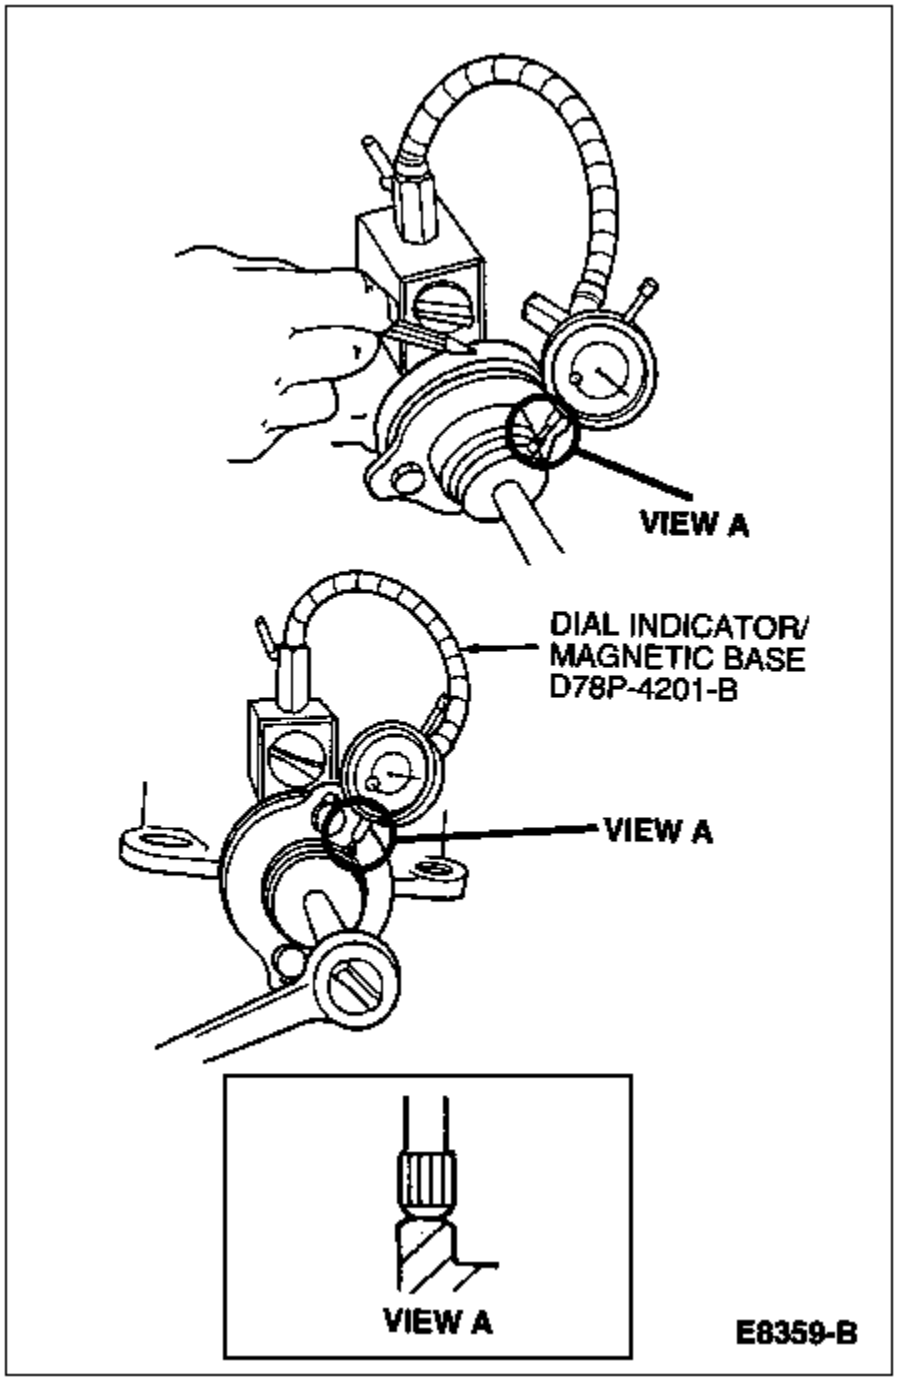


6. Align holes in clamp plate with holes in rear axle universal joint flange and install bolts. Snug bolts evenly.



7. **NOTE: Refer to Section 05-02B for rear axle universal joint flange Removal and Installation procedures.**

   Turn companion flange runout gauge as shown to locate and mark high spot on rear axle universal joint flange. If flange runout exceeds 0.010 inch, remove rear axle universal joint flange, reindex 180 degrees on pinion and reinstall. Check runout again. If necessary, rotate rear axle universal joint flange until an acceptable runout is obtained. If flange runout is still more than 0.010 inch, replace rear axle universal joint flange.



8. If excessive runout is still evident after replacement of the rear axle universal joint flange, replace the differential ring gear and pinion (4209) Repeat the above checks until runout is within specifications. Install the driveshaft assembly as outlined in Section 05-01 . Tighten bolts to 95-130 Nm (70-96 lb-ft).

Tooth Contact Pattern Check of Gearset

1. To check the gear tooth contact, paint the gear teeth with the special marking compound. A mixture that is too wet will run and smear; too dry a mixture cannot be pressed out from between the teeth.

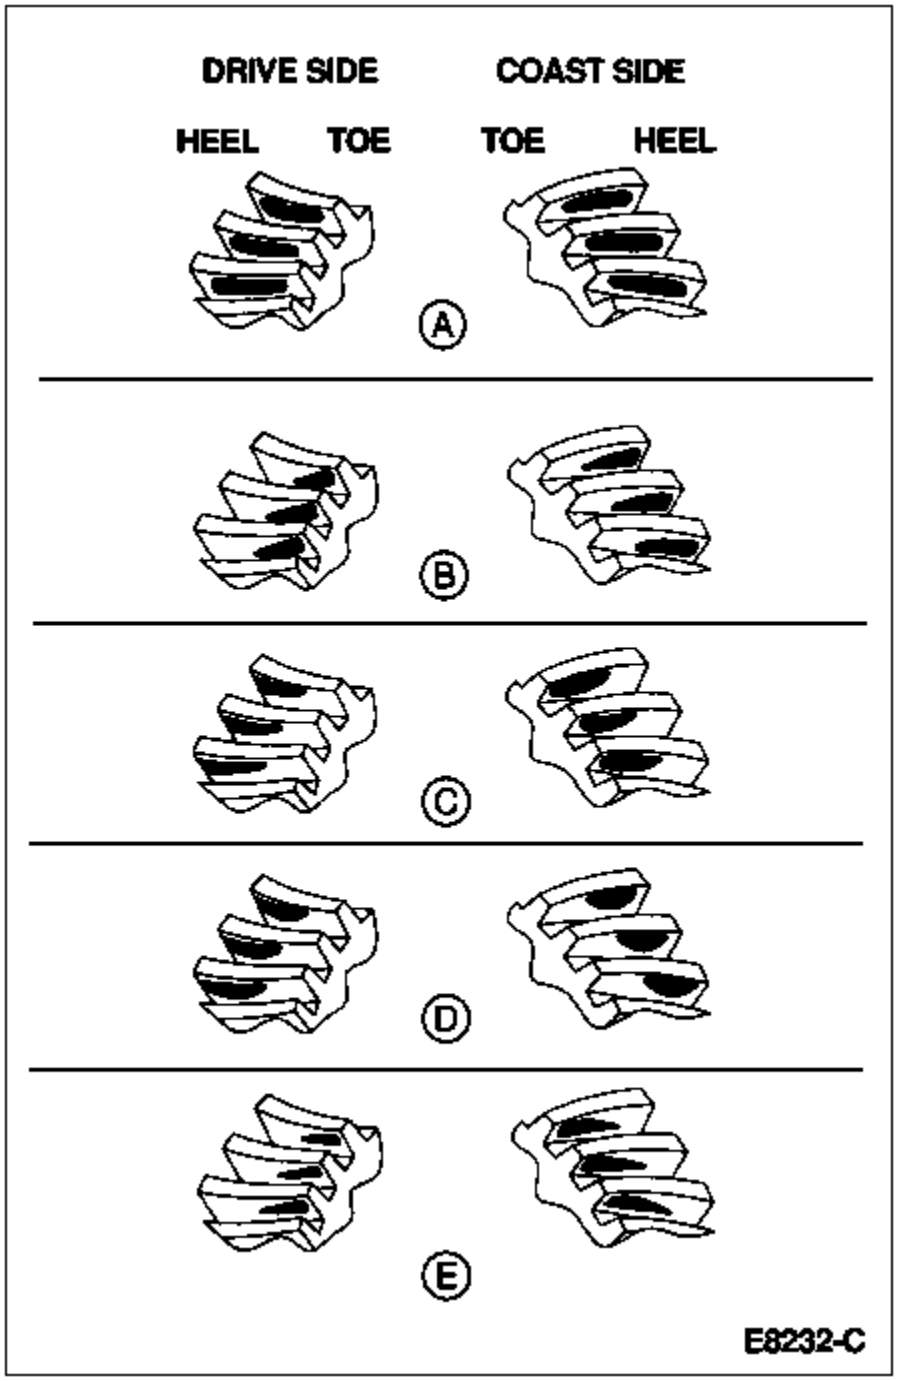
2. Rotate the ring gear (use a box wrench on the ring gear attaching bolts as a lever) several complete revolutions in both directions or until a clear tooth contact pattern is obtained.

3. Certain types of gear tooth contact patterns on the ring gear indicate incorrect adjustment. Incorrect adjustment can be corrected by readjusting the ring gear or the pinion.

4. The illustration shows acceptable tooth patterns for all axles. In general, desirable tooth patterns should have the following characteristics:

    a. The drive pattern should be fairly well centered on the tooth.
    b. The coast pattern should be fairly well centered on the tooth.
    c. Some clearance between the pattern and the top of the tooth is desirable.
    d. There should be no hard lines where the pressure is high.

    Contact Pattern Location



Item	Part Number	Description
A	—	Normal or Desirable Pattern (Part of 4209)
B	—	Backlash Correct. Thinner Pinion Position Shim Required (Part of 4209)
C	—	Backlash Correct. Thicker Pinion Position Shim Required (Part of 4209)
D	—	Pinion Position Shim Correct. Decrease Backlash

		(Part of 4209)
E	—	Pinion Position Shim Correct. Increase Backlash (Part of 4209)

Inspection Before Disassembly of Axle

Axle Backlash Check

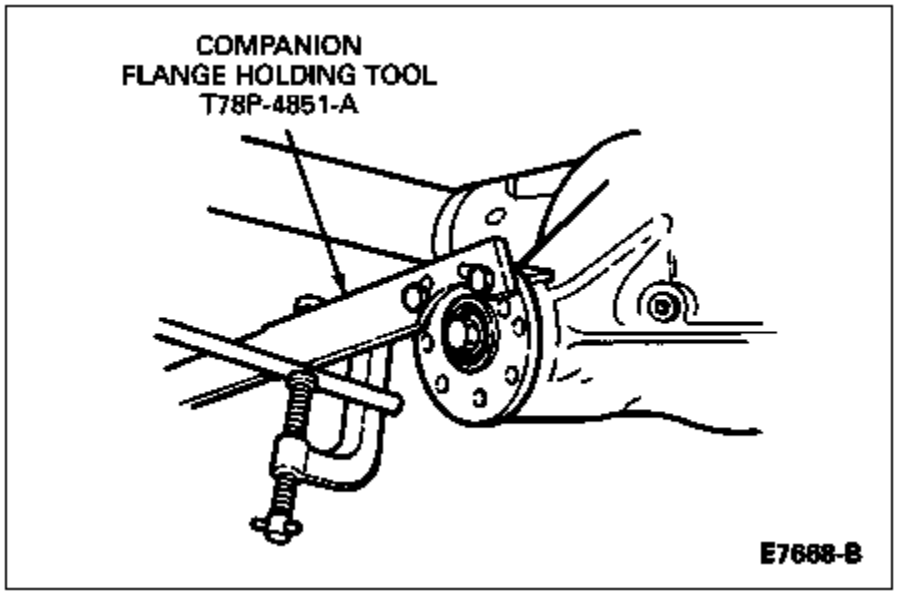
Clunk noise is due to backlash in the driveline, but not necessarily in the rear axle (4001). To determine whether driveline clunk is caused by the rear axle, make a check of the total axle backlash as follows.

1. **NOTE: Do not perform this procedure for limited slip axles. There is no effective way to check backlash on limited slip axles.**

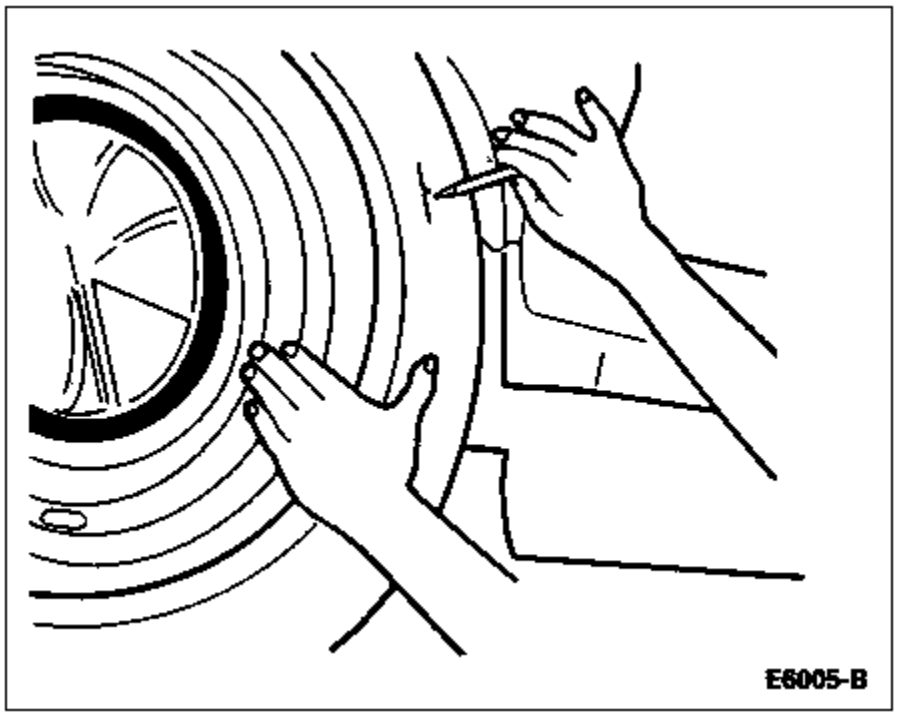
   Raise the vehicle on a frame or twin-post hoist so that the rear wheels are free.

2. Clamp a bar between the rear axle companion flange and a part of the frame or body so that the rear axle companion flange cannot move.

3. Lock the left rear wheel to keep it from turning.



4. Turn the right wheel slowly until you "feel" it in a drive condition. Hold a chalk marker on the side of the tire 304.8mm (12 inches) from the center of the wheel.



5. Turn the wheel the other way until you again feel the drive condition.

6. Measure the length of the chalk mark, which is the total axle backlash. **It should be 25.4mm (1 inch) or less.**

   If the backlash is within this limit, the clunk will not be eliminated by going into the axle.

7. Check for these conditions if the backlash is excessive:

   - Elongation of the differential pinion shaft holes in the differential case (4204).
   - Missing differential pinion thrust washer (4230) or differential side gear thrust washer (4228).
   - Galling of the differential pinion shaft (4211) and bore.

   If none of the above conditions show up, there may be a loose fit of the axle shafts (4234) to the side gear splines. You should continue as follows **until the correction is made.**

   - Install new differential side gear (4236) and recheck the backlash.
   - Install two new axle shafts.

Ring and Pinion Backlash Check

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Pinion Depth Gauge	T79P-4020-A

The differential case and drive pinion should be inspected before they are removed from the differential

carrier casting. These inspections can help find the cause of the concern and determine the correction needed.

1. Wipe the lubricant from the internal working parts and visually inspect the parts for wear or damage.

2. Rotate the gears to see if there is any roughness which would indicate worn or damaged bearings or gears.

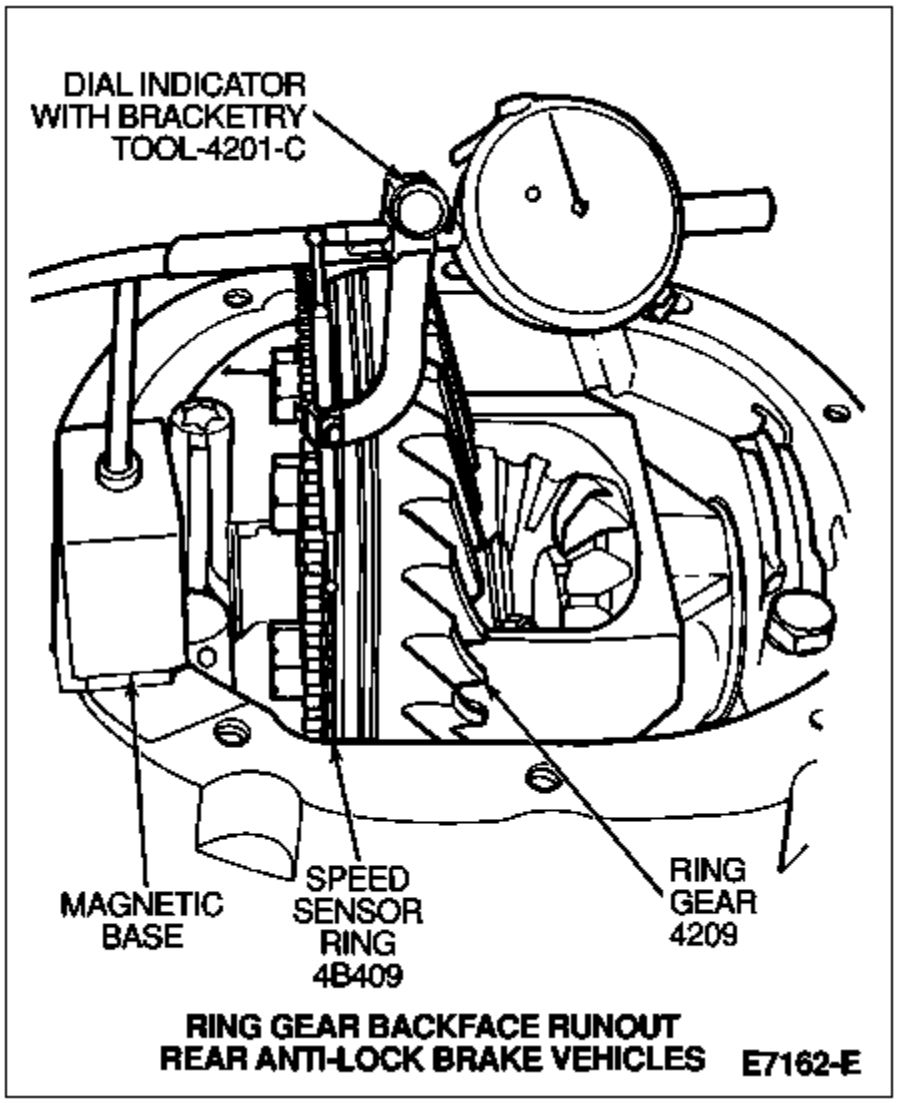
3. Check the ring gear and pinion teeth for signs of scoring, abnormal wear or nicks/chips.

4. **NOTE: On vehicles equipped with rear anti-lock brakes (RABS), mount Dial Indicator with Bracketry TOOL-4201-C or equivalent on the carrier so the tip of the dial indicator contacts the backface of the ring gear and pinion. There is a space provided between the anti-lock speed sensor ring and the ring gear and pinion for measuring ring gear and pinion backface runout.**

   Set up a dial indicator, and check ring gear and pinion backlash and ring gear and pinion backface runout.

5. **NOTE: Mount Dial Indicator with Bracketry TOOL-4201-C or equivalent on the carrier so the tip of the dial indicator contacts the backface of the ring gear (part of ring gear and pinion). There is a space provided between the anti-lock speed sensor ring and the ring gear from measuring ring gear backface runout.**

   Position dial indicator as shown and check ring gear backface runout.



RING GEAR BACKFACE RUNOUT
REAR ANTI-LOCK BRAKE VEHICLES E7162-E

Inspection After Disassembly of the Axle

Thoroughly clean all parts. The pinion seal is a synthetic rubber and must not be cleaned, soaked or washed in cleaning solvents. Always use clean solvent when cleaning bearings. Oil the bearings immediately after cleaning, to prevent rusting. Inspect the parts for wear or damage. If rust is present, remove with a wire brush mounted on a power drill or equivalent. Rinse clean with metal-prep solvent on sponge or rag to remove all particles. With a clean sponge, coat tube interior with Dupont 3012-5 Red Oxide Preparakote or equivalent. Allow to dry for a minimum of one hour.

When a scored ring gear and pinion is replaced, the axle housing should be washed thoroughly. Inspect individual parts as outlined below.

Gears

Examine the teeth of ring gear and pinion for scoring or excessive wear. Worn gears cannot be rebuilt to correct a noisy condition. Gear scoring is the result of excessive shock loading, vehicle loading, or the use of an incorrect lubricant all of which contribute to the loss of lubricating film between the two gears. Scored gears cannot be reused. Examine the teeth and thrust surfaces of the differential gears. Wear on the hub of the differential side gear can cause a chucking noise known as chuckle when the vehicle is driven at low speeds. Wear of splines, thrust surfaces, or thrust washers, can contribute to excessive driveline backlash.

Bearing Cups and Cone and Roller Assemblies

Check bearing cups for rings, scores, galling, or excessive wear. Pinion bearing cups must be solidly seated in the housing bores. Check for seating by attempting to insert a 0.04mm (0.0015-inch) feeler gauge between these cups and the bottoms of their bores.

When operated in the bearing cups, cone and roller assemblies must turn without roughness. Examine the large roller ends for wear. If the original blend radius has worn to a sharp edge, the bearing should be replaced.

If inspection reveals either a worn bearing cup or a worn cone and roller, both parts should be replaced to avoid damage.

Rear Brake Anti-Lock Sensor

Inspect the rear brake anti-lock sensor for loose metal particles, and clean if required. Note any indication of rear axle assembly (4006) lubricant leakage through core of rear brake anti-lock sensor or around perimeter. Replace as required.

Anti-Lock Speed Sensor Ring

Examine the anti-lock speed sensor ring to see that it is firmly pressed on to the differential case (4204) and check it for damaged (dented, chipped or missing) teeth that could result in erratic RABS performance. If damage is found, remove and replace anti-lock speed sensor ring.

Universal Joint Flange, Rear Axle

Be sure that the surfaces of the rear axle companion flange have not been damaged in removing the driveshaft (4602) or in removing the rear axle companion flange from the rear axle assembly. The end of the rear axle companion flange that contacts the front differential pinion bearing inner race or slinger washer, as

well as the flat surface of the pinion nut counterbore, must be smooth. Polish these surfaces if necessary. Note also the barrel of the rear axle companion flange for any damage which could permit the pinion seal to leak. Roughness aggravates backlash noises and causes wear of the rear axle companion flange and pinion nut, with a resultant loss in pinion bearing preload.

Differential Housing

Make sure that the differential bearing bores are smooth (if applicable). Remove any nicks or burrs from the mounting surfaces of the differential carrier housing.

Differential Case

Make sure that the hubs where the bearings mount are smooth. Carefully examine the differential case bearing shoulders, which may have been damaged when the bearings were removed. The bearings will fail if they do not seat firmly against the shoulders. Check the fit (free rotation) of the differential side gears in their counterbores.

NOTE: Care should be taken to prevent damage to the anti-lock speed sensor ring while handling and servicing the differential case.

Damper Assembly, Rear Axle

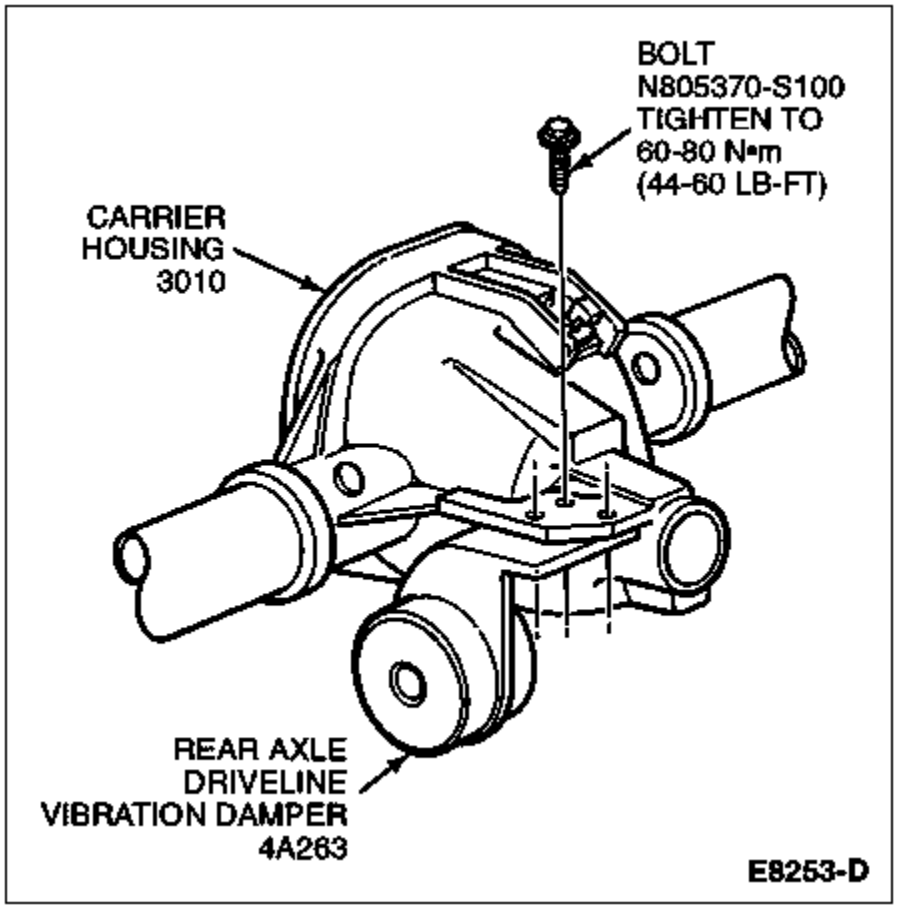
Aerostar

A rear axle drive line vibration damper (4A263) is located on the right side of the carrier. Use the following procedure for removal and installation.

Removal and Installation

1. Remove the bolts that attach the rear axle drive line vibration damper to the carrier. Discard bolts.
2. Remove damper assembly from carrier.

   For Installation, follow removal steps in reverse order. Tighten new rear axle driveline vibration damper bolts to 60-80 Nm (44-60 lb-ft).



Limited Slip Differential Parts

Inspect the differential clutch packs for uneven or extreme wear. The tanged clutch plates must be free from burrs, nicks or scratches which could cause excessive or erratic wear to the internally splined clutch plates. The internally splined clutch plates should be inspected for condition of the material, and wear. Replace the clutch plates if their thickness is less than 1.5mm (0.059 inch) or if the material is scored or badly worn. Inspect the clutch plate internal teeth for wear. Replace them, if excessive wear is evident.

Clutch plates should be replaced as a set only. Examine all thrust surfaces and hubs for wear. Abnormal wear on these surfaces can contribute to a noisy rear axle assembly (4006).

Wheel Bearing and Seal

Straight roller bearings are used in semi-floating rear axle assemblies, which are used in all light trucks under 8551 GVW. The bearing rides on the axle shaft (4234). The seal has internal lips running against the seal internal surface.

Full service procedures for these bearings and axle shaft oil seals (3254) are provided in Section 05-02A or Section 05-02B .

Axles

Certain rear axle assembly (4006) and driveline concern symptoms are also common to the engine (6007), transmission (7003), rear wheel bearing (1225), tires, and other parts of the vehicle. For this reason, be sure that the cause of the concern is in the rear axle assembly before adjusting, repairing or replacing any of the parts. Refer to Section 00-04 .

Coupling Shaft Angle Adjustment

Check coupling shaft angle (Ranger S/C only) and adjust to specification by shimming the driveshaft center bearing support (4800) or the transmission-to-rear crossmember mount.

To decrease the coupling shaft angle:

Shim the driveshaft center bearing support using flat shims until the specified coupling shaft angle is obtained. Plate stock must be used to maintain proper preload compression of the rubber insulator.

To increase the coupling shaft angle:

Place shims under the transmission-to-rear crossmember mount until the specified coupling shaft angle is obtained.

Driveline Angle Correction

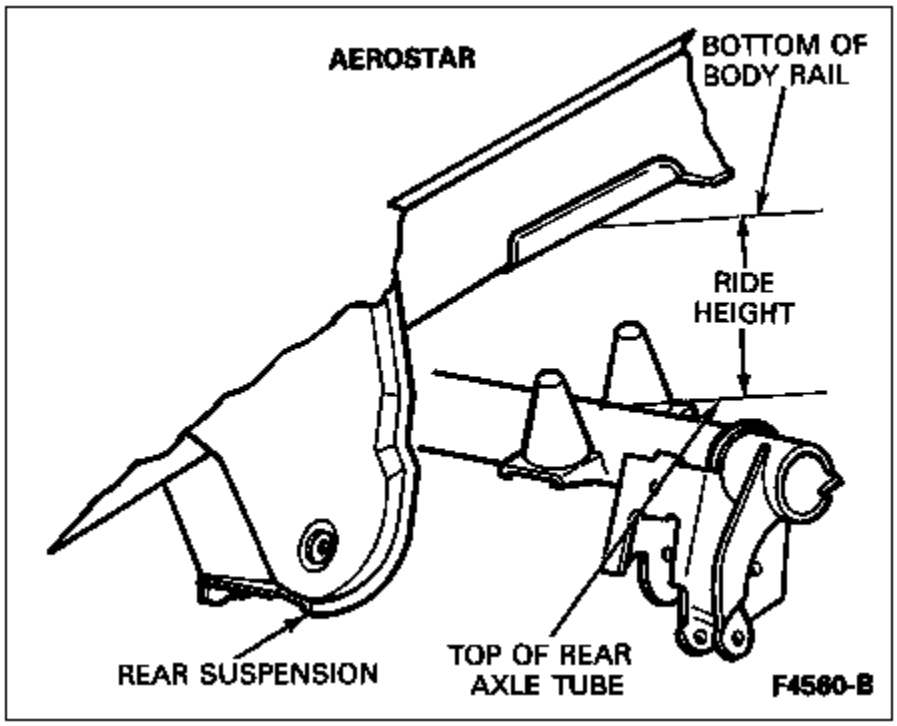
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Pinion Angle Level Gauge	T68P-4602-A

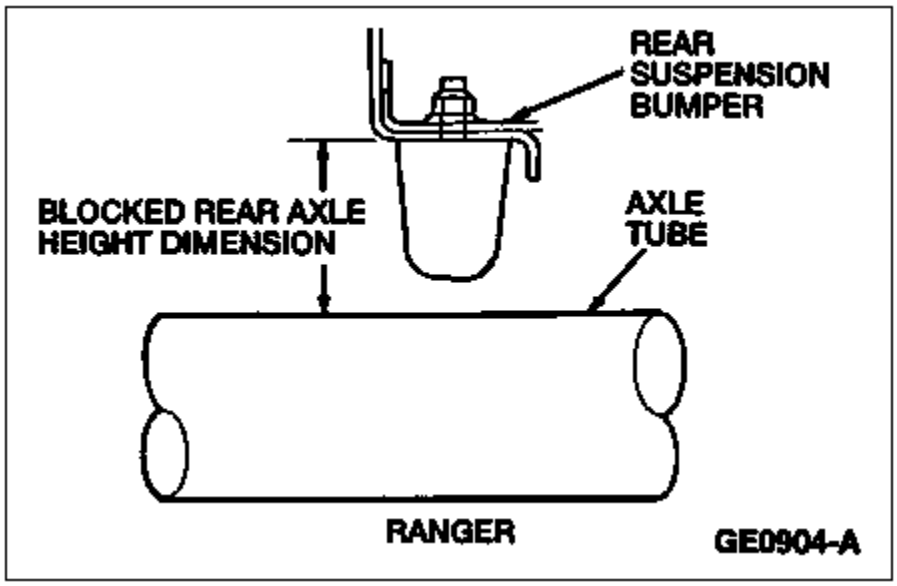
1. **NOTE: Driveline angles are given in relation to a 0-degree longitudinal (fore-aft) unibody frame rail angle and are specified for individual components. Refer to the Specifications portion of this section for the specified engine (6007), driveshaft (4602) and pinion angle.**

   Raise the vehicle on a drive-on type hoist or back onto a front-end alignment rack. Jounce the vehicle to normalize the suspension and make sure the suspension components are in the normal-load condition.

2. On Aerostar, measure the ride height between the top of the axle tube and the bottom of the unibody frame rail. The vehicle must be in the curb weight (unloaded) condition.



On Ranger measure the ride height between the top of the axle tube and the bottom of the frame rail. The vehicle must be in the curb weight (unloaded) condition.



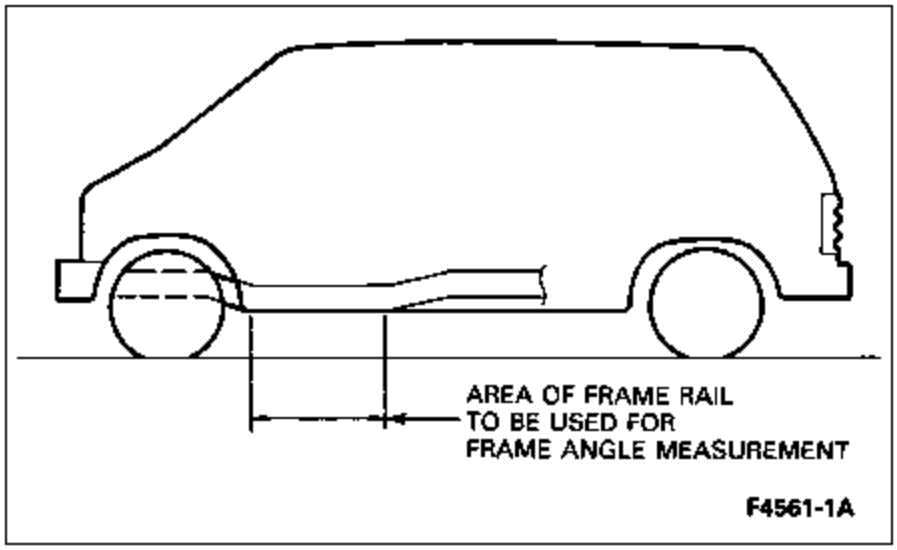
Find the recorded ride height in the Driveshaft Angle chart in the Specifications portion of this section. The specified driveshaft angles correspond to the measured ride height.

3. Check driveline angles with Pinion Angle Level Gauge T68P-4602-A as described in next step, or with an adjustable bubble (spirit level) protractor as described in Step 5.

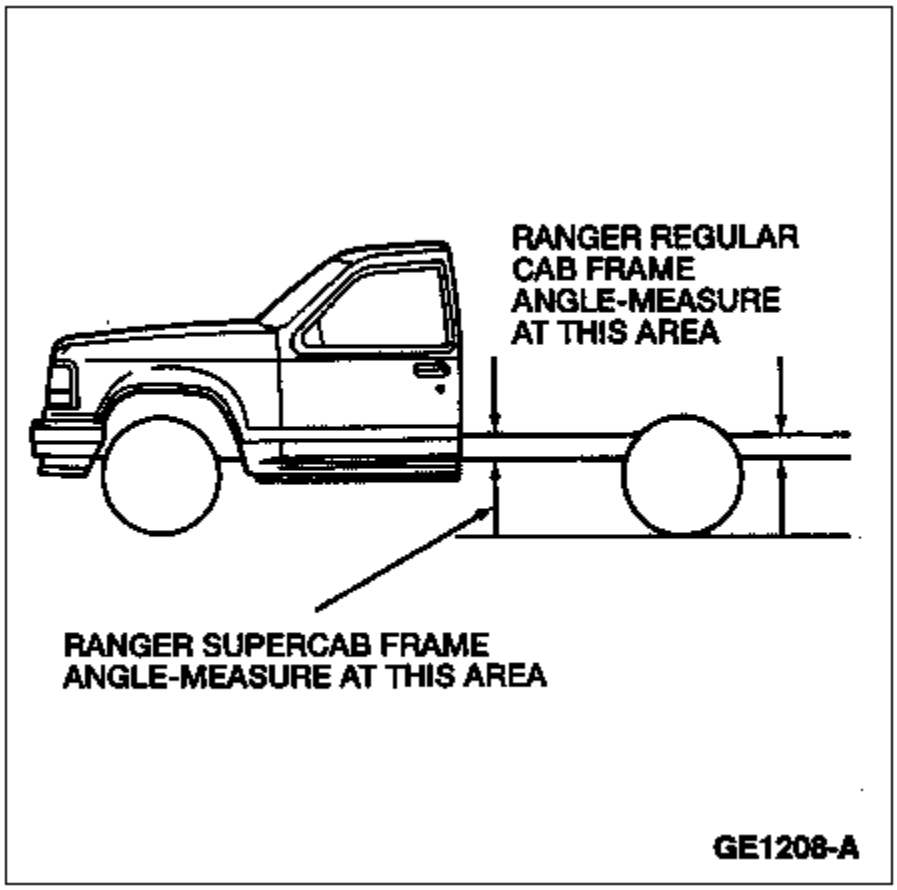
    - The protractor is used when the tool kit is not available or when the angles to be measured are more than 12 degrees.
    - All angles should be read within 1/2 degree with the tool or protractor held plumb on a clean, flat surface.

4. To check driveline angle with Pinion Angle Level Gauge T68P-4602-A:

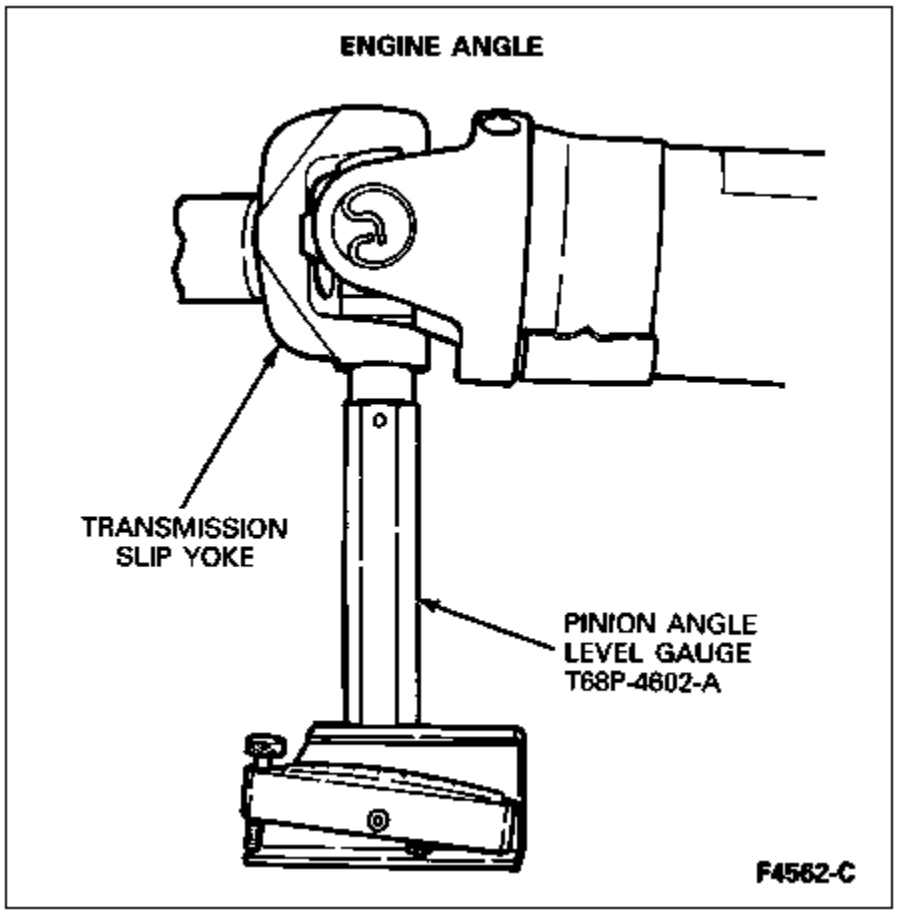
    - On Aerostar, place the vee magnet of the tool on the bottom of the vehicle unibody frame directly below the front drive/passenger seat.
    - On Ranger, place the vee magnet of the tool on the bottom of the vehicle frame directly behind the rear axle area.
    - On the Ranger SuperCab it is more accurate to measure the frame angle at the frame center bearing crossmember.
    - Calibrate the tool to a "zero" bubble reading. This gives the 0-degree frame reference angle. Take and average the readings from both sides to obtain a more accurate reading.



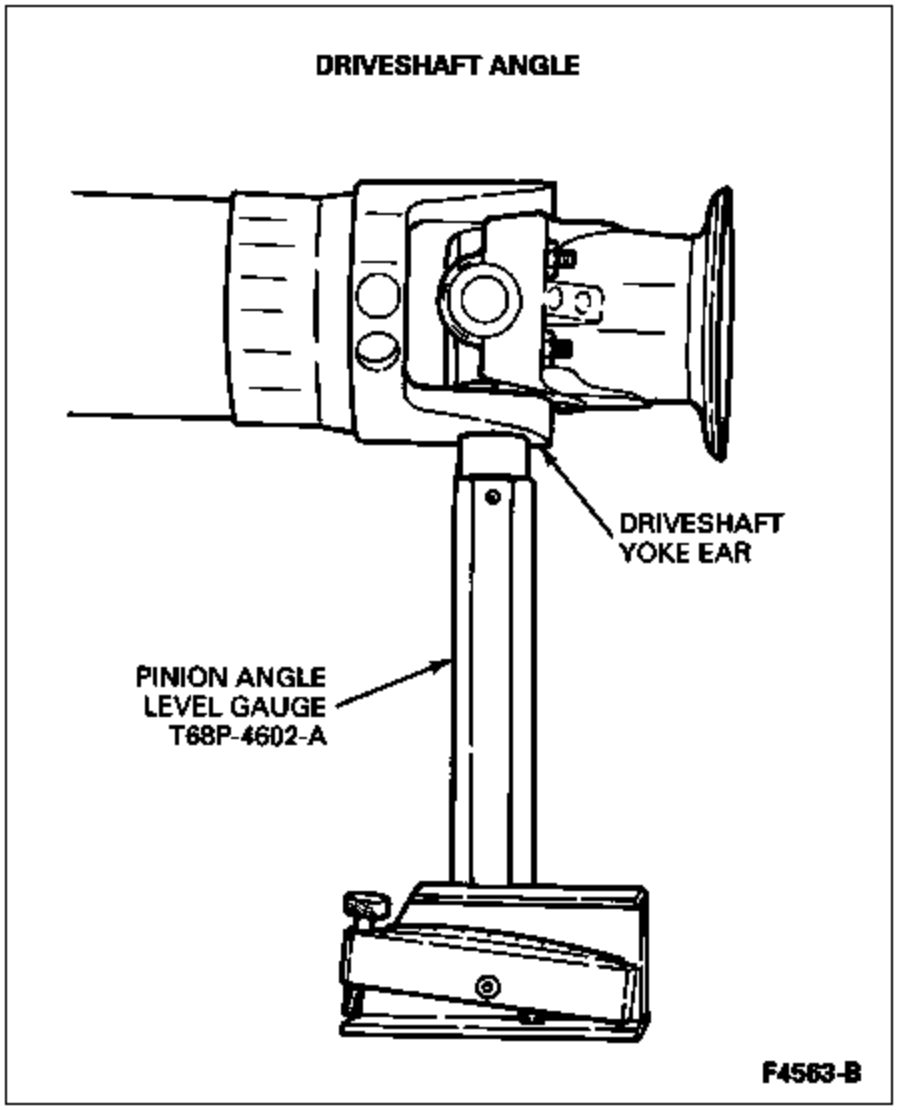
AREA OF FRAME RAIL
TO BE USED FOR
FRAME ANGLE MEASUREMENT
F4561-1A



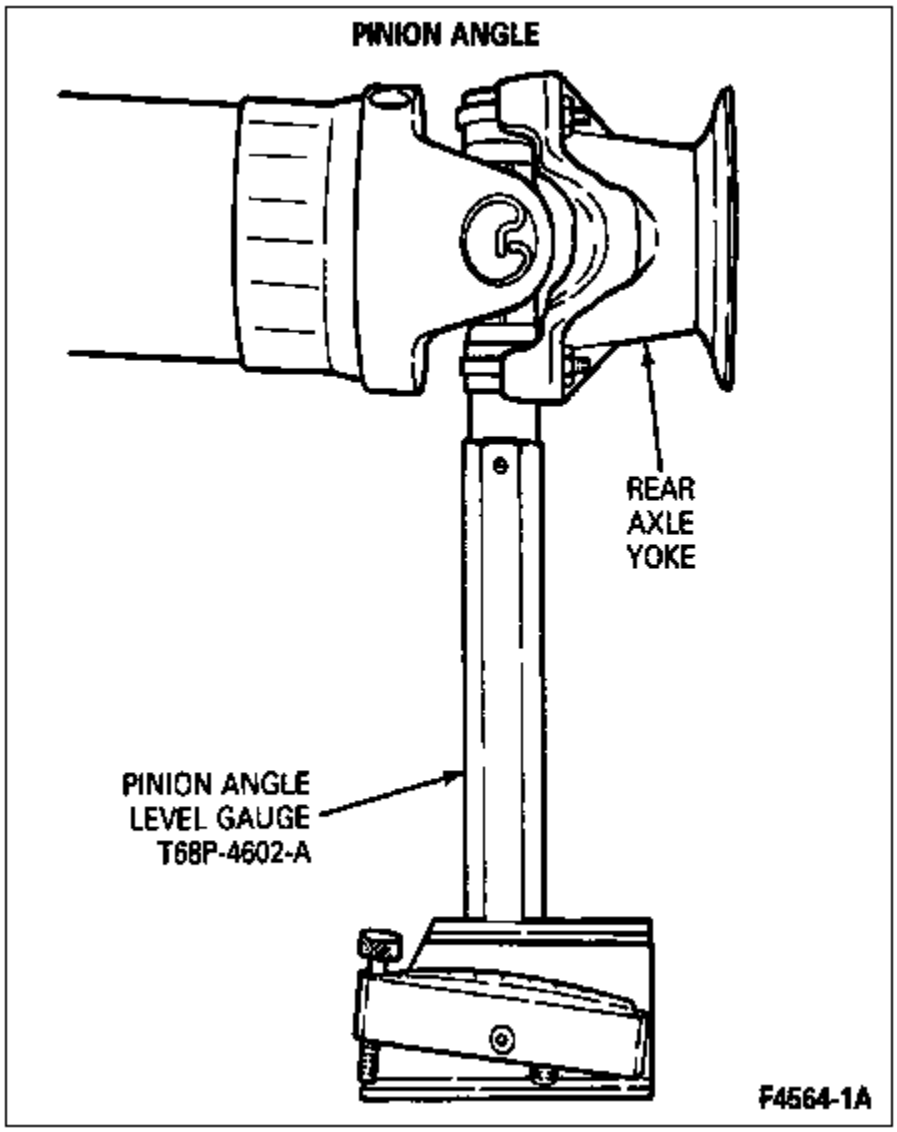
RANGER REGULAR
CAB FRAME
ANGLE-MEASURE
AT THIS AREA
RANGER SUPERCAB FRAME
ANGLE-MEASURE AT THIS AREA
GE1208-A



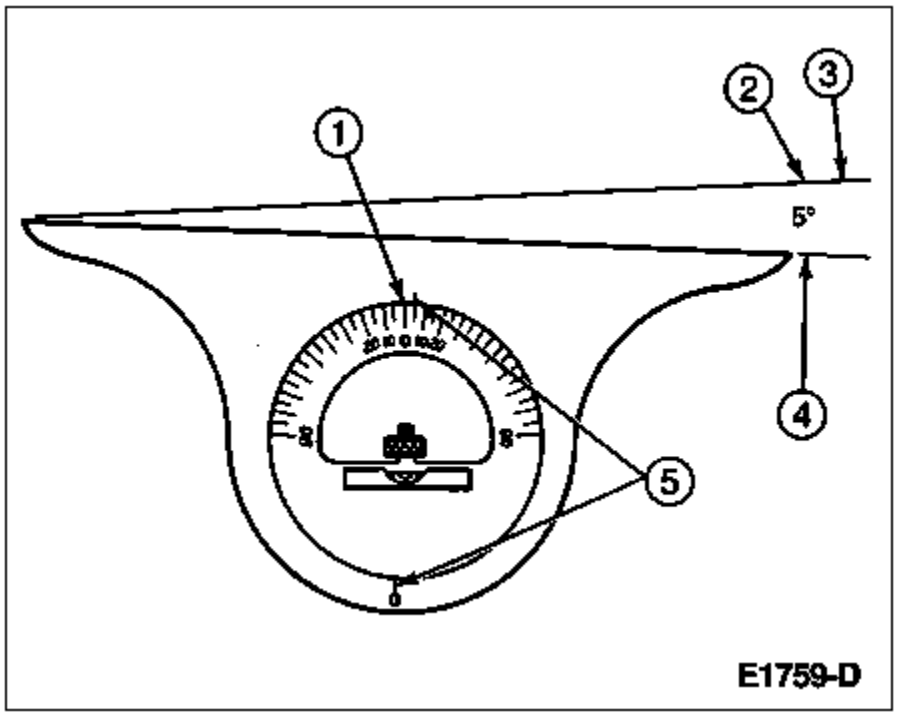
The angle of the component is measured by mounting the tool to the bearing cap of the U-joint which is mounted to the component. Engine angle is the same as the angle of the transmission/transfer case flange and measured by mounting the tool to the U-joint cap in the yoke.



DRIVESHAFT ANGLE
DRIVESHAFT
YOKE EAR
PINION ANGLE
LEVEL GAUGE
T68P-4602-A
F4563-B



Since the spirit level cannot be zeroed relative to the frame, the measured frame angle reading will have to be added/subtracted from the measured reading before comparing to specification.

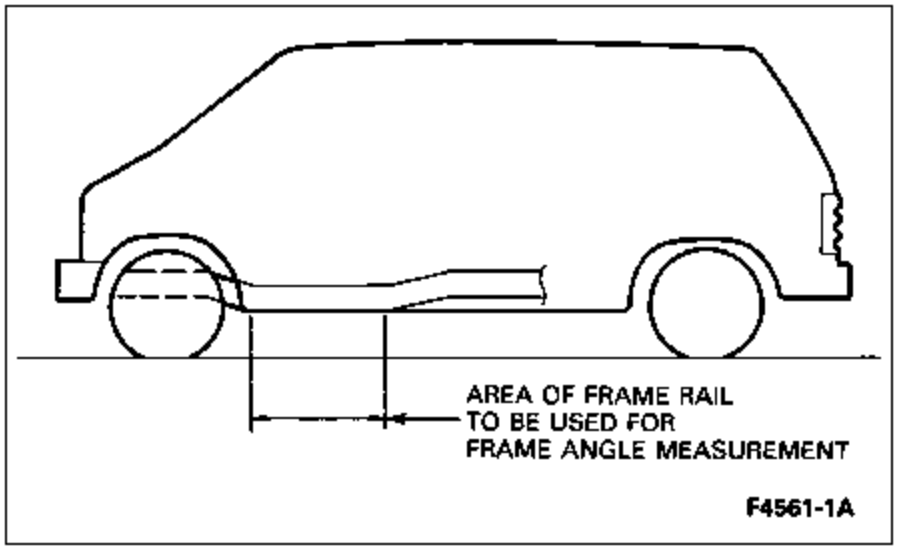


Item	Part Number	Description
1	—	Protractor Zero (0) Degree Mark
2	—	A Five (5) Degree Angle Is Read from the Zero (0) Degree Mark
3	5005	Frame
4	—	Component Angle
5	—	Protractor Indexing Marks

5. **NOTE: When using a bubble (spirit level) protractor, the angles are read from the 0-degree frame angle. When using the protractor in a vertical position, the 90-degree mark on the protractor is read as the 0-degree frame angle. For example, when the protractor is placed on the component and the protractor reads 85 degrees, the component angle is actually 5 degrees.**

   Driveline angle check with adjustable bubble (spirit level) protractor:

   - On Aerostar, place the protractor on the bottom of the vehicle unibody frame directly below the front driver/passenger seat.
   - On Ranger Regular Cab, place the protractor on the bottom of the vehicle frame directly behind the rear axle area.
   - On Ranger SuperCab, place the protractor on the bottom of the vehicle frame next to the center bearing crossmember attaching rivets. This gives the 0-degree frame angle. Take and average the readings from both sides to obtain a more accurate reading. Use this average measurement as a reference point to compare measured driveline angles.



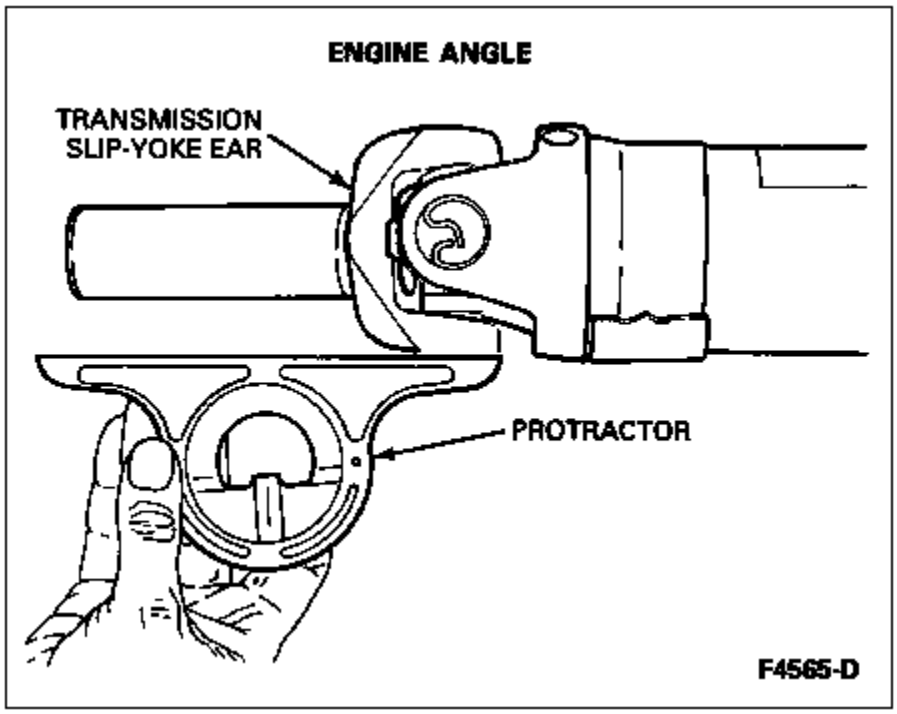
To check the engine angle, rotate the driveshaft until one transmission slip-yoke ear is parallel to the floor. Place the protractor so it is flush against the slip-yoke ear. Make sure the protractor is not resting against any portion of the driveshaft assembly. Record the angle reading. Adjust for frame angle.

- If the engine angle reading differs from the specified angle by 1 degree or more, proceed to Engine Angle Adjustment in this section and normalize the engine and transmission mounts. Refer to Diagnosis and Testing in this section.
- With the engine angle at specifications, check the driveshaft and pinion angles. Refer to Rear Driveshaft Angle Specifications at the end of this section.

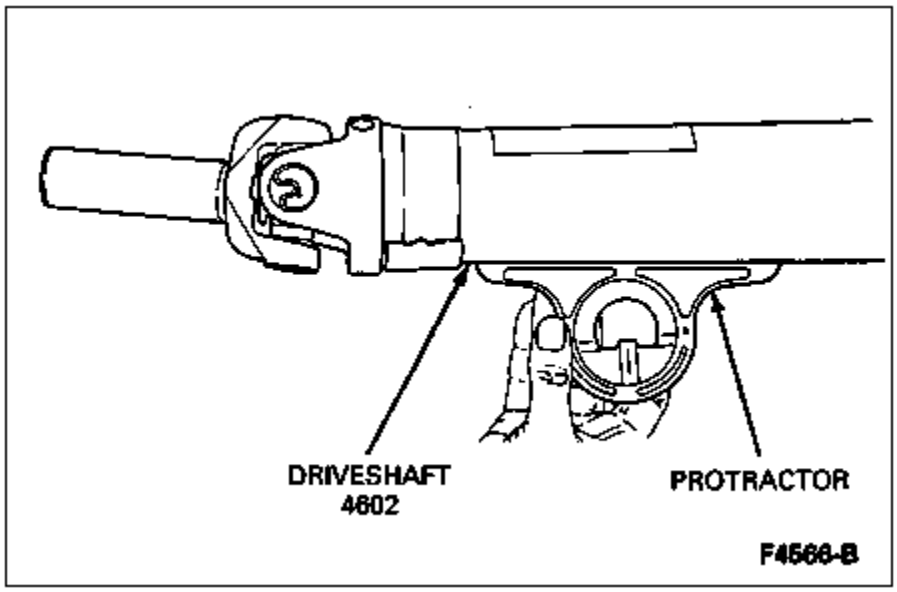
6. **NOTE: The engine angle can alternately be measured off the bottom of the starter motor (11001) if the transmission should obstruct the protractor.**

   To check the driveshaft angle, place the protractor on any portion of the driveshaft tube so the plane surface of the protractor is flush against the bottom surface of the tube and parallel to the floor.

   Record the reading. Adjust for frame angle. Check the pinion angle and if both or either reading is not to specifications, refer to Driveshaft and Pinion Angle Adjustment in this section.

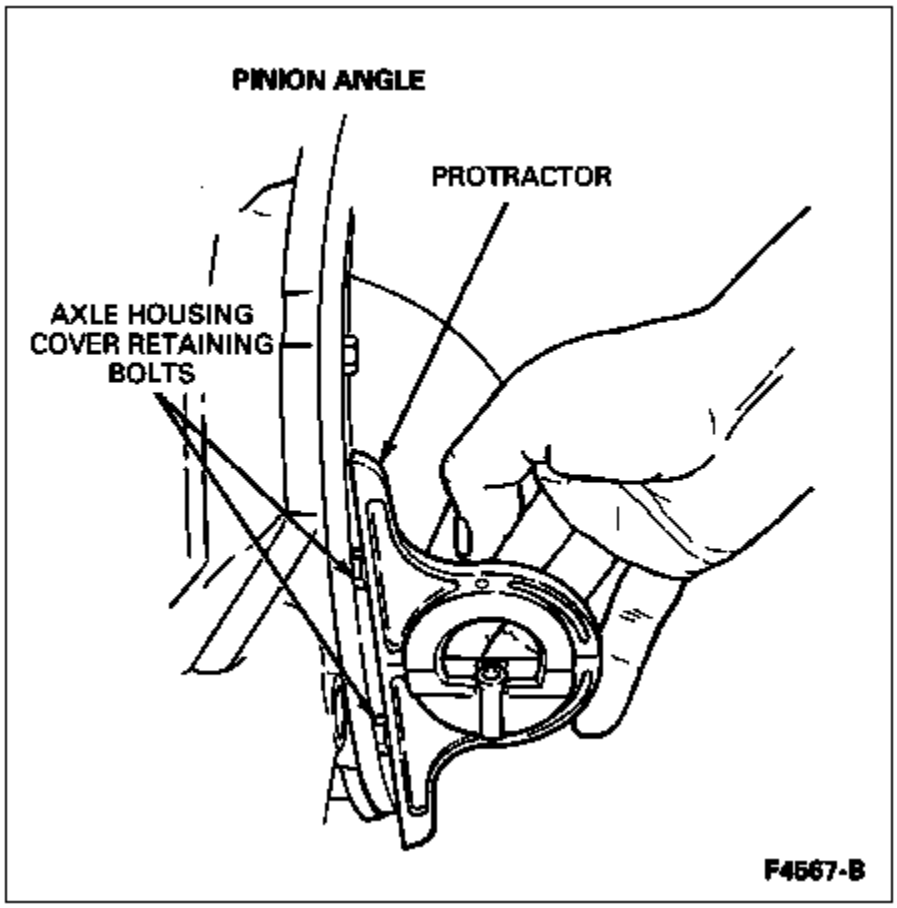


Measuring Driveshaft Angle



Pinion Axle Adjustments

To check the pinion angle, place the protractor in a vertical position so it is flush against two rear axle cover retaining bolts. Rotate the protractor bubble indicator so the 90-degree marks align with the indexing marks. Level the bubble to the level marking and read the protractor. For example, if the protractor indicates a reading of 85 degrees, the pinion angle reading is 5 degrees. Record the reading. Adjust for frame angle. If the reading is not to specifications, refer to Driveshaft and Pinion Angle Adjustment in this section.



Engine Angle Adjustments

The engine angle is adjusted by normalizing the engine mounts. The engine mounts are normalized by loosening the engine mount nuts to frame. Raise the engine up off the frame, then lower the engine and let it settle into place. Service any damaged mounts at this time. Tighten all fasteners to the specified torque. Recheck the engine angle, if the angle is still out of specification, place shims under the transmission-to-rear crossmember mount until the specified angle is obtained.

Driveshaft Runout and Balance

Vibration or shudder which is noticeable either on fast acceleration, when coasting, or when using the engine (6007) for braking, may be caused by the rear axle housing (4010) being loose on the rear suspension, improper tire balance, improper driveline installation, or driveline balance.

If driveshaft (4602) components are replaced and shaft vibration is encountered after installation, disconnect the driveshaft and remove the driveshaft. Rotate the rear axle companion flange 180 degrees; then, reconnect the driveshaft to the driveshaft slip yoke (4841) and reinstall in vehicle. If the vibration persists, disconnect the driveshaft at the rear axle companion flange. Rotate the rear axle companion flange 180 degrees and reconnect the driveshaft to the rear axle companion flange.

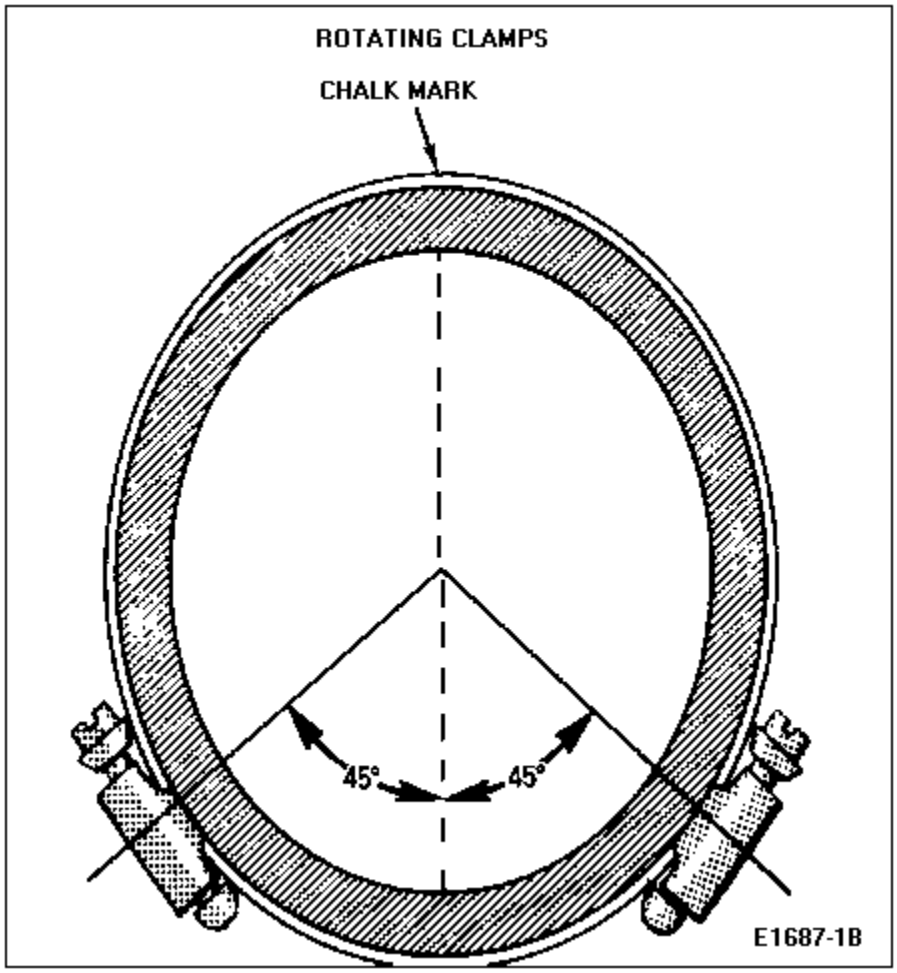
If rotating the driveshaft 180 degrees does not eliminate vibration, the driveshaft may be balanced, using the following procedure:

Driveshaft Balancing

1. Raise the vehicle on a twin-post hoist so that both the front and rear axles are safely supported with all wheels free to rotate.
2. Remove the rear wheels and tires. Reinstall lugnuts to retain brake drums or rotors.
3. With the transmission (7003) in gear, increase the vehicle speed to the maximum vibration level. Note and record the speed of this vibration period as a baseline speed.
4. With the transmission in gear, run the vehicle with the driveshaft rotating at a speedometer speed of 64-80 km/h (40-50 mph); have an assistant carefully bring a crayon, piece of chalk, or colored pencil up until it just barely contacts the rear end, center and front end of the driveshaft. The chalk marks will indicate the heavy side of the driveshaft. Use caution when checking the driveshaft near the balance weights to prevent injury to the hands.
5. Install two screw-type hose clamps on the driveshaft so that their heads are located 180 degrees from the chalk mark, starting at the pinion yoke end of the driveshaft. Tighten the clamps.
6. **CAUTION: To prevent overheating, do not run the vehicle on the hoist for an extended period.**

   Run the vehicle up to the baseline speed. If vibration is still evidenced, rotate the clamps approximately 45 degrees away from each other and test for correction of vibration.
7. If necessary, continue to rotate the clamps apart in smaller increments until the vibration is eliminated or begins to be reduced.
8. If the vibration is not completely eliminated, repeat the foregoing procedure and balance the front end of the driveshaft, checking for elimination or reduction in the vibration level.
9. Reinstall wheels and tires.

10. Remove the vehicle from the hoist and road test.

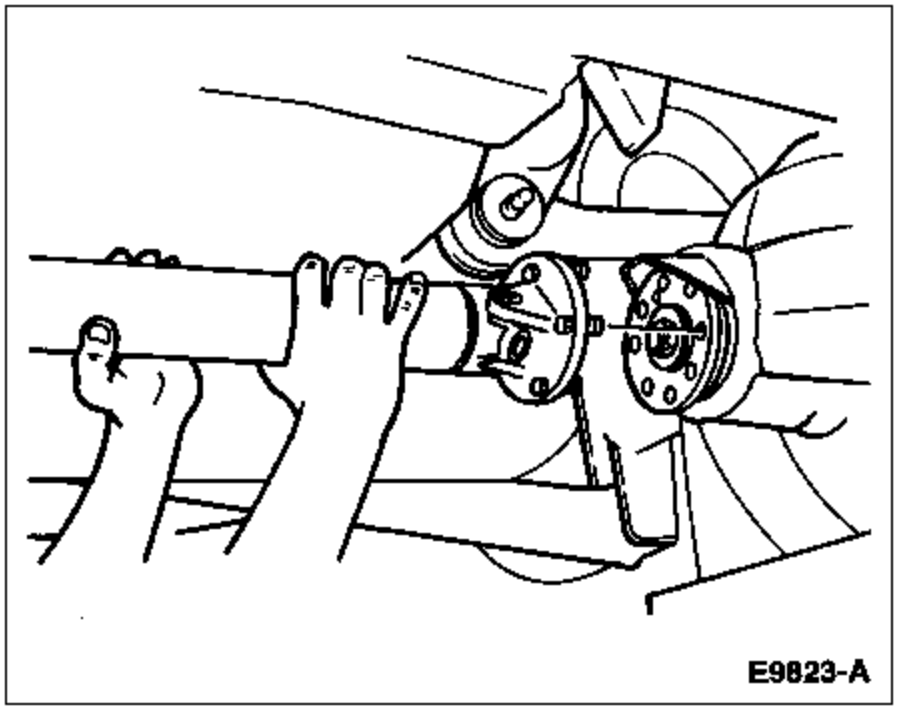


Alternate Procedure

1. Road Test — Evaluate and record road speed at which vibration occurs.

2. Raise vehicle on a frame contact hoist. Remove the wheels and tires. Reinstall lugnuts to retain drums or rotors. Re-evaluate by starting the engine, engaging the transmission and accelerating to the indicated speeds at which the vibration was most severe during the road test. Suspending the rear axle assembly (4006) makes the driveline more sensitive to vibration.

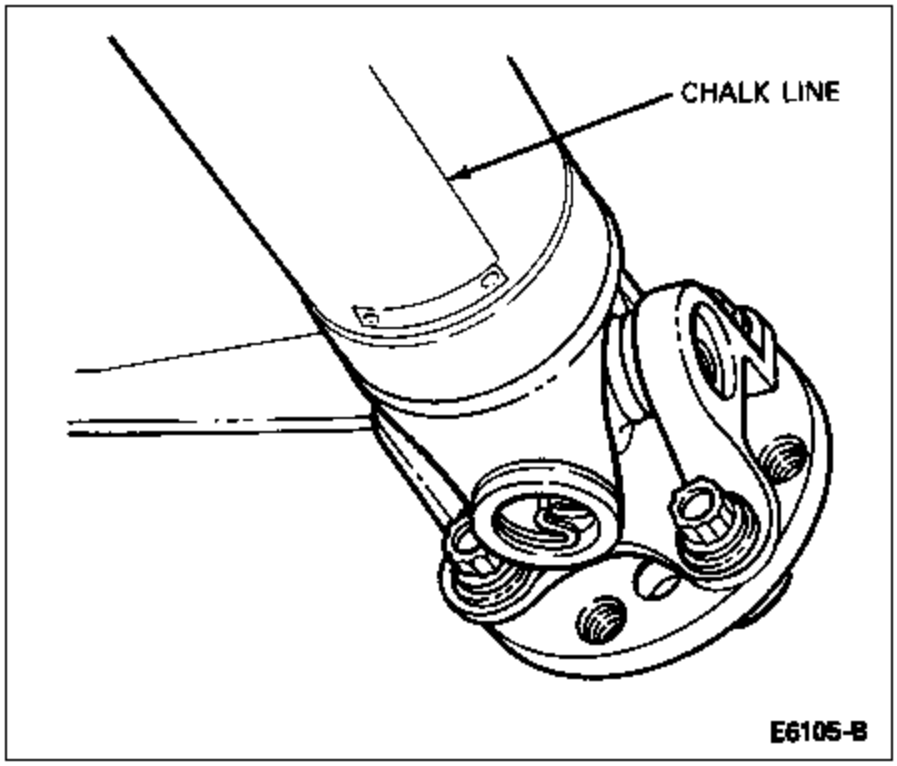
3. Disconnect the driveshaft from the rear axle companion flange. Rotate the driveshaft 180 degrees from its original position and reinstall. Repeat evaluation per Step 2 above.



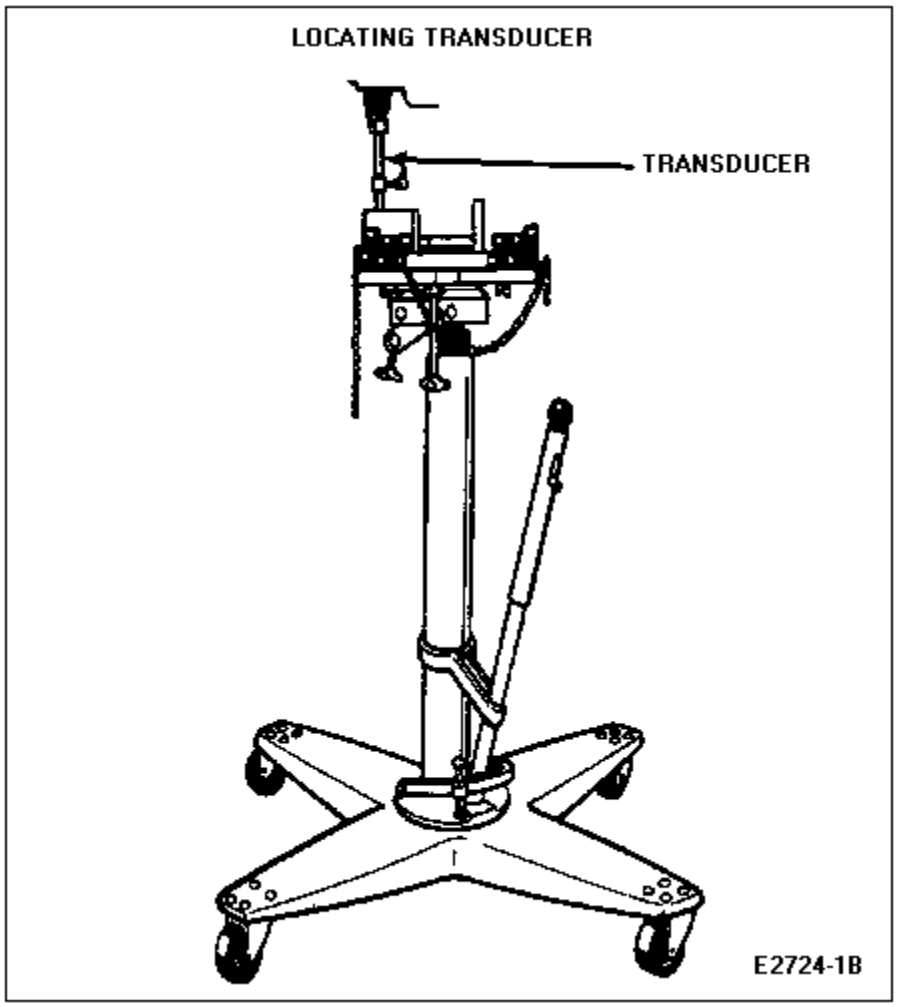
In some cases, rotating the driveshaft 180 degrees may decrease the vibration to an acceptable level. However, if the vibration level is increased, install the driveshaft in its original position and then index in 45-degree increments to fine tune the balance of the driveline system. If the vibration level does not decrease to an acceptable level, proceed to Step 4.

4. A vehicle is more sensitive to excessive imbalance or runout at the rearward end of the driveshaft, therefore, locate the heavy side of the driveshaft by the use of the strobe light and transducer, as follows:

   Scribe an axial chalk line (at any radial location) approximately 101.6mm (4 inches) long at the rear of the driveshaft. Locate the transducer on the bottom side of the carrier, and secure it in place. Run the engine and driveline at the worst vibration speed noted and visually note the position of the chalk line by use of the strobe light. This provides a starting point for the initial location of the clamps.

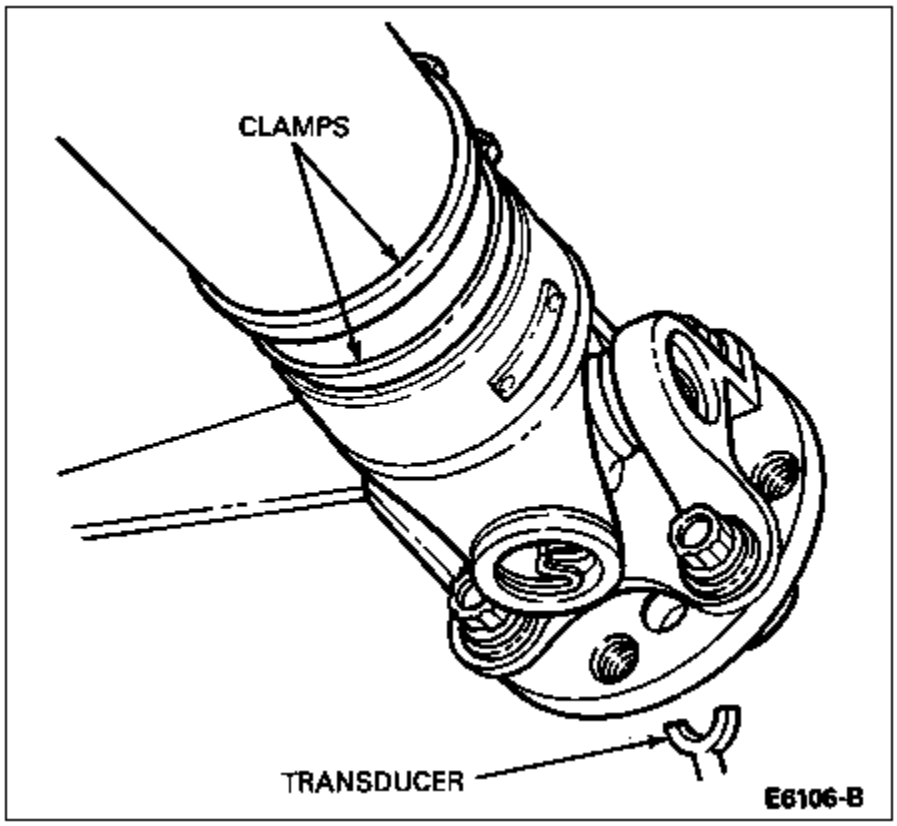


CHALK LINE
E6105-B



5. Stop the engine and rotate the driveshaft so that the chalk line is in the same location as it was noted under the strobe light.

6. Install two (stainless steel) hose clamps on the driveshaft. Position the clamp heads 180 degrees from the transducer and tighten the clamps.



7. **CAUTION: Do not run the engine with the transmission engaged on the hoist for extended periods due to the danger of overheating the engine or transmission.**

   Run the engine and driveline through the speed range. If no vibration is felt, remove the lugnuts, install the wheels and tires and reinstall the lugnuts in the correct position and proceed to Step 9. However, if any vibration still exists, the combined weight of the two hose clamp heads may be in excess. To reduce this excess weight, rotate the clamp heads away from each other approximately 15 degrees (one each way from the original position). Run the engine and driveline and note if the vibration has been reduced.

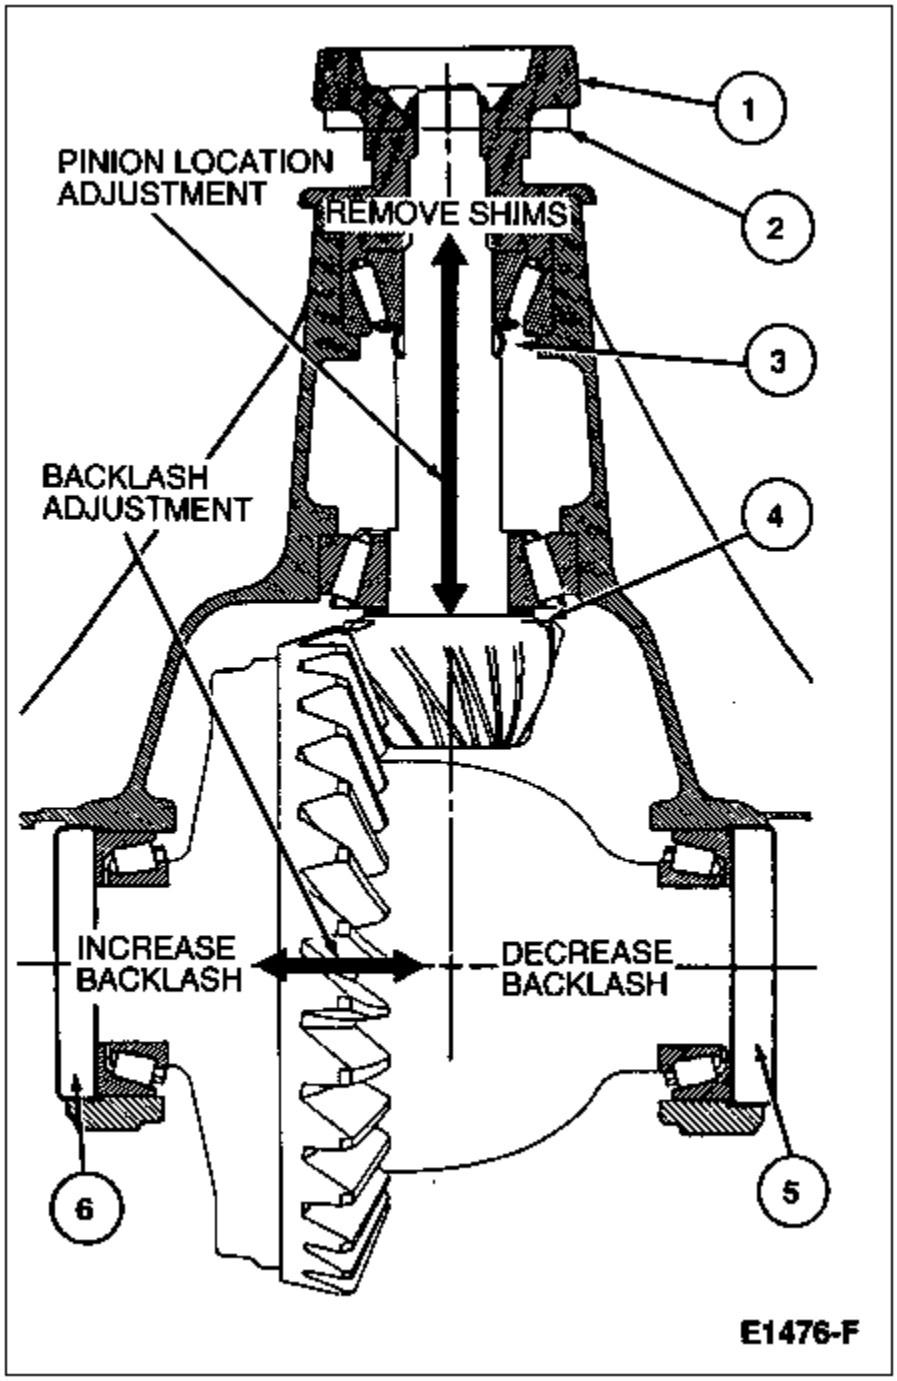
8. Continue to rotate the clamp heads apart in smaller angular increments until the vehicle feel of balance (vibration) is best. At this point, install the wheels and tires per Step 7 and road test the vehicle to determine the actual degree of improvement. If satisfactory improvement has been obtained, proceed with Step 9. If no improvement has been obtained, the clamps must be removed and diagnosis should be redirected to other areas, such as wheels, tires, driveline angle, and rear axle companion flange runout. For additional information, refer to Diagnosis and Testing in this section.

9. When the vehicle has been corrected to a satisfactory level, as determined by a road test evaluation, tighten the clamps securely. Clean thoroughly with lacquer thinner, and spray the clamps with a commercially available black paint for a finished appearance.

Pinion and Ring Gear Adjustment

Two separate adjustments affect pinion and ring gear tooth contact. They are pinion location and backlash.

Individual differences in matching the rear axle housing (4010) and the differential pinion bearings (4630) require the use of shims to locate the pinion for correct contact with the ring gear. Refer to Section 05-02A for shim selection procedures.



Item	Part Number	Description
1	4851	Rear Axle Universal Joint Flange
2	4859	Drive Pinion Oil Seal Deflector
3	4662	Differential Drive Pinion Bearing Spacer
4	4663	Drive Pinion Bearing Adjustment Shim
5	4067	Differential Bearing Shim
6	4067	Differential Bearing Shim

Slip-Yoke Spline

Vehicle noise and vibration can be caused by a seized driveshaft slip yoke (4841) spline. The service resolution to minimize driveshaft slip-yoke spline contamination and ultimate seizure is as follows:

1. Scribe alignment marks between the driveshaft (4602) and rear axle to ensure proper alignment.

2. On vehicles with 4x4 systems, disconnect the driveshaft from the transfer case. On Ranger SuperCab vehicles, remove the two bolts securing the center bearing to the center bearing crossmember. Remove the driveshaft from the vehicle.

3. On vehicles with 4x4 systems and Ranger SuperCab vehicles, scribe alignment marks between the slip-yoke and the driveshaft tube before removing the slip spline boot. Check boot for cracks or tears and replace if necessary.

4. Clean the male slip splines. Some slip splines have a blue plastic coating. Take care not to damage this coating. Fine abrasive cloth may be required to dress and polish the male spline. Remove all hardened grease deposits, dirt or rust. Inspect for worn or galled splines. The plastic coating, if installed, must not be removed. Replace driveshaft if necessary.

5. Clean and inspect the female splines of the driveshaft slip-yoke, removing any hardened grease deposits, dirt or rust. Inspect splines for worn or galled conditions. Replace driveshaft if necessary.

6. Apply a coating of Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B to the entire male slip splines prior to assembling of the driveshaft.

7. Using a clean long handle (stencil-type) brush, apply Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B spread evenly on all the female splines of the slip-yoke.

8. Reassemble the driveshaft, taking care to realign the driveshaft with the marks scribed in Step 3 to ensure proper universal joint phasing. The spline joint must slide freely by hand. Install new driveshaft slip-yoke boot clamps.

9. On 4x2 vehicles, insert the slip-yoke into the end of the transmission housing. On 4x4 vehicles, attach the driveshaft flange to the transfer case output flange. Support the rear end of the driveshaft. Never allow the driveshaft to hang unsupported from one end.

10. Attach the driveshaft to the rear axle, taking care to realign the driveshaft and the rear axle circular flange using the scribe marks from Step 1. On Ranger SuperCab vehicles, align the center bearing bracket, and attach the center bearing bracket to the crossmember.

11. Torque all bolts to the torques specified at the end of this section.

Axle Lubrication, Rear

The ability of any rear axle assembly (4006) to deliver quiet, trouble-free operation over a period of years is largely dependent upon the use of good quality gear lubricants. To make sure gears and bearings will last as long as possible, use only specified hypoid gear lubricants.

Rear Axle lube quantities must be replaced every 160,000 km (100,000 miles) or if the axle has been submerged in water. Otherwise, the lube should not be checked or changed unless a leak is suspected or repair required. High Performance Rear Axle Lubricant XY-80W90-QL or equivalent meeting Ford specification WSP-M2C197-A is available for repairs and refills in situations that fall into the severe or extreme use categories. Refer to maintenance schedules, in Section 00-03.

Draining and Filling

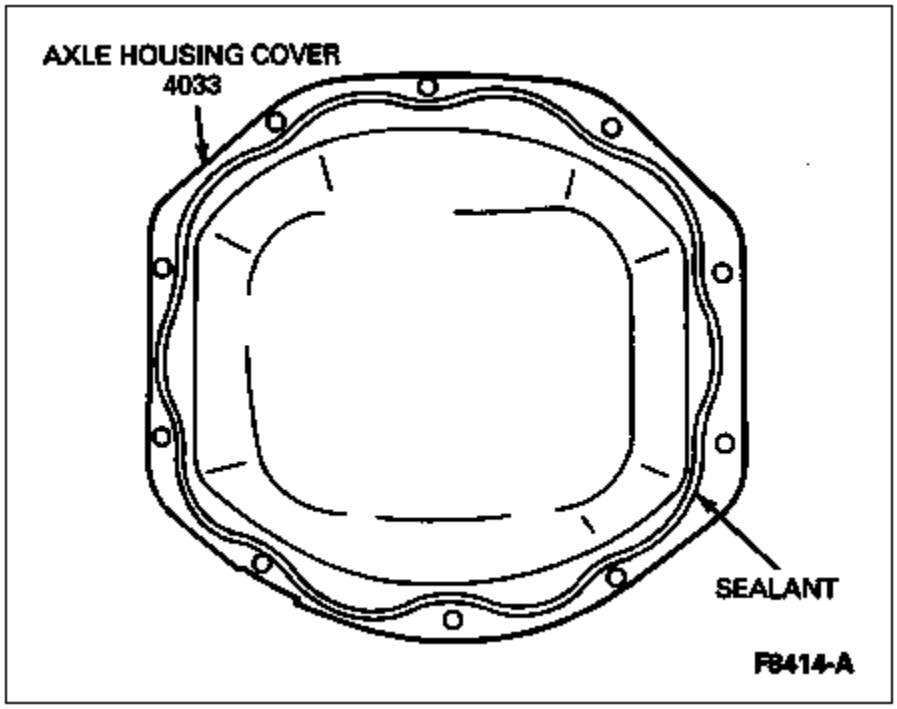
Draining

1. Raise vehicle. Refer to Section 00-02 .
2. Clean all dirt from area of axle housing cover.
3. Drain rear axle lubricant by removing axle housing cover.

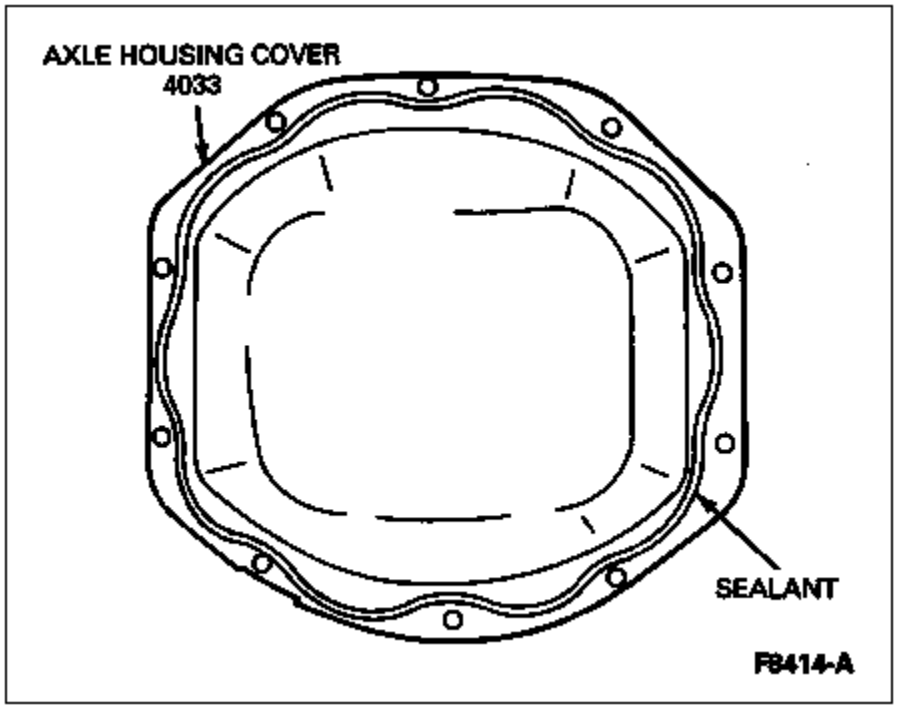
Filling

CAUTION: Make sure machined surfaces on both cover and carrier are clean before installing the new silicone sealant. Inside of axle must be covered when cleaning the machined surface to prevent axle contamination. Tighten the cover bolts in a crosswise pattern to ensure uniform draw on cover.

NOTE: Cover assembly must be installed within 15 minutes of application of the silicone rubber or new silicone rubber must be applied.



1. Apply Silicone Rubber D6AZ-19562-AA or BA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A. Install axle housing cover and tighten retaining bolts to 28-38 Nm (21-28 lb-ft).



2. Add Motorcraft Rear Axle Lubricant XY-80W90-QL or KL or equivalent meeting Ford specification WSP-M2C197-A until it is 6.14mm (1/4-9/16 inch) below bottom of fill hole. Add 118.3 ml (4 oz.) of Ford Additive Friction Modifier C8AZ-19B546-A or equivalent meeting Ford specification EST-M2C118-A to Traction-Lok® axles. Install fill plug and tighten to 20-41 Nm (15-30 lb-ft).

Driveshaft — Aerostar

Driveshaft, Front, Ranger 4x4

Removal

1. **NOTE: All driveshafts are balanced. Mark the driveshaft in relation to the rear universal joint yoke and transfer case yoke so that it may be installed in the original position.**

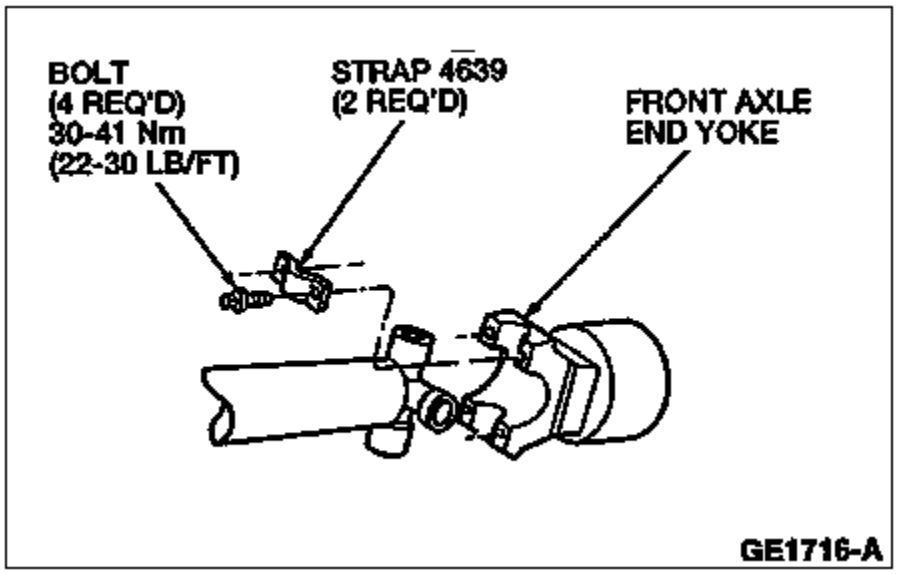
   Remove the bolts retaining the driveshaft to the transfer case (7A195).

2. Remove the bolts and straps retaining the driveshaft to the front axle.

3. Remove shaft from vehicle.

Installation

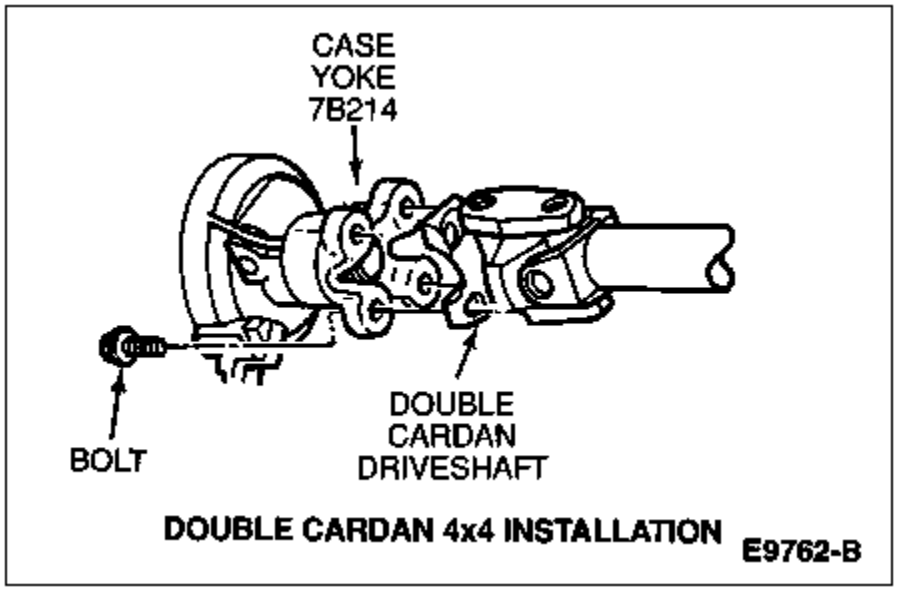
1. Install the front universal joint into the front axle yoke. Support the driveshaft during installation. DO NOT ALLOW THE DRIVESHAFT TO HANG FREE.



2. Install the straps and bolts that retain the driveshaft to the front axle yoke. Tighten the bolts to 30-41 Nm (22-30 lb-ft).

3. Position the rear of the driveshaft to the transfer case yoke. Install the bolts. Tighten the bolts to 88-119 Nm (65-87 lb-ft).

tomsn048@gmail.com



DOUBLE CARDAN 4x4 INSTALLATION E9762-B

tomsn048@gmail.com

Driveshaft, Front, Aerostar E-4WD

Removal

1. **NOTE: All driveshafts are balanced. Mark the driveshaft in relation to the front universal joint yoke and transfer case output so that it may be installed in the original position.**

   Scribe alignment marks on the driveshaft tube and transfer case output shaft.

2. Remove the driveshaft slip-yoke boot clamp at the transfer case with end cutter pliers and discard the driveshaft slip-yoke boot clamp.

3. Remove the bolts retaining the driveshaft to the front axle companion flange.

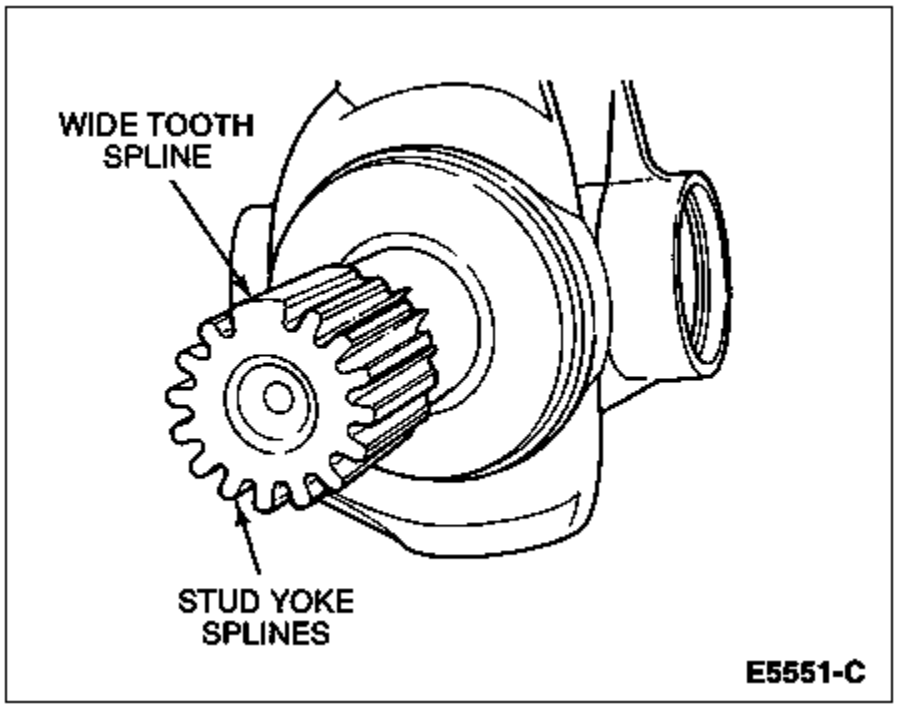
4. Remove the shaft from vehicle.

Installation

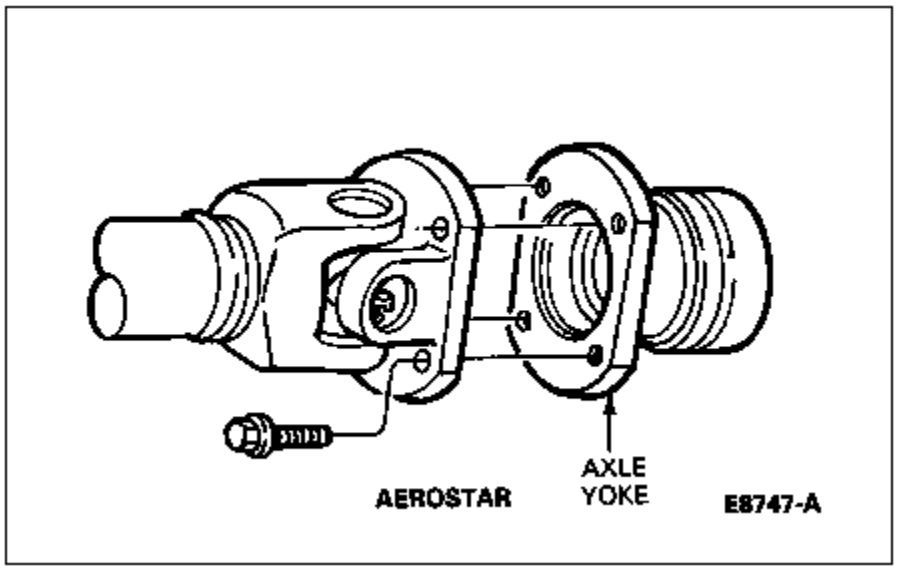
1. Apply a light coating of Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B to the yoke splines.

2. Slide the driveshaft into the transfer case output slip splines. Make sure the yellow dot on the driveshaft tube aligns within the radial zone of yellow tape on the transfer case (or that the scribe marks in Step 1 of the removal process are aligned). Note that the driveshaft stud yoke splines have a single wide tooth, which must be aligned with one of the two wide gaps in the transfer case output slip splines. Pull the driveshaft slip-yoke boot onto its mating surface and install the slip-yoke boot clamp on the driveshaft slip-yoke boot with an appropriate tool.

tomsn048@gmail.com



3. Install the driveshaft to the front axle flange. Tighten the bolts to 30-41 Nm (22-30 lb-ft).



tomsn048@gmail.com

tomsn048@gmail.com

Slip-at-Transmission Driveshafts, Aerostar 4x2, SWB/LWB Ranger 4x2

Removal

1. **NOTE: All driveshafts are balanced. Mark the driveshaft in relation to the rear universal joint yoke and the rear axle circular flange so that it may be installed in the original position.**

   To maintain driveline balance, locate original paint mark on rear axle companion flange and mark driveshaft flange yoke (4866) in the same location. If original mark is not visible on rear axle companion flange, mark both the rear axle companion flange and driveshaft flange yoke at any location.

2. **CAUTION: Do not allow driveshaft to hang free. Support the driveshaft during removal procedures.**

   Remove the bolts retaining the driveshaft to the rear axle circular flange.

3. Disconnect the driveshaft from the rear axle companion flange. Pull the driveshaft toward the rear of the vehicle until the driveshaft slip yoke (4841) clears the extension housing (7A039) and seal. Install the appropriate plug in the extension housing to prevent lubricant leakage.

Installation

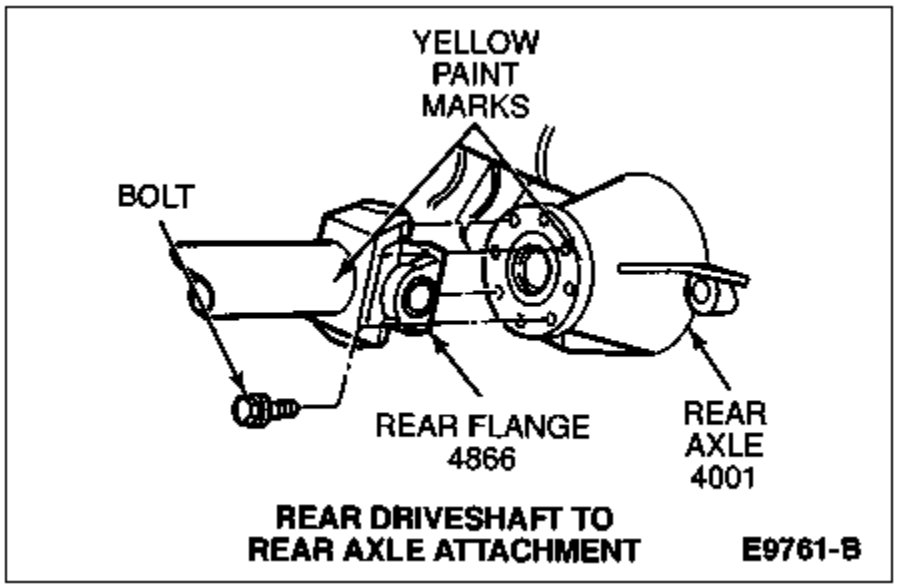
1. Lubricate the driveshaft slip-yoke splines with Premium Long-Life grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B. Remove the plug from the transmission extension housing. Inspect the housing seal for damage; replace if required. Slide the driveshaft slip-yoke into the output extension housing of the transmission. Do not allow the driveshaft slip-yoke to bottom out on the output shaft with excessive force.

2. **NOTE: When installing a new service driveshaft, align the factory-made yellow paint mark at the rear of the driveshaft tube with the factory-made yellow paint mark on the rear axle companion flange.**

   Position the driveshaft so that the index mark on the rear yoke (or yellow dot on driveshaft tube) is in line with the index mark on the rear axle companion flange. This ensures original driveline balance. If a vibration exists after installation, refer to Section 00-04.

3. Install the bolts that retain the driveshaft to the rear axle companion flange. Tighten the bolts to 95-129 Nm (70-95 lb-ft).

tomsn048@gmail.com



tomsn048@gmail.com

Slip-Between-Center Driveshafts with Double Cardan Joint at the Transfer Case, SWB Ranger 4x4

Removal

1. **NOTE: All driveshafts are balanced. Mark the driveshaft in relation to the rear universal joint yoke and the rear axle circular flange so that it may be installed in the original position.**

   To maintain driveline balance, locate original paint mark on rear axle companion flange and mark driveshaft flange yoke (4866) in the same location. If original mark is not visible on rear axle companion flange, mark both the rear axle companion flange and driveshaft flange yoke at any location.

2. **CAUTION: Do not allow driveshaft to hang free. Support the driveshaft during removal procedures.**

   Remove the bolts retaining the driveshaft to the transfer case circular flange.

3. Remove the bolts retaining the driveshaft to the rear axle companion flange.

4. Remove shaft from vehicle.

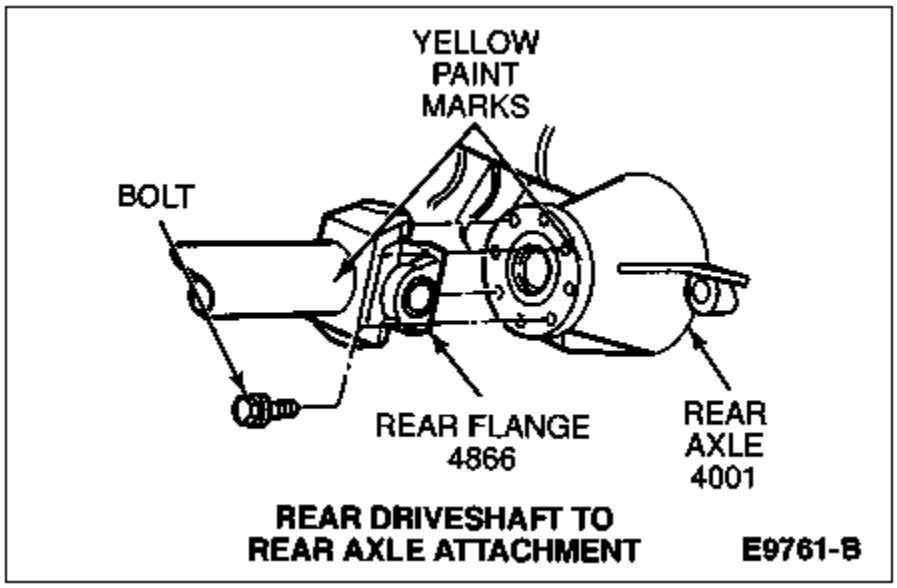
Installation

1. **NOTE: When installing a new service driveshaft, align the factory-made yellow paint mark at the rear of the driveshaft tube with the factory-made yellow paint mark on the rear axle companion flange.**

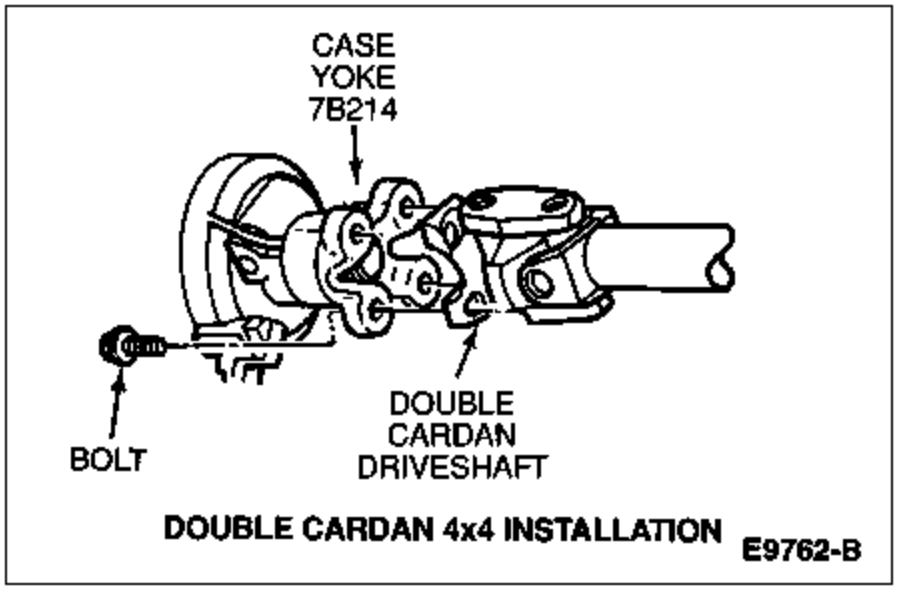
   Position the driveshaft so the index mark on the rear yoke (or yellow dot on driveshaft tube) is in line with the index mark on the rear axle companion flange. This assures original driveline balance. If a vibration exists after installation, refer to Section 00-04 .

2. Install the bolts that retain the driveshaft to the rear axle companion flange. Support the driveshaft during installation. DO NOT ALLOW THE DRIVESHAFT TO HANG FREE.

tomsn048@gmail.com



3. Position the driveshaft to the transfer case flange and install the bolts.



4. Tighten the driveshaft-to-rear axle bolts and driveshaft-to-transfer case bolts to 95-129 Nm (70-95 lb-ft).

tomsn048@gmail.com

tomsn048@gmail.com

Two-Piece Driveshafts with Slip at Transmission Coupling Shaft and Slip Between Center Rear Shaft, Ranger SuperCab 4x2

Removal

1. **NOTE: All driveshafts are balanced. Mark the driveshaft in relation to the rear universal joint yoke and the rear axle circular flange so that it may be installed in the original position.**

   To maintain driveline balance, locate original paint mark on the rear axle companion flange and mark driveshaft flange yoke (4866) in the same location. If original mark is not visible on rear axle companion flange, mark both the rear axle companion flange and driveshaft flange yoke at any location.

2. Remove the bolts that retain the driveshaft center bearing bracket (4A499) to the frame crossmember. Remove spacers under the center bearing bracket, if installed.

3. **CAUTION: Do not allow driveshaft to hang free. Support the driveshaft during removal procedures.**

   Remove the bolts retaining the driveshaft to the rear axle circular flange.

4. Disconnect the driveshaft from the rear axle companion flange. Pull the driveshaft toward the rear of the vehicle until the driveshaft slip yoke (4841) clears the extension housing (7A039) and seal. Install the appropriate plug in the extension housing to prevent lubricant leakage.

Installation

1. **NOTE: When installing a new service driveshaft, align the factory-made yellow paint mark at the rear of the driveshaft tube with the factory-made yellow paint mark on the rear axle companion flange.**

   Lubricate the driveshaft slip-yoke splines with Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B. Remove the plug from the transmission extension housing. Inspect the housing seal for damage; replace if required. Slide the driveshaft slip-yoke into the output extension housing of the transmission. Do not allow the driveshaft slip-yoke to bottom out on the output shaft with excessive force.

2. **NOTE: Make sure that the center bearing bracket is reinstalled "square" to the driveshaft. If spacers were installed under the center bearing bracket, make sure they are reinstalled.**

   Position the driveshaft so that the index mark on the rear yoke (or yellow dot on driveshaft tube) is in line with the index mark on the rear axle companion flange. This ensures original driveline balance. If a vibration exists after installation, refer to Section 00-04 .

3. Install the bolts that retain the driveshaft to the rear axle companion flange. Tighten to 95-129 Nm (70-95 lb-ft).

tomsn048@gmail.com

4. Install the bolts that retain the driveshaft center bearing bracket to the frame crossmember. Tighten to 37-50 Nm (27-37 lb-ft).

tomsn048@gmail.com

Driveshaft, Rear, with Single Cardan Universal Joint

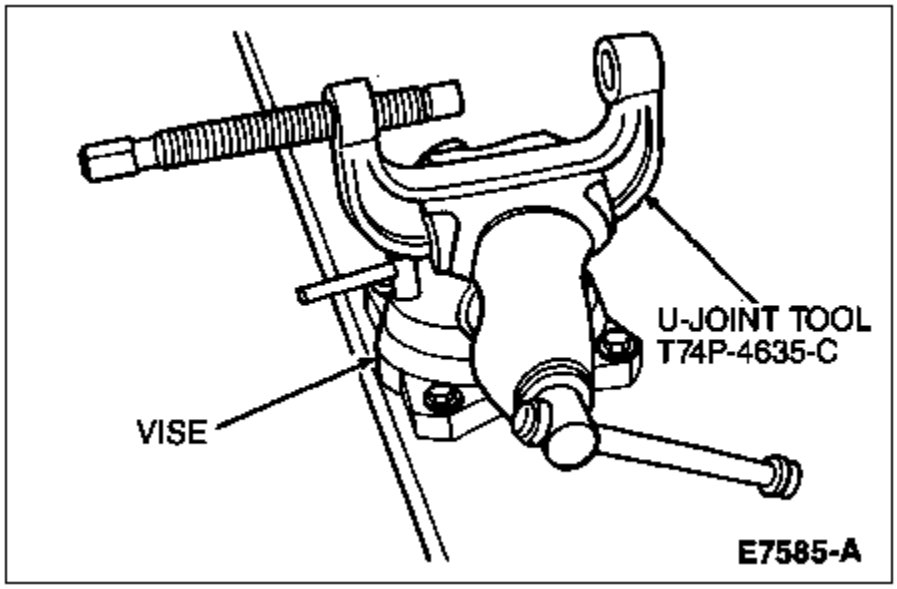
WARNING: UNDER NO CIRCUMSTANCES IS THE DRIVESHAFT TO BE CLAMPED IN THE JAWS OF A VISE OR SIMILAR HOLDING FIXTURE. DENTING OR LOCALIZED FRACTURE OF THE TUBE MAY RESULT, WHICH COULD CAUSE DRIVESHAFT FAILURE DURING VEHICLE OPERATION.

SPECIAL SERVICE TOOL (S) REQUIRED

Description	Tool Number
U-Joint Tool	T74P-4635-C

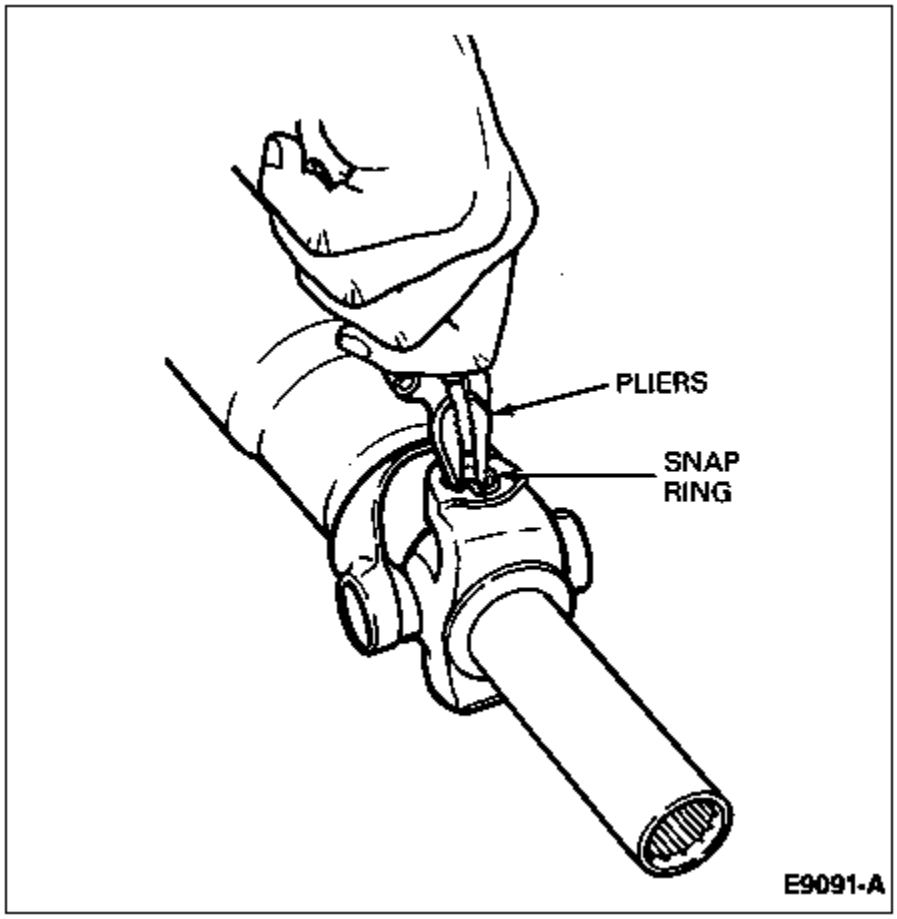
Disassembly

1. Place the driveshaft on a suitable workbench, being careful not to damage the tube.
2. Prior to disassembly, mark the positions of the driveshaft components relative to the driveshaft tube. All components must be reassembled in the same relationship to maintain proper balance.
3. Clamp U-joint Tool T74P-4635-C in vise.



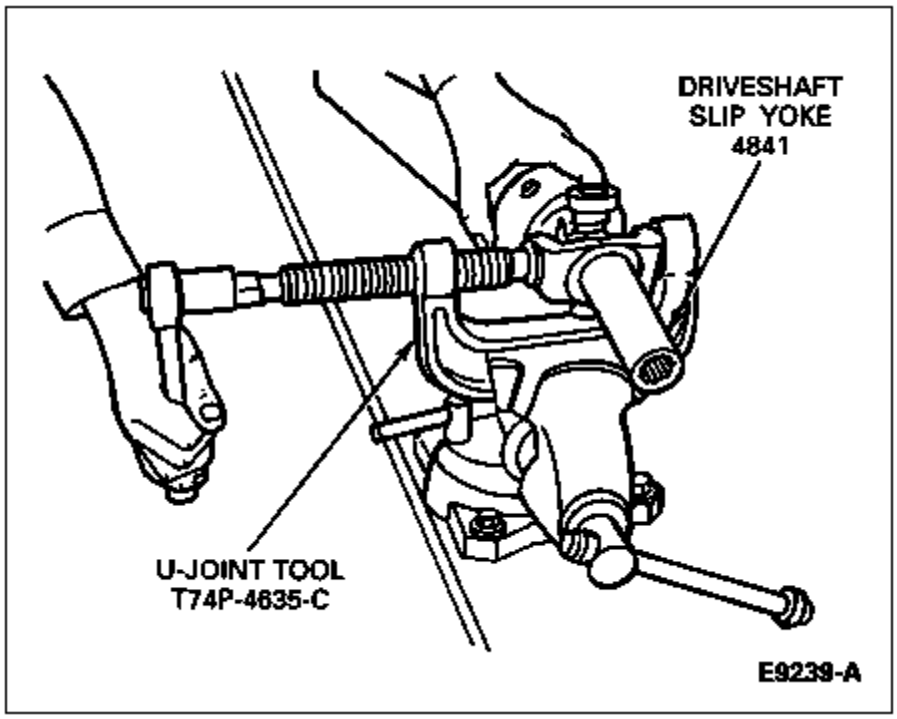
4. Remove the snap rings that retain the bearing cups.

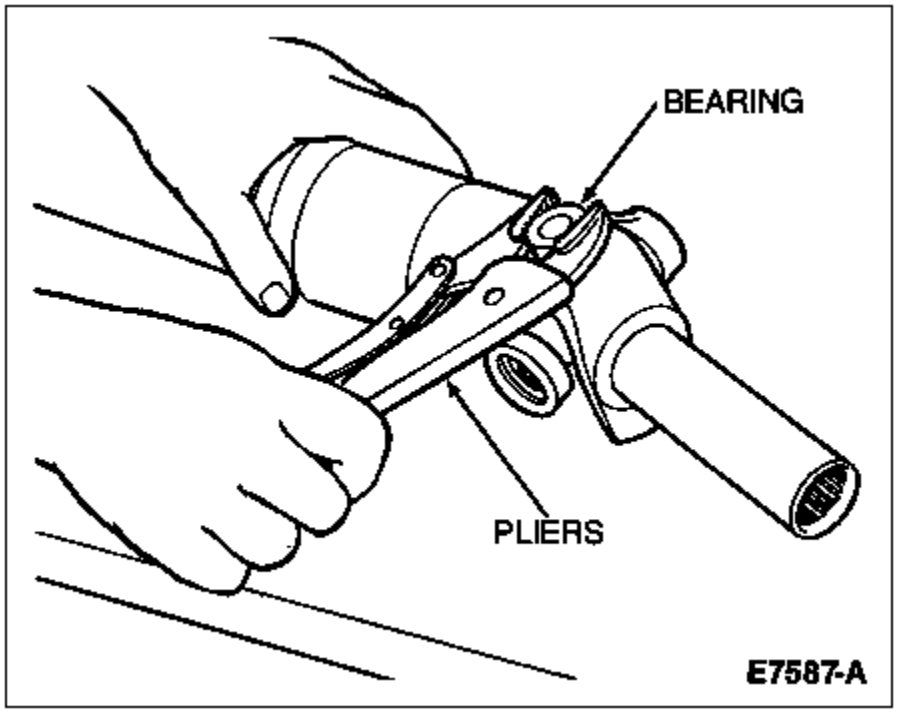
tomsn048@gmail.com



5. Position the driveshaft slip yoke (4841) or flange yoke in U-joint Tool T74P-4635-C and press out bearing. If bearing cup cannot be pressed all the way out of the driveshaft slip yoke or flange yoke, remove it with vise grip or channel lock pliers.

tomsn048@gmail.com





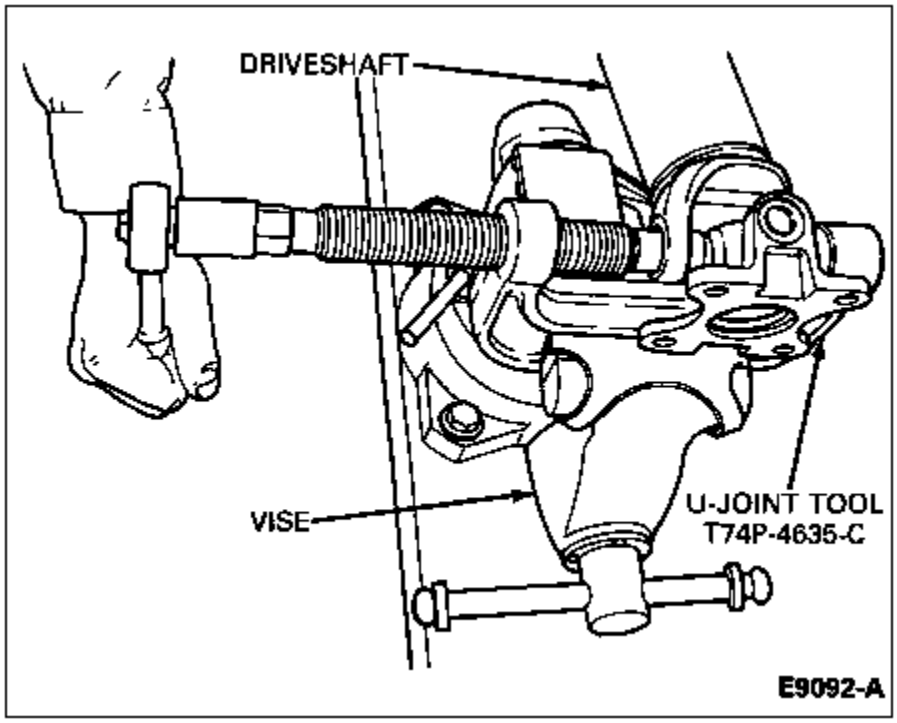
6. Reposition the driveshaft slip yoke or flange yoke in U-joint Tool T74P-4635-C 180 degrees to press on the spider and remove the remaining bearing cup from the opposite side.

7. Remove driveshaft slip yoke or flange yoke from the spider.

8. Remove the remaining bearing cups, spiders and rear flange from the driveshaft in the same manner.

tomsn048@gmail.com

9. Clean all foreign matter from the yoke area at each end of the driveshaft.



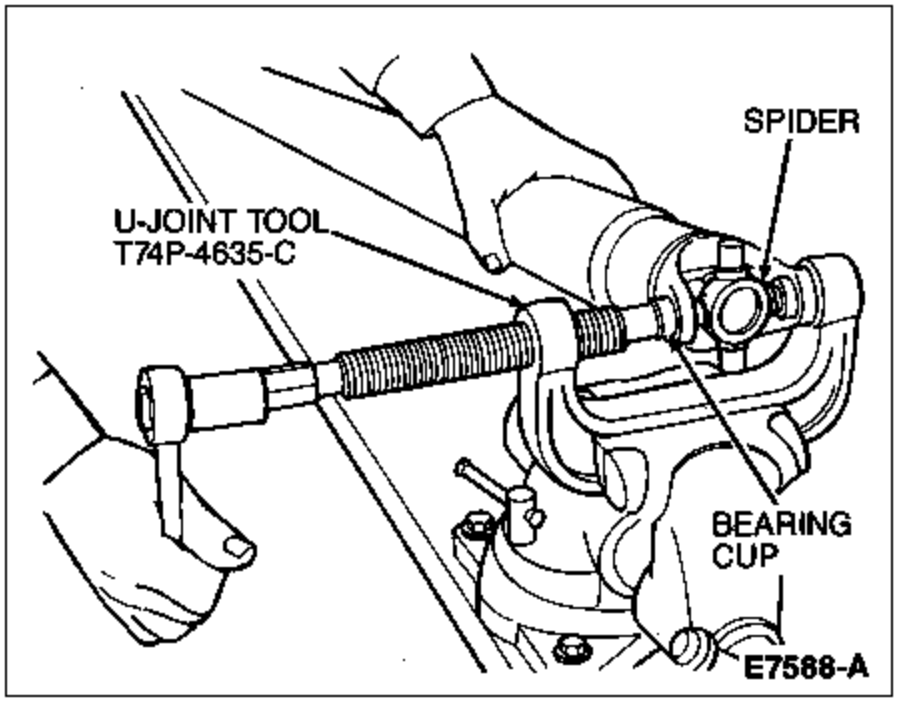
Assembly

NOTE: Universal joint kits are to be installed as complete assemblies only. Do not mix components from other universal joints.

1. Start a new bearing cup into the yoke of the driveshaft.

2. Position the new spider in the driveshaft yoke and press the bearing cup 6.3mm (1/4 inch) below the yoke surface using U-joint Tool T74P-4635-C.

tomsn048@gmail.com



3. Remove U-joint Tool T74P-4635-C and install a new snap ring.

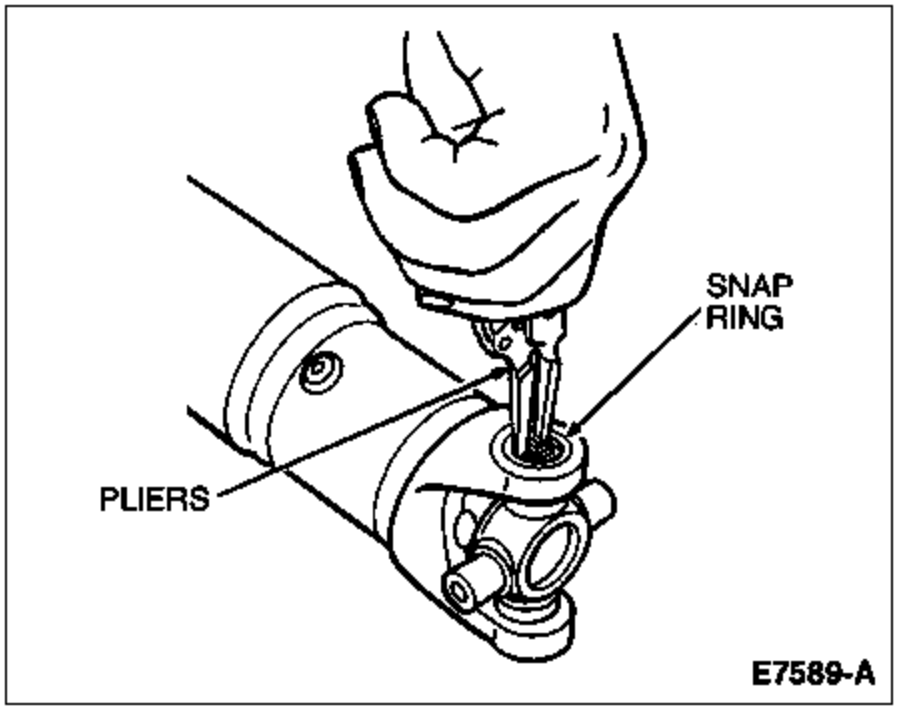
4. Start a new bearing cup into the opposite side of the yoke. Check needles for proper position.

5. **NOTE: Make sure the driveshaft slip yoke or flange are installed in the same position as marked before disassembly. Assemble universal joint using the yellow snap rings supplied in the kit. If difficulty is encountered with yellow snap rings, install the black snap rings supplied in the kit.**

   Position driveshaft in U-joint Tool T74P-4635-C and press on the bearing cup until the opposite bearing cup contacts the snap ring.

6. Remove the driveshaft from tool and install a new snap ring. Check snap ring for proper seating.

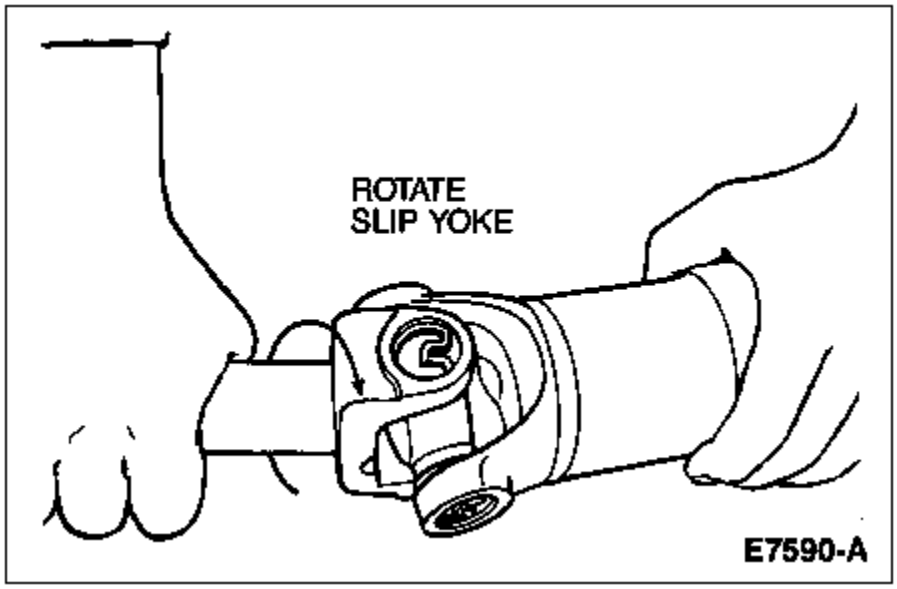
tomsn048@gmail.com



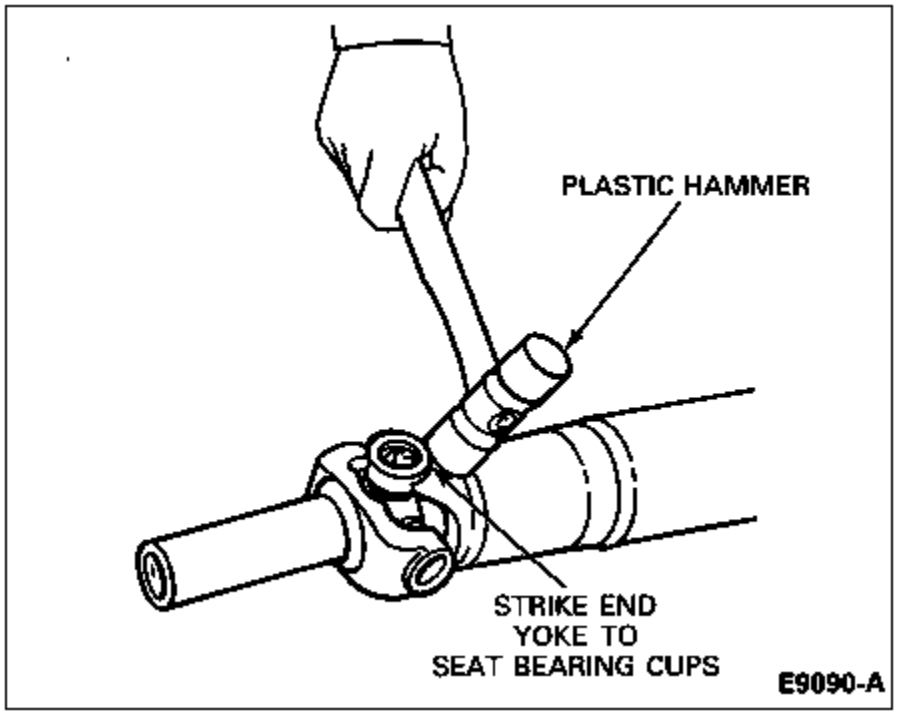
7. Install the remaining new bearing cups, spider, rear flange, driveshaft slip yoke or flange yoke and snap rings to the spider in the same manner.

8. **CAUTION: When performing the following procedure, take care to support the shaft end and do not strike the bearings during this procedure.**

   Check universal joint kit for freedom of movement. If binding has resulted from misalignment during assembly, a sharp rap on the yokes with a brass or plastic hammer will seat bearing needles. Make sure universal joints rotate easily without binding before installing driveshaft.



tomsn048@gmail.com



9. Lubricate the universal joint (if equipped with grease fittings) with Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B.

tomsn048@gmail.com

Driveshaft, with Double Cardan Universal Joint

WARNING: UNDER NO CIRCUMSTANCES IS THE DRIVESHAFT TO BE CLAMPED IN THE JAWS OF A VISE OR SIMILAR HOLDING FIXTURE. DENTING OR LOCALIZED FRACTURE OF THE TUBE MAY RESULT WHICH COULD CAUSE DRIVESHAFT FAILURE DURING VEHICLE OPERATION.

SPECIAL SERVICE TOOL (S) REQUIRED

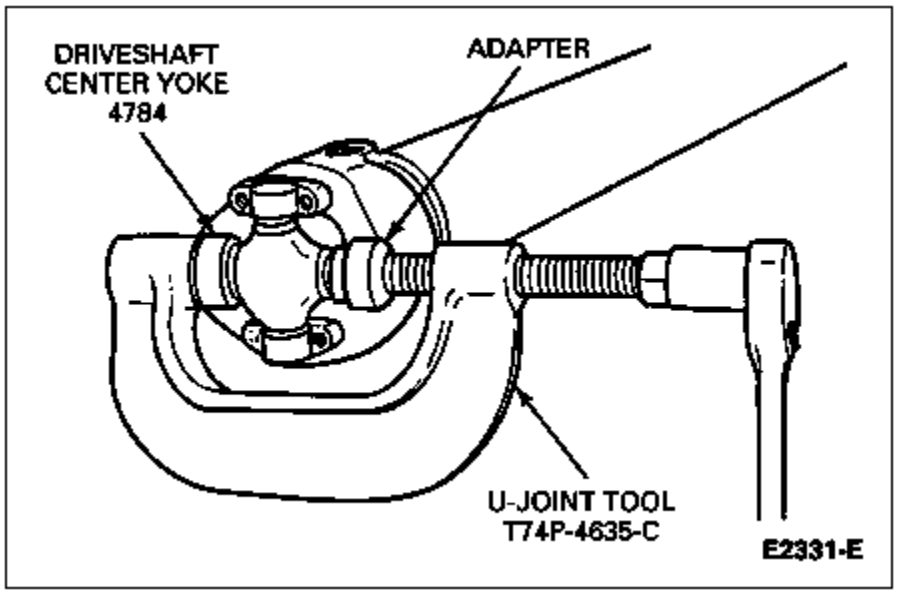
Description	Tool Number
U-Joint Tool	T74P-4635-C

Disassembly

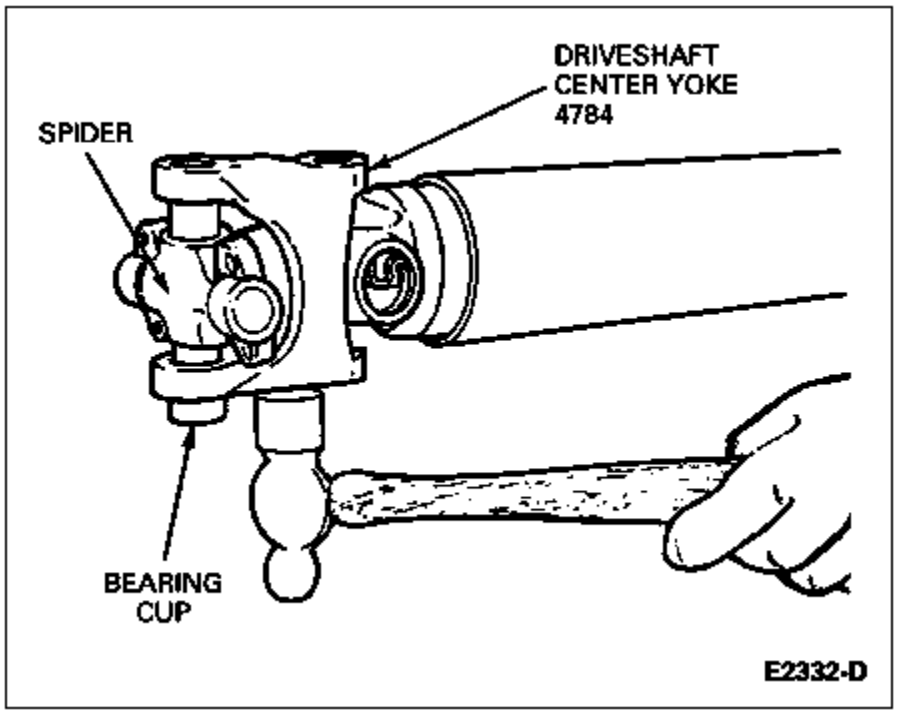
1. Place the driveshaft on a suitable workbench being careful not to damage the tube.
2. **CAUTION: The spiders must be assembled with the bosses in their original position to provide proper clearance.**

   Mark the positions of the spiders, the driveshaft center yoke (4784), and the driveshaft centering socket yoke (4782) as related to the stud yoke which is welded to the front of the driveshaft tube.
3. Remove the snap rings that secure the bearings in the front of the driveshaft center yoke.
4. Position the U-joint Tool T74P-4635-C as shown. Thread the tool clockwise until the bearing protrudes approximately 9.525mm (3/8 inch) out of the driveshaft center yoke.

tomsn048@gmail.com

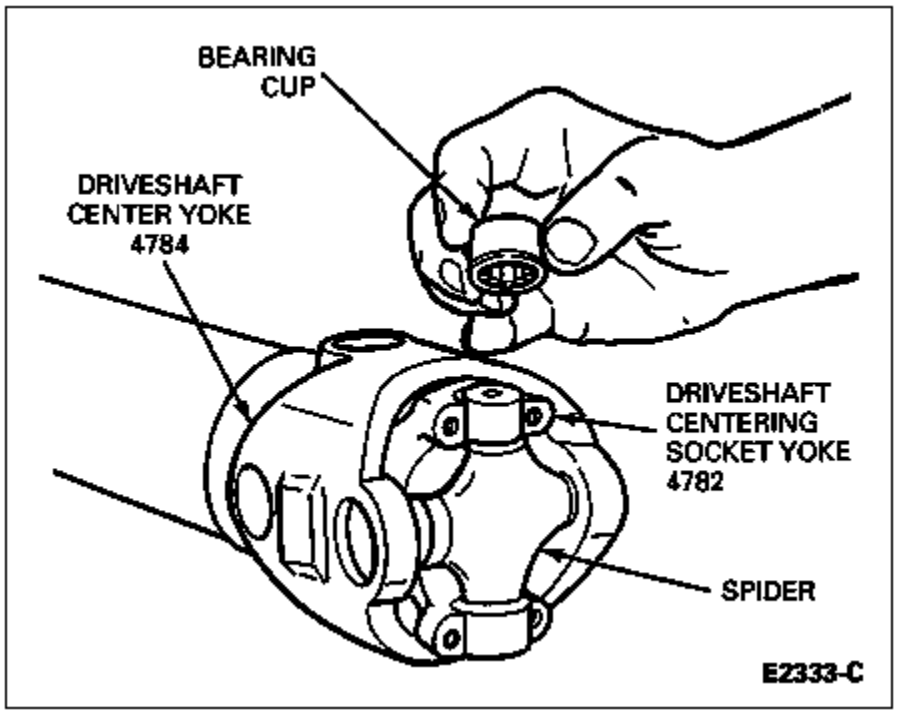


5. Position the bearing in a vise and tap on the driveshaft center yoke as shown to free it from the bearing.



6. Lift the two bearing cups from the spider.

tomsn048@gmail.com



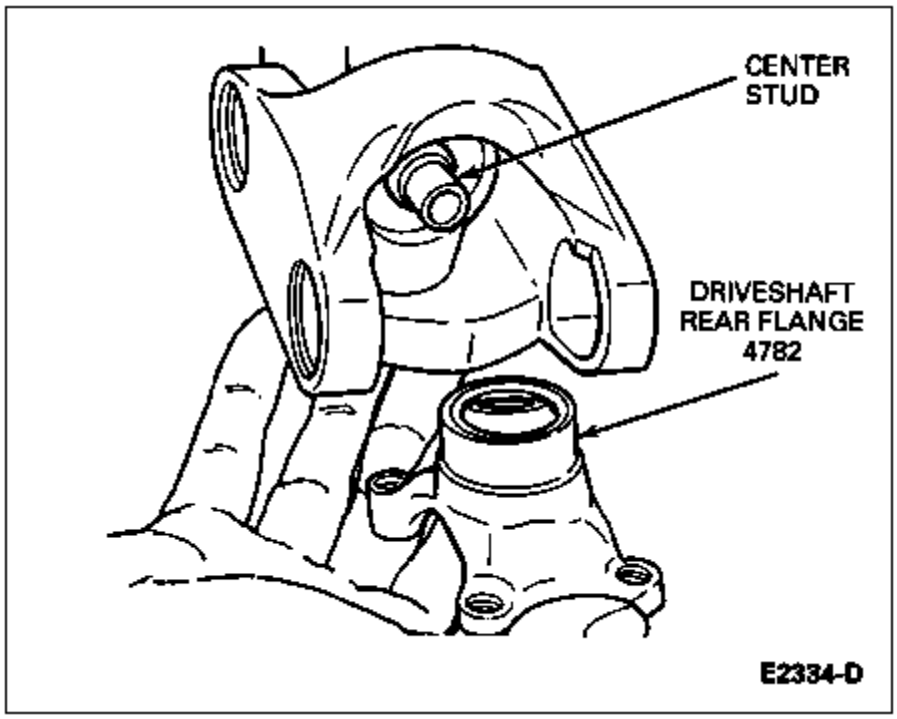
7. Reposition the tool on the driveshaft center yoke and move the remaining bearing in the opposite direction so that it protrudes approximately 9.525mm (3/8 inch) out of the driveshaft center yoke.

8. Grip the bearing in a vise. Tap on the driveshaft center yoke to free it from the bearing.

9. Remove the spider from the driveshaft center yoke.

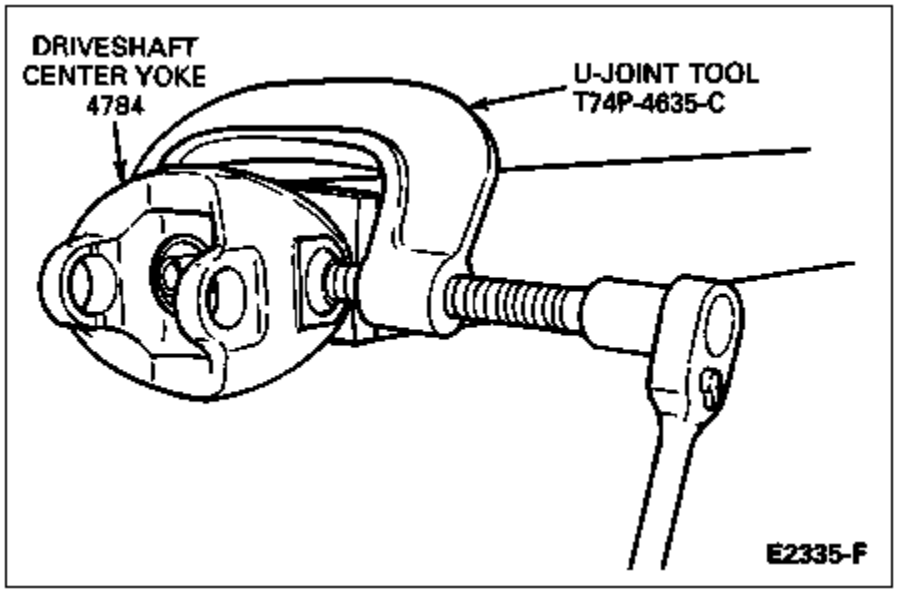
10. Pull the driveshaft centering socket yoke off the center stud. Remove the rubber seal from the centering ball stud.

tomsn048@gmail.com



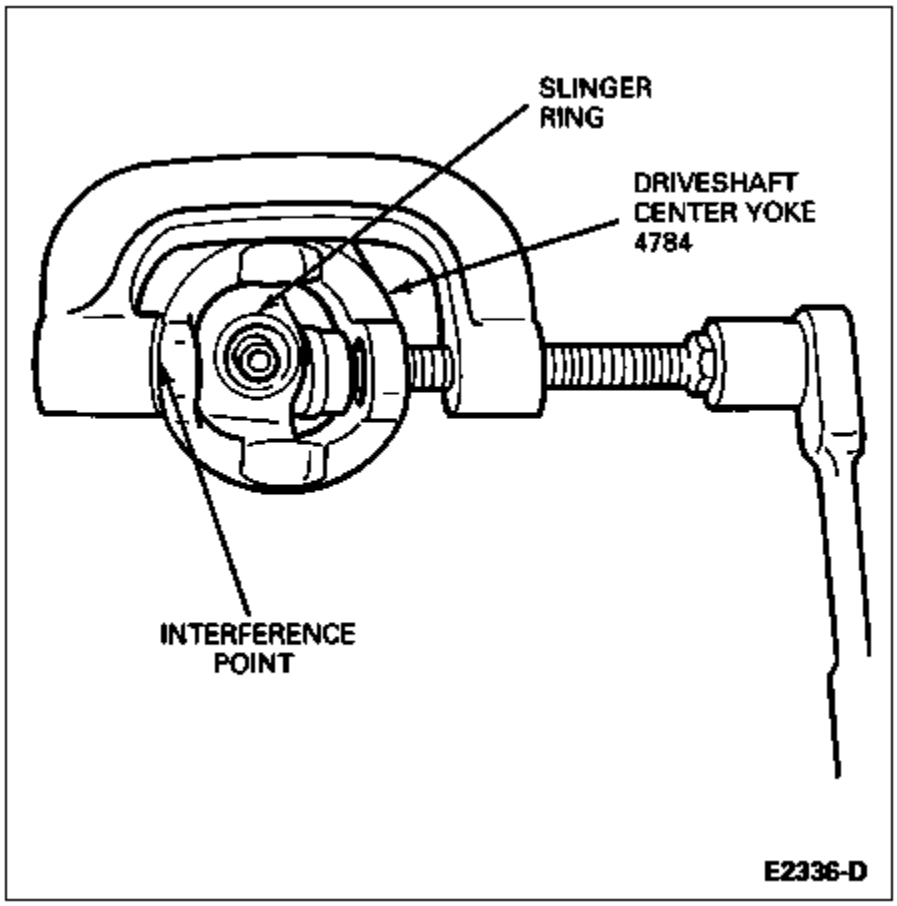
11. Remove the snap rings from the driveshaft center yoke and from the driveshaft yoke.

12. Position the tool on the driveshaft yoke and press the bearing outward until the inside of the driveshaft center yoke almost contacts the slinger ring at the front of the driveshaft yoke.



Pressing beyond this point can distort the slinger ring. The arrow shown illustrates the interference point.

tomsn048@gmail.com



13. Clamp the exposed end of the bearing in a vise and drive on the driveshaft center yoke with a soft-faced hammer to free it from the bearing.

14. Reposition the tool and press on the spider to remove the opposite bearing.

15. Remove the driveshaft center yoke from the spider.

16. Remove the spider from the driveshaft yoke in the same manner.

17. Clean all serviceable parts in cleaning solvent. If using a repair kit, install all of the parts supplied in the kit. If the driveshaft is damaged, replace the complete shaft to be assured of a balanced assembly.

Assembly

1. To assemble the universal joint, position the spider in the driveshaft yoke. Make sure the spider bosses (or lubrication plugs on kits) will be in the same position as originally installed. Press in the bearing using U-joint Tool T74P-4635-C. Install the snap rings.

2. Pack the socket relief and the ball with Premium Long-Life Grease XG-1-C- or -K or equivalent meeting Ford specification ESA-M1C75-B, then position the driveshaft center yoke over the spider ends and press in the bearing. Install the snap rings.

3. Install a new seal on the centering ball stud. Position the driveshaft centering socket yoke on the stud.

tomsn048@gmail.com

4. Place the front spider in the driveshaft center yoke. Make sure the spider bosses (or lubrication plugs on kits) are properly positioned.

5. With the spider loosely positioned on center stop, proceed to seat the first pair of bearings into the driveshaft centering socket yoke, then press the second pair into the driveshaft center yoke. Install the snap rings.

6. Apply pressure on the driveshaft centering socket yoke and install the remaining bearing cup.

7. On universal joint kits equipped with grease fittings lubricate the universal joints using Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B.

---

tomsn048@gmail.com

Center Bearing, SuperCab 4x2 and 4x4

Disassembly and Assembly

1. Unbolt the center bearing mount and spin the bearing. If bearing does not rotate freely it must be replaced.

2. Inspect the rubber insulator for evidence of hardening, cracking or deterioration before removing shaft. Replace if damaged.

3. Remove driveshaft from vehicle.

4. Separate driveshaft from coupling shaft as described above. Make sure to mark driveshaft and coupling shaft.

5. Remove the nut retaining the half-round yoke to the coupling shaft and remove yoke.

6. **NOTE: Make sure the yoke is reinstalled on the coupling shaft in the same orientation as it was originally installed. The orientation is critical so that proper driveshaft balance and universal joint phasing is maintained. Tighten the attaching nut to 135-162 Nm (100-120 lb-ft).**

   Reinstall the coupling shaft yoke.

7. Reassemble driveshaft to coupling shaft, again maintaining proper orientation of driveshaft to coupling shaft.

tomsn048@gmail.com

Driveshaft Slip-Yoke Boot

Slip-At-Transfer Case Slip-Yoke Boot Replacement, Aerostar E-4WD

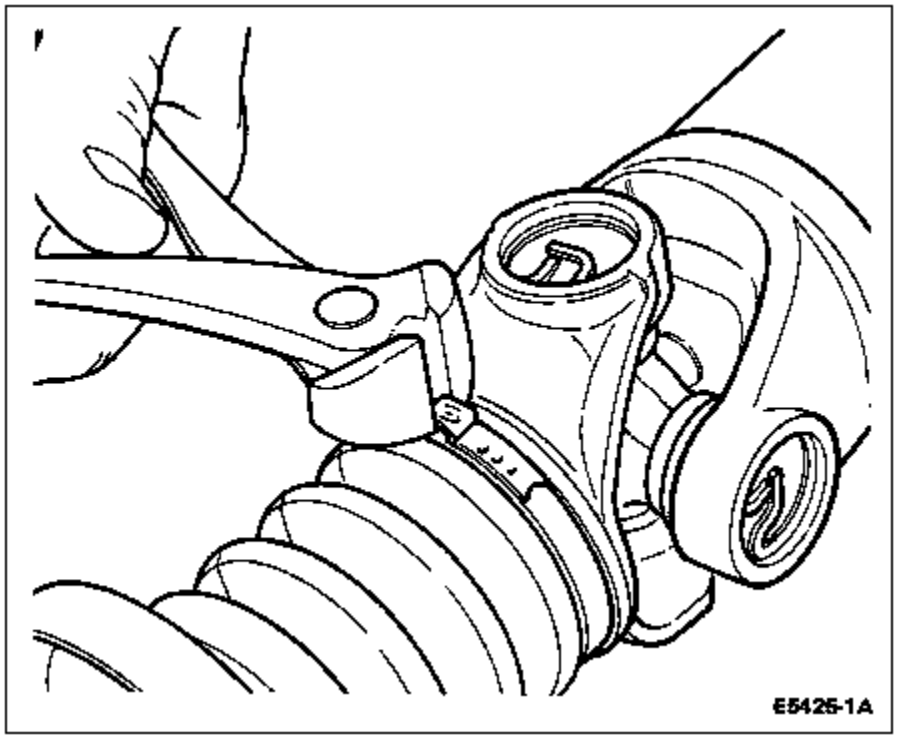
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Keystone Clamp Pliers	T63P-9171-A

Removal

1. Remove driveshaft from vehicle as illustrated in Removal and Installation, Driveshaft, Front in this section.

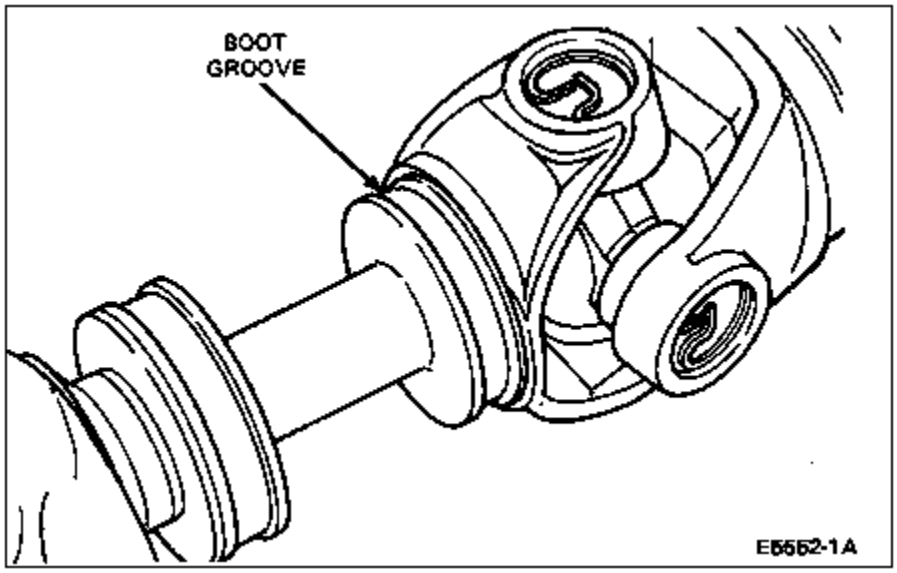
2. Remove the driveshaft slip-yoke boot clamp with the end cutter pliers as shown. Discard the driveshaft slip-yoke boot clamp. Remove the driveshaft slip-yoke boot from the stud yoke.



Installation

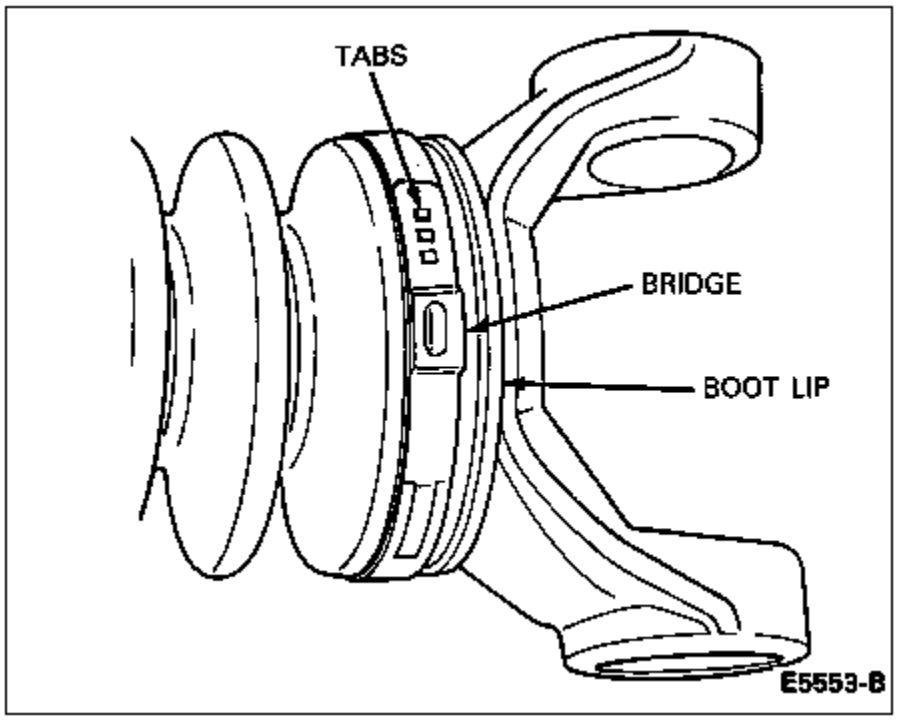
1. Install new driveshaft slip-yoke boot on the stud yoke, making sure the driveshaft slip-yoke boot is seated in the groove in the stud yoke.

tomsn048@gmail.com



2. Install a new driveshaft slip-yoke boot clamp on the driveshaft slip yoke boot. Locate the clamp tabs in the slots so each tab fits into a slot. Crimp the driveshaft slip-yoke boot clamp securely using Keystone Clamp Pliers T63P-9171-A. Do not crimp to the point where the clamp bridge is cut or the driveshaft slip-yoke boot is damaged.

3. Install driveshaft into vehicle as illustrated in this section.



tomsn048@gmail.com

tomsn048@gmail.com

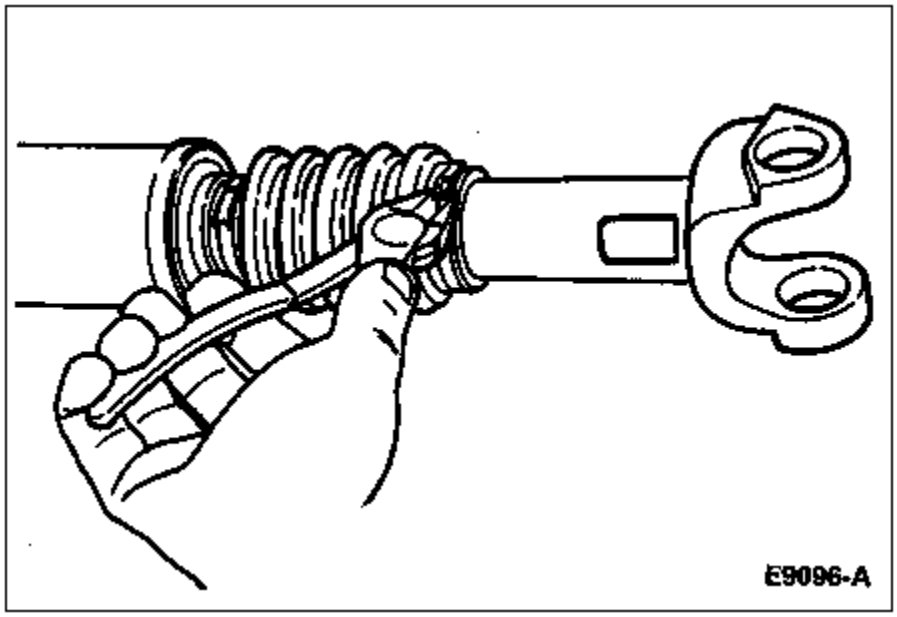
Slip Between Center Driveshaft Slip Yoke Boot, Ranger 4x4 Front and Rear Driveshafts, Ranger SuperCab 4x2 Rear Driveshafts

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Keystone Clamp Pliers	T63P-9171-A

Removal

1. Remove driveshaft as illustrated in this section.
2. Scribe alignment marks on the driveshaft slip-yoke and the driveshaft tube to ensure proper U-joint phasing when reassembled.
3. Remove the driveshaft slip-yoke boot clamps with the end cutter pliers as shown. Discard the driveshaft slip-yoke boot clamps.



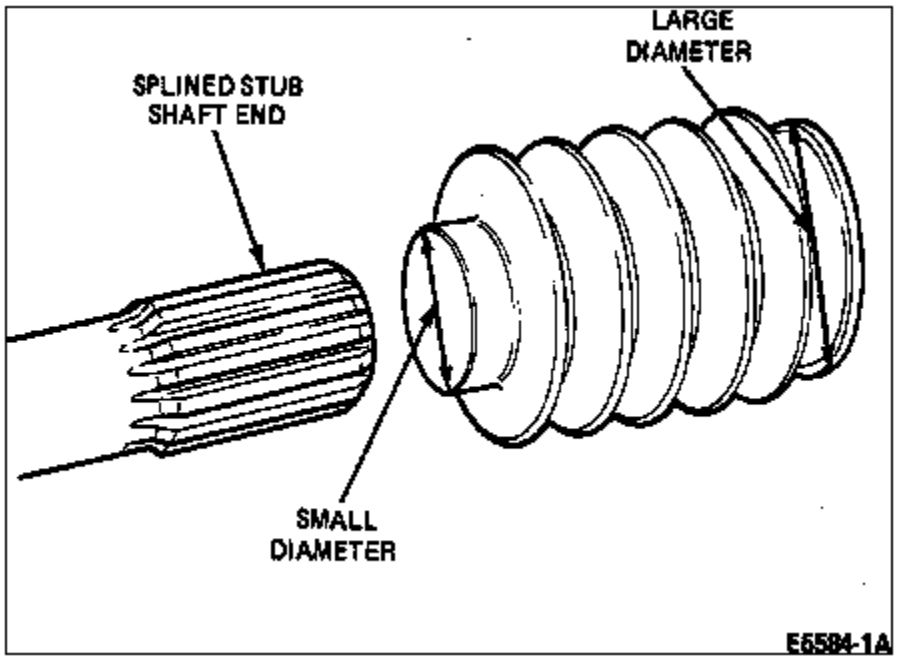
4. Remove the driveshaft slip-yoke boot from the driveshaft tube neck and the driveshaft slip yoke. Pull driveshaft slip-yoke off driveshaft stub shaft splines. Discard driveshaft slip-yoke boot.
5. If the driveshaft slip-yoke boot is found to be cracked or split, the grease should be checked for contamination. If driveshaft was operating satisfactorily and grease does not appear to be contaminated, continue with the installation procedure.

tomsn048@gmail.com

6. Check the lubricant for contamination by rubbing between two fingers. Any gritty feeling indicates a contaminated driveshaft slip-yoke and stub shaft. If the grease appears to be contaminated, inspect the stub shaft and driveshaft slip-yoke for wear. Clean all foreign matter from the driveshaft splines.

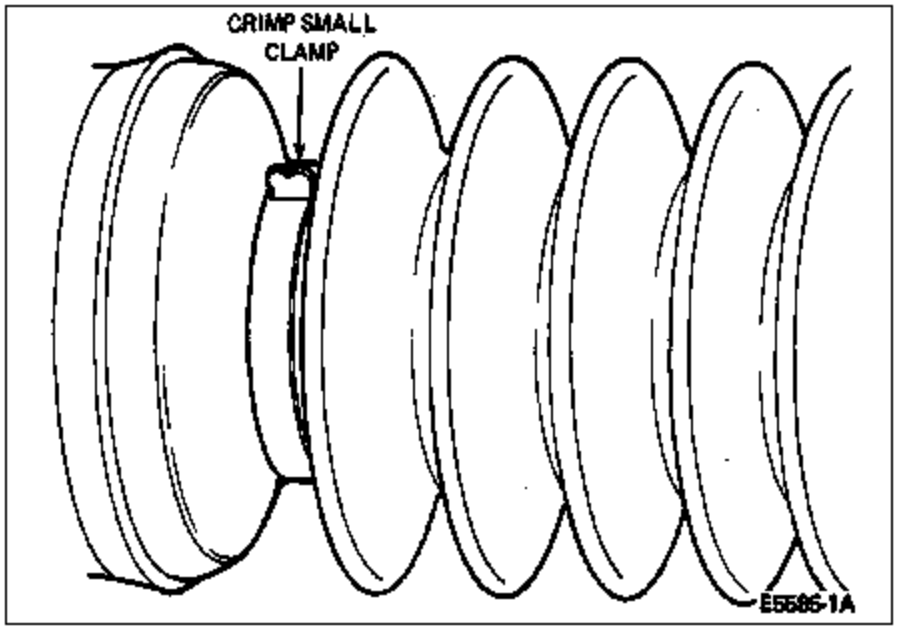
Installation

1. Install the driveshaft slip-yoke boot with the small diameter facing the splined stub shaft end. Push the driveshaft slip-yoke boot as far as it will travel on the stub shaft.



2. Install a new small driveshaft slip-yoke boot clamp and crimp the driveshaft slip yoke boot clamp using Keystone Clamp Pliers T63P-9171-A.

tomsn048@gmail.com



3. Pull the driveshaft slip-yoke boot toward the driveshaft and coat the stub shaft splines with Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B.

4. Fill the driveshaft slip-yoke boot with approximately 10 grams (.36 ounce) of Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B.

5. Slide the large slip-yoke boot clamp onto the barrel of the driveshaft slip-yoke before assembling shaft together.

6. Align the driveshaft slip-yoke and driveshaft tube using the alignment marks scribed in Step 2 of the Removal procedure. Push the driveshaft slip-yoke onto the stub shaft.

7. Remove all excess grease from the driveshaft slip-yoke boot and driveshaft slip-yoke. Position the driveshaft slip-yoke boot over the groove.

8. Move the driveshaft slip-yoke in or out in order to position the slip-yoke about 25-38mm (1-1.5 inches) from the collapsed position.

9. Using Keystone Clamp Pliers T63P-9171-A, crimp the large driveshaft slip-yoke boot clamp.

10. Reinstall driveshaft as illustrated in this section.

tomsn048@gmail.com

tomsn048@gmail.com

Axle Shaft

Removal

1. **NOTE: Whenever a plastic axle housing cover (4033) is removed, it must be replaced with a new cover and bolts. Steel axle housing covers may be reused after thorough cleaning and removing all old gasket material from cover and carrier face.**

   NOTE: For 3.08:1, 3.27:1 and 3.45:1 ratio axles, refer to Steps 4-6. For 3.73:1 and 4.10:1 ratio axles, refer to Steps 7-10.

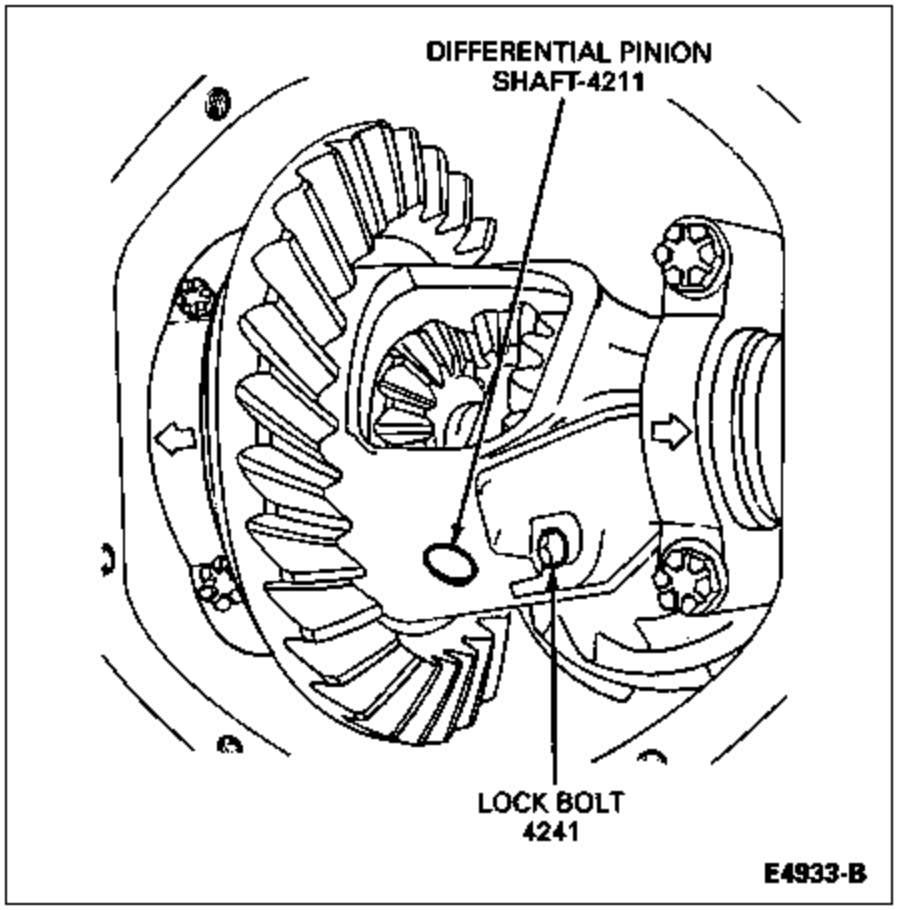
   Raise vehicle to the desired working height, and remove the rear wheel and tire assemblies. Remove the brake drums (1126).

2. Clean all dirt from the area of carrier axle housing cover with a wire brush and/or cloth.

3. Remove axle housing cover and drain lubricant.

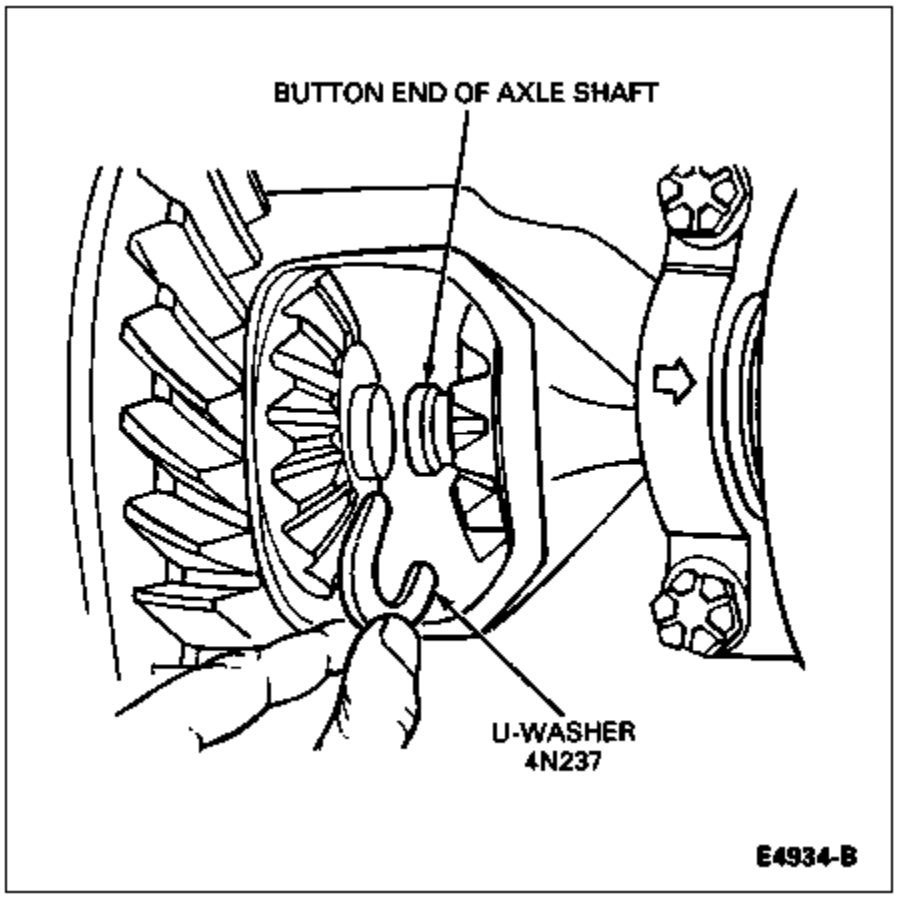
4. Remove differential pinion shaft lock bolt and differential pinion shaft. The pinion gears may be left in place. Once the axle shafts (4234) are removed, reinstall the differential pinion shaft and differential pinion shaft lock bolt.

tomsn048@gmail.com



5. Push the flanged end of the axle shafts toward the center of the vehicle and remove the U-washer from the button end of the axle shaft.

tomsn048@gmail.com



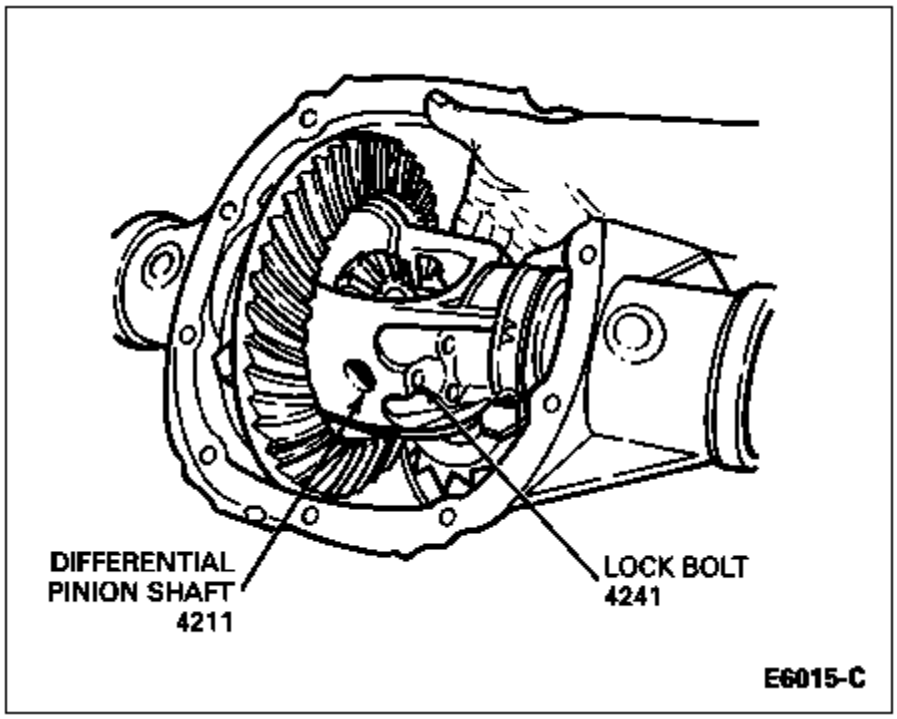
6. **CAUTION: Always remove axle shafts completely from housing or damage to inner wheel bearing oil seal (1177) may result.**

   Remove the axle shaft from the housing, being careful not to damage the inner wheel bearing oil seal.

7. For 3.73:1 and 4.10:1 ratio rear axle assemblies (4006), remove the differential pinion shaft lock bolt.

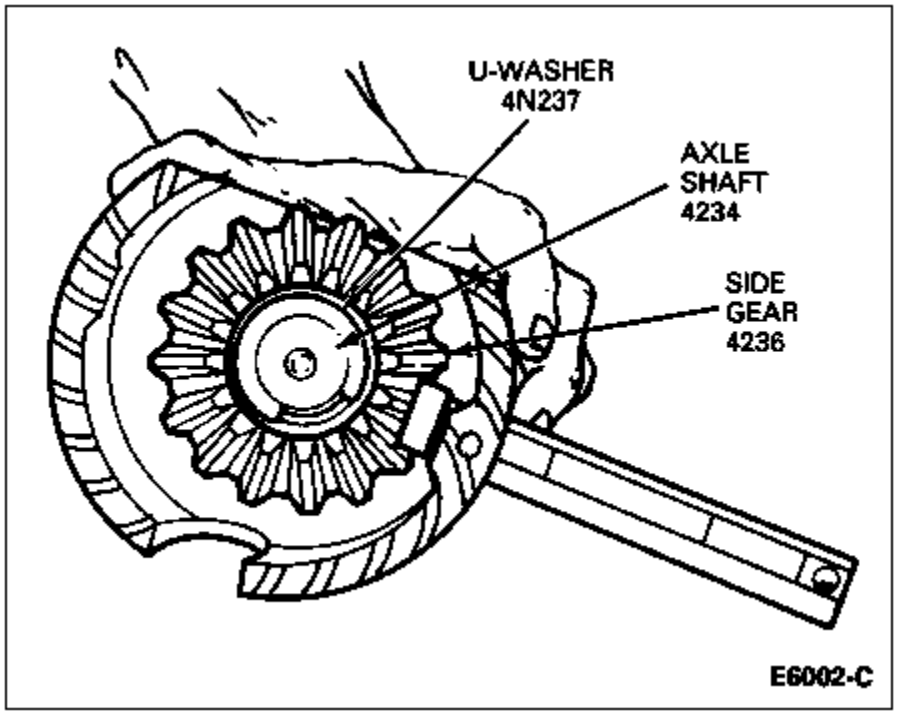
8. Place hand behind differential case (4204) and push out part of differential pinion shaft until the step on the shaft contacts the ring gear.

tomsn048@gmail.com



9. Remove the U-washer from the axle shafts.

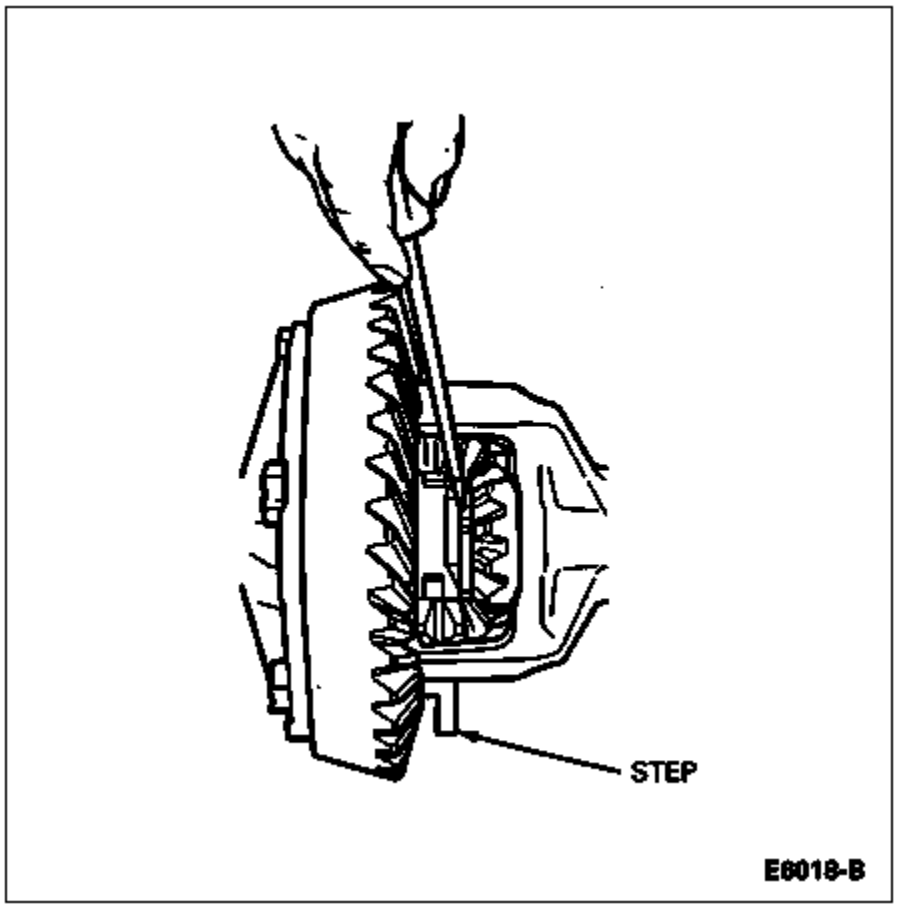
10. Remove the axle shafts from the rear axle housing, being careful not to damage the inner wheel bearing oil seal.



tomsn048@gmail.com

Installation

NOTE: To permit installation ofaxle shaft on 3.73:1 and 4.10:1 axle ratios, make sure the step in the differential pinion shaft contacts the ring gear.



1. **CAUTION: When performing the next step, care must be taken not to let the axle shaft splines damage the oil seal or wheel bearing.**

   Carefully slide the axle shaft into the axle housing. Start the splines into the differential side gear (4236) and push firmly until the button end of the axle shaft can be seen in the differential case.

2. Install the U-washers on the button end of the axle shaft splines, then pull the axle shaft outboard until the splines engage and the U-washer seats in the counterbore of the differential side gear.

3. **CAUTION: Replace differential pinion shaft lock bolt after removal. If new bolt is not available, thoroughly clean threads of used bolt and coat with Threadlock and Sealer E0AZ-19554-A or equivalent meeting Ford specification WSK-M2G351-A5 before installation.**

   Position the differential pinion shaft through the differential case and pinion gears, aligning the hole in the shaft with the lock bolt hole. Install differential pinion shaft lock bolt and tighten to 20-40 Nm (15-30 lb-ft).

tomsn048@gmail.com

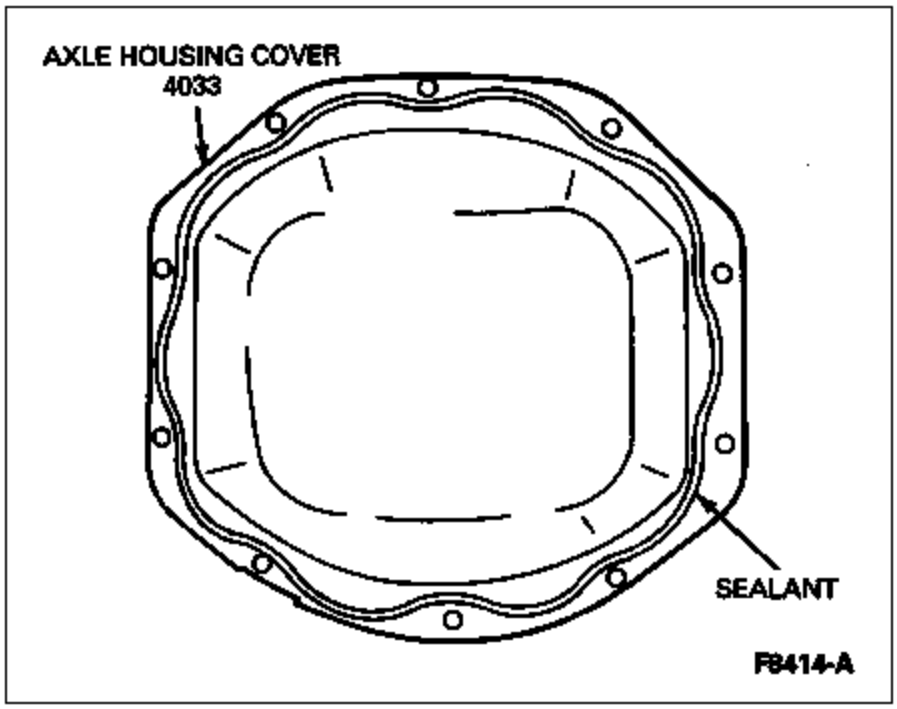
4. **CAUTION: Make sure machined surface on carrier is clean before installing the cover. Inside of rear axle (4001) must be covered when cleaning the machined surface to prevent axle contamination.**

   On Ranger vehicles with steel axle housing covers, clean cover thoroughly. Apply a new continuous bead of Silicone Rubber Sealant D6AZ-19562-BA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A to the axle housing cover.

5. **CAUTION: Always replace plastic axle housing cover with a new one, using new bolts whenever axle housing cover is removed.**

   On Aerostar vehicles, install a new plastic axle housing cover and new bolts. Tighten all cover screws including ratio tag bolt to 21-27 Nm (15-20 lb-ft).

6. On Ranger vehicles equipped with steel axle housing covers, tighten cover screws to 38-52 Nm (28-38 lb-ft). Cover assembly must be installed within 15 minutes of application of the silicone or new sealant must be applied.



7. Add Rear Axle Lubricant XY-80W90-QL or equivalent WSP-M2C197-A until it is 6-14mm (1/4-9/16 inch) below bottom of fill hole. Add four ounces of Friction Modifier C8AZ-19B546-A or equivalent meeting Ford specification EST-M2C118-A for Traction-Lok® rear axle assemblies. Install fill plug and tighten to 20-41 Nm (15-30 lb-ft).

   Make sure axle housing vent is not plugged with debris.

8. Install the brake drums, wheels and tires. Tighten lug nuts to 115-156 Nm (85-115 lb-ft).

tomsn048@gmail.com

tomsn048@gmail.com

Sensor Indicator, Anti-Lock Brake

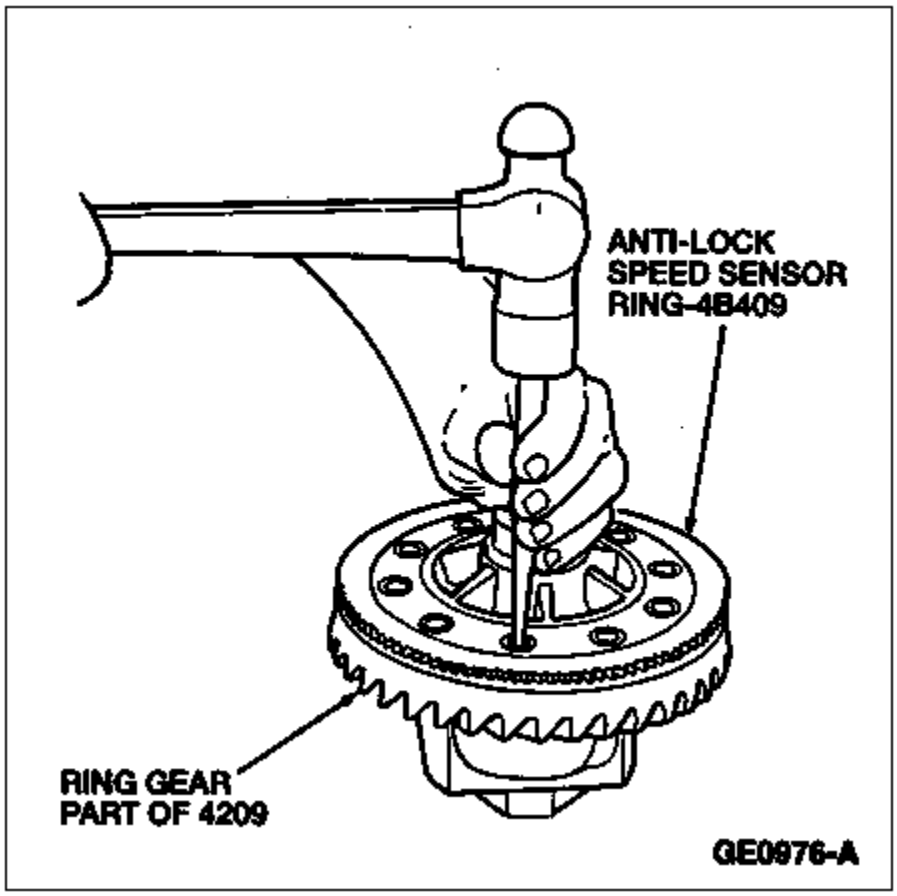
Removal

1. **NOTE: Do not remove anti-lock speed sensor ring unless replacement is required. It does not have to be removed for ring gear replacement.**

   CAUTION: Extreme care should be taken not to scratch, dent, chip or otherwise cause damage to anti-lock brake sensor ring teeth while handling or during assembly.

   NOTE: Before removing ring gear inspect it and determine if ring runout check is necessary. If so, refer to Section 05-00 .

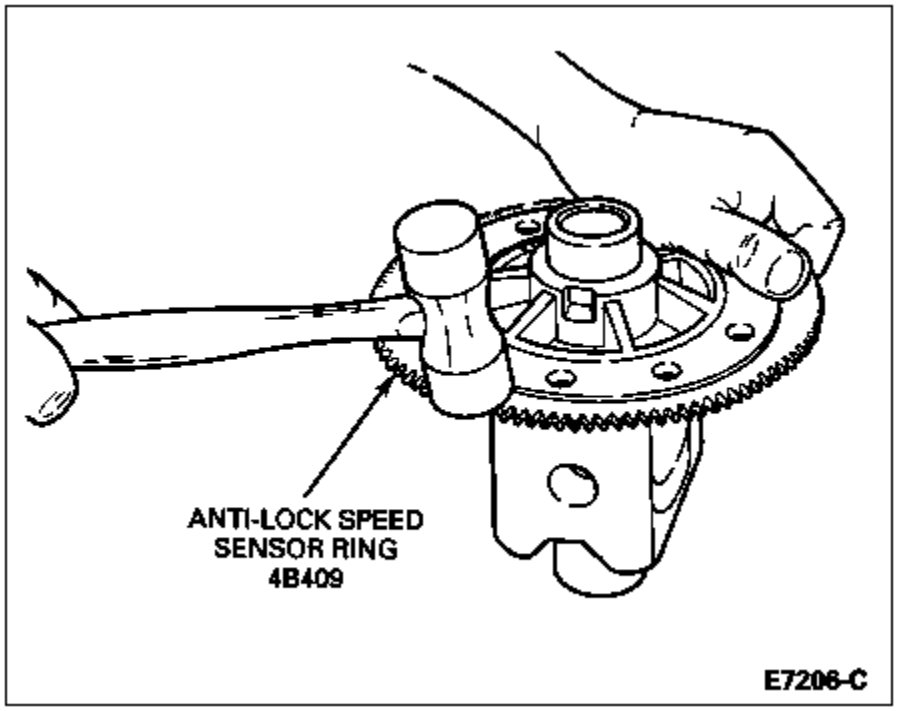
   Remove the bolts retaining the ring gear to the differential case (4204). Remove the ring gear by striking at alternate holes around the gear.



tomsn048@gmail.com

2. **CAUTION: The anti-lock speed sensor ring must be discarded upon removal. If removed, a new anti-lock brake sensor ring must be installed.**

   If replacement is required remove the anti-lock brake sensor ring by tapping with a soft-faced hammer. Discard the anti-lock speed sensor ring.



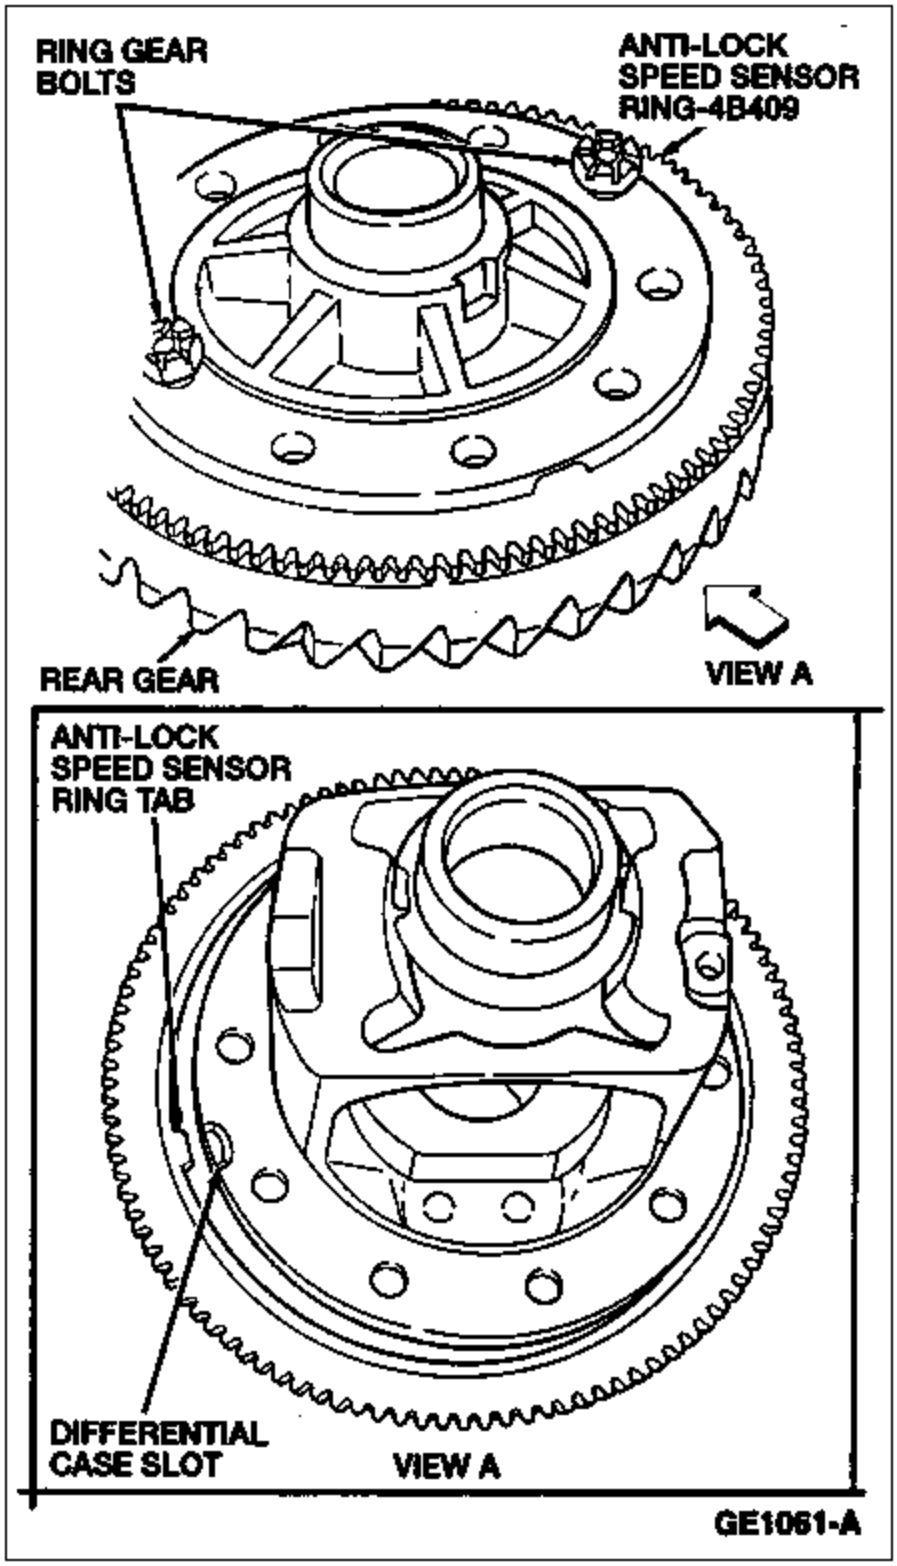
Installation

1. **CAUTION: Extreme care should be taken not to scratch, dent, chip or otherwise cause damage to anti-lock speed sensor ring teeth while handling or during assembly.**

   CAUTION: The tab on the anti-lock speed sensor ring must be aligned with the slot in the differential case.

   Position the ring gear and anti-lock speed sensor ring on the differential case. The tab on the anti-lock speed sensor ring must be aligned with the slot in the differential case as shown. Start two ring gear retaining bolts through the differential case into the ring gear to make sure case-to-ring gear bolt hole alignment is achieved.

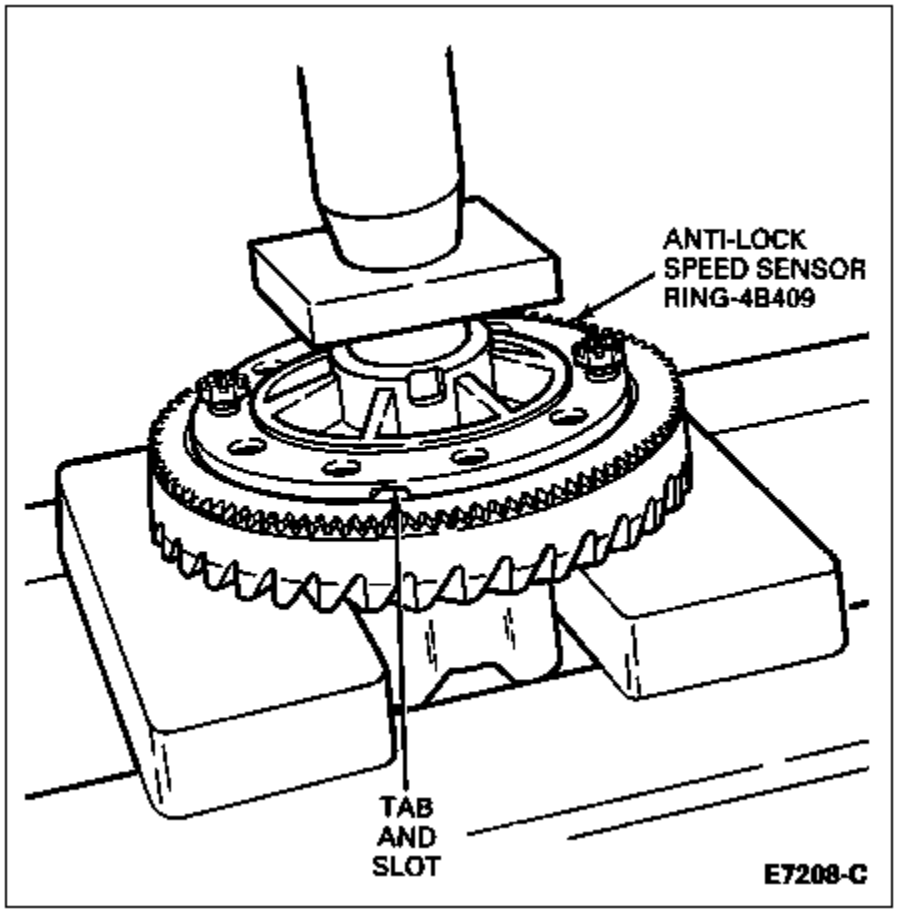
tomsn048@gmail.com



2. Press the ring gear and anti-lock speed sensor ring on the differential case using the ring gear as a pilot.

3. Coat the threads of the ring gear retaining bolts with Stud and Bearing Mount E0AZ-19554-BA or equivalent meeting Ford specification WSK-M2G349-A1. Install the bolts and alternately and evenly tighten to 95-115 Nm (70-85 lb-ft).

tomsn048@gmail.com



tomsn048@gmail.com

Seal and Bearing Replacement

SPECIAL SERVICE TOOL(S) REQUIRED

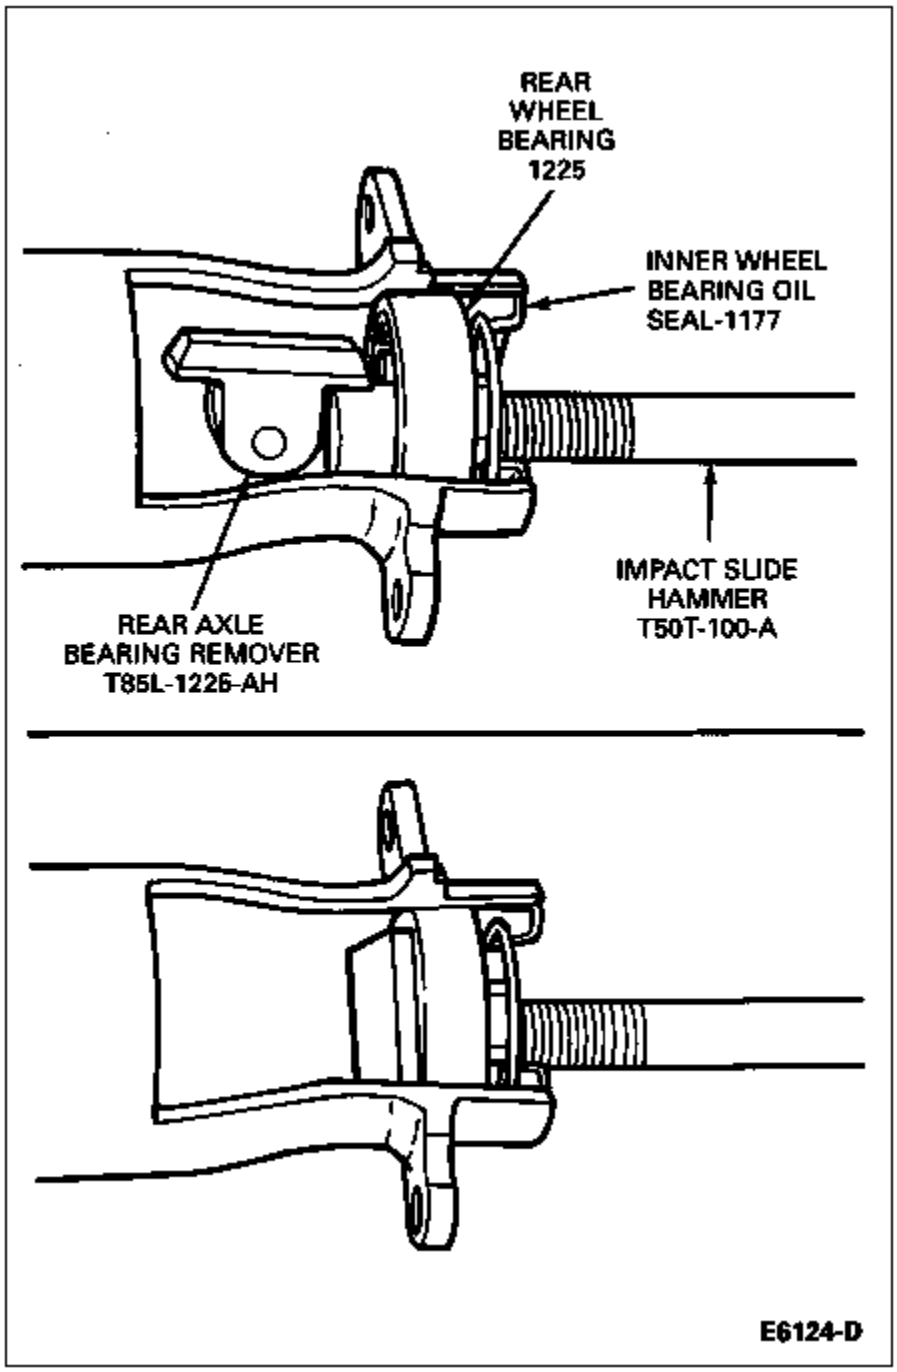
Description	Tool Number
Rear Axle Bearing Remover	T85L-1225-AH
Impact Slide Hammer	T50T-100-A
Axle Tube Seal Replacer	T78P-1177-A
Axle Tube Bearing Replacer	T78P-1225-A

Removal

1. Remove the axle shaft (4234) as described in this section.

2. Insert Rear Axle Bearing Remover T85L-1225-AH and Impact Slide Hammer T50T-100-A into the bore as shown and position it behind the rear wheel bearing (1225) so the tangs on the tool engage the bearing outer race. Remove the rear wheel bearing and inner wheel bearing oil seal (1177) as a unit, using the Impact Slide Hammer Tool T50T-100-A and Rear Axle Bearing Remover T85L-1225-AH.

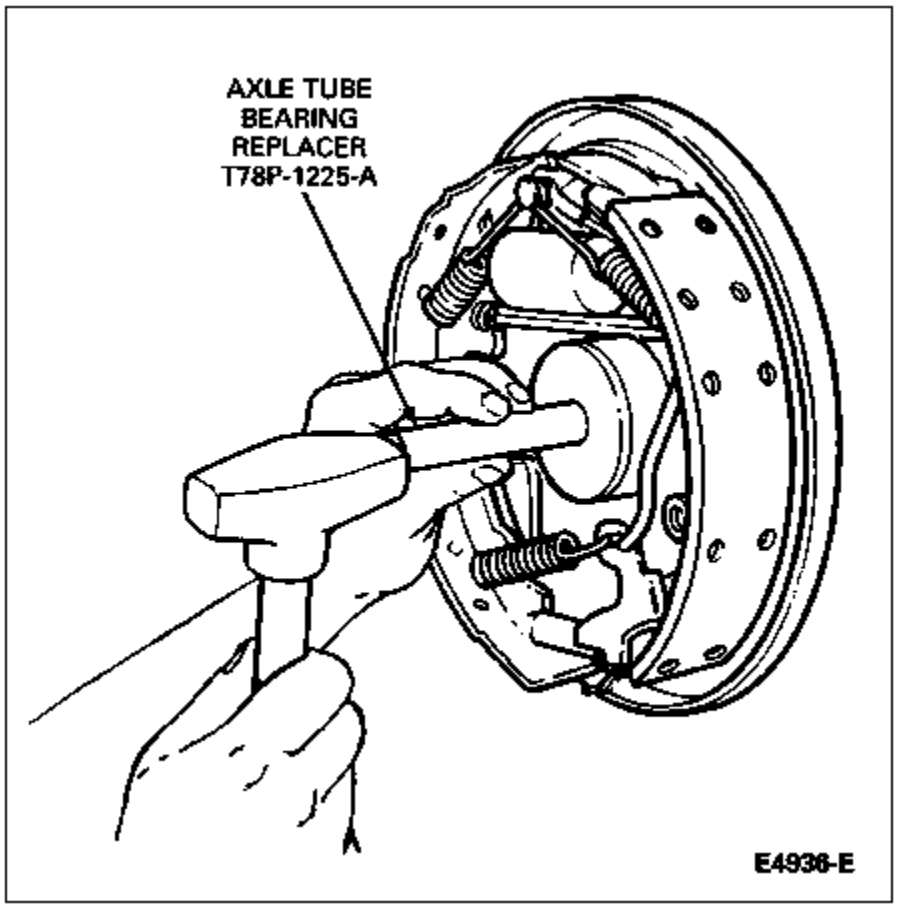
tomsn048@gmail.com



Installation

1. Lubricate the new rear wheel bearing with rear axle lubricant and install into the housing bore using Axle Tube Bearing Replacer T78P-1225-A.

tomsn048@gmail.com



2. Apply Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B between the lips of the inner wheel bearing oil seal.

3. **CAUTION: Installation of the rear wheel bearing or inner wheel bearing oil seal assembly without the proper tool may result in an early failure. If inner wheel bearing oil seal becomes cocked in the bore during installation, remove it and install a new one.**

   Install a new inner wheel bearing oil seal using Axle Tube Seal Replacer T78P-1177-A.

4. Install the axle shaft; refer to the procedure in this section.

tomsn048@gmail.com

tomsn048@gmail.com

Drive Pinion Seal and Universal Joint Flange, Rear Axle

SPECIAL SERVICE TOOL(S) REQUIRED

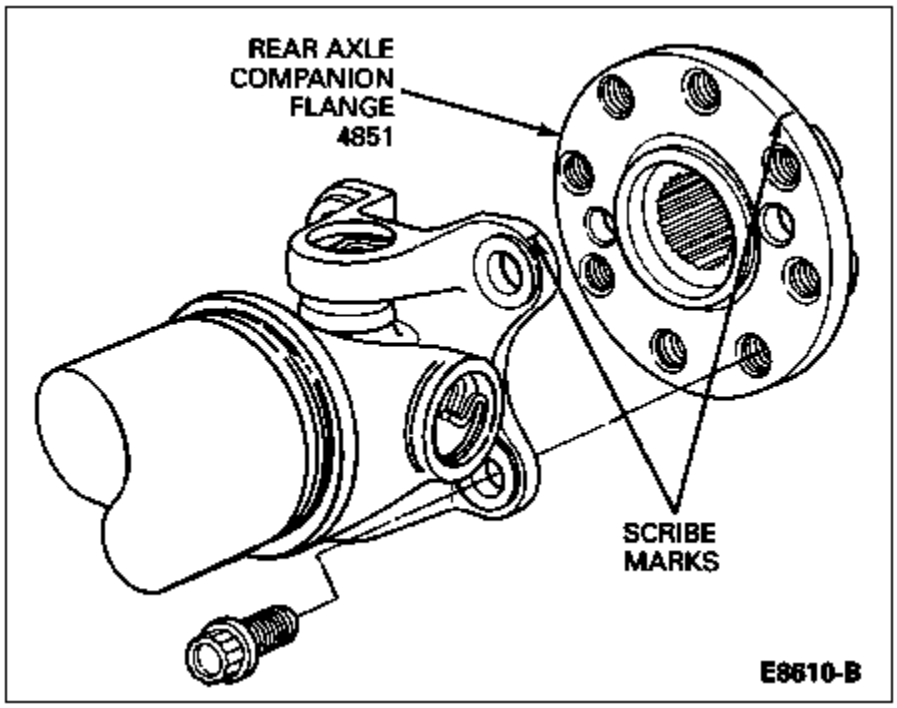
Description	Tool Number
Companion Flange Holding Tool	T78P-4851-A
Differential Side Bearing Puller	T77F-4220-B1
Drive Pinion Oil Seal Replacer	T79P-4676-A

Removal

Replacement of the pinion seal involves removal and installation of only the pinion nut and the rear axle companion flange.

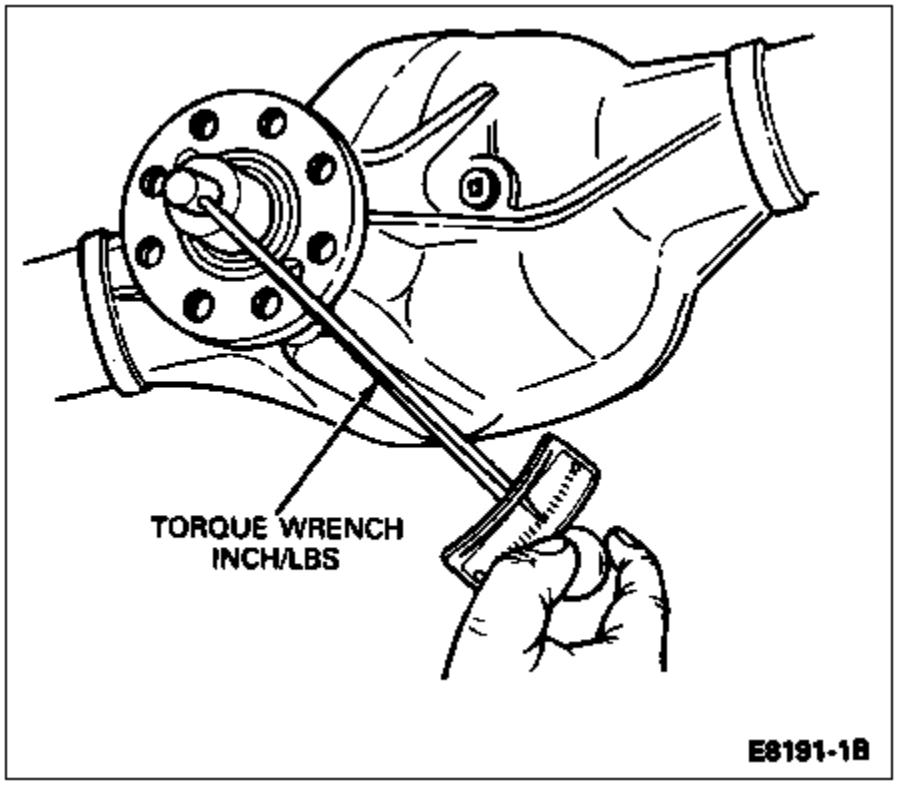
1. **CAUTION: This operation disturbs the pinion bearing preload, which must be carefully reset when assembling.**

   Raise the vehicle and install safety stands. Remove the rear wheels and brake drums (1126). Make scribe marks on the driveshaft end yoke and rear axle companion flange to ensure proper position of the driveshaft and rear axle companion flange at assembly. Disconnect the driveshaft from the rear axle companion flange and support it out of the way.



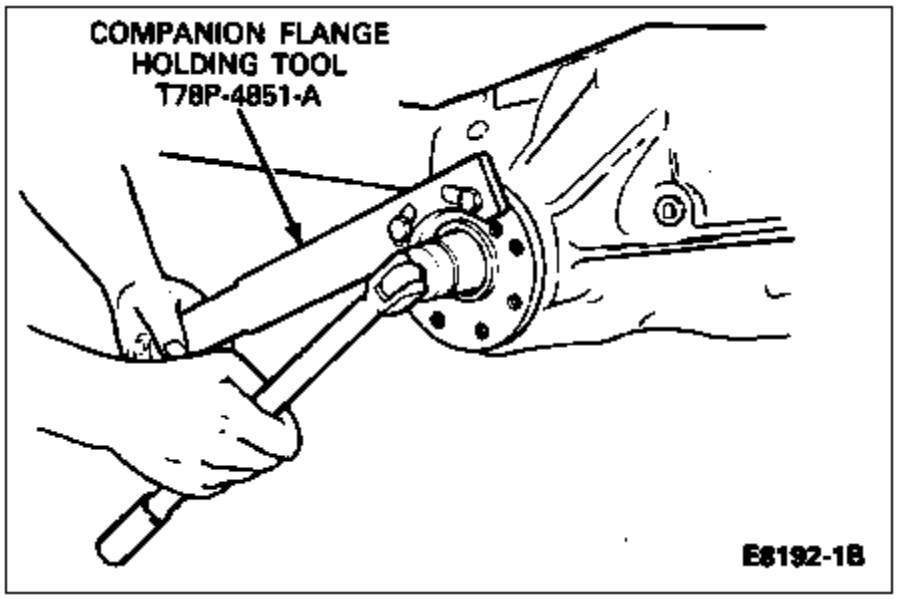
tomsn048@gmail.com

2. Install Nm (inch-pound) torque wrench on the pinion nut. Record the torque required to maintain rotation of the ring gear and pinion through several revolutions.

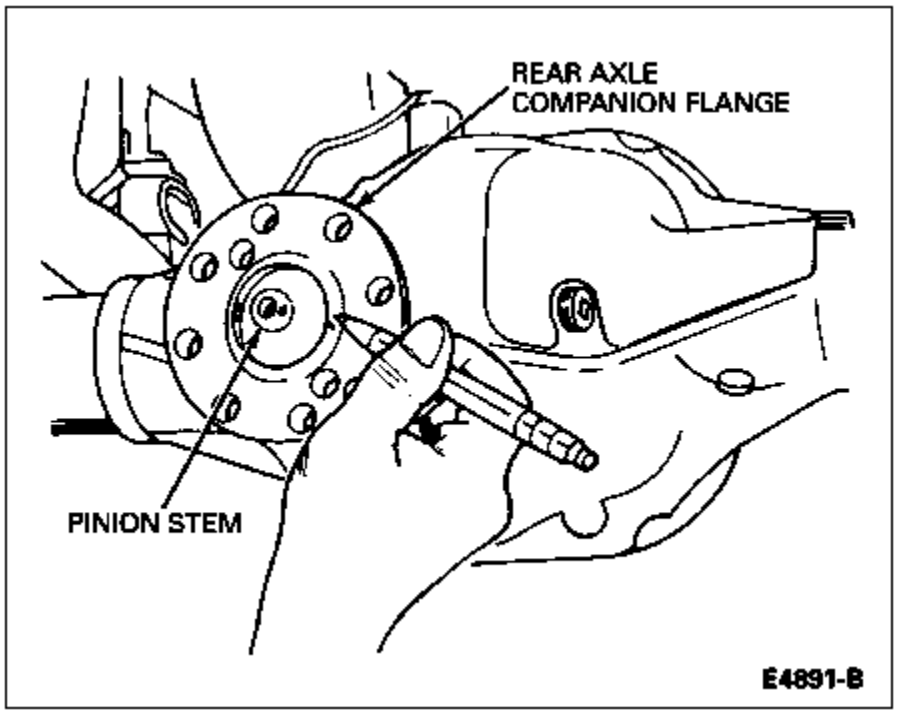


3. While holding the rear axle companion flange with Companion Flange Holding Tool T78P-4851-A remove the pinion nut. Clean the area around the pinion seal. Place a drain pan under the pinion seal to catch any lubricant that may spill out of rear axle assembly (4006) when rear axle companion flange and pinion seal are removed.

tomsn048@gmail.com



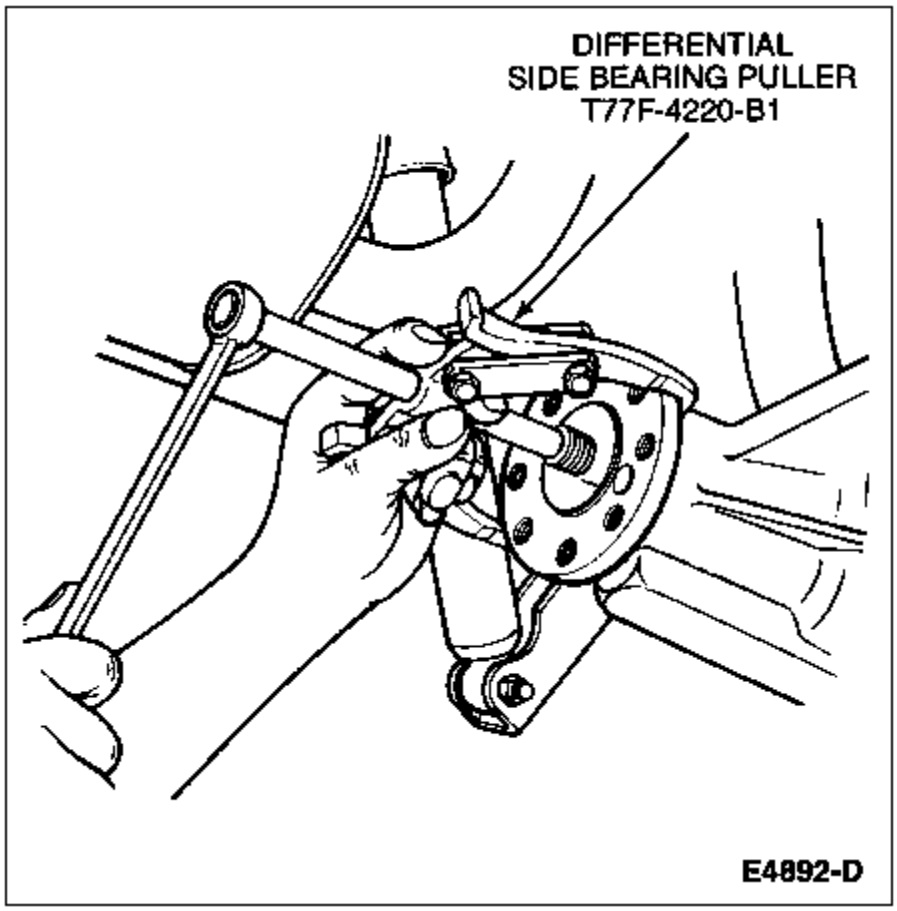
4. Mark the rear axle companion flange in relation to the drive pinion stem so the flange can be reinstalled in the same position.



5. **CAUTION: Never hammer on the companion flange.**

Using Differential Side Bearing Puller T77F-4220-B1 remove the rear axle companion flange.

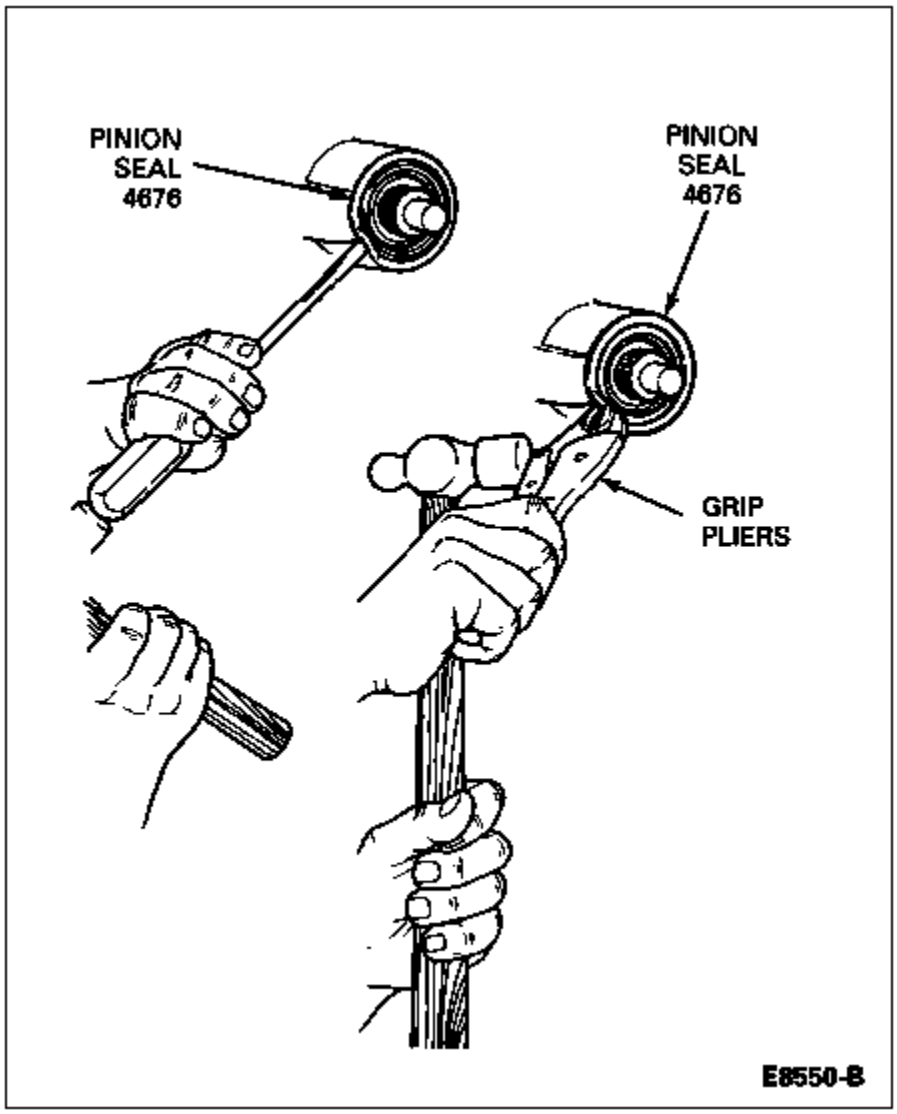
tomsn048@gmail.com



6. **CAUTION: Care should be taken not to damage housing during pinion seal removal.**

   Pry up on metal flange of pinion seal. Install gripping pliers and strike with hammer until pinion seal is removed.

tomsn048@gmail.com



Installation

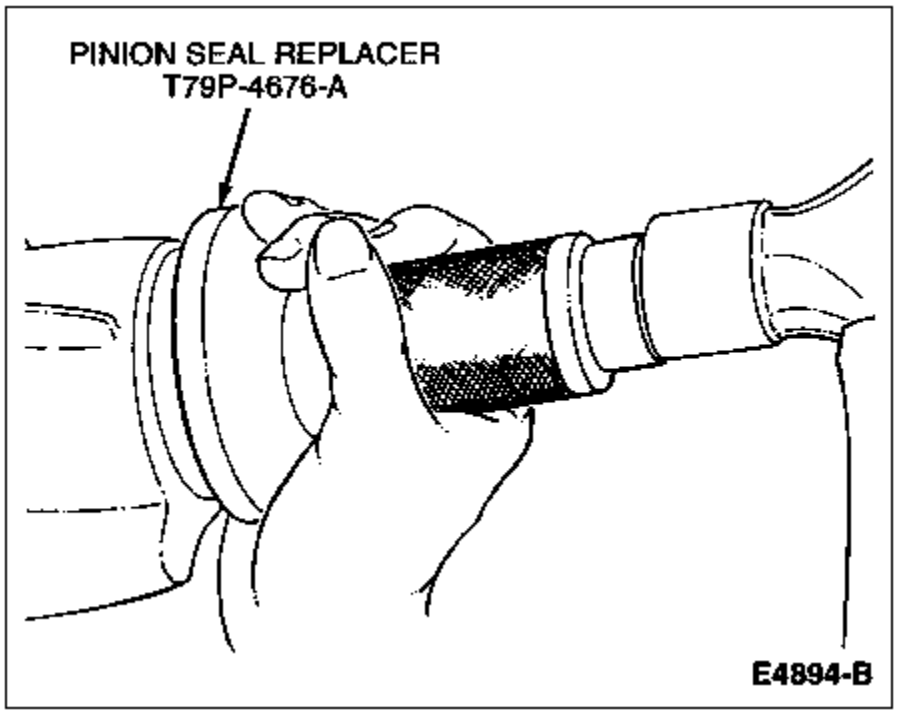
1. Check the splines on the drive pinion stem to be sure they are free of burrs. If burrs are evident, remove them by using a fine crocus cloth, working in a rotational motion.

2. Apply Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B between the lips of the pinion seal. Install seal on Pinion Seal Replacer T79P-4676-A.

3. **CAUTION: Installation of the pinion seal without the proper tool may result in early failure. If pinion seal becomes cocked during installation, remove it and install a new one. Never hammer on pinion seal metal casing.**

   Install the pinion seal in the housing using Pinion Seal Replacer T79P-4676-A.

tomsn048@gmail.com



4. Check the seal surface of the rear axle companion flange for scratches, nicks or a groove around the diameter. If any of these conditions exist, replace with a new rear axle companion flange. Apply a small amount of lubricant to the splines. Align the mark on the rear axle companion flange with the mark on the drive pinion stem.

5. **NOTE: If a new rear axle companion flange is being installed, disregard the scribe mark on the drive pinion stem.**

   NOTE: The rear axle companion flange must never be hammered on or installed with power tools.

   Install rear axle companion flange using Companion Flange Replacer TOOL-4858-E or equivalent.

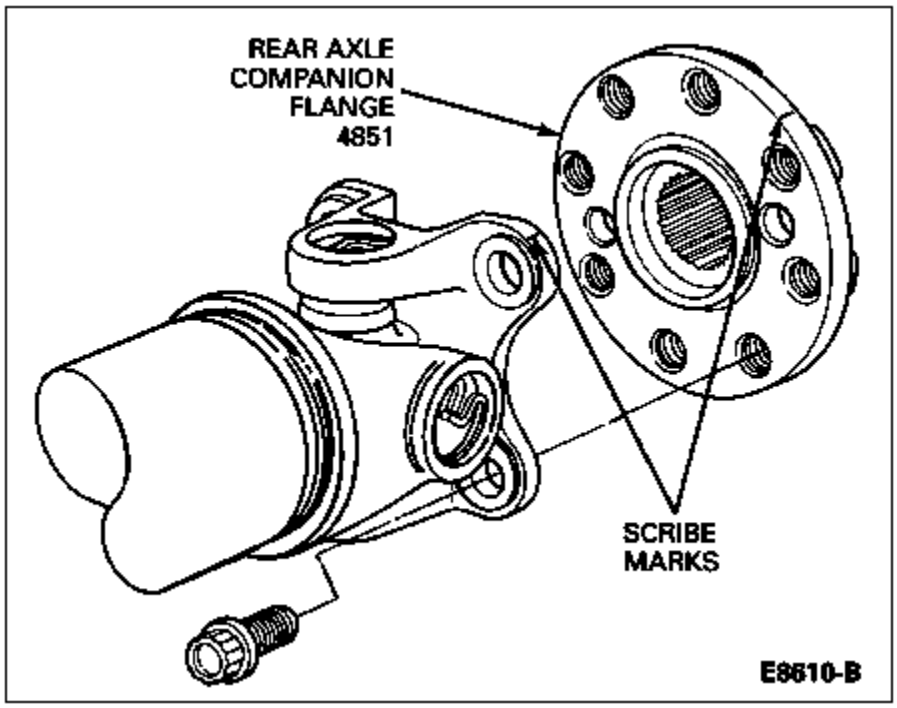
6. Wipe the drive pinion stem clean.

7. Install a new nut on the drive pinion stem. Hold the rear axle companion flange with Companion Flange Holding Tool T78P-4851-A while tightening the nut.

8. Tighten the pinion nut, rotating the pinion occasionally to make sure bearings are seated properly. Also, take frequent pinion bearing torque preload readings until the original recorded preload reading is obtained or to specification 0.9-1.6 Nm (8-14 lb-in). **Under no circumstances should the pinion nut be backed off to reduce preload. If reduced preload is required, a new collapsible spacer and pinion nut must be installed.**

9. Connect the rear driveshaft end yoke to the rear axle companion flange, aligning the scribe marks on the driveshaft end yoke and rear axle companion flange. Install bolts and tighten to 95-128 Nm (70-95 lb-ft).

tomsn048@gmail.com



10. **NOTE: Use Premium Rear Axle Lubricant XY-80W90-QL or equivalent meeting Ford specification WSP-M2C197-A.**

    Add lubricant through the filler hole until the lubricant level reaches 6-14 mm (1/4 to 9/16 inch) below the bottom of the filler hole with the axle in the running position and the vehicle level on the hoist. Install fill plug and tighten to 20-41 Nm (15-30 lb-ft).

11. Reinstall brake drums and rear wheels. Remove safety stands and lower vehicle. Tighten the lug nuts to 115-156 Nm (85-115 lb-ft).

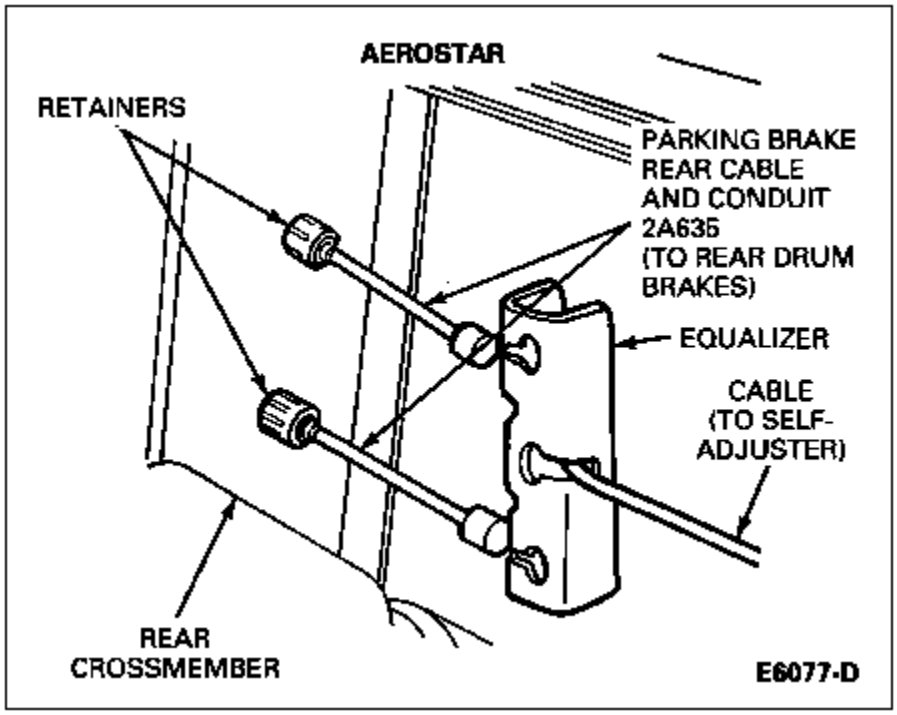
tomsn048@gmail.com

Rear Axle, Aerostar

Removal

NOTE: Use a twin-post type hoist to remove the rear axle (4001).

1. Release the tension of the parking brake rear cable and conduit (2A635) as follows:
    a. Raise the vehicle.
    b. Pull rearward on the front cable, from underneath the vehicle, approximately 50.8mm (2 inches). Clamp the cable, part of parking brake rear cable and conduit behind the crossmember taking care to make sure the plastic coating on the parking brake rear cable and conduit is not damaged. This will release tension on the parking brake rear cable and conduit.
2. Remove the parking brake rear cable and conduit from the equalizer. Compress the tabs on the retainers and pull the parking brake rear cable and conduit through the rear crossmember.



3. Position jackstands on the frame rear lift points or under the rear axle bumper brackets (4731).
4. Scribe a mark aligning the driveshaft end yoke and rear axle companion flange to the rear axle. Remove the driveshaft assembly. Plug the extension housing (7A039) to prevent fluid spillage.

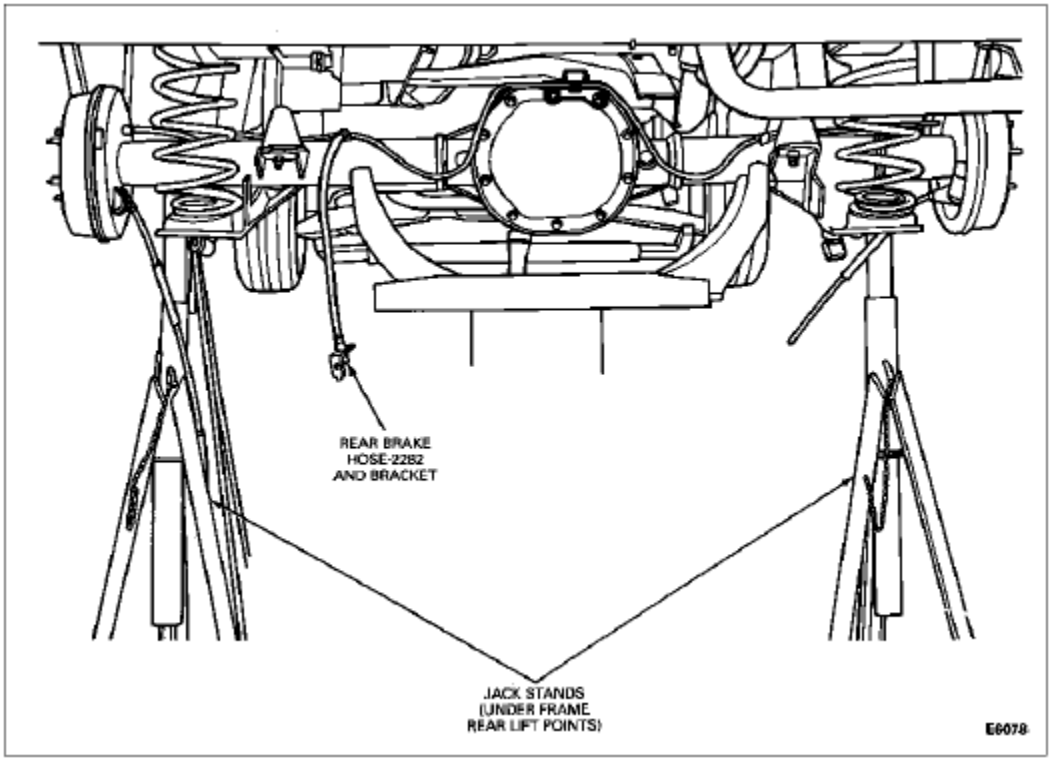
tomsn048@gmail.com

5. Disconnect RABS connector from rear brake anti-lock sensor. Disconnect wiring from locator clip and position out of way.

6. Remove the wheel and tire assemblies.

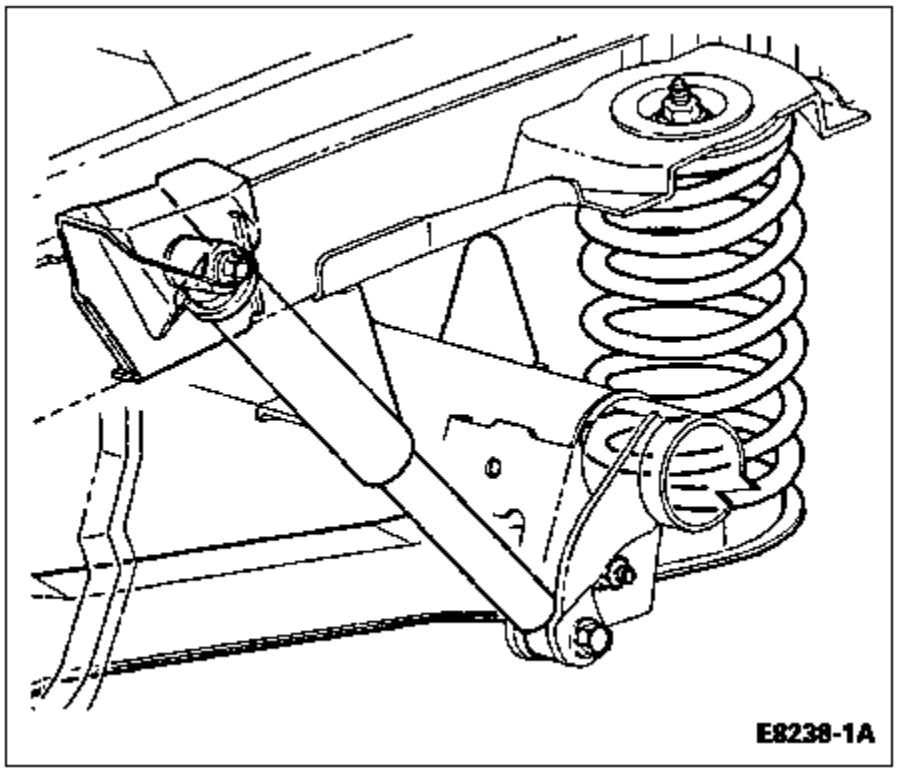
7. Disconnect the brake lines by disconnecting the brake jounce hose from the master cylinder rear tube. Plug the tube. Remove the jounce hose and rear axle bumper bracket from the frame.

Rear Axle



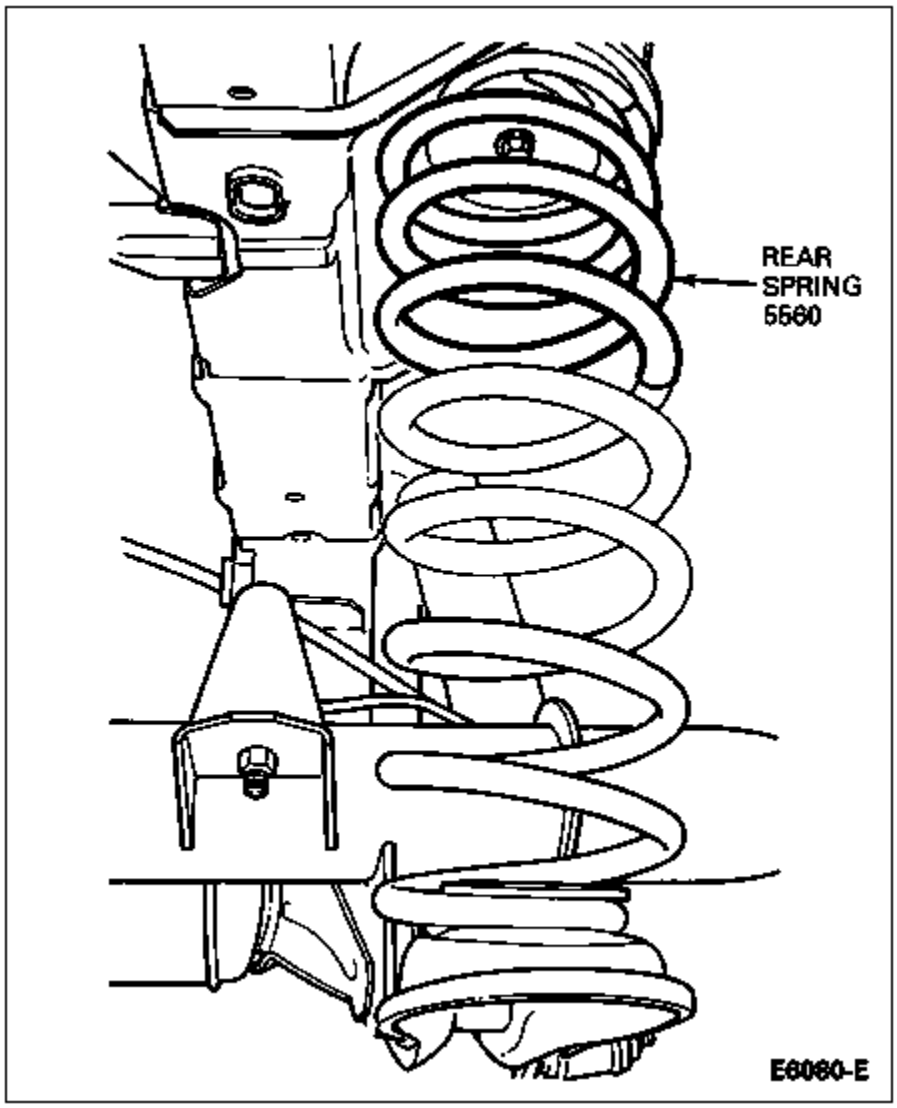
8. Disconnect the shock absorber from the lower rear suspension arm and bushing (5500).

tomsn048@gmail.com



9. Lower the rear axle assembly (4006) until the rear springs are no longer under compression.

tomsn048@gmail.com



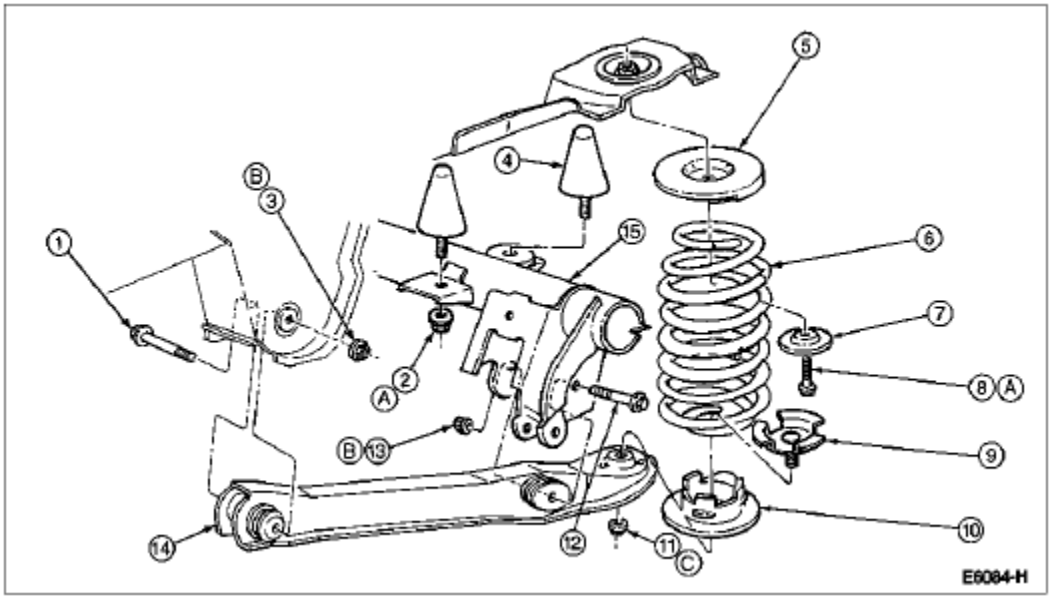
10. Remove the lower spring retainer, then the upper retainer and remove the rear spring.

11. **NOTE: Make sure adequate clearance exists to remove the bolts retaining the rear suspension arm and bushing at therear axle assembly.**

    Raise the axle to the normal load position and disconnect the rear suspension arm and bushings at the rear axle assembly.

Rear Axle, Aerostar

tomsn048@gmail.com



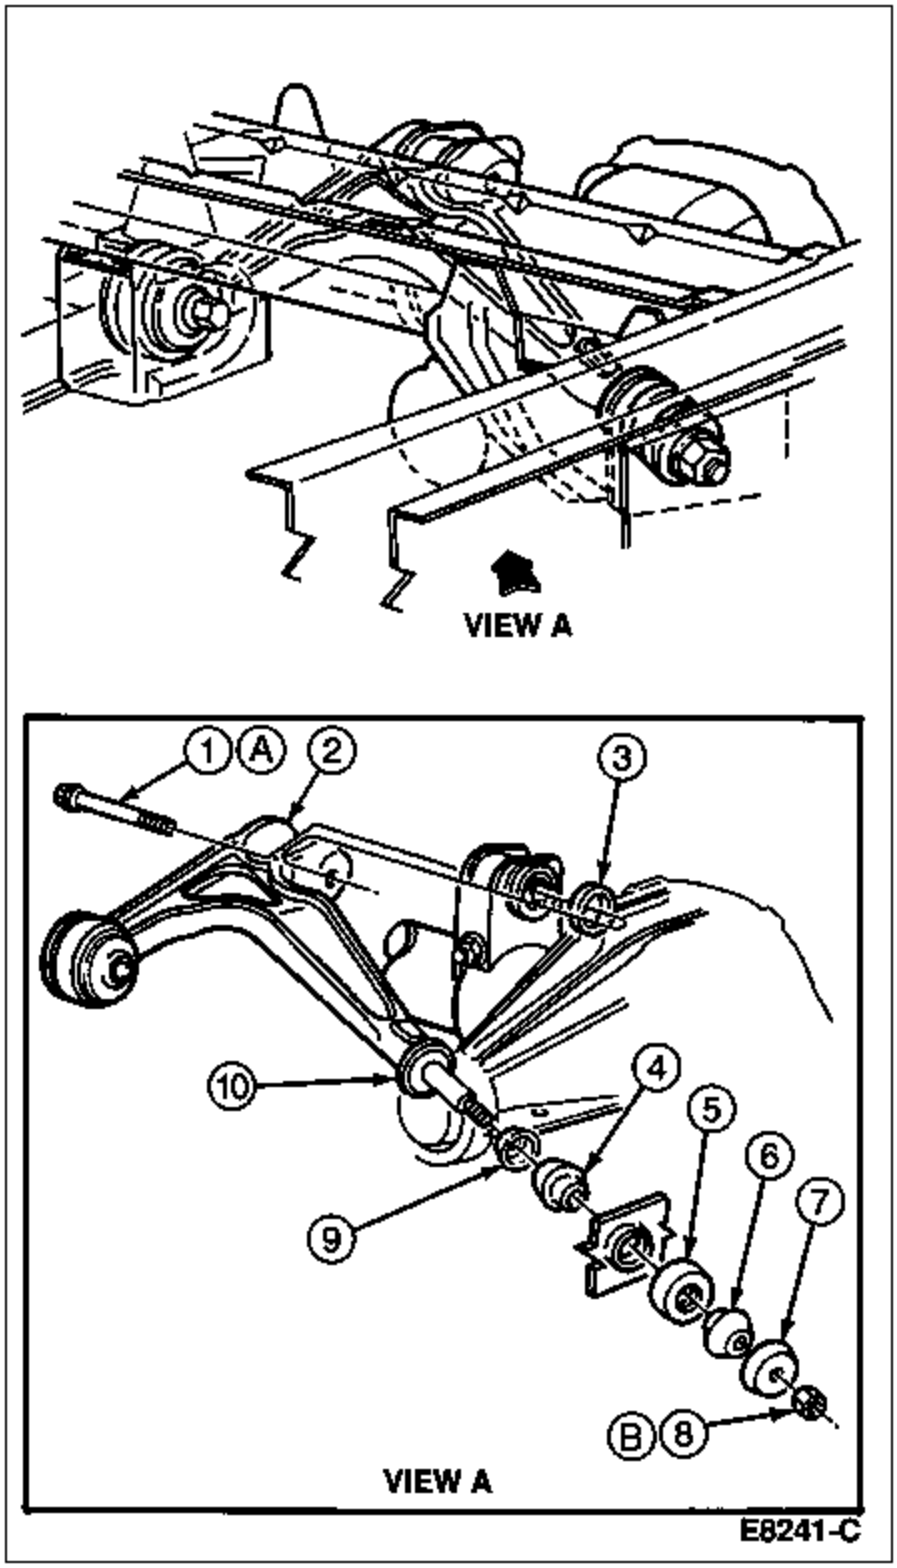
Item	Part Number	Description
1	805791	Lower Rear Suspension Arm and Bushing to Frame Nut
2	800152	Rear Axle Bumper Nut
3	801670	Lower Rear Suspension Arm and Bushing to Frame Nut
4	4730	Rear Axle Bumper
5	5536	Rear Spring Insulator
6	5560	Rear Spring
7	5A543	Rear Spring Upper Retainer
8	605919	Upper Spring Retainer Bolt
9	5A569	Rear Spring Lower Retainer
10	5741	Rear Spring Center Mounting Insulator
11	620483	Lower Spring Retainer Nut
12	N803923	Lower Rear Suspension Arm and Bushing to Rear Axle Retaining Bolt
13	N801670	Lower Rear Suspension Arm and Bushing to Rear Axle Nut
14	5500	Rear Suspension Arm and Bushing, Lower
15	4001	Rear Axle
A	—	Tighten to 40-55 Nm (30-40 Lb-Ft)
B	—	Tighten to 129-177 Nm (95-130 Lb-Ft)
C	—	Tighten to 55-85 Nm (41-63 Lb-Ft)

tomsn048@gmail.com

12. Remove the bolt and nut retaining the upper rear suspension arm and bushing to the rear axle. Remove the upper rear suspension arm and bushing from the axle.

13. Lower the rear axle assembly from the vehicle.

tomsn048@gmail.com



Item	Part Number	Description
1	806054	Upper Rear Suspension Arm and Bushing to Axle Housing Bolt

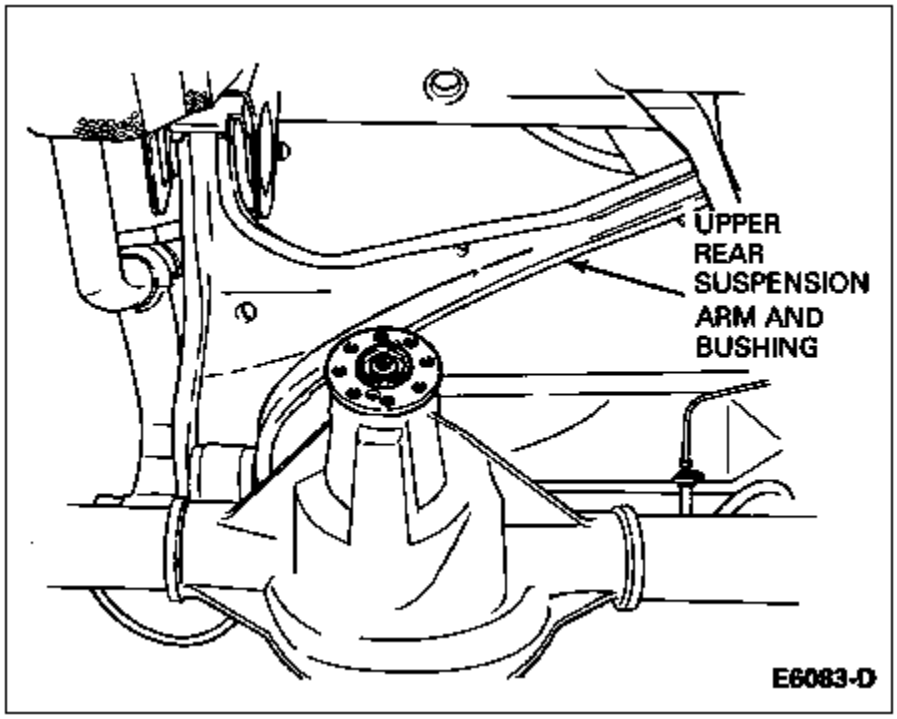
tomsn048@gmail.com

2	5500	Rear Suspension Arm and Bushing, Upper
3	5K679	Bushing
4	5K752	Insulator
5	5K580	Spacer
6	5K752	Insulator
7	5A349	Retainer
8	801670	Nut
9	5A349	Retainer
10	5500	Plastic Washer
A	—	Tighten to 210-285 Nm (155-210 Lb-Ft)
B	—	Tighten to 81-135 Nm (80-100 Lb-Ft)

Installation

1. Raise the rear axle assembly into position in the vehicle.
2. **NOTE: Do not tighten to specified torque at this time.**

   Position the upper rear suspension arm and bushing and install the bolt. Tighten until snug.



3. Lower the rear axle assembly to the spring unloaded position. Place the lower insulator on the lower

tomsn048@gmail.com

rear suspension arm and bushing. Place the upper insulator on top of the rear spring. The rear spring (white colored) must face upward. Install the rear spring in position on the lower rear suspension arm and bushing and rear axle assembly.

4. Install the lower retainer and lower spring retainer nut. Tighten the nut to 55-85 Nm (41-63 lb-ft).
5. Install the upper retainer and upper spring retainer bolt. Tighten the bolt to 40-55 Nm (30-40 lb-ft).
6. Raise the rear axle assembly to the normal load position and tighten the lower rear suspension arm and bushing to rear axle retaining bolt and nut to 129-177 Nm (95-130 lb-ft). Tighten upper rear suspension arm and bushing bolt to 210-285 Nm (155-210 lb-ft).
7. Connect the shock absorber to the lower control arm bracket . Install the shock bolt nut on the inside of the lower control arm bracket. Install the nut and tighten to 54-82 Nm (40-60 lb-ft).
8. Position RABS wiring harness in locator clip and connect to rear brake anti-lock sensor.
9. Attach the rear brake hose (2282) and rear axle bumper bracket to the frame. Connect the rear brake hose to the tube from the master cylinder.
10. Install the wheel and tire assemblies on the brake drums (1126). Tighten the lug nuts to 115-156 Nm (85-115 lb-ft).
11. Install the driveshaft assembly, making sure the scribed marks on the rear axle companion flange and driveshaft end yoke are in alignment. Install the bolts and tighten to 95-128 Nm (70-95 lb-ft).
12. Raise the vehicle and remove the jackstands.
13. Pull the parking brake rear cable and conduits through the clips on the vehicle underbody side rails and through the rear crossmember. Connect the parking brake rear cable and conduits to the equalizer.
14. Unclamp the front parking brake cable to restore cable tension.
15. Bleed the brakes as described in Section 06-06 .
16. Check and, if required, adjust pinion rear axle angle as described in Section 05-00 .
17. Lower the vehicle.

---

tomsn048@gmail.com

tomsn048@gmail.com

Rear Axle, Ranger

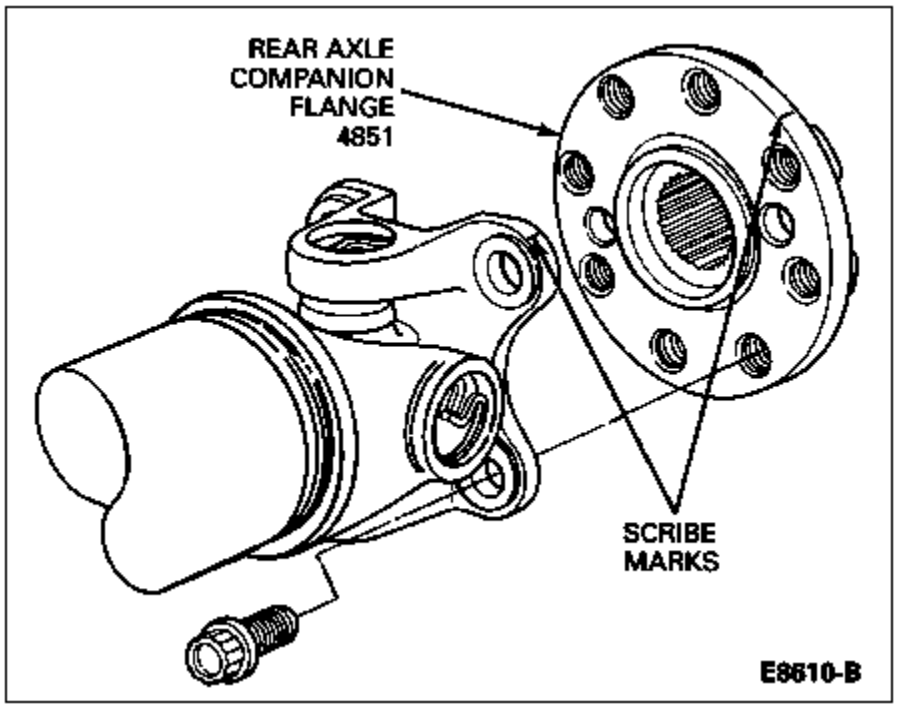
Removal

1. Raise and support the vehicle.
2. Remove the wheel and tire assemblies.
3. Remove the brake drums. Refer to Section 06-02 .
4. Remove the rear stabilizer bar (5A772). Refer to Section 04-02 .
5. Disengage the brake lines from the clips on the axle housing.
6. **NOTE: Do not open the hydraulic brake system lines.**

   Remove the hydraulic brake T-fitting bolt from the axle housing.
7. Position a drain pan under the axle housing cover (4033).
8. Remove the axle housing cover screws and the axle housing cover and allow the lubricant to drain from the rear axle assembly (4006). Clean and remove all the gasket material from the axle housing cover.
9. Remove the axle shafts (4234). Refer to the procedure in this section.
10. Remove the four nuts and bolts from each brake backing plate to the axle housing flange.
11. Support each backing plate with wire.
12. Disconnect the rear anti-lock brake sensor electrical connector.
13. Disconnect the vent from the axle housing.
14. **NOTE: Scribe marks on the driveshaft end yoke and on the rear axle companion flange to ensure proper position of the driveshaft at installation.**

    Remove the driveshaft-to-rear axle companion flange bolts and separate the driveshaft from the companion flange.

tomsn048@gmail.com



15. Position the driveshaft out of the way and support it with wire.
16. Support the rear axle assembly with a jack.
17. Remove the lower nut and bolt from each rear shock absorber and swing the lower end free of the mounting bracket on the axle housing.
18. Remove the nuts from the LH and RH spring U-bolts and drive the U-bolts from the rear spring plates (5796).
19. Lower the rear axle assembly and carefully remove it from the vehicle.

Installation

1. Raise the rear axle assembly and carefully position it to the vehicle.
2. Install the rear spring plates, the LH and RH spring U-bolts, and the U-bolt nuts. Tighten the U-bolt nuts to 88-118 Nm (65-80 lb-ft).
3. Position each rear shock absorber to the mounting bracket on the axle housing and install the lower nuts and bolts. Tighten the shock absorber lower bolt nuts to 53-72 Nm (39-53 lb-ft).
4. Connect the driveshaft end yoke to the rear axle companion flange, making sure to verify that the marks made during removal align, and that the driveshaft is installed in its original position.
5. Apply Loctite® Stud and Bearing Mount E0AZ-19554-BA or equivalent meeting Ford specification WSK-M2G349-A1 to the threads of the driveshaft end yoke-to-rear axle companion flange bolts. Tighten the bolts to 95-128 Nm (70-95 lb-ft).
6. Position the hydraulic brake T-fitting bolt to the axle housing and install the bolt. Tighten the hydraulic

tomsn048@gmail.com

brake T-fitting bolt securely.

7. Install the brake lines to the clips on the axle housing.

8. Position the brake backing plates to the axle housing flanges and install the four nuts and bolts. Tighten the brake backing plate-to-axle housing nuts to 27-54 Nm (20-40 lb-ft).

9. **NOTE: Make sure that the axle vent is not plugged with debris.**

   Apply Loctite® Stud and Bearing Mount E0AZ-19554-BA or equivalent meeting Ford specification WSK-M2G349-A1 to the threads on the axle housing vent. Install the vent to the axle housing.

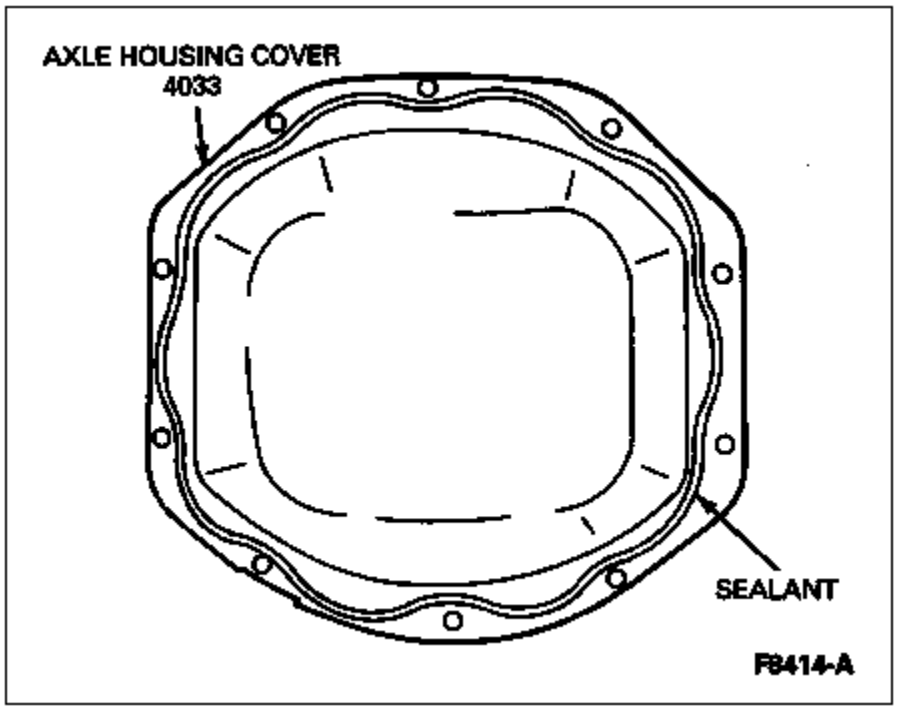
10. Install the rear stabilizer bar. Refer to Section 04-02 .

11. Connect the rear anti-lock brake sensor electrical connector.

12. Install the axle shafts. Refer to Section 05-02A .

13. **CAUTION: Make sure that the machined surface on the carrier is clean and free of the gasket material before installing the axle housing cover. The inside of the rear axle assembly must be covered when cleaning the machined surface to prevent contamination.**

    Apply a new continuous bead of Silicone Rubber Sealant D6AZ-19562-BA or -AA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A to the axle housing cover.



14. Tighten the axle housing cover screws to 38-52 Nm (28-38 lb-ft).

15. Install the brake drums. Refer to Section 06-02 .

tomsn048@gmail.com

16. Install the wheel and tire assemblies. Tighten the lug nuts to 115-156 Nm (85-115 lb-ft).

17. Remove the rear axle assembly fill plug and add Premium Rear Axle Lubricant XY-80W90-QL or equivalent meeting Ford specification WSP-M2C197-A until the lubricant level is 6-14mm (1/4-9/16 inch) below the bottom of the fill hole. Add 4 ounces of Friction Modifier C8AZ-19B546-A or equivalent meeting Ford specification EST-M2C118-A for Traction-Lok® rear axle assembly. Install the fill plug and tighten to 20-41 Nm (15-30 lb-ft).

18. Lower the vehicle.

---

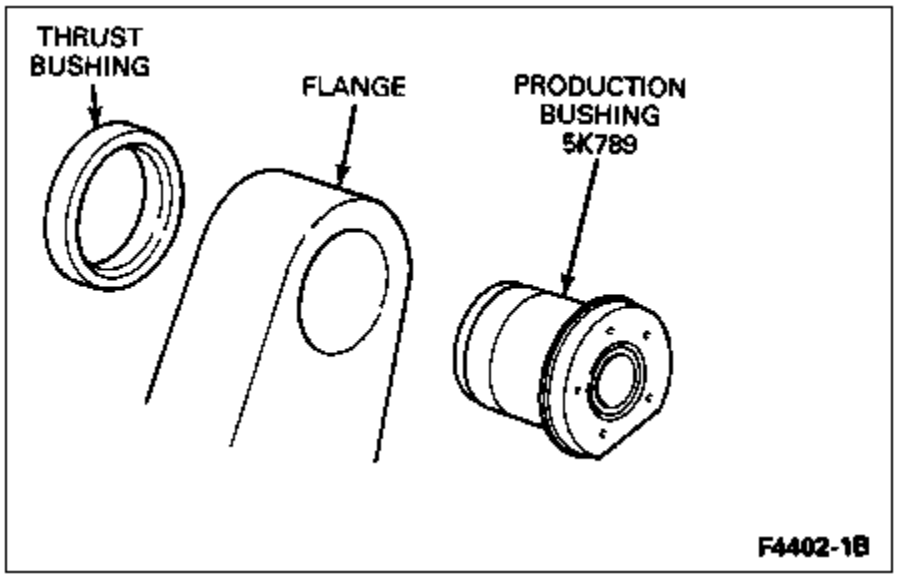
tomsn048@gmail.com

Axle Housing-to-Upper Control Arm Bushing, Aerostar

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Axle Housing Bushing Mounting Adapter	T85T-5638-AH11
Forcing Screw	T78P-5638-A1
Axle Housing Bushing Remover	T85T-5638-AH12
Axle Housing Bushing Replacer	T85T-5638-AH13

NOTE: In service, the pinion angle adjustment is changed using an eccentric service bushing F09Z-5K789-B. If the bushing is being replaced due to damage or wear only, use standard production bushing F09Z-5K789-A. For pinion angle measurement procedures, refer to Driveline Angle Checking in Section 05-00 .



Removal

1. **CAUTION: The axle must be securely supported on the hoist or stands. If more axle-hoist travel is required, disconnect the shock absorbers (18080) from the rear suspension lower arms.**

   Raise the vehicle on a twin post hoist. Position jackstands on the frame rear lift points or under the rear bumper support brackets. If a frame hoist is used, raise the vehicle and position tall jackstands under the rear axle (4001). Lower the hoist until the axle is in the normal ride height position.

tomsn048@gmail.com

2. Remove upper rear suspension arm-to-axle housing bolt.

3. With the vehicle securely supported on safety stands, slowly lower the rear axle until the upper rear suspension arm and bushing (5500) disengages from the rear axle. If a frame hoist is used, raise the hoist until the rear suspension arm disengages from the rear axle.

4. On the inboard side of the flange, insert a flat-blade screwdriver between the thrust bushing and flange. Pry the thrust bushing end off the bushing and flange without damaging any surfaces.

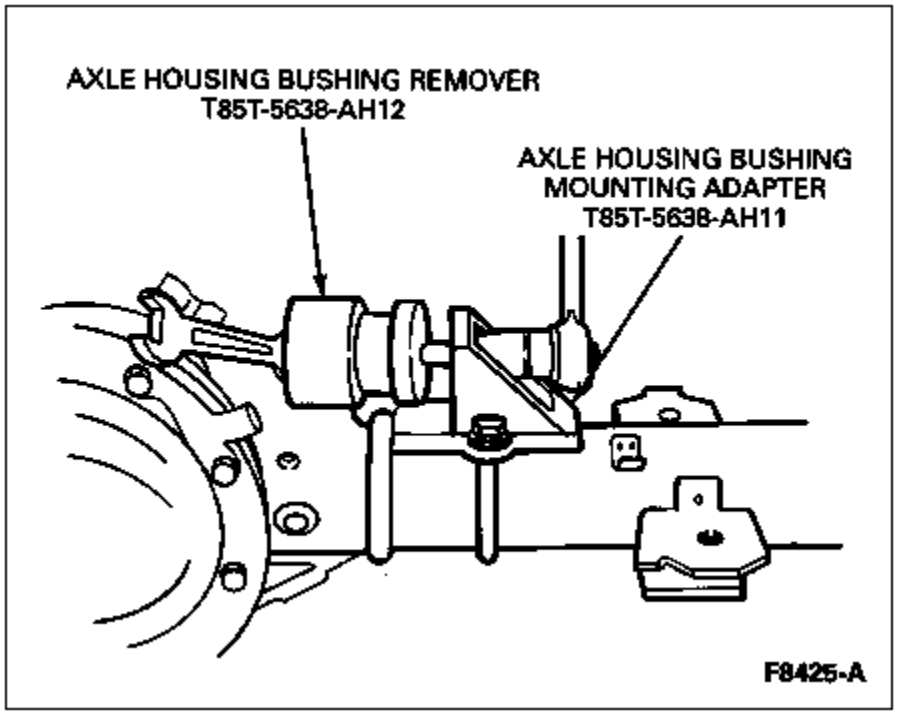
5. Attach Axle Housing Bushing Mounting Adapter T85T-5638-AH11 to the axle housing tube by using the U-bolt.

6. Place the Forcing Screw T78P-5638-A1 through the axle housing bushing to be removed.

7. Place the Axle Housing Bushing Remover T85T-5638-AH12 onto the forcing screw and thread a 7/16-20 nut onto the forcing screw.

8. Tighten the forcing screw to pull the bushing out of the axle housing.

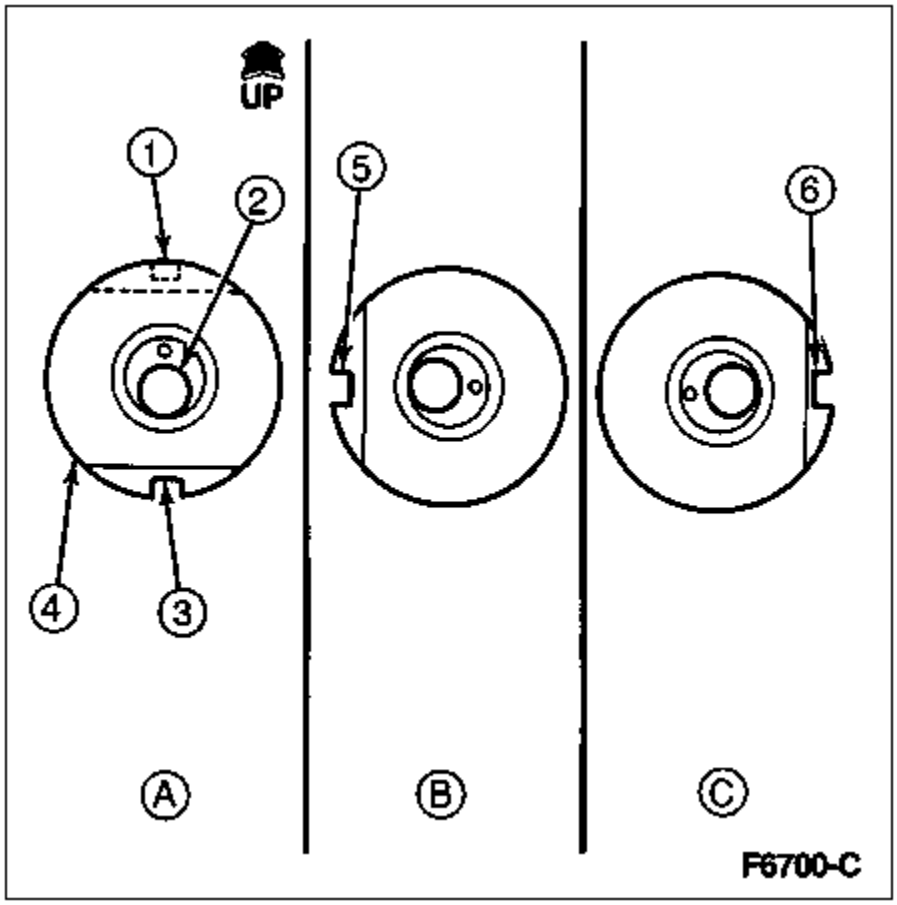
9. Remove the forcing screw, bushing remover and mounting adapter.



Installation

1. **NOTE: The notch on the bottom of the bushing must point in a 6 or 12 o'clock position for zero pinion angle adjustment, 3 o'clock position for 1.25° pinion angle up adjustment and 9 o'clock position for -1.25° pinion angle down adjustment.**

tomsn048@gmail.com



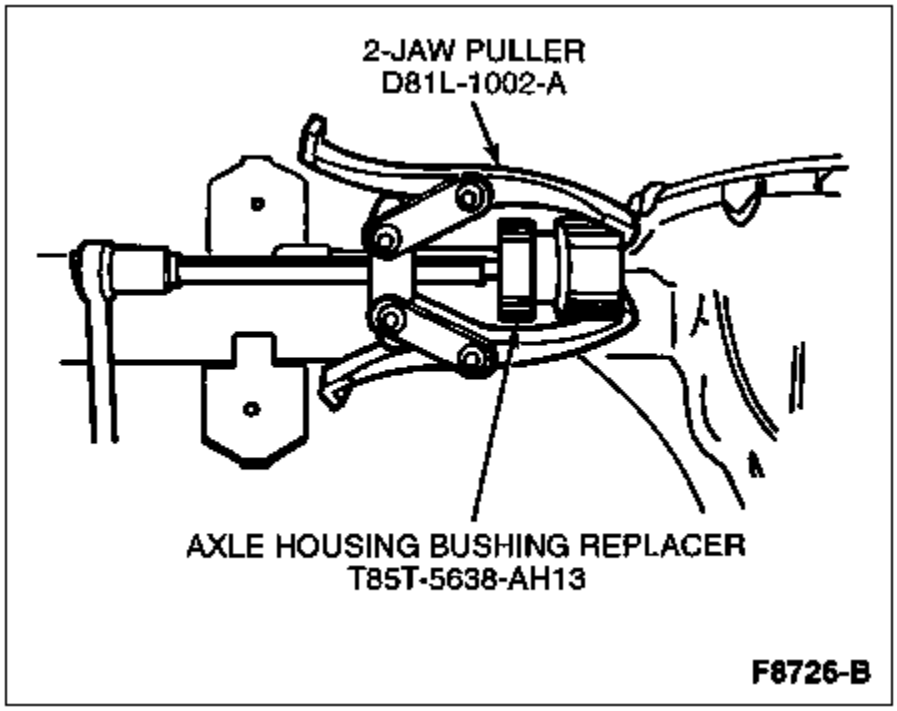
Item	Part Number	Description
1	—	12 O'Clock Position (Part of 5K789)
2	—	Bolt Hole (Part of 5K789)
3	—	6 O'Clock Position (Part of 5K789)
4	5K789	Eccentric Service Bushing
5	—	9 O'Clock Position (Part of 5K789)
6	—	3 O'Clock Position (Part of 5K789)
A	—	Nominal Position
B	—	Pinion Nose Down Position 1.25°
C	—	Pinion Nose Up Position 1.25°

Lubricate the bushing to be installed and place the bushing into the axle housing bushing bore.

2. Position 2-Jaw Puller D81L-1002-A or equivalent around the axle housing bushing bracket with Axle Housing Bushing Replacer Adapter T85T-5638-AH13 between the forcing screw and the flanged end of the bushing.

tomsn048@gmail.com

3. Turn the forcing screw to push bushing into position. Remove the installation tools.



4. On the inboard side of flange, install thrust bushing so steel washer faces the flange.
5. With the vehicle body securely supported on safety stands, raise the rear axle until the rear suspension arm engages the flange on the axle housing. If a frame hoist is used, lower the vehicle until the rear suspension arm and bushing engages the flange on the axle housing.
6. Install the nut and bolt retaining the rear suspension arm and bushing to the flange and tighten until snug. Do not tighten to the specified torque at this time.
7. If removed, connect the shock absorber to the lower axle bracket. Install and tighten the retaining nut to 54-82 Nm (40-60 lb-ft).
8. Position the rear axle in the normal ride position. Tighten the bolt retaining the upper rear suspension arm and bushing to the axle housing to 210-285 Nm (155-210 lb-ft).
9. If required, check and adjust the driveline angularity or driveline angle check as described in Section 05-00 .
10. Remove the safety stands and lower the vehicle.

tomsn048@gmail.com

tomsn048@gmail.com

Axle Disassembly

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Differential Side Bearing Puller	T77F-4220-B1
Impact Slide Hammer	T50T-100-A
Pinion Bearing Cone Remover	T71P-4621-B
Pinion Depth Gauge Set	T79P-4020-A

Sensor, Anti-Lock Brake

1. Clean axle mounting surface, using caution to prevent dirt from entering axle housing.

2. Remove hold-down bolt. Remove rear brake anti-lock sensor.

Differential Case Removal

1. All service operations on the differential case (4204) and the drive pinion can be performed with the axle housing installed in the vehicle.

   Raise the vehicle on drive thru hoist and place jackstands under the rear frame crossmember. Lower the hoist so that the rear axle assembly (4006) drops down far enough for working ease.

2. **NOTE: The next step requires removal of the axle housing cover (4033). On Aerostar, once removed, the plastic axle housing cover must be replaced with a new one.**

   Remove the axle housing cover from the carrier rear face and drain the lubricant. Inspect the differential case and drive pinion before removal following the procedures under Cleaning and Inspection in this section.

3. Check and record the ring gear runout as described in Section 05-00 .

   - Check and record the ring gear backlash as described in this section.

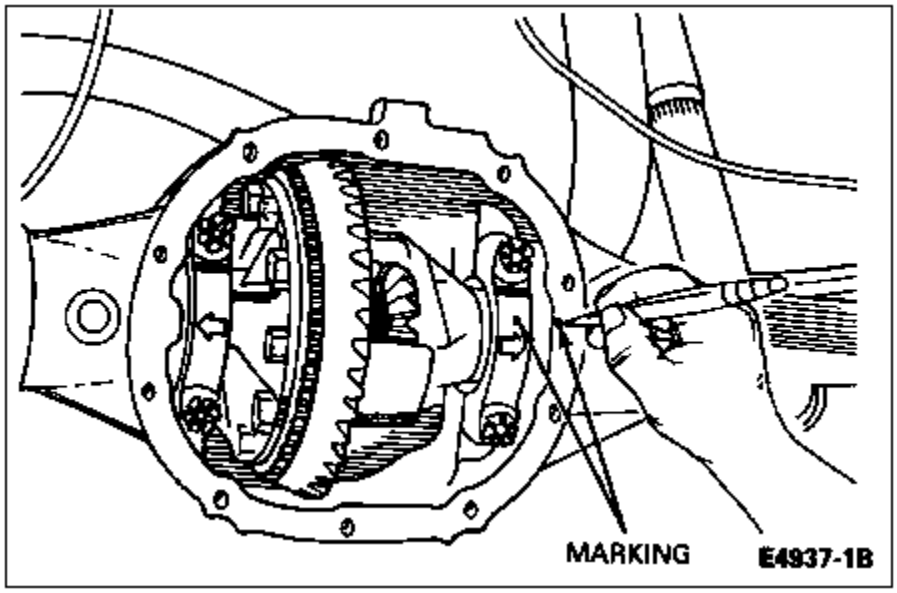
4. Remove the rear wheels and brake drums (1126).

5. Remove the axle shafts (4234) as described in this section under Axle Shaft Removal and Installation.

6. Make scribe marks on the driveshaft end yoke and the rear axle companion flange to ensure proper alignment at assembly. If required, remove the damper assembly from the carrier. Disconnect the driveshaft end yoke from the rear axle companion flange. Remove the driveshaft assembly from the vehicle.

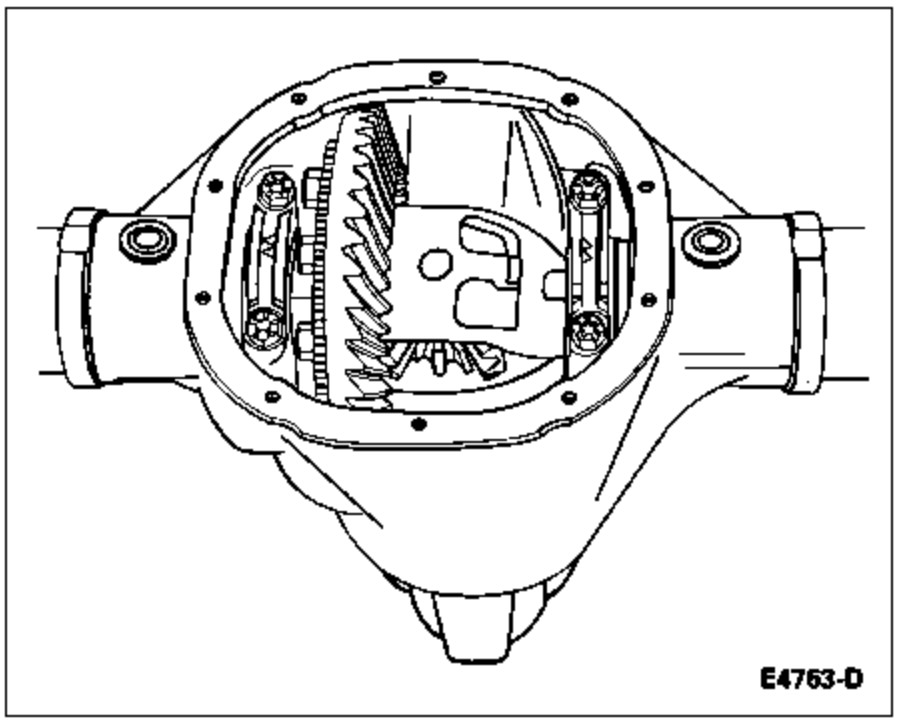
tomsn048@gmail.com

7. Mark differential bearing caps to make sure they are installed in original positions during assembly.



8. Loosen the differential bearing cap bolts.

   - Bearing caps **must** be installed in their original positions and locations. Triangles embossed on bearing caps must face outboard toward the axle shafts.

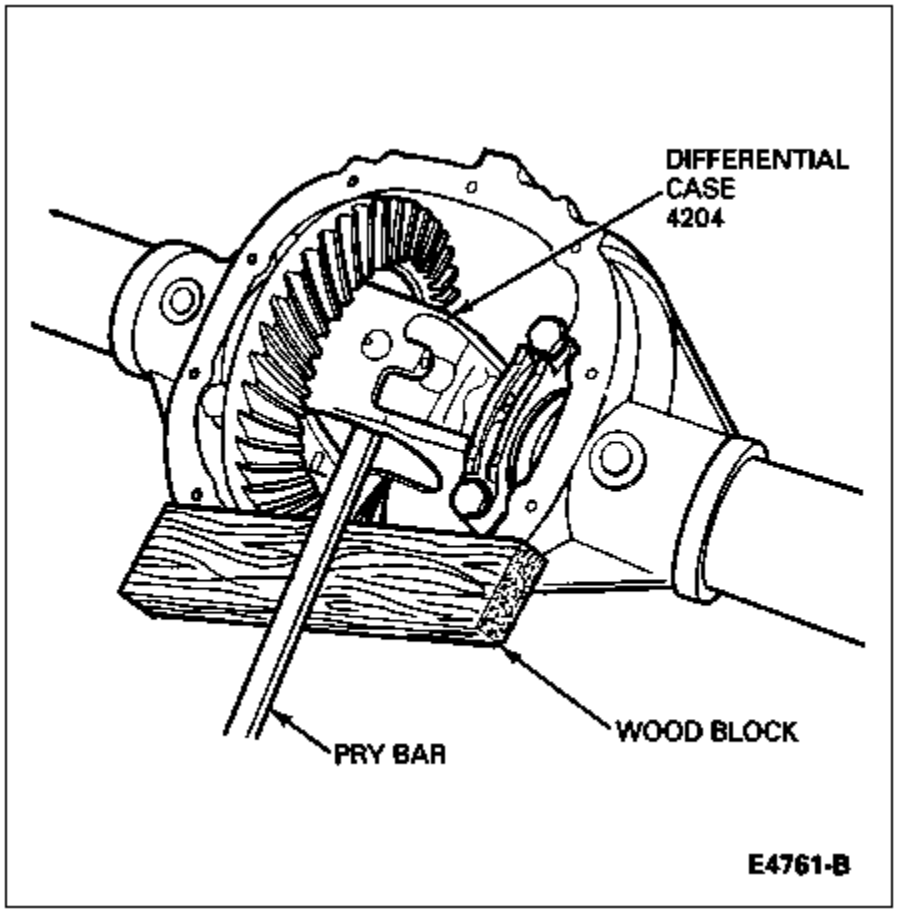


9. **NOTE: Before removing differential case from carrier, inspect it and determine if differential case runout check is necessary. If so, refer to Section 05-00 .**

tomsn048@gmail.com

Pry the differential case, differential bearing cups (4222) and differential bearing shims (4067) out until they are loose in the bearing caps. Remove the bearing caps and remove the differential case from the carrier. If the ring gear is removed from the differential case, coat ring gear bolts with Stud and Bearing Mount E0AZ-19554-BA or equivalent meeting Ford specification WSK-M2G349-A1 prior to installation. Tighten to 95-115 Nm (70-85 lb-ft). For rear anti-lock brake sensor replacement, refer to Sensor Indicator, Anti-Lock Brake in the Removal and Installation portion of this section. For Traction-Lok® Differentials, refer to Section 05-02C .

- If a high ratio ring gear (3.73:1-4.10:1) is removed, make sure the drive pinion shaft is installed in the differential case before installing the ring gear on the differential case.



Drive Pinion Removal

1. Mark the rear axle companion flange in relation to the drive pinion stem. Hold the rear axle companion flange with the proper tool and remove the pinion nut. If a new rear gear and pinion is being installed, the driveshaft centering socket yoke (4782) need not be marked.

2. **NOTE: Before removing rear axle companion flange, inspect it and determine if companion flange runout check is necessary. If so, refer to Section 05-00 .**

   Remove the rear axle companion flange with Differential Side Bearing Puller T77F-4220-B1. With a soft-faced hammer, drive the pinion out of the bearing cone and roller and remove it through the rear of the carrier casting.

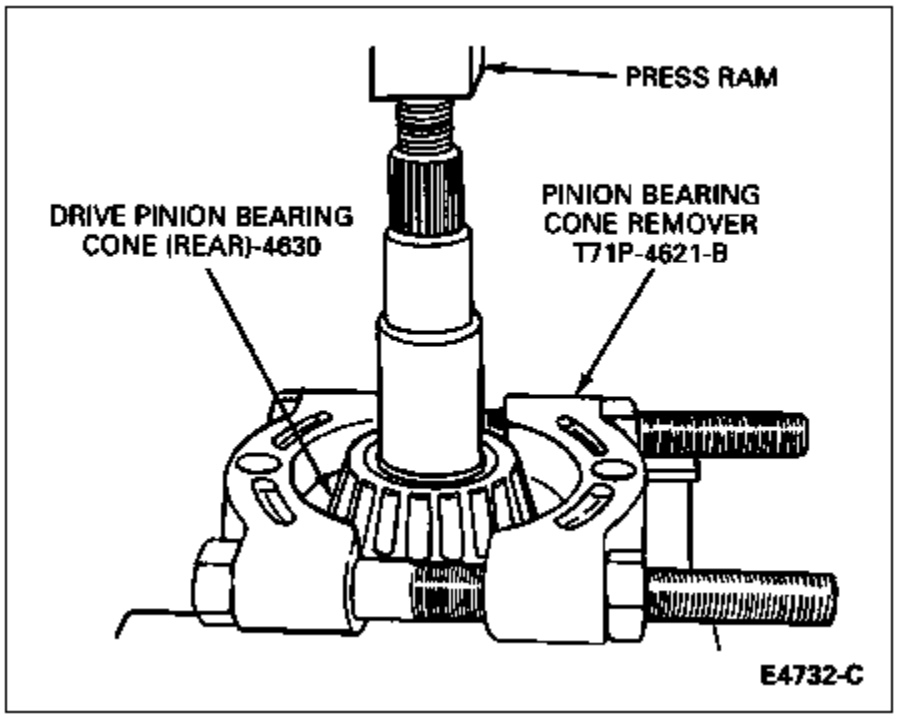
tomsn048@gmail.com

3. Remove the pinion seal with Seal Remover TOOL-1175-AC or equivalent and Impact Slide Hammer T50T-100-A. Remove the bearing cone and roller and oil slinger from the carrier casting.

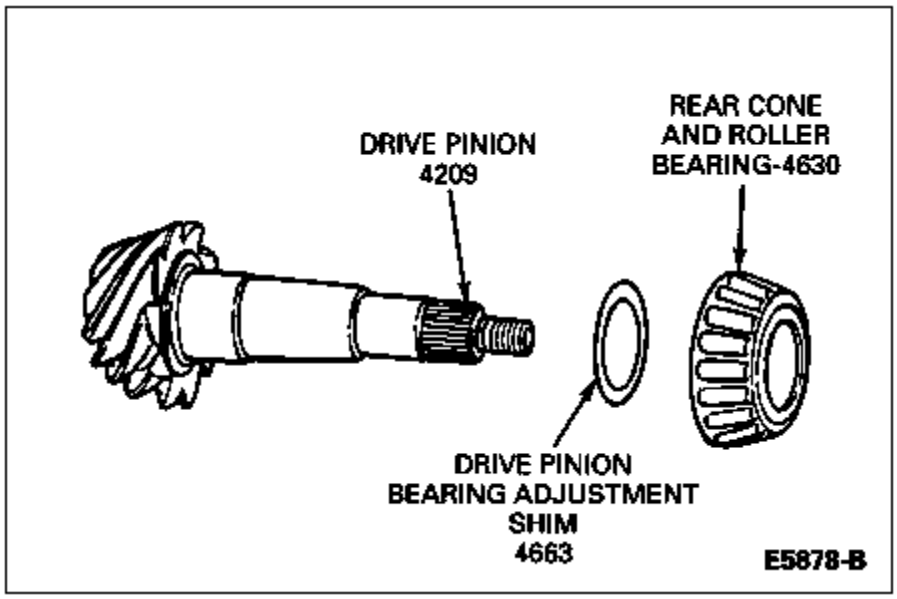
4. Remove the drive pinion, front bearing cone, spacer and pinion seal as described in this section under Rear Axle, Disassembly.

5. To remove the rear drive pinion bearing cone, use Pinion Bearing Cone Remover T71P-4621-B as shown. Measure the shim found under the differential pinion bearing (4630) with a micrometer. Record the thickness.

6. Before installing the drive pinion bearing cone on the drive pinion, a drive pinion shim must be selected as described below.



tomsn048@gmail.com



Pinion Bearing Cup Removal

1. **NOTE: Do not remove the pinion bearing cups from the differential carrier unless damaged or unless new bearings are to be installed.**

   If the pinion bearing cups are to be replaced, tap alternately (with a brass drift of suitable length) on each side of the pinion bearing cups during removal to prevent them from becoming cocked in the differential carrier bore.

---

tomsn048@gmail.com

Axle Assembly

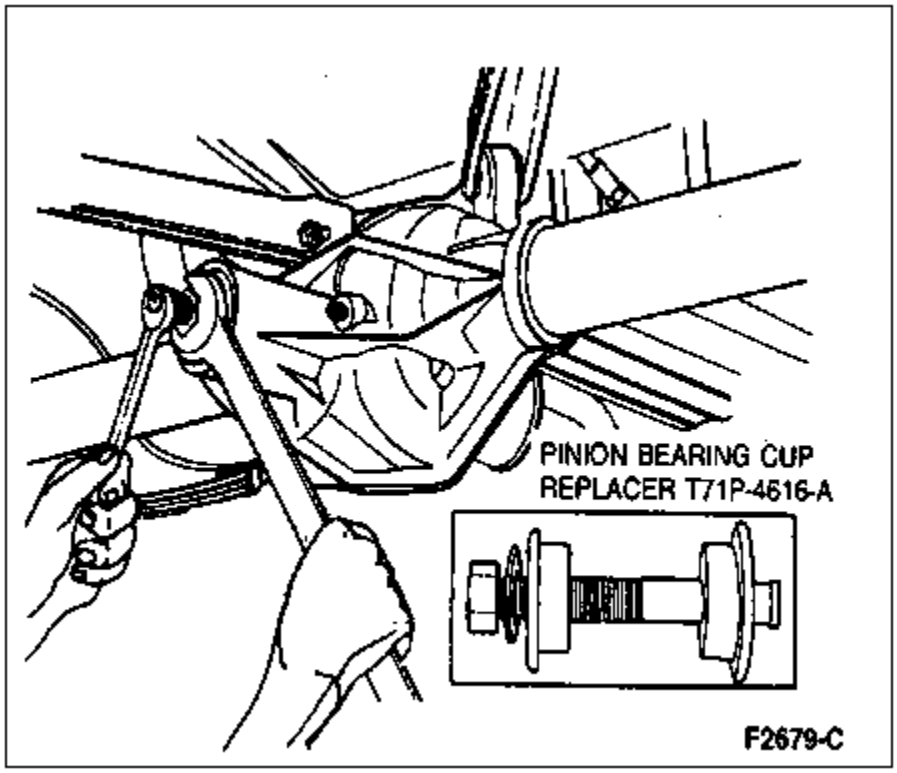
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Pinion Bearing Cup Replacer	T71P-4616-A
Pinion Seal Replacer	T79P-4676-A
Companion Flange Holding Tool	T78P-4851-A
Shim Driver	T85L-4067-AH

Pinion Bearing Cup Installation

1. **NOTE: To make sure pinion bearing cups will seat properly, clean bores before installing.**

   Install the new pinion bearing cups with Pinion Bearing Cup Replacer T71P-4616-A. Make sure the pinion bearing cups are properly seated in their bores. If a 0.038mm (0.0015-inch) feeler gauge can be inserted between a pinion bearing cup and the bottom of its bore at any point around the pinion bearing cup, the pinion bearing cup is not properly seated. Whenever the pinion bearing cups are replaced, the pinion bearings should also be replaced.

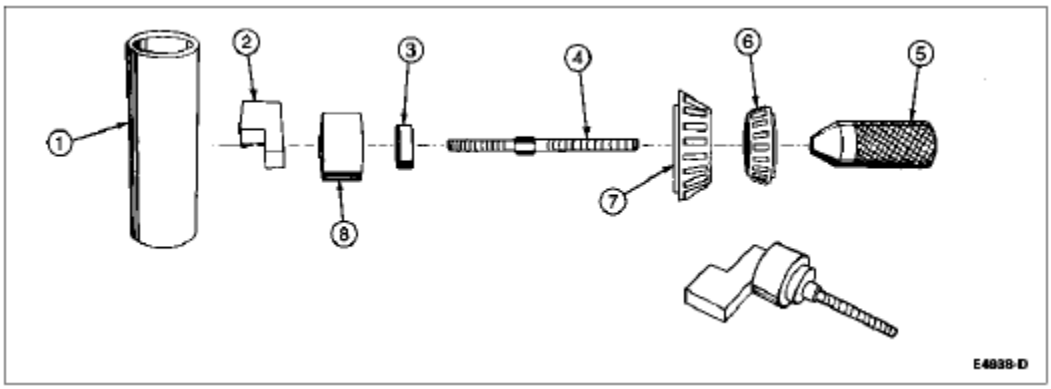


tomsn048@gmail.com

Drive Pinion Shim Selection

Individual differences in machining the carrier casting and the ring gear and pinion and variation in bearing widths require a pinion shim between the rear bearing and pinion head, in order to locate the pinion for correct tooth contact with the ring gear. When replacing a ring gear and pinion, the correct shim thickness for the new ring rear and pinion to be installed, is determined by the following procedure using Pinion Depth Gauge Set T79P-4020-A as shown below.

Pinion Depth Gauge Set T79P-4020-A

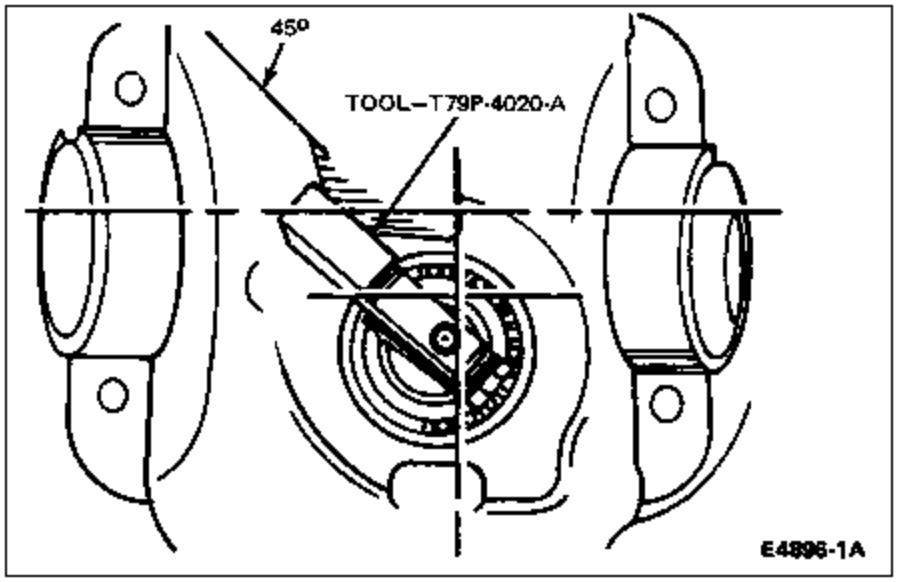


Item	Part Number	Description
1	D80T-4020-F49	Gauge Tube (2.892 Inch Thick)
2	T76P-4020-A10	Gauge Block (1.700 Inch Thick)
3	T76P-4020-A3	Aligning Adapter (1.612 Inch O.D.)
4	T76P-4020-A9	Screw
5	T76P-4020-A11	Handle
6	4621	Bearing Cone and Roller (Front)
7	4630	Differential Pinion Bearing Cone (Rear)
8	T78P-4020-A15	Gauge Disc

1. **NOTE: The gauge block must be offset to obtain an accurate reading.**

   Place the rear drive pinion bearing cone (new or used if in good condition) over the aligning tool and insert it into the rear axle pinion bearing cup (4628) of the carrier. Place the front bearing into the front pinion bearing cup and assemble the tool handle into the screw and tighten to 27 Nm (20 lb-ft).

tomsn048@gmail.com

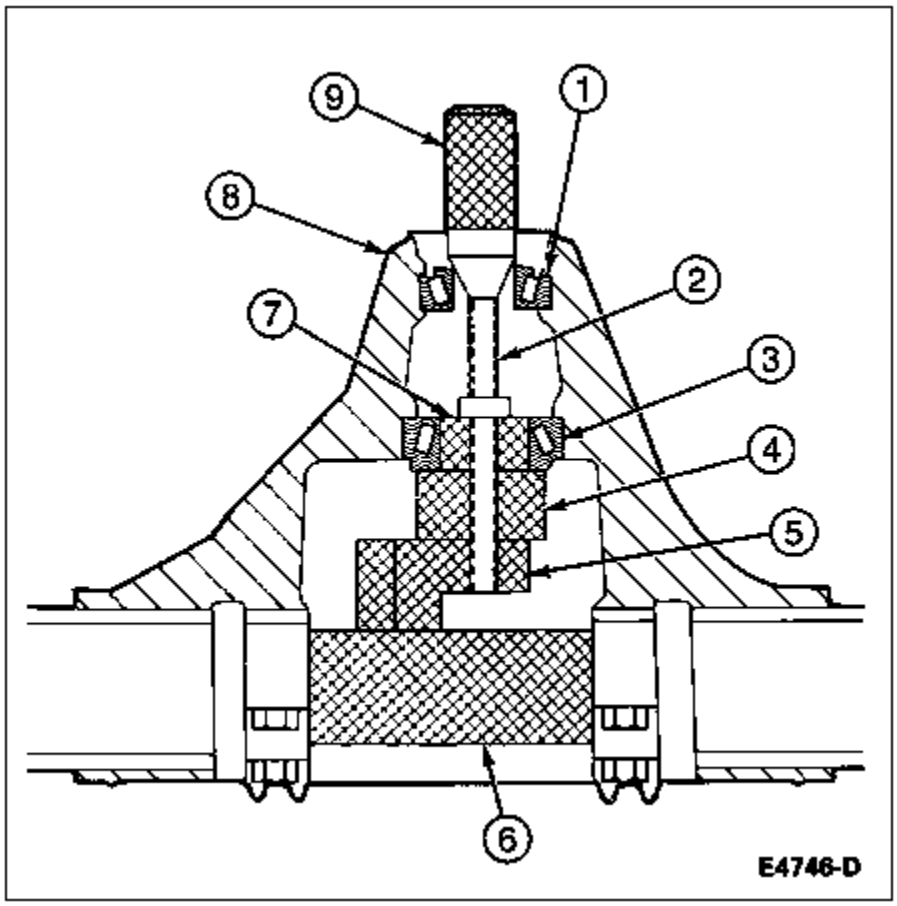


2. **NOTE: Shims must be flat. Do not use dirty, bent, nicked or mutilated shims as a gauge.**

   Center the gauge tube into the differential bearing bore. Install the bearing caps with the arrows pointing outward and the caps in their original locations. Tighten the bolts to 95-115 Nm (70-85 lb-ft).

   - Make sure that the gauge handle adapter screw, aligning adapter, gauge disc and gauge block assembly are securely mounted between front and rear bearing. Recheck tool handle torque prior to gauging to make sure that bearings are properly seated. This can affect final shim selection if improperly assembled. Clean bearing cup and differential pedestal surfaces thoroughly. Apply only **light** oil film on bearing assemblies prior to gauging.
   - Gauge block should then be rotated several half turns to make sure rollers are properly seated in bearing cups. Rotational torque on the gauge assembly should be 4.5 Nm (40 lb-in) with new bearings. Final position should be approximately 45 degrees across gauge tube to make sure that gauge block is in line with gauge tube high point. This area should be utilized for pinion shim selection. Selection of pinion shim with gauge block not lined up with tube high point will cause improper shim selection and may result in axle noise.
   - Utilize pinion shims as the gauge for shim selection. This will minimize errors in attempting to stack feeler gauge stock together or simple addition errors in calculating correct shim thickness.
   - **It is important to feel a slight drag on the shim for the correct selection.** Do not attempt to force the shim between the gauge block and gauge tube. This will reduce the chance of selecting a shim thicker than required which results in a deep tooth contact in final assembly for integral rear axles (4001).

tomsn048@gmail.com

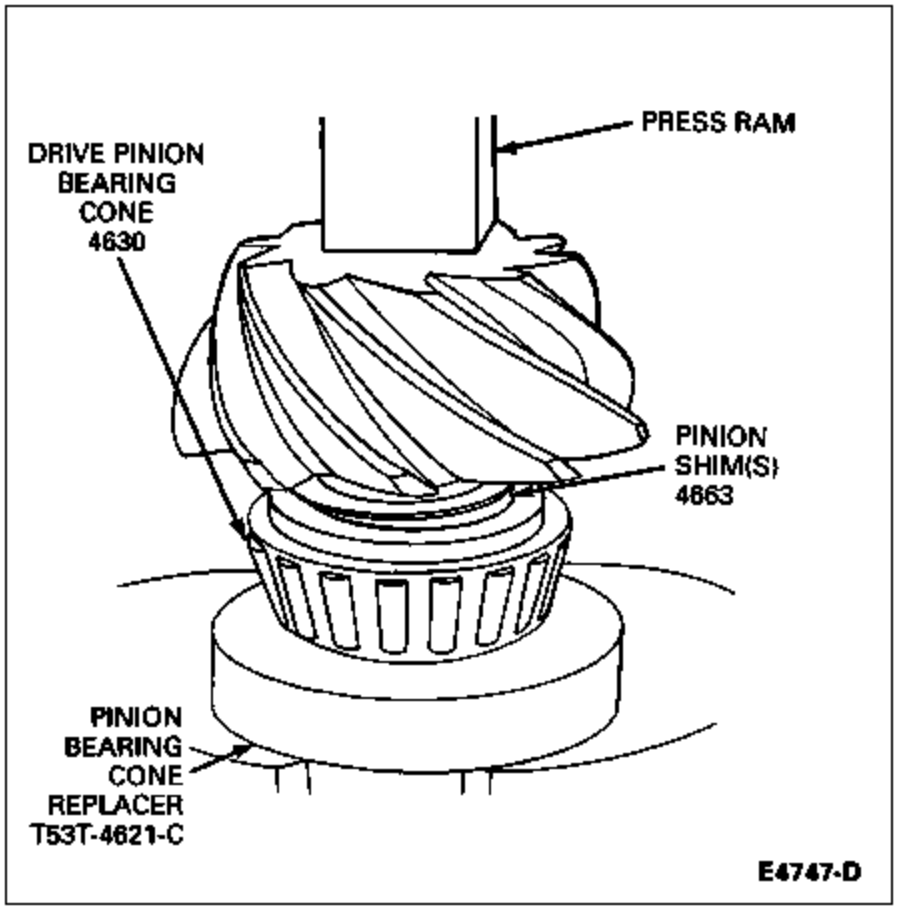


Item	Part Number	Description
1	4621	Bearing Cone and Roller (Front)
2	T76P-4020-A11	Handle
3	4630	Drive Pinion Bearing Cone (Rear)
4	T78P-4020-A15	Gauge Disc
5	T76P-4020-A10	Gauge Block
6	D80T-4020-F49	Gauge Tube
7	T76P-4020-A3	Aligning Adapter
8	4204	Differential Case
9	T76P-4020-A11	Handle

3. **NOTE: The same rear pinion bearing used in this procedure must be used in final assembly of the rear axle.**

   Place the selected shims on the drive pinion shaft and press the pinion bearing until firmly seated on the shaft.

tomsn048@gmail.com

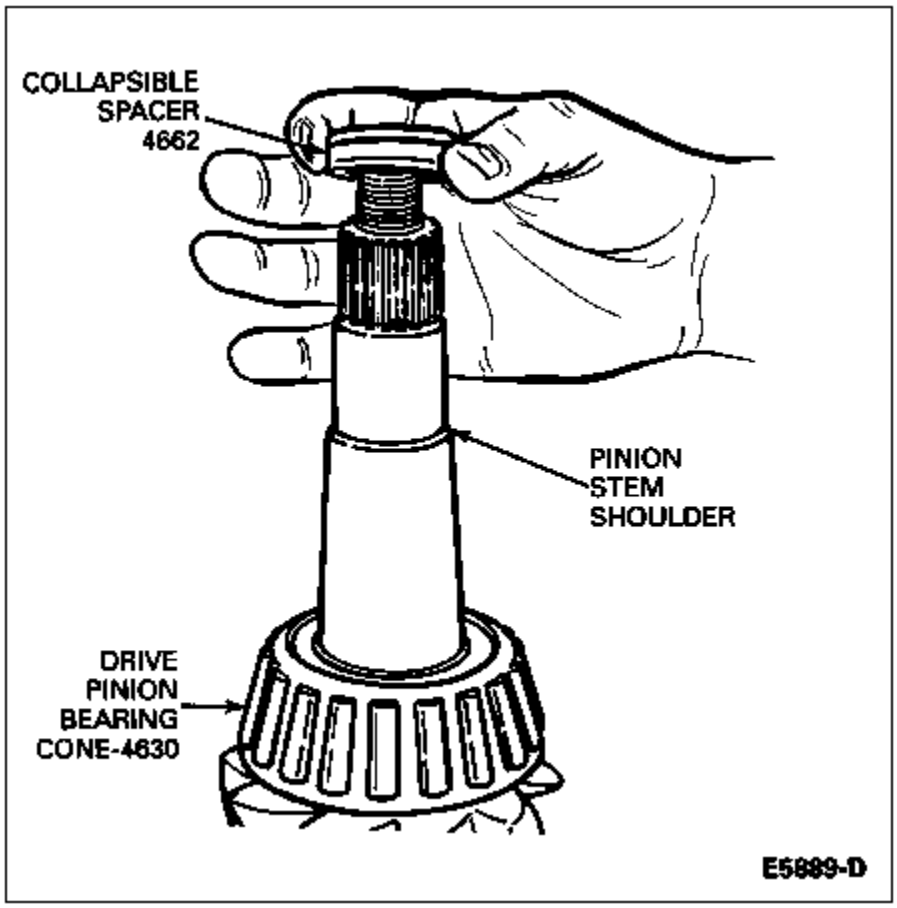


Drive Pinion Installation

1. Check splines on the drive pinion stem to be sure they are free of burrs. If burrs are evident, remove them by using a fine crocus cloth, working in a rotational motion. Wipe the pinion clean.

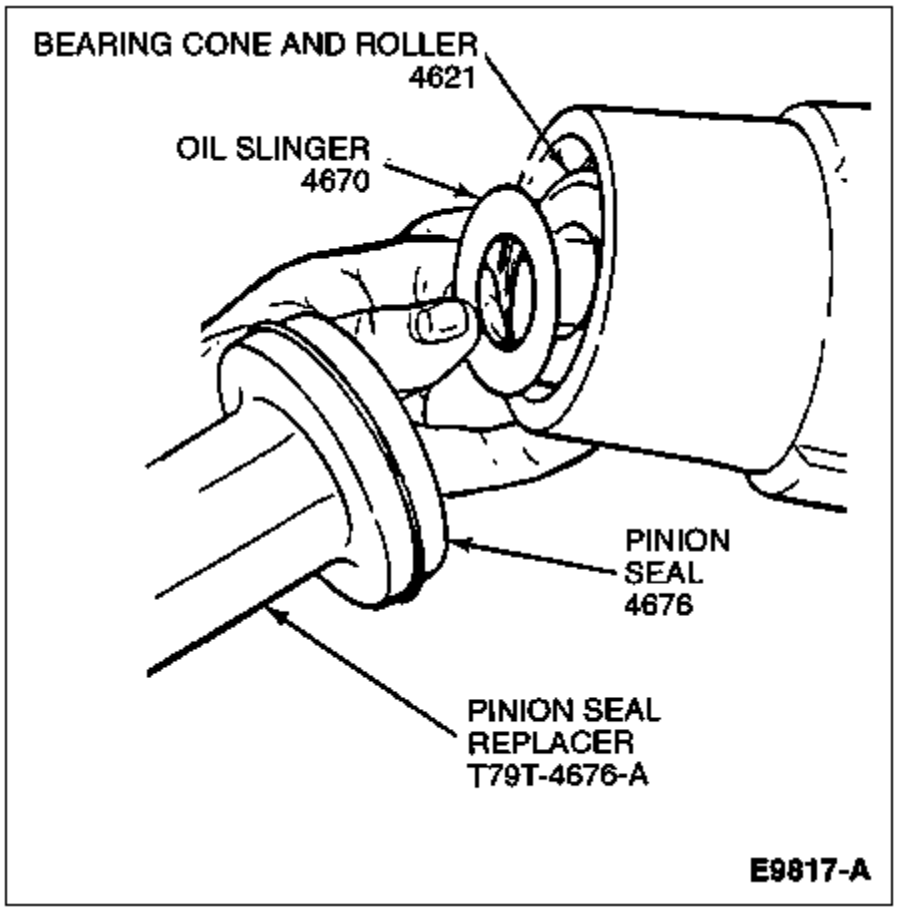
2. Place a new collapsible spacer on the pinion stem against the pinion stem shoulder.

tomsn048@gmail.com



3. Install the front pinion bearing and oil slinger in the axle housing bore and install the pinion seal on the Pinion Seal Replacer T79P-4676-A.

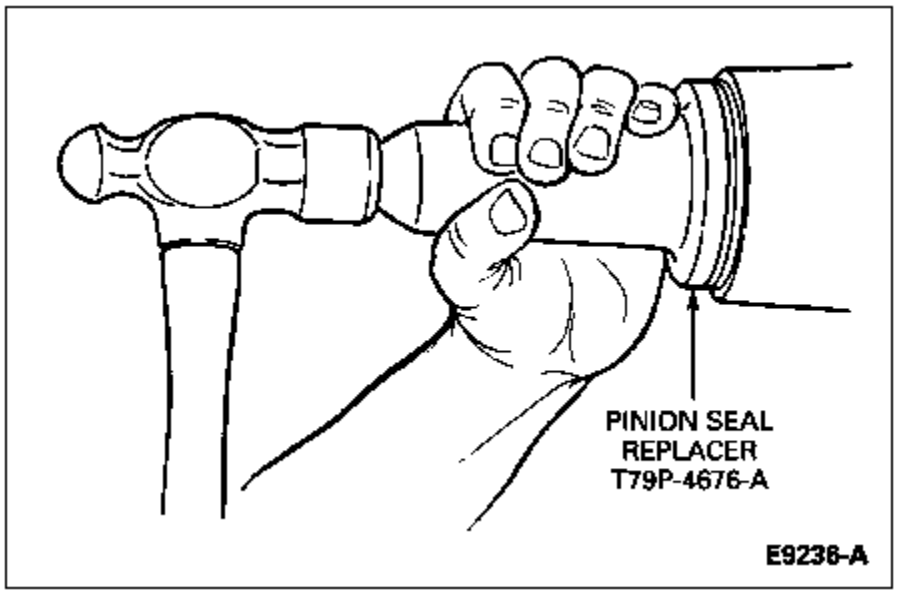
tomsn048@gmail.com



4. **CAUTION: Installation without the proper tool may result in early seal failure. If pinion seal becomes cocked during installation, remove it and install new one.**

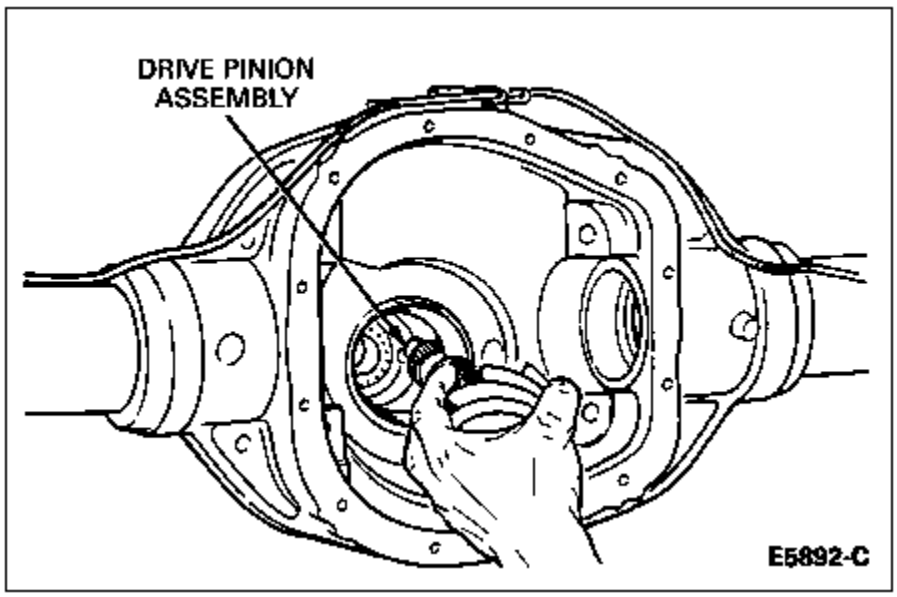
   Clean the pinion seal seat surface. Install the pinion seal in the housing bore using Pinion Seal Replacer T79P-4676-A. Coat the lips of the pinion seal with Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B.

tomsn048@gmail.com



5. **NOTE: Differential bearing preload and ring gear backlash is adjusted with the drive pinion and differential case (4204) installed. Adjustment is performed by the installation of shims between the differential bearing cup and axle housing.**

   From the rear of the axle housing, install the drive pinion assembly (drive pinion, shims, rear bearing cone and roller, and collapsible spacer) into the rear axle housing pinion shaft bore.



6. **NOTE: If a new rear axle companion flange is being installed, disregard the scribe mark on the pinion stem.**

   Apply a small amount of lubricant to the companion flange shaft splines of rear axle companion flange. Align the mark on the rear axle companion flange with the mark on the pinion stem.

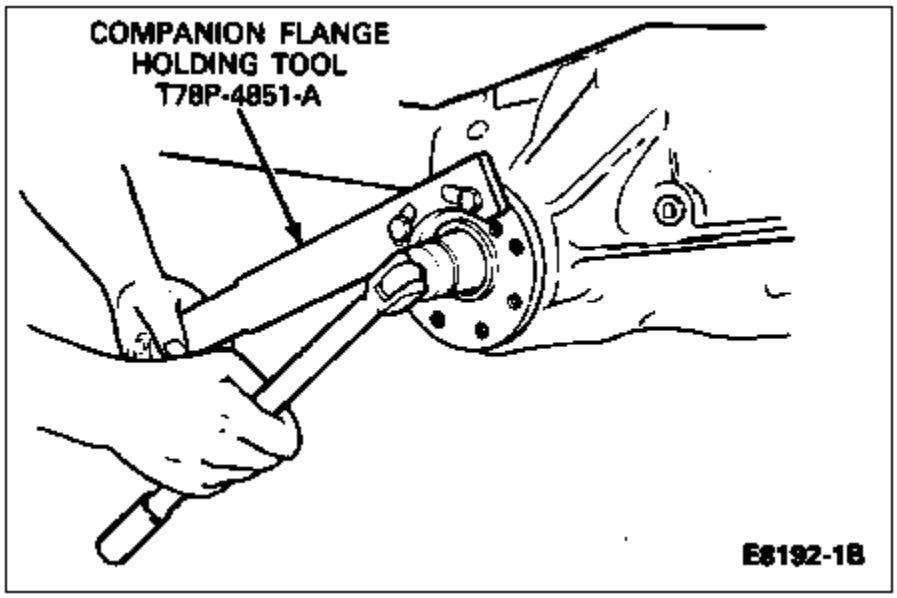
tomsn048@gmail.com

Universal Joint Flange Installation

1. **NOTE: The rear axle companion flange must never be hammered on or installed with power tools.**

   With the drive pinion in place in the axle housing, install rear axle companion flange using Companion Flange Replacer TOOL-4858-E or equivalent.

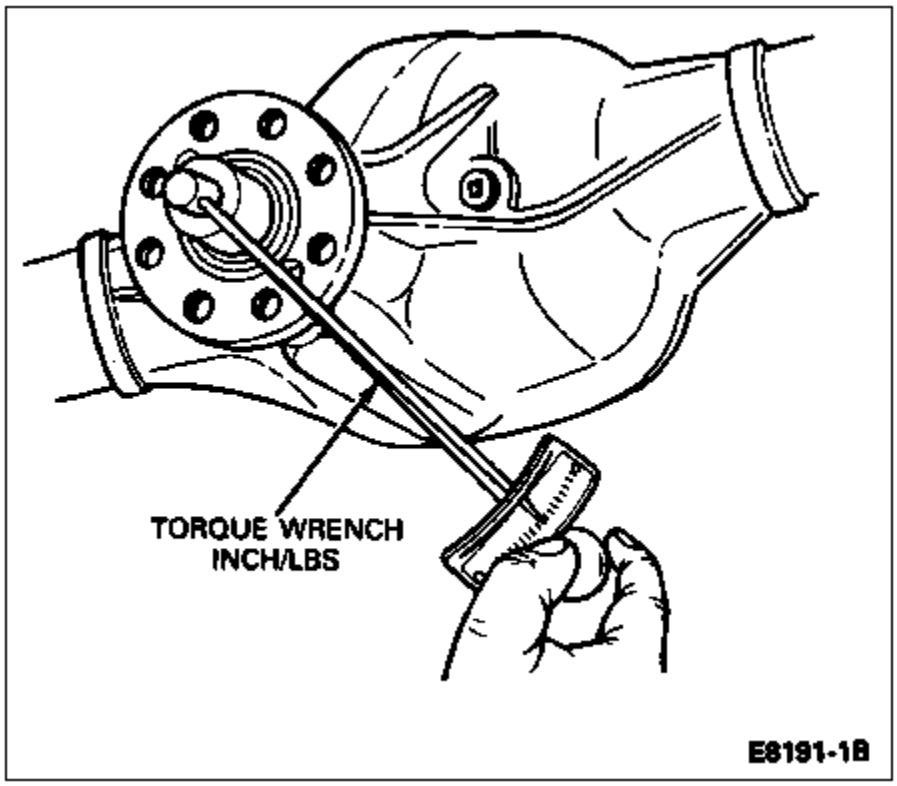
2. Start a new pinion nut. Hold the rear axle companion flange with Companion Flange Holding Tool T78P-4851-A.



3. Tighten the pinion nut, rotating the pinion occasionally to make sure pinion bearing is properly seated. Take frequent pinion bearing torque preload readings until the original recorded preload reading is obtained by rotating the pinion with an inch-pound torque wrench.

   If the original recorded preload is lower than specification (used bearings .9-1.5 Nm [8-14 lb-in]; new bearings 1.8-3.3 Nm [16-28 lb-in]), tighten to specification. If the preload is higher than specification, tighten to original reading as recorded. **Under no circumstances should the pinion nut be backed off to reduce preload. If reduced preload is required, a new collapsible spacer and pinion nut must be installed.**

tomsn048@gmail.com

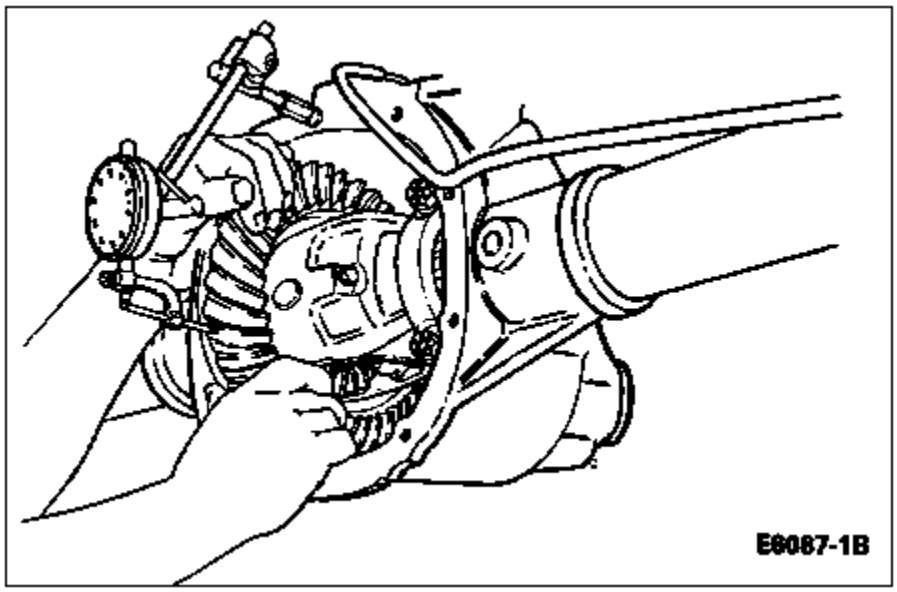


tomsn048@gmail.com

Differential Case Installation

For shim selection after a complete replacement of the axle housing, the differential (4026) or differential bearings (4221), use the following instructions. For replacement only of a ring gear and pinion, or a backlash adjustment, follow Steps 9 through 13 and Step 15, using the differential bearing shims (4067) that were originally in the rear axle (4001).

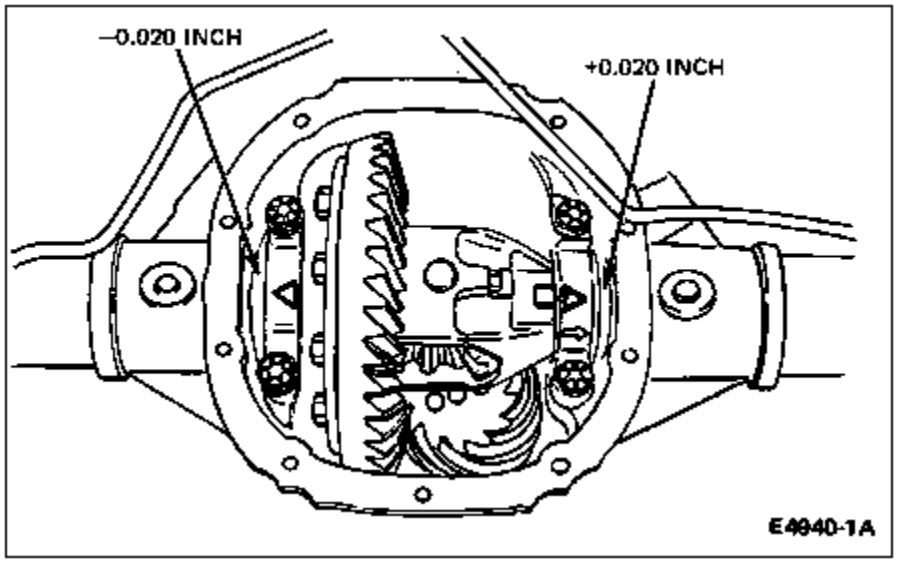
1. With pinion depth set and pinion installed, place differential case gear assembly with differential bearings and cups in the carrier.
2. Install a 6.73mm (0.265-inch) differential bearing shim on left side.
3. Install left bearing cap and tighten bolts finger-tight.
4. Install progressively larger differential bearing shims on the right side until the largest one selected can be assembled with a slight drag feel.
    - Apply pressure toward left side to make sure differential bearing cup (4222) is seated.
5. Install right side bearing cap and tighten all four (4) bolts to 95-115 Nm (70-85 lb-ft).
6. Rotate assembly to make to free rotation.
7. Check ring gear and pinion backlash. If the backlash is 0.20-0.38mm (0.008-0.015 inch) with 0.304-0.381mm (0.012-0.015 inch) preferred, proceed to Step 14. If backlash is not within specifications, go to Step 10, unless zero backlash is measured, then go to Step 8.



8. If a zero backlash condition occurs, add .508mm (0.020 inch) to the right side and subtract .508 mm

tomsn048@gmail.com

(0.020 inch) from the left side to allow backlash indication.



9. Recheck backlash.

10. If backlash is not to specification, correct backlash by increasing thickness of one differential bearing shim and decreasing thickness on the other differential bearing shim the same amount. Refer to chart for approximate change of differential bearing shim.

BACKLASH SPECIFICATIONS

Backlash Change Required (Inch)	Thickness Change Required (Inch)	Backlash Change Required (Inch)	Thickness Change Required (Inch)
.001	.002	.009	.012
.002	.002	.010	.014
.003	.004	.011	.014
.004	.006	.012	.016
.005	.006	.013	.018
.006	.008	.014	.018
.007	.010	.015	.020
.008	.010	—	—

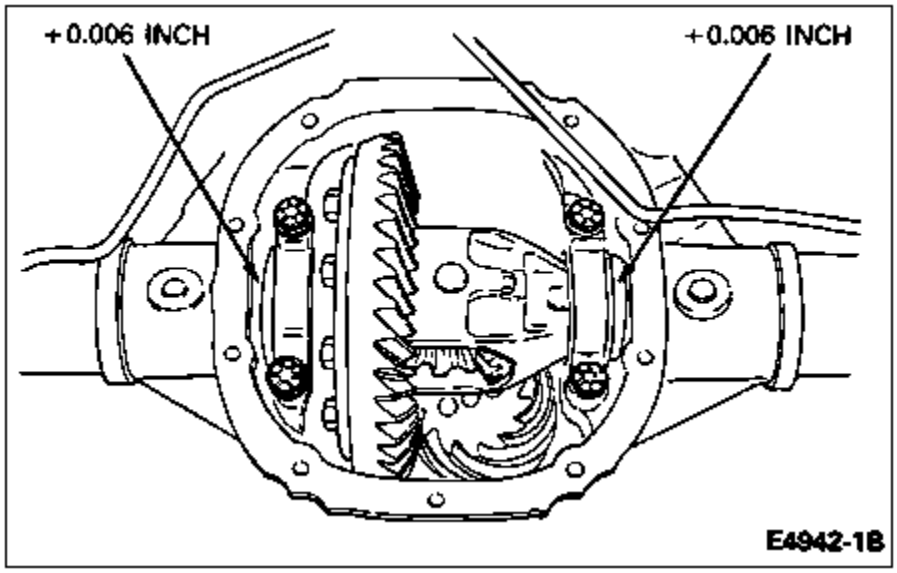
11. Install the differential bearing shims by driving into position with Shim Driver T85L-4067-AH. Install and tighten the bearing cap bolts to 95-115 Nm (70-85 lb-ft).

12. Rotate assembly several times.

13. Recheck backlash. If backlash is within specification, go to Step 14. If backlash is not within specification, repeat Step 10. Backlash specification is 0.20-0.38mm (0.008-0.015 inch). Preferred range is 0.304-0.381mm (0.012-0.015 inch).

tomsn048@gmail.com

14. Remove bearing caps and bolts. To establish differential bearing preload, increase both left and right shim sizes by 0.006 inch. Make sure differential bearing shims are fully seated and assembly turns freely.



15. Install bearing caps and tighten bolts to 95-115 Nm (70-85 lb-ft).

16. Utilize white marking compound to obtain a tooth mesh contact pattern in your assembly.

    Pattern inspection is intended to allow technicians the ability to detect gross errors in set-up prior to complete reassembly. Pattern contact should be within the primary area of the ring gear tooth surface avoiding any narrow or hard contact with outer perimeter of tooth (top to root, toe to heel). Pattern inspection should be on the drive (pull) side. Correct assembly of drive pattern will result in satisfactory coast performance. If gross pattern error is detected, with preferred backlash of 0.30-0.38mm (0.012-0.015 inch), recheck pinion shim selection.

Axle Shaft Installation

1. Install the axle shafts (4234); refer to the procedure in this section.

2. Remove the oil seal replacer from the transmission extension housing (7A039). Install the driveshaft in the extension housing. Align the scribe marks and connect the driveshaft end yoke at the rear axle companion flange. Install bolts and tighten to 95-128 Nm (70-95 lb-ft).

Sensor, Anti-Lock Brake

Installation

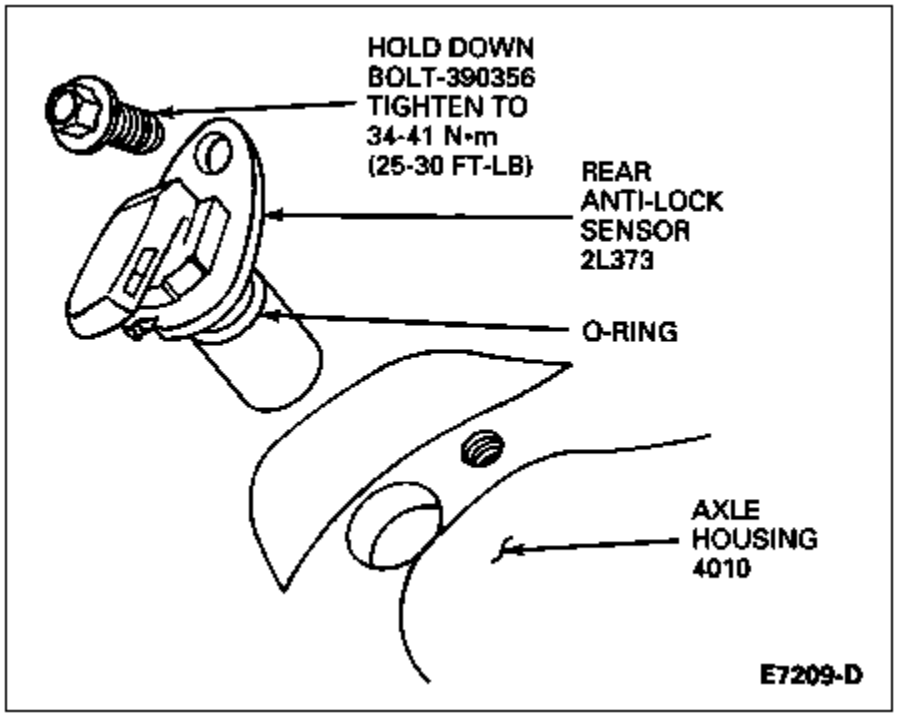
1. If new rear brake anti-lock sensor is to be installed, lightly lubricate O-ring with motor oil. If old rear brake anti-lock sensor is to be reinstalled, clean and blow off metal particles using compressed air. Remove and replace O-ring with a new O-ring.

tomsn048@gmail.com

- Apply a light film of motor oil to the O-ring.

2. Firmly grasp rear brake anti-lock sensor at sides (do not install by applying force on connector) and push into axle housing, aligning mounting flange hole with threaded hole in axle housing.

3. Install hold-down bolt and tighten to 34-41 Nm (25-30 lb-ft).



tomsn048@gmail.com

Inspection Before Disassembly of Carrier

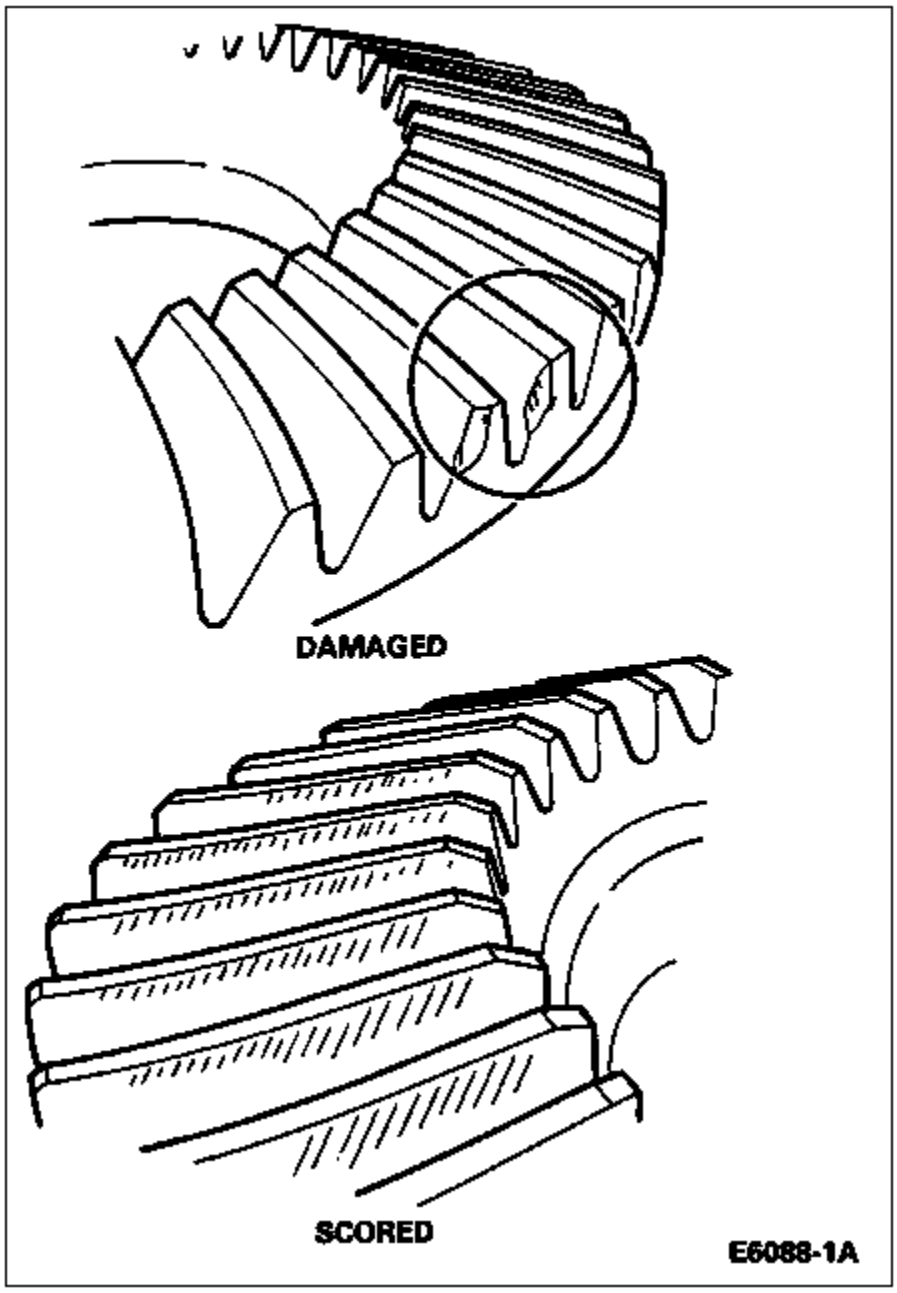
The differential case (4204) and drive pinion should be inspected before they are removed from the carrier. These inspections may find the cause of the concern and determine the resolution.

1. Wipe the lubricant from the internal working parts and visually inspect the parts for wear and/or damage.

2. Rotate the gears to see if there is any roughness which would indicate worn or damaged bearings or gears.

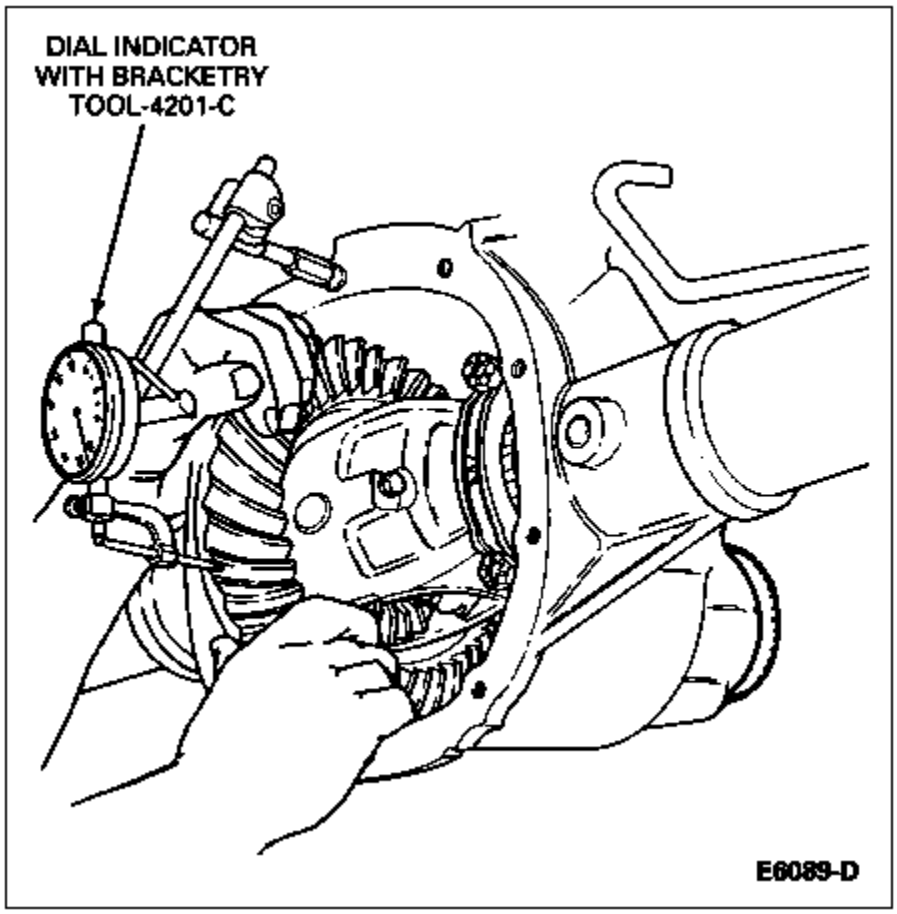
3. Check the ring gear teeth for signs of scoring, abnormal wear or nicks/chips.

tomsn048@gmail.com



4. Set up Dial Indicator With Bracketry TOOL-4201-C or equivalent and check ring gear backlash and ring gear backface runout. Refer to the Specifications at the end of this section for allowable conditions.

tomsn048@gmail.com



tomsn048@gmail.com

Inspection After Disassembly of Carrier

Thoroughly clean all parts. Always use new solvent when cleaning bearings. Do not spin dry bearings with compressed air. Oil the bearings immediately to prevent rusting. Inspect the parts for any major wear or damage. Clean the inside of the axle housing before rebuilding. When a scored or chipped ring gear and pinion is replaced, the axle housing must be washed thoroughly. Inspection procedures for individual parts are outlined below.

Sensor Indicator, Anti-Lock Brake

Discard and replace if damaged or removed from the ring gear.

Gears

Examine the ring gear and pinion teeth for scoring, excessive wear, nicks and chipping. Worn, scored and damaged gears cannot be rebuilt to correct a noisy condition.

Bearing Cups

Check pinion bearing cup for deep scores, galling, or spalling. If a 0.038mm (0.0015-inch) feeler gauge can be inserted between a pinion bearing cup and the bottom of its bore at any point around the pinion bearing cup, the pinion bearing cup must be reseated.

Universal Joint Flange, Rear Axle

Make sure that the surfaces of the rear axle companion flange have not been damaged in removing the driveshaft or in removing the rear axle companion flange from the pinion.

In addition, the following areas must be smooth and free of nicks:

- The pinion nut counterbore and seal surface.
- The back face of the rear axle companion flange that contacts the slinger.

Cone and Roller Assemblies

When operated in the differential bearing cups (4222), bearing rollers must turn without roughness. Examine the roller ends for step wear. If inspection reveals either a damaged pinion bearing cup or a damaged cone and roller, both parts should be replaced.

Carrier Housing

Make sure that the differential bearing bores are smooth. Remove any nicks or burrs from the mounting surfaces of the differential housing.

Differential Case

Make sure that the hubs where the bearings mount are smooth. Carefully examine the differential case bearing shoulders, which may have been damaged when the differential bearings (4221) were removed. The bearing assemblies will fail if they do not seat firmly against the shoulders. Check the fit (free rotation) of

tomsn048@gmail.com

the differential side gears (4236) in their counterbore.

tomsn048@gmail.com

Axle, Integral Carrier, 8.8-Inch Ring Gear

NOTE: Procedures for removal of rear axles (4001) are different between Aerostar and Ranger vehicles. Therefore, each procedure is shown in this section. Internally, the rear axles are the same.

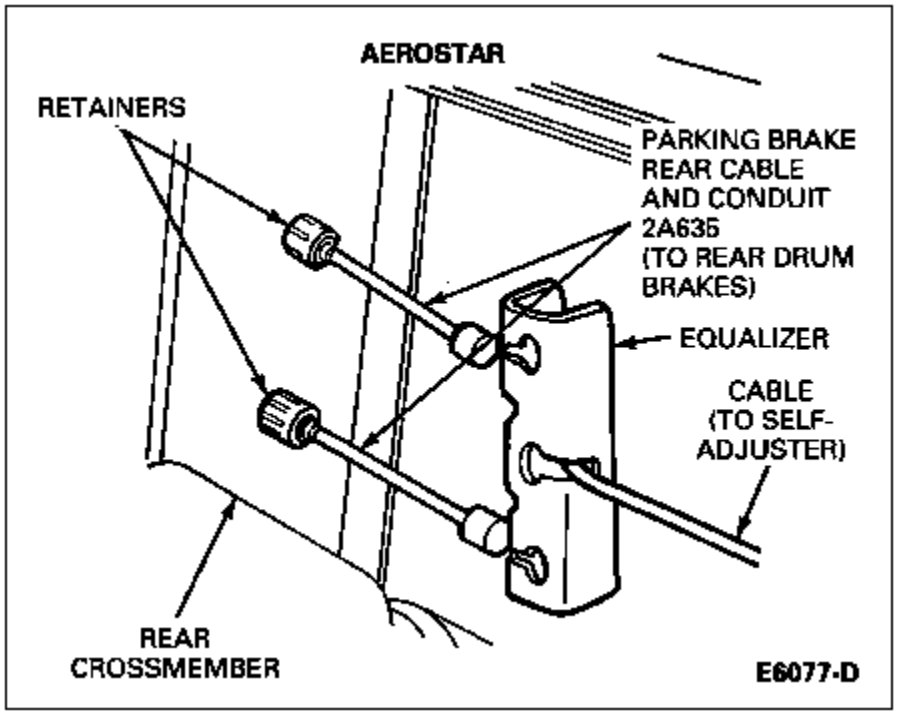
Rear Axle, Aerostar

Removal

1. Release tension on parking brake rear cable and conduit (2A635) as follows:

    a. Raise the vehicle.
    b. Pull rearward on the front parking brake cable, from underneath the vehicle, approximately 50.8mm (2 inches). Clamp the cable behind the crossmember making sure the plastic coating on the cable is not damaged. This will release tension on the parking brake rear cable and conduits.

2. Remove the parking brake rear cable and conduits from the equalizer. Compress the tabs on the outer rear wheel bearing retainers and pull the parking brake rear cable and conduits through the rear crossmember.



3. Position jackstands on the frame rear lift points or under the rear axle bumper brackets (4731).

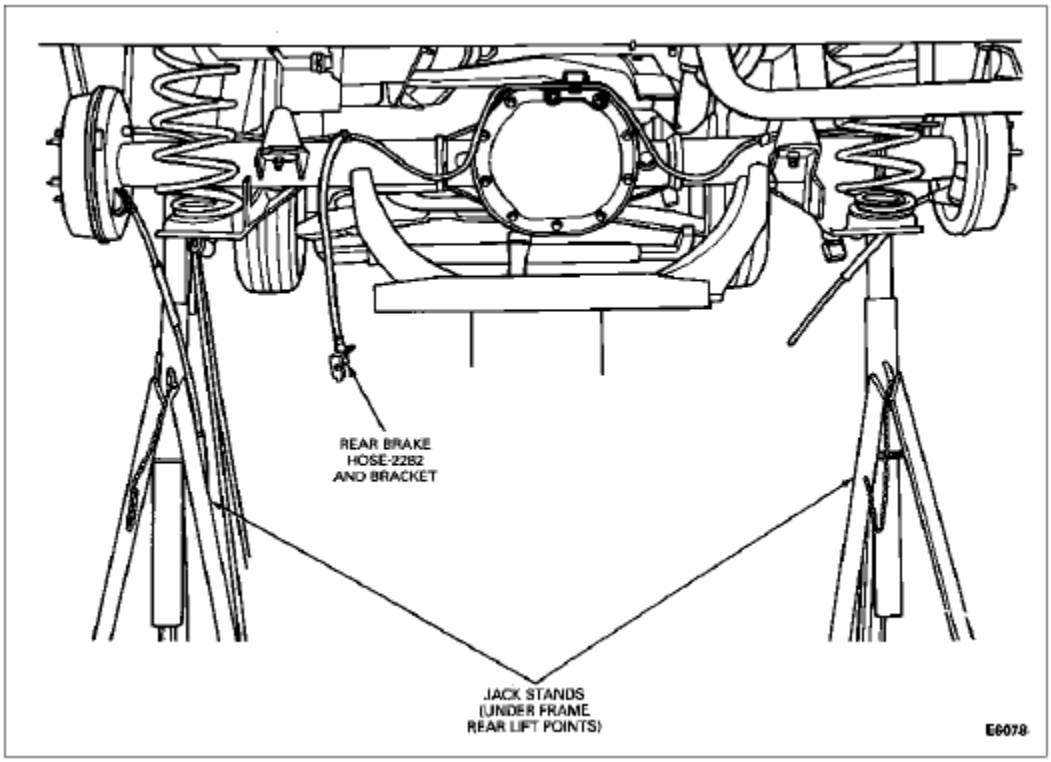
4. Disconnect rear brake anti-lock sensor harness connector.

5. Scribe a mark aligning the driveshaft to the rear axle companion flange. Remove the driveshaft. On 4x2 models, plug the extension housing (7A039) to prevent fluid spillage.

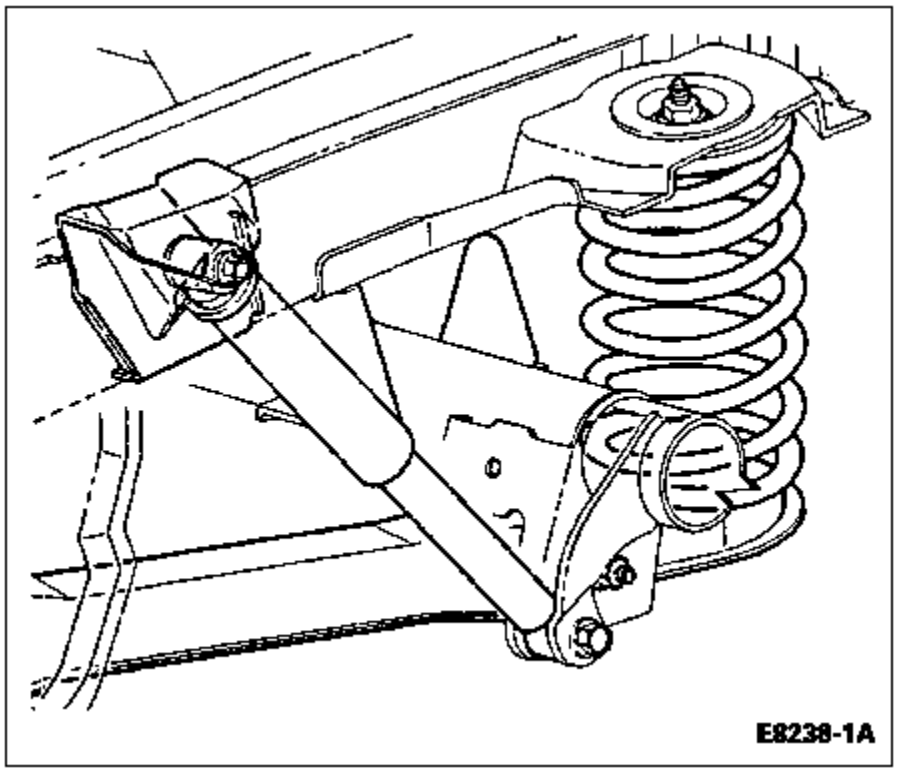
6. Remove the wheels and tires from the brake drums (1126).

7. Disconnect the brake tubing by disconnecting the rear brake hose (2282) from the rear brake tube (2267). Plug the rear brake tube. Remove the rear brake hose and bracket from the frame.

Rear Axle Removal, Aerostar



8. Disconnect the shock absorber from the rear suspension lower arm.



9. Lower the rear axle (4001) until the rear springs (5560) are no longer under compression.

10. Remove the lower spring retainer, then the upper retainer and remove the rear spring. Repeat for the other rear spring.

11. Raise the rear axle to the normal load position.

12. **NOTE: Make sure adequate clearance exists to remove the bolts retaining the rear suspension lower arm to the rear axle.**

    Disconnect the rear suspension lower arms at the rear axle.

Rear Spring and Lower Control Arm, Aerostar

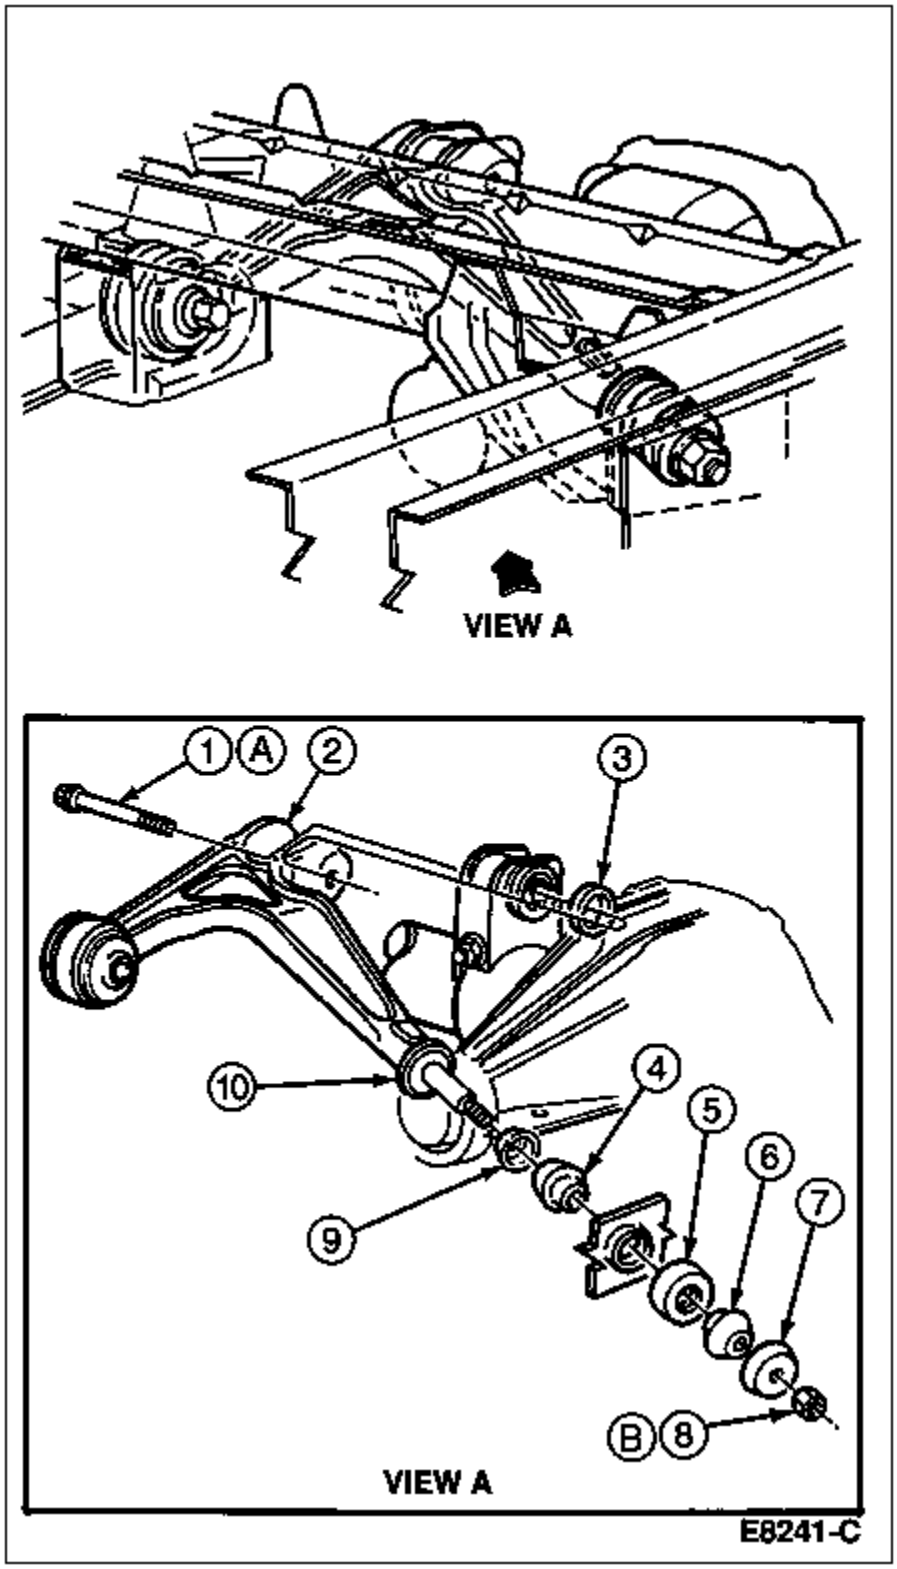
A	—	Tighten to 40-55 Nm (30-40 Lb-Ft)
B	—	Tighten to 136-175 Nm (100-129 Lb-Ft)
C	—	Tighten to 55-88 Nm (41-65 Lb-Ft)

13. Remove the bolt and nut retaining the upper control arm to the rear axle. Remove the upper control arm from the rear axle.

14. Lower the rear axle from the vehicle.

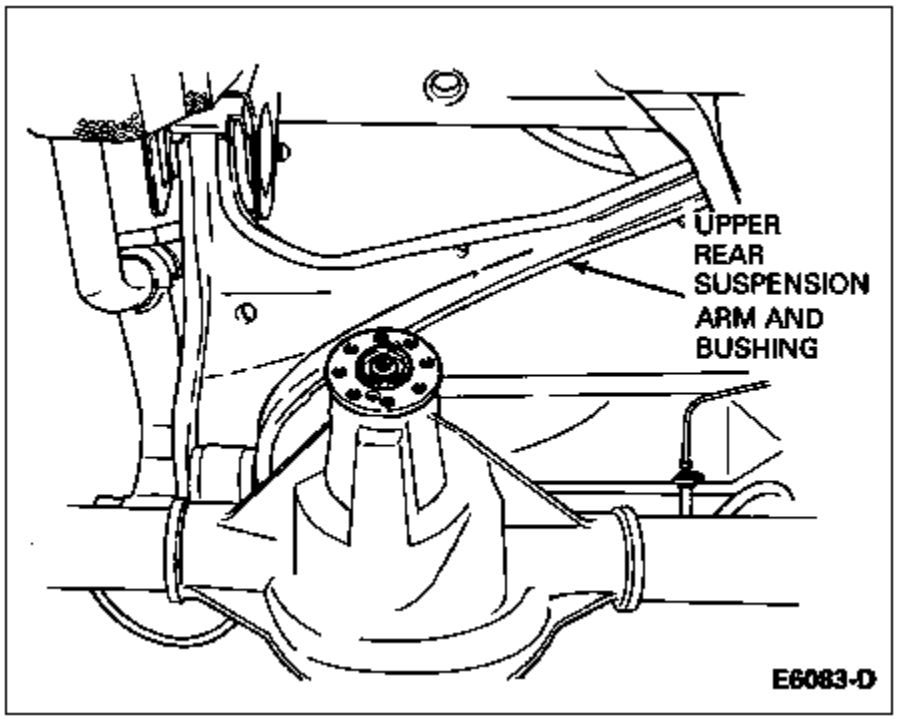


Item	Part Number	Description
1	806054	Bolt

2	5500	Rear Suspension Arm and Bushing
3	5K679	Bushing
4	5K752	Insulator
5	5K580	Spacer
6	5K752	Insulator
7	5A349	Retainer
8	801670	Nut
9	5A349	Retainer
10	—	Plastic Washer (Part of 5500)
A	—	Tighten to 210-285 Nm (155-210 Lb-Ft)
B	—	Tighten to 81-135 Nm (60-100 Lb-Ft)

Installation

1. Raise the rear axle into position in the vehicle.
2. Position the upper control arm over the cam adjuster and bushing. Install the bolt, nut and retainer. Tighten until snug. DO NOT TIGHTEN TO SPECIFIED TORQUE AT THIS TIME.



3. Lower the rear axle to the spring unloaded position. Place the lower rear spring insulator on the lower

rear suspension arm and bushing (5500). Place the upper rear spring insulator on top of the rear spring. The tapered coil (white colored) must face upward. Install the rear spring in position on the control arm and rear axle.

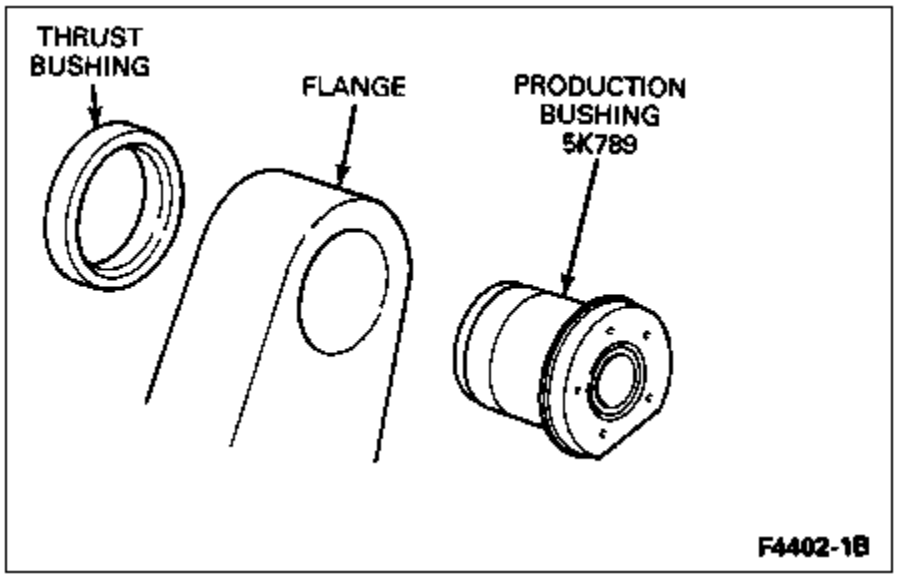
4. Install the lower retainer and nut. Tighten the nut to 55-88 Nm (40-65 lb-ft).
5. Install the upper retainer and bolt. Tighten the bolt to 40-55 Nm (30-40 lb-ft).
6. Raise the rear axle to the normal load position and tighten the bolt and nut retaining the rear suspension lower arm to the rear axle to 136-175 Nm (100-129 lb-ft).
7. Connect the shock absorber to the rear suspension lower arm. Install the shock bolt nut on the inside of the rear suspension lower arm bracket. Install the nut and tighten to 54-82 Nm (40-60 lb-ft).
8. Tighten all upper control arm fasteners to the specified torque.
    - Tighten the bolt retaining the control arm to the axle to 210-285 Nm (155-210 lb-ft).
    - Tighten the nut and bolt retaining the control arm to the right frame bracket to 125-170 Nm (92-125 lb-ft).
    - Tighten the nut and washer assembly retaining the control arm to the left frame bracket to 81-135 Nm (60-100 lb-ft).
9. Attach the brake jounce hose and bracket to the frame. Connect the hose to the rear brake tube.
10. Install the wheel and tire assemblies on the brake drums. Tighten the lugnuts to 115-156 Nm (85-115 lb-ft).
11. Connect harness connector on rear brake anti-lock sensor.
12. On 4x2 vehicles, install the driveshaft making sure the scribed marks on the companion flange and driveshaft are in alignment. Install the bolts and tighten to 95-128 Nm (70-95 lb-ft).
13. Raise the vehicle and remove the jackstands.
14. Pull the parking brake rear cable and conduits and retainers through the clips on the vehicle underbody side rails and through the rear crossmember. Connect the parking brake rear cable and conduits to the equalizer.
15. Unclamp the front parking brake cable to restore cable tension.
16. Bleed the brakes as described in Section 06-06.
17. Check and, if required, adjust pinion rear axle angle as described in Section 05-00.

Axle Housing-to-Upper Control Arm Bushing, Aerostar

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Axle Housing Bushing Mounting Adapter (Part of Set T85T-5638-AH)	T85T-5638-AH11
Forcing Screw (Part of Set T78P-5638-A)	T78P-5638-A1
Axle Housing Bushing Remover (Part of Set T85T-5638-AH)	T85T-5638-AH12
Axle Housing Bushing Replacer (Part of Set T85T-5638-AH)	T85T-5638-AH13

NOTE: In service, the pinion angle adjustment is changed using an eccentric service bushing F09Z-5K789-B. If the bushing is being replaced due to damage or wear only, use standard production bushing F09Z-5K789-A. For pinion angle measurement procedures, refer to Driveline Angle Checking in Section 05-00 .



Removal

1. **CAUTION: The axle must be securely supported on the hoist or stands. If more axle-hoist travel is required, disconnect the shock absorbers (18080) from the rear suspension lower arms.**

   Raise the vehicle on a twin-post hoist. Position jackstands on the frame rear lift points or under the rear bumper support brackets. If a frame hoist is used, raise the vehicle and position tall jackstands under the rear axle (4001). Lower the hoist until the axle is in the normal ride height position.

2. Remove rear suspension arm-to-axle housing nut and bolt.

3. With the vehicle securely supported on safety stands, slowly lower the rear axle until the rear suspension arm and bushing (5500) disengages from the rear axle. If a frame hoist is used, raise the hoist until the rear suspension arm disengages from the rear axle.

4. On the inboard side of the flange, insert a flat-blade screwdriver between the thrust bushing and flange. Pry the thrust bushing end off the bushing and flange without damaging any surfaces.

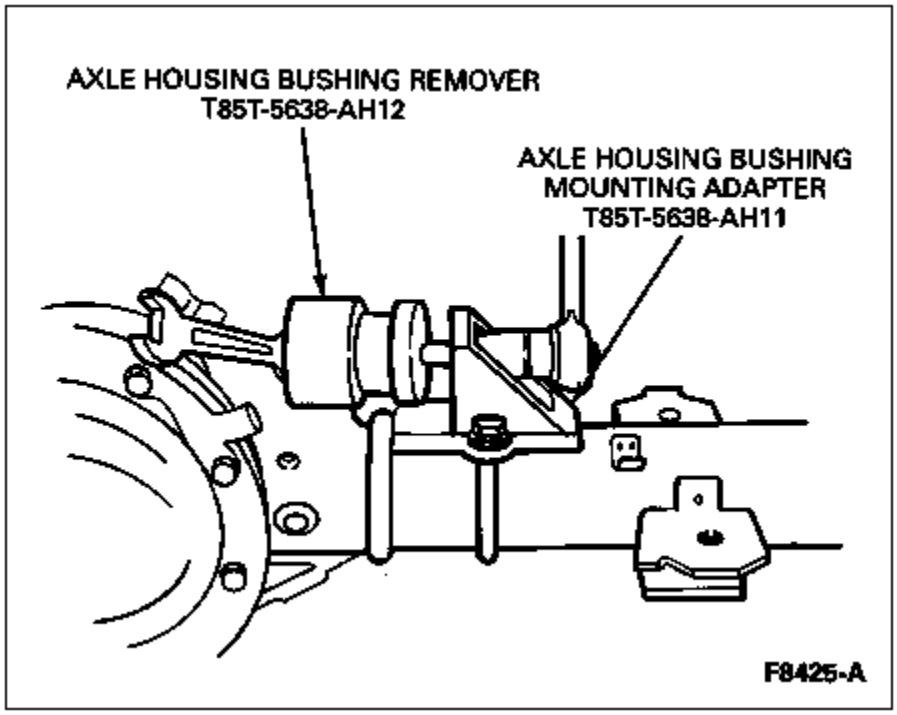
5. Attach Axle Housing Bushing Mounting Adapter T85T-5638-AH11 to the axle housing tube by using the U-bolt.

6. Place the Forcing Screw T78P-5638-A1 through the axle housing bushing to be removed.

7. Place the Axle Housing Bushing Remover T85T-5638-AH12 onto the forcing screw and thread a 7/16-20 nut onto the forcing screw.

8. Tighten the forcing screw to pull the bushing out of the axle housing.

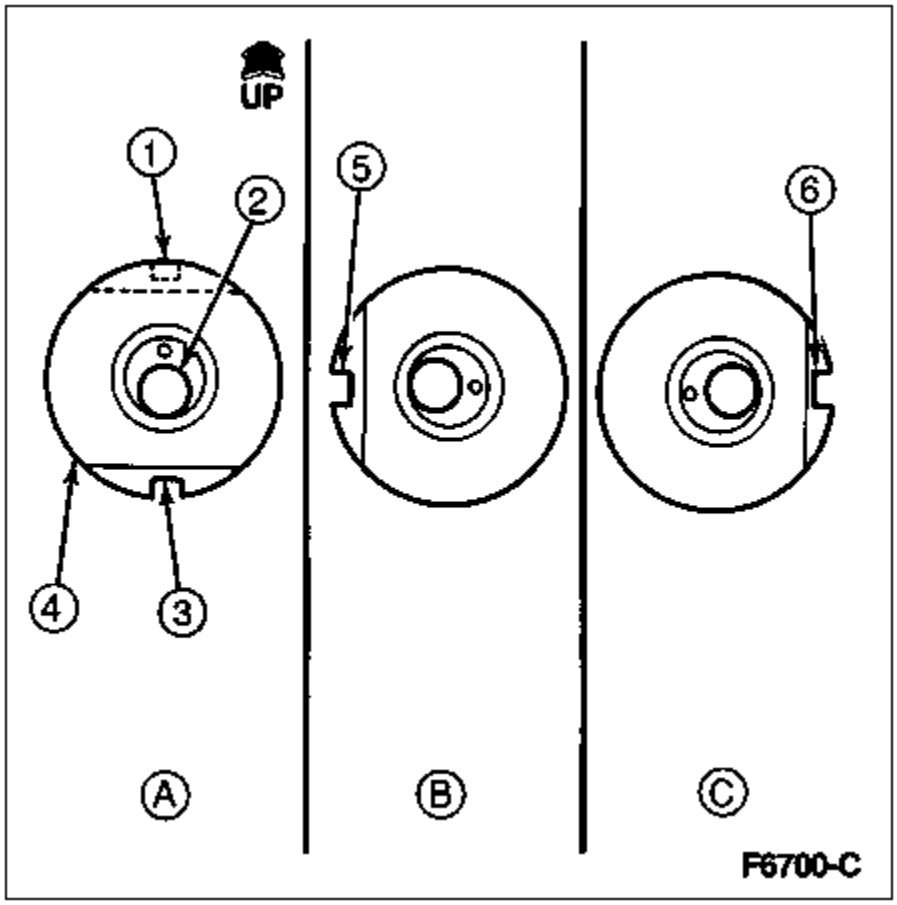
9. Remove the forcing screw, bushing remover and mounting adapter.



Installation

1. **NOTE: The notch on the bottom of the bushing must point in a 6 or 12 o'clock position for zero pinion angle adjustment, 3 o'clock position for 1.25° pinion angle up adjustment and 9 o'clock position for -1.25° pinion angle down adjustment.**

   Lubricate the bushing to be installed and place the bushing into the axle housing bushing bore.



Item	Part Number	Description

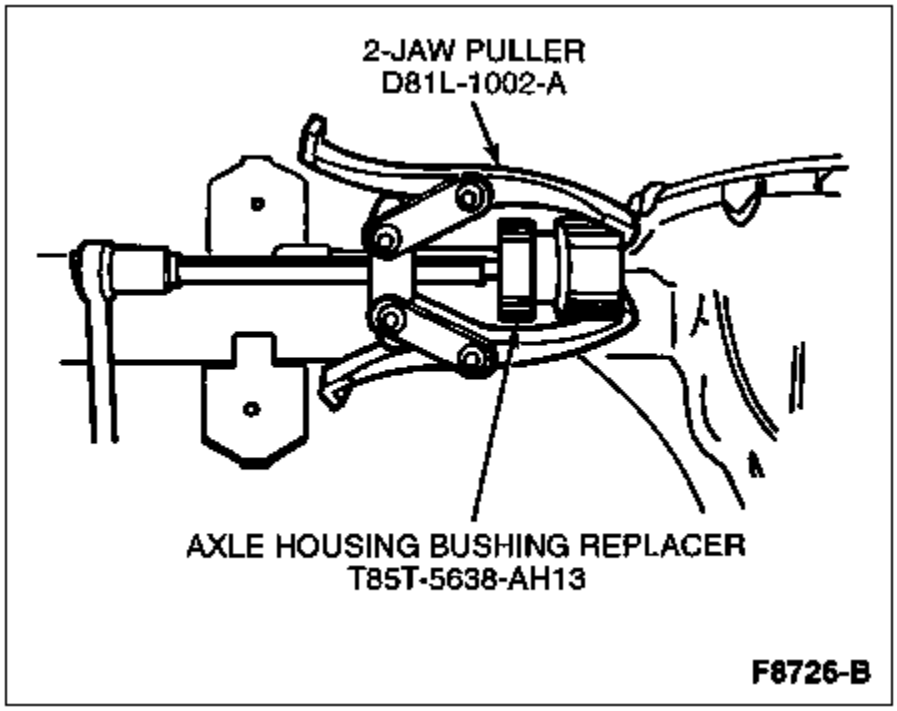
6	—	3 O'Clock Position (Part of 5K789)
A	—	Nominal Position
B	—	Pinion Nose Down Position 1.25°
C	—	Pinion Nose Up Position 1.25°

2. Position 2-Jaw Puller D81L-1002-A or equivalent around the axle housing bushing bracket with Axle Housing Bushing Replacer T85T-5638-AH13 between the forcing screw and the flanged end of the bushing.

3. Turn the forcing screw to push bushing into position. Remove the installation tools.



4. On the inboard side of flange, install thrust bushing so steel washer faces the flange.

5. With the vehicle body securely supported on safety stands, raise the rear axle until the rear suspension arm engages the flange on the axle housing. If a frame hoist is used, lower the vehicle until the rear suspension arm and bushing engages the flange on the axle housing.

6. Install the nut and bolt retaining the rear suspension arm and bushing to the flange and tighten until snug. Do not tighten to the specified torque at this time.

7. If removed, connect the shock absorber to the suspension lower arms. Install and tighten the retaining nut to 54-82 Nm (40-60 lb-ft).

8. Position the rear axle in the normal ride position. Tighten the nut and bolt retaining the rear suspension arm and bushing to the flange to 210-285 Nm (155-210 lb-ft).

9. If required, check and adjust the driveline angularity or driveline angle check as described in Section 05-00 .

10. Remove the safety stands and lower the vehicle.

Rear Axle, Ranger

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Companion Flange Holding Tool	T78P-4851-A
Differential Bearing Cone Remover/Replacer	T77F-4220-B1

Removal

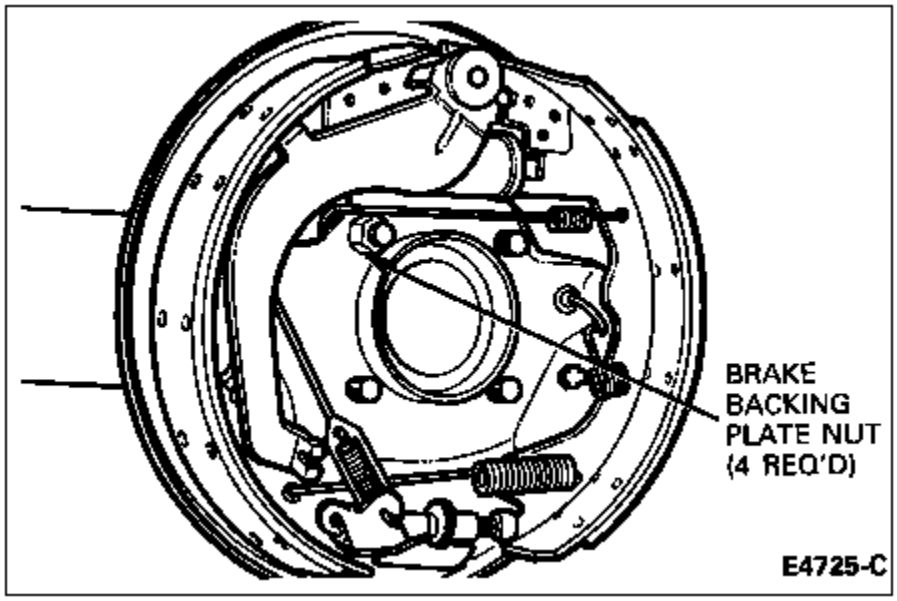
1. Raise the vehicle on a hoist, position safety stands under the rear frame crossmember. Remove the wheels and brake drums (1126).

2. **NOTE: Discard axle housing cover in this procedure if cover is plastic.**

   Drain the lubricant from the rear axle (4001) by removing the axle housing cover (4033). Discard axle housing cover. A new axle housing cover must be installed at assembly time.

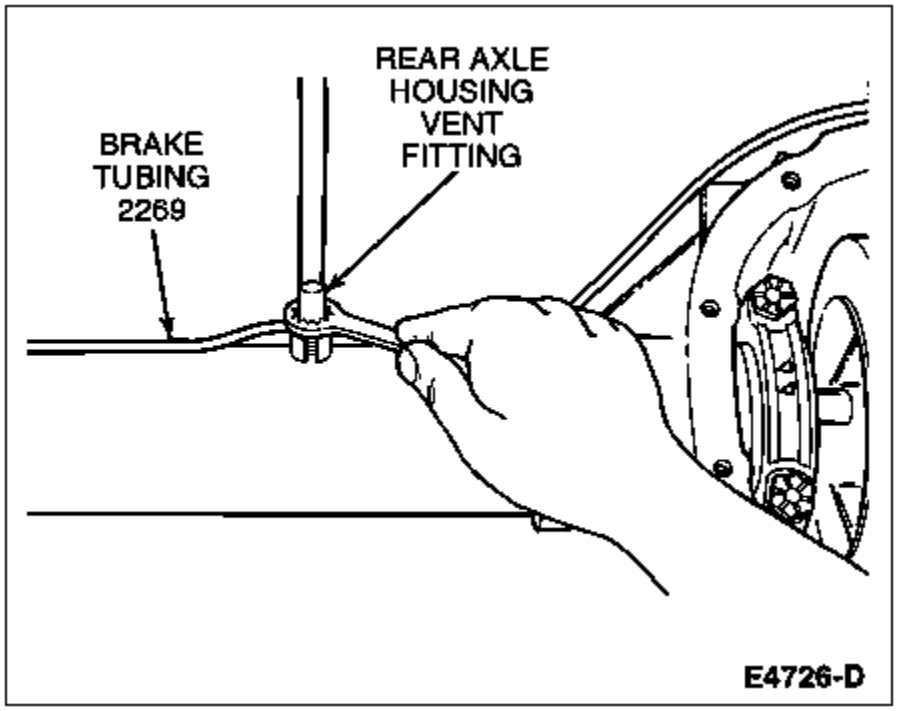
3. Remove the axle shafts (4234). Refer to the procedure in this section.

4. Remove the four retaining nuts from each brake backing plate and wire the brake backing plate to the underbody.

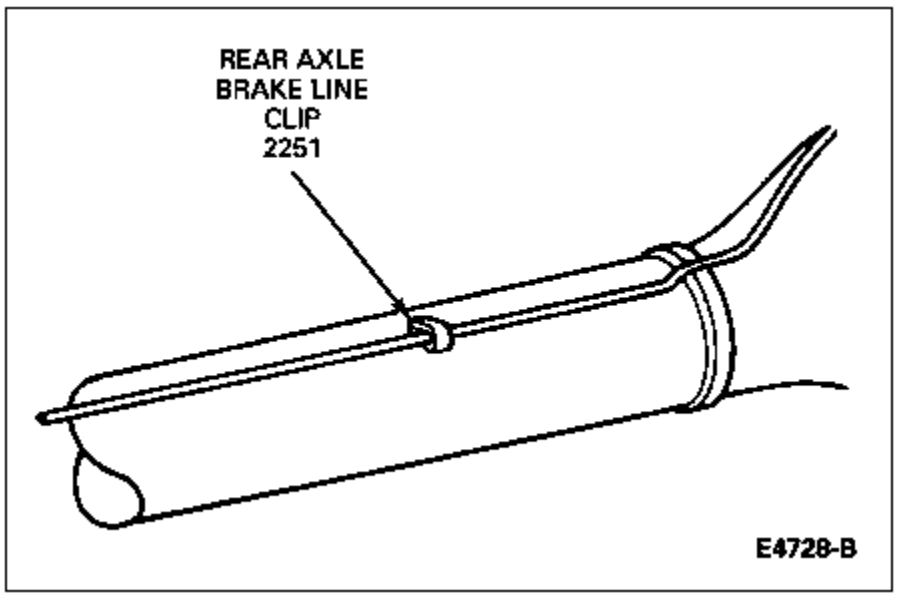


5. **NOTE: The axle housing vent is secured to the axle housing through the brake junction block.**

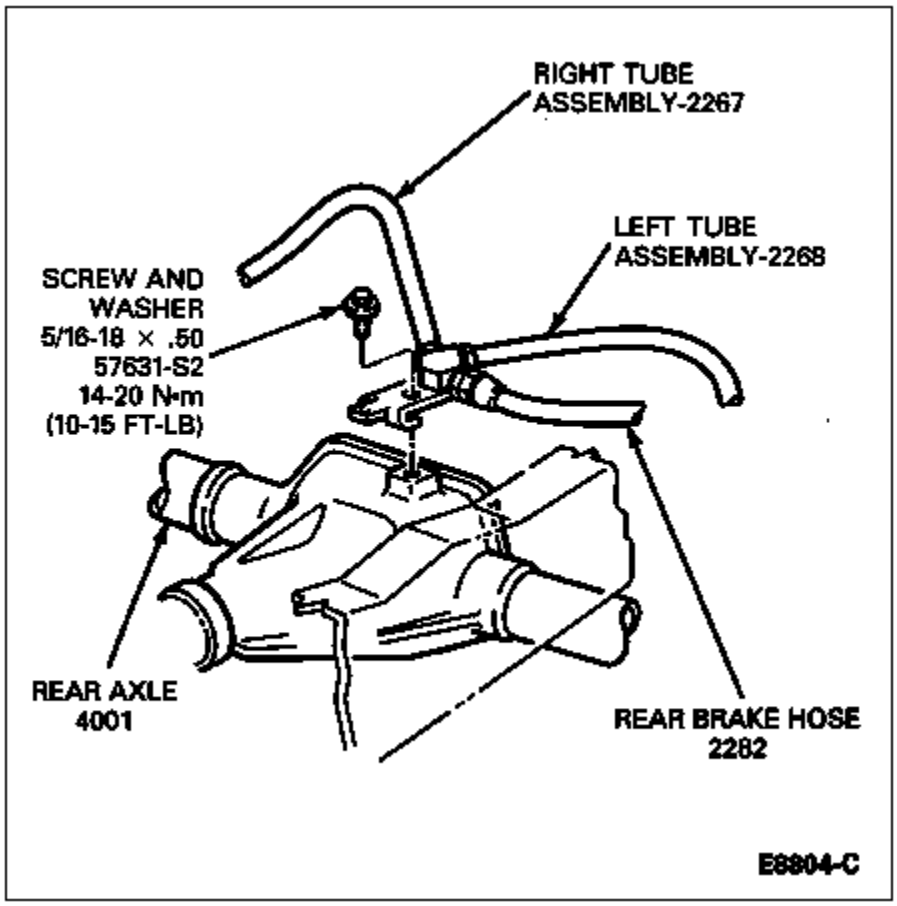
   Disconnect the axle hose from the axle housing vent and the axle housing vent from the axle housing.



6. Disengage the brake backing plate from the rear axle brake line clips (2251) that retains the brake backing plate (2211) to the axle housing and carrier.

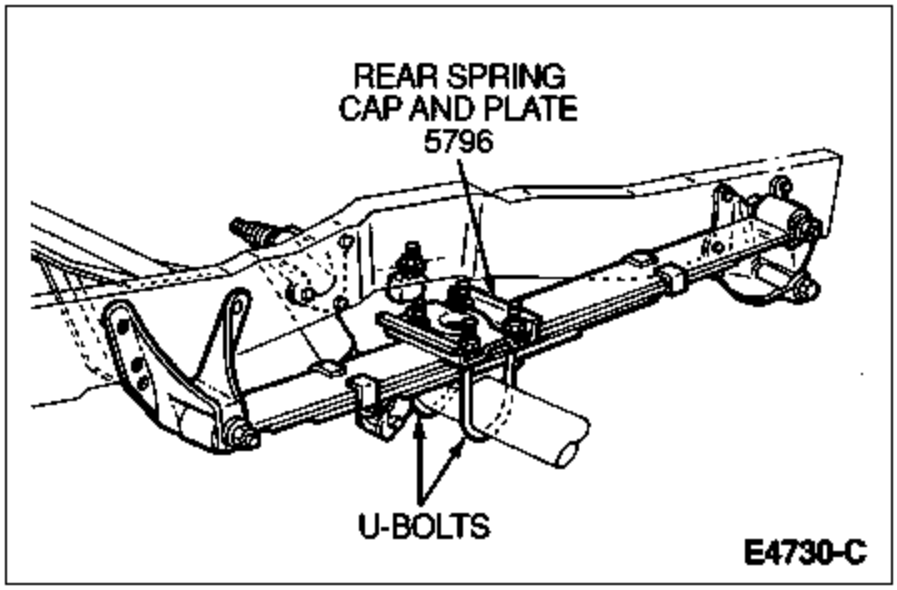


7. Remove the hydraulic brake junction block from the axle housing. **Do not open the hydraulic brake system lines.**



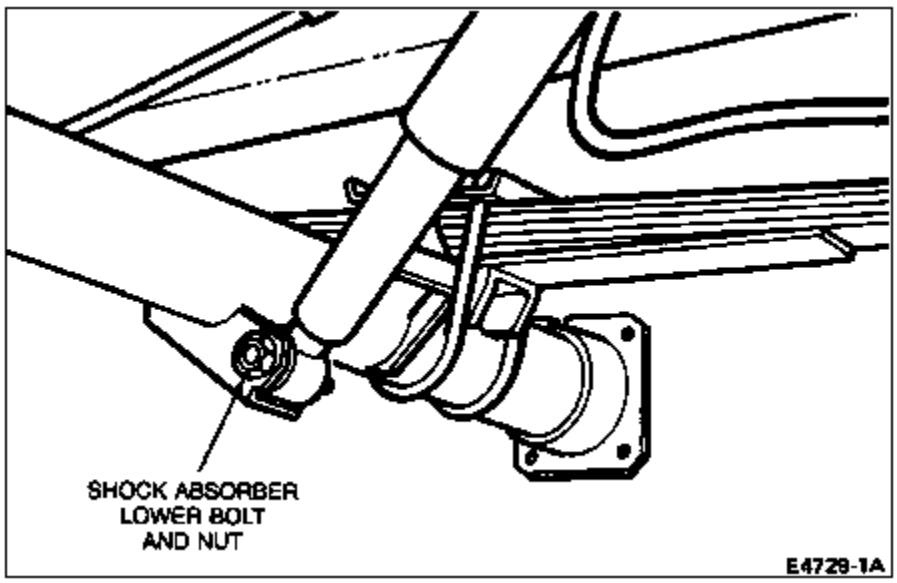
8. Make scribe marks on the driveshaft and the rear axle companion flange to make sure proper position of the driveshaft is obtained at assembly. Disconnect the driveshaft at the rear axle companion flange and support.

9. Support the axle housing on a jack, and then remove the U-bolt nuts. Remove the U-bolts and rear spring plates (5796).



10. Disconnect the shock absorber lower bolts from the mounting brackets on the axle housing.

11. Remove the axle housing from the vehicle.



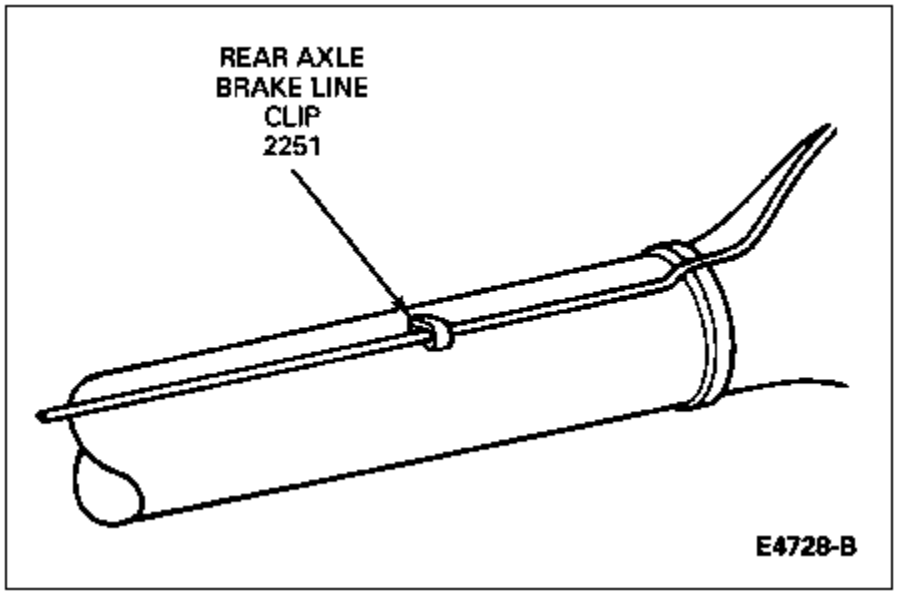
Installation

1. Raise the axle housing into position so that the rear spring plate can be installed. Install U bolts and nuts. Tighten to 88-118 Nm (65-87 lb-ft).

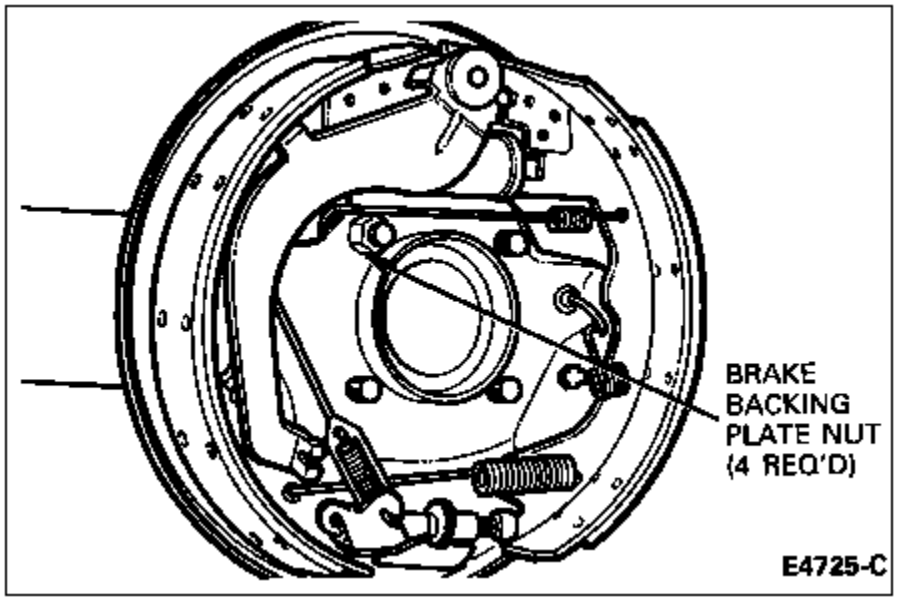
2. Connect the shock absorber lower bolts to the mounting bracket on the axle housing. Install the attaching nuts and tighten to 54-82 Nm (40-60 lb-ft).

3. Insert the axle housing vent fitting into the hydraulic junction block and position the assembly over the axle housing vent hole. Hand start the axle housing vent fitting and tighten.

4. Position the brake tubing to the axle housing and secure with the rear axle brake line clip at the right-hand axle tube and axle housing vent fitting through the junction block.



5. Install the brake backing plate on the axle housing flanges (no gaskets required). Tighten the attaching nuts to 28-54 Nm (21-40 lb-ft).



6. Install the axle shaft as described under the Disassembly and Assembly portion of this section.

7. Install the brake drums, wheels and tires.

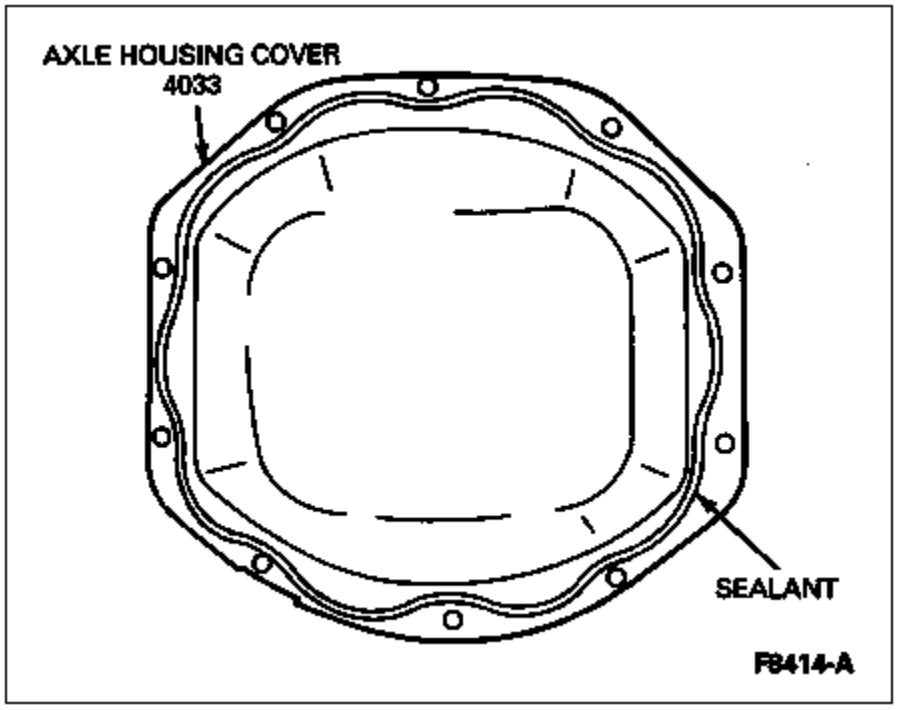
8. **CAUTION: Make sure machined surface on carrier is clean and free of oil before applying silicone sealant. Inside of rear axle must be covered when cleaning the machined surface to prevent rear axle contamination.**

   Connect the rear end of the driveshaft to the rear axle companion flange, making sure the driveshaft is installed in its original position.

   Apply Stud and Bearing Mount E0AZ-19554-BA or equivalent meeting Ford specification WSK-M2G349-A1 to the threads on the attaching bolts. Tighten bolts to 95-128 Nm (70-95 lb-ft).

9. **NOTE: Ranger vehicles are equipped with SMC plastic axle housing covers. A new SMC plastic axle housing cover and bolts must be installed whenever removed.**

   Clean the gasket mounting surface of the axle housing. Apply a new continuous bead of Silicone Rubber Sealant D6AZ-19562-AA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A to the new SMC plastic cover. Allow one hour cure time before filling the carrier with proper amount of the specified lubricant.



10. Install new axle housing cover and tighten all cover bolts to 21-27 Nm (15-20 lb-ft).

11. Add Premium Rear Axle Lubricant XY-80W90-QL or equivalent meeting Ford specification WSP-M2C197-A for all rear axles until the lubricant level is 6.35-14.28mm (1/4 to 9/16 inch) below the bottom of the filler hole with the rear axle in the running position. Lower the vehicle and road test.

Axle Disassembly

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Shim Driver	T85L-4067-AH
Axle Tube Bearing Replacer	T78P-1225-A
Differential Side Bearing Remover	T70P-4221-A or T57L-4220-A
Differential Side Bearing Replacer	T57L-4221-A2
Pinion Depth Gauge	T79P-4020-A
Pinion Bearing Cup Replacer	T67P-4616-A
Axle Tube Seal Replacer	T78P-1177-A
Companion Flange Holding Tool	T78P-4851-A
Differential Bearing Cone Remover/Replacer	T77F-4220-B1
Rear Axle Bearing Remover	T85L-1225-AH
Impact Slide Hammer Pinion Bearing Cone Remover	T50T-100-A T71P-4621-B

Companion Flange and Pinion Oil Seal Removal

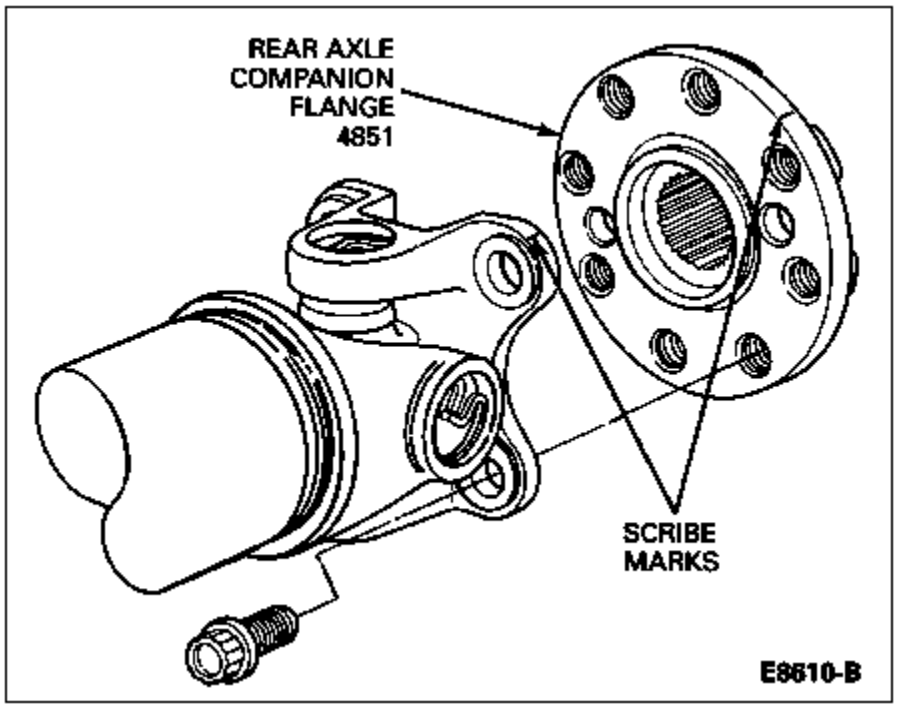
Replacement of the pinion seal involves removal and installation of only the drive pinion nut and the rear axle companion flange.

1. **CAUTION: This operation disturbs the rear bearing cone and roller preload, and this preload must be carefully reset when assembling.**

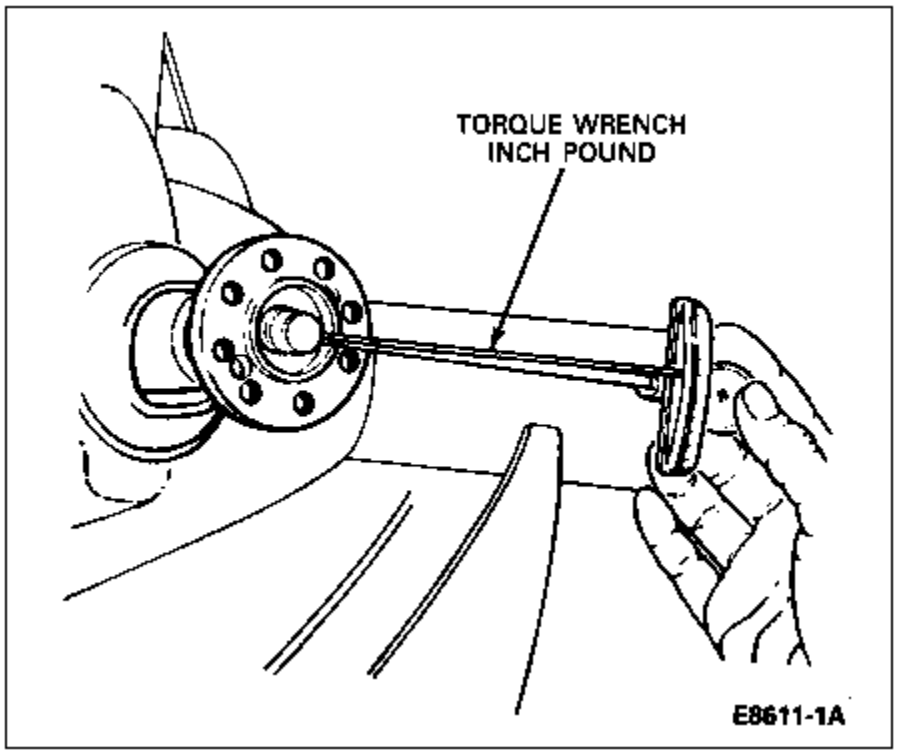
   Raise the vehicle and install safety stands. Remove the wheel covers (if equipped), rear wheels and brake drums (1126) to prevent brake drag during differential pinion bearing preload adjustment.

2. Mark the driveshaft axle end flange and the rear axle companion flange to ensure proper position of the driveshaft during assembly. On 4x2 vehicles, disconnect the driveshaft from the rear axle companion flange. Remove the driveshaft from the extension housing (7A039). Install an oil seal replacer tool in the extension housing to prevent oil leakage.

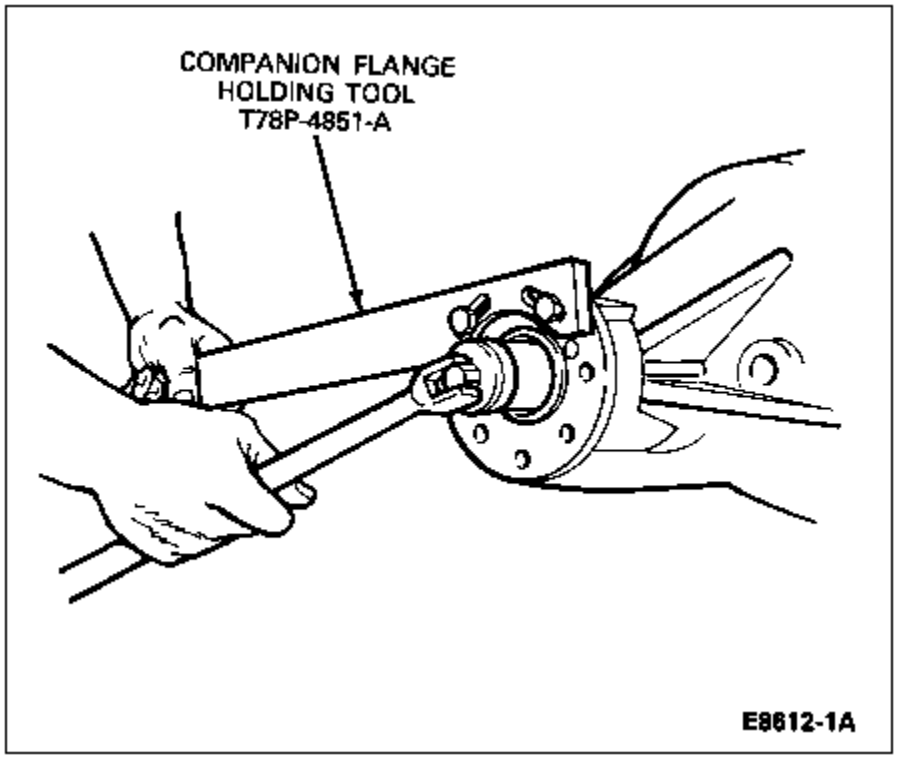
   On 4x4 vehicles, mark the driveshaft in relation to the flange on the transfer case (7A195) and the flange on the rear axle (4001). Remove bolts securing driveshaft to transfer case flange. Remove bolts securing driveshaft to axle flange and remove the driveshaft.



3. Install a pound-inch torque wrench on the pinion nut. Record the torque required to maintain rotation of the drive pinion shaft through several revolutions.

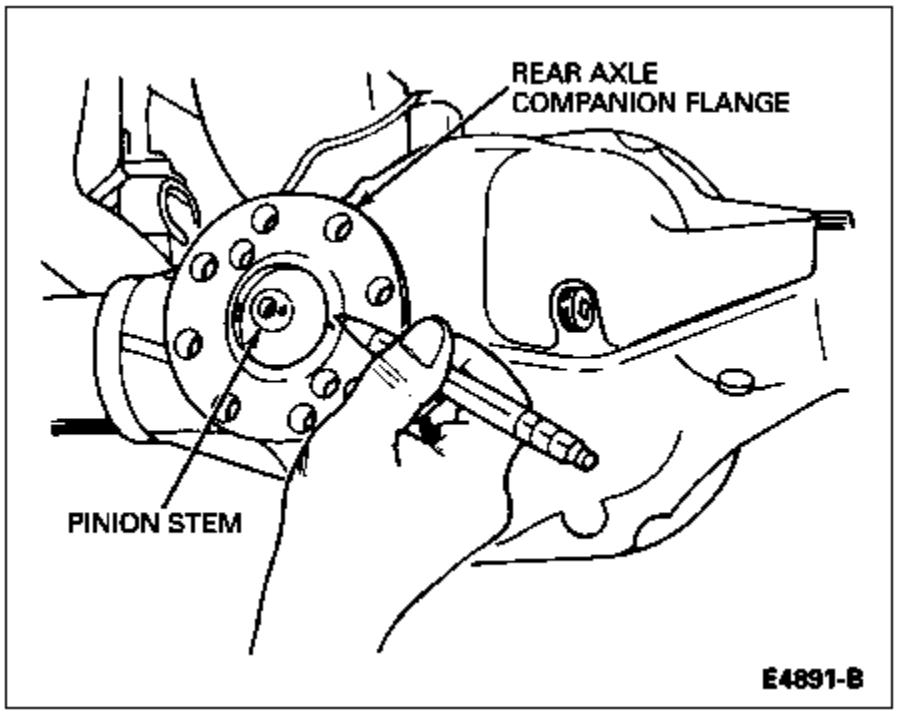


4. While holding the rear axle companion flange with Companion Flange Holding Tool T78P-4851-A, remove the pinion nut.

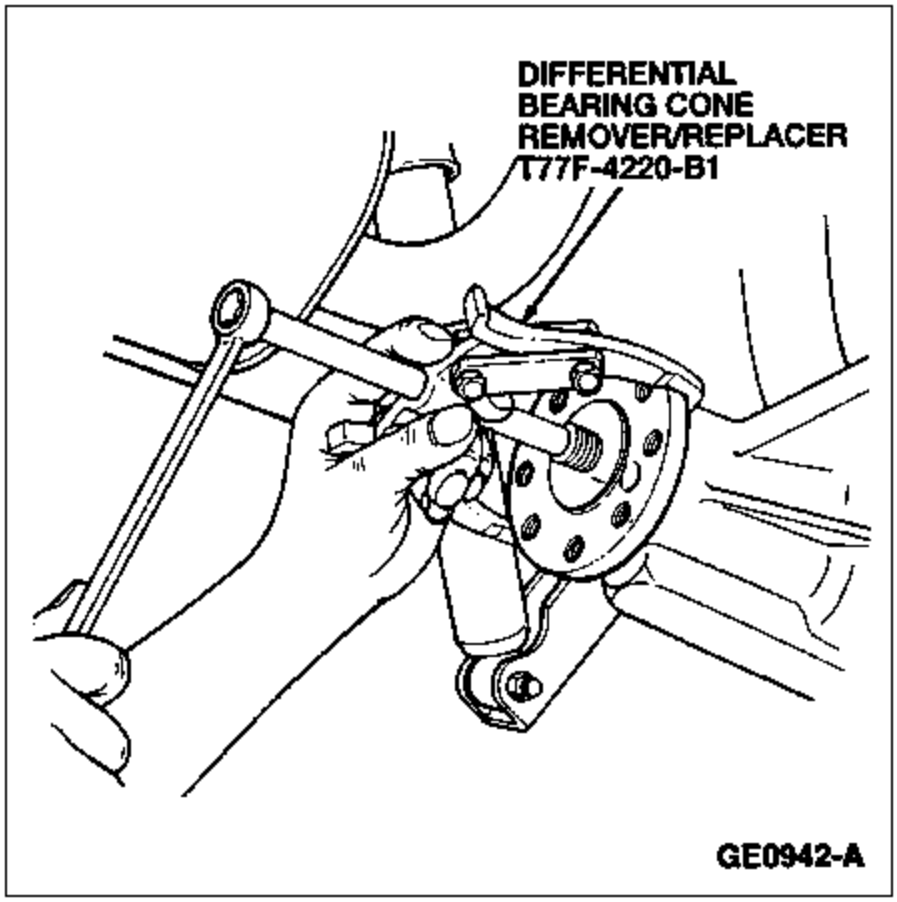


5. Clean the area around the pinion oil seal. Place a drain pan under the pinion oil seal, or raise the front of the vehicle higher than the rear.

   Mark the rear axle companion flange in relation to drive pinion shaft so flange can be reinstalled in the same position.

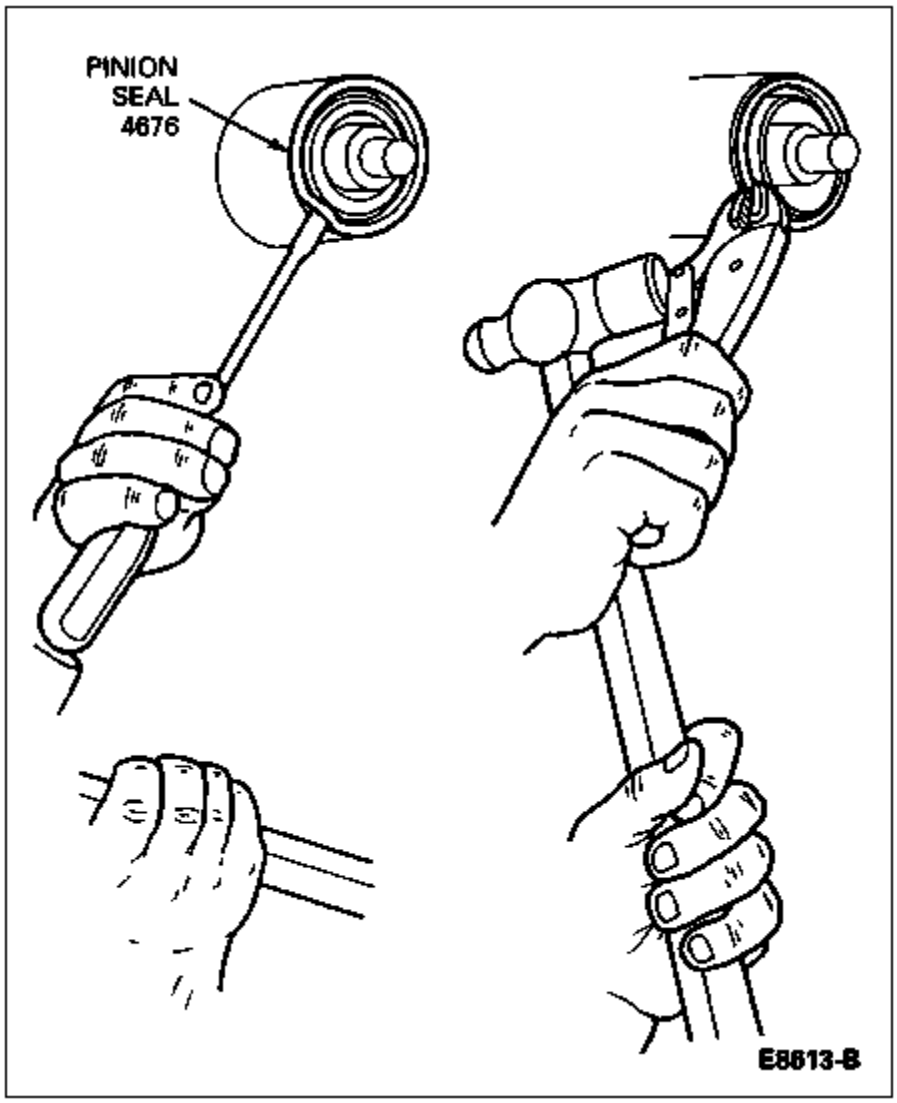


6. Using Differential Bearing Cone Remover/Replacer T77F-4220-B1, remove the rear axle companion flange.



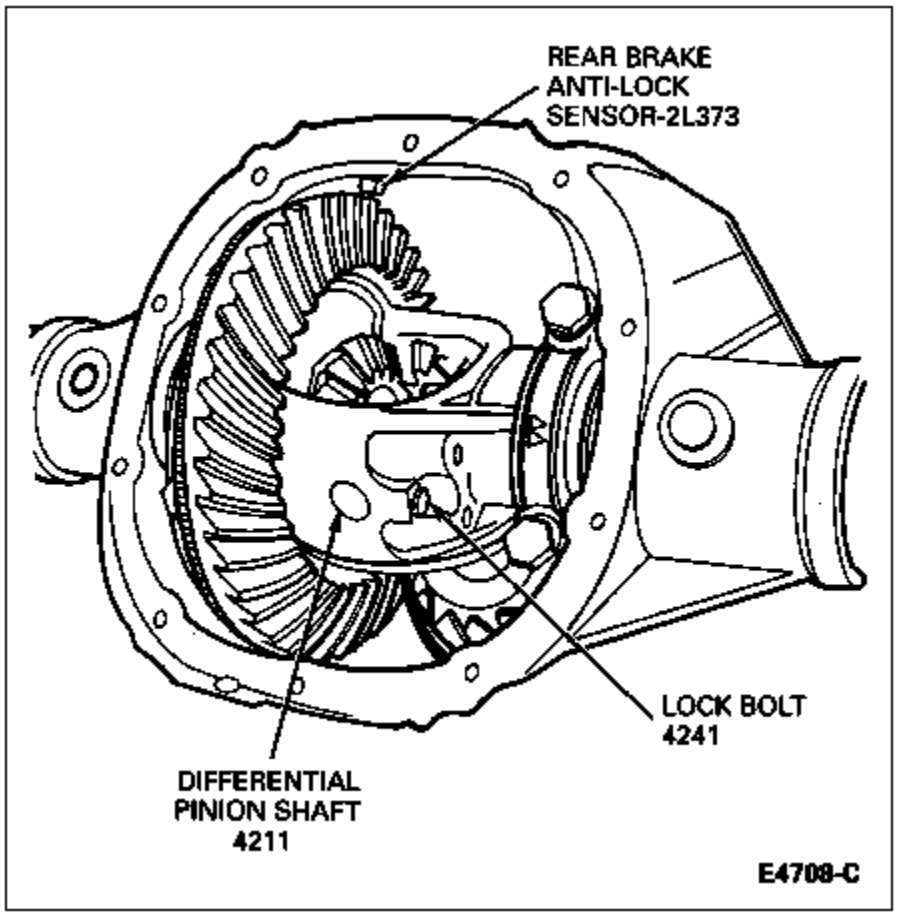
7. **CAUTION: Do not damage axle housing while removing pinion oil seal.**

   Pry up on metal flange of pinion oil seal. Install gripping pliers and strike with hammer until pinion seal is removed.



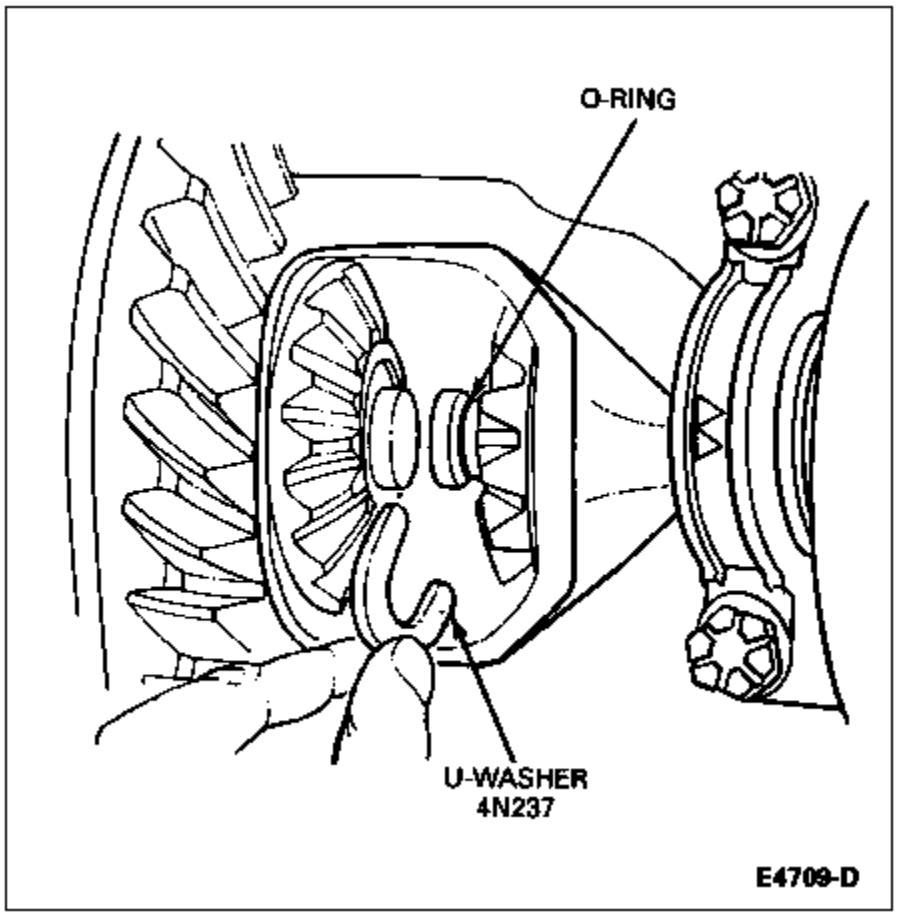
Axle Shaft Removal

1. Clean all dirt from the area of rear axle differential carrier cover with a wire brush or cloth.
2. Drain rear axle lubricant by removing the axle housing cover (4033).
3. Remove lock bolt and pinion shaft.

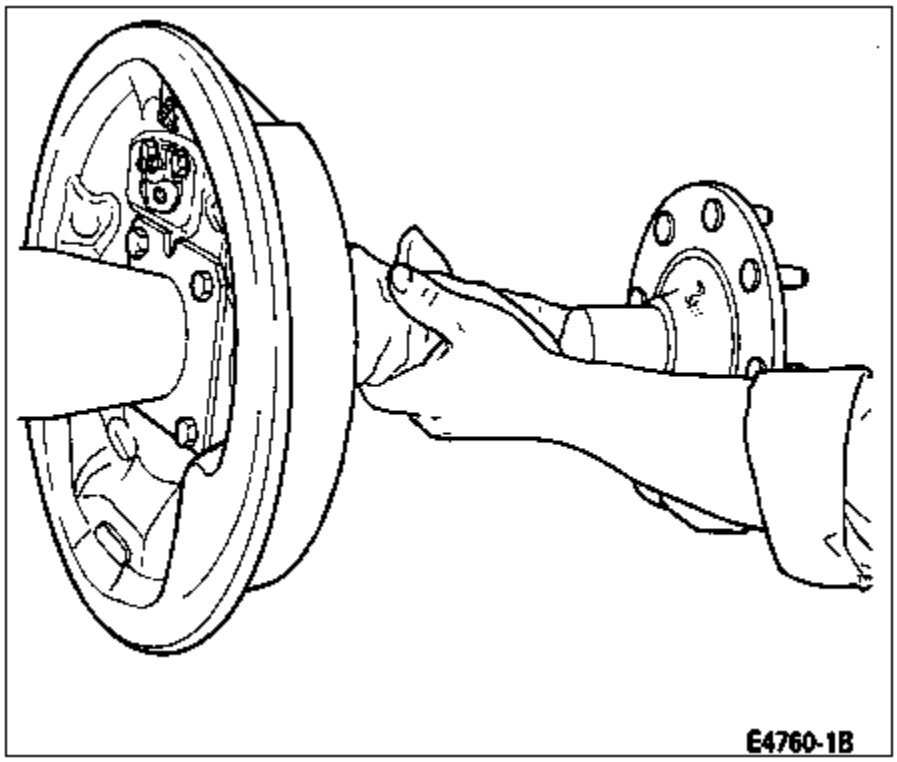


4. **NOTE: When removing U-washer, be careful not to lose or damage the rubber O-ring which is in the axle shaft groove under the U-washer.**

   Push the flanged end of the axle shafts (4234) inboard and remove the U-washer from each axle shaft.

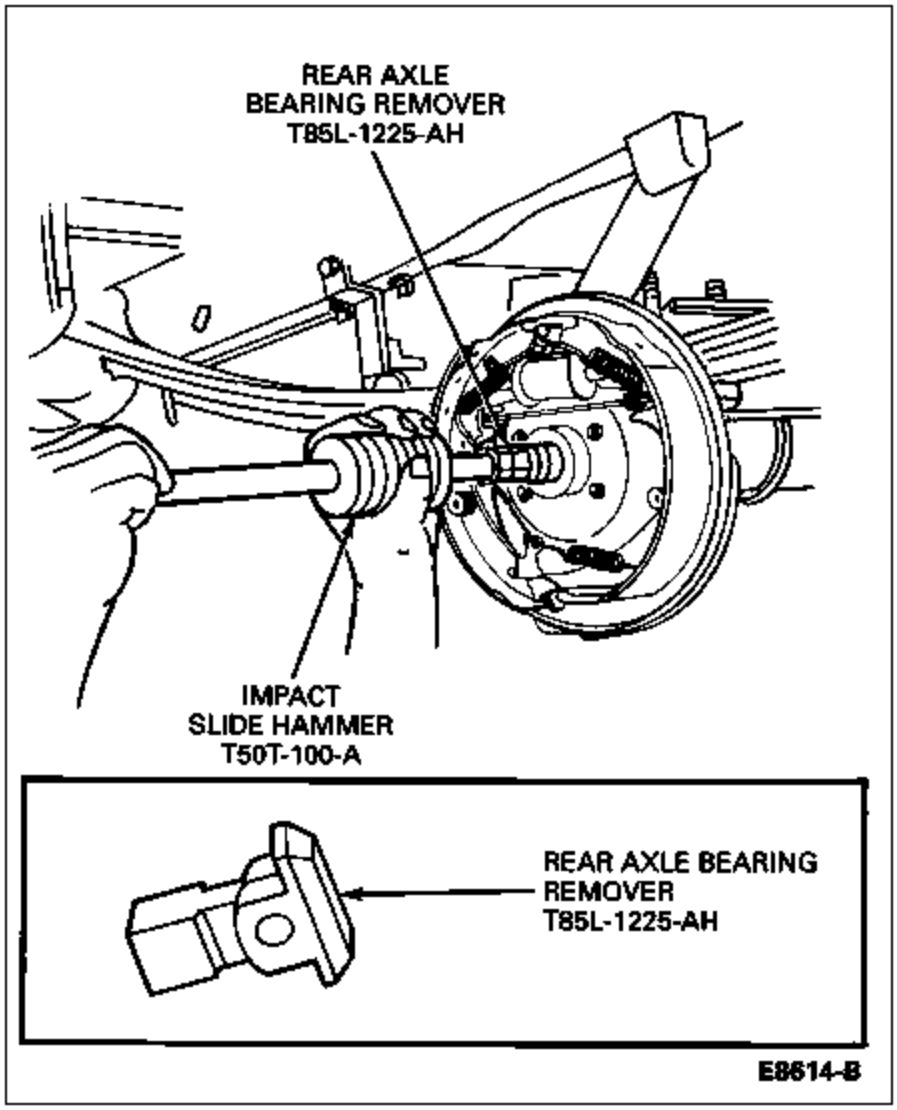


5. Remove the axle shaft from the axle housing, being careful not to damage the oil seal.



Wheel Bearing and Oil Seal Removal

1. Using Impact Slide Hammer T50T-100-A and Rear Axle Bearing Remover T85L-1225-AH, insert into the bore as shown and position it behind the rear wheel bearing (1225) so the tangs on the tool engage the rear wheel bearing outer race. Remove the rear wheel bearing and inner wheel bearing oil seal (1177) as a unit.



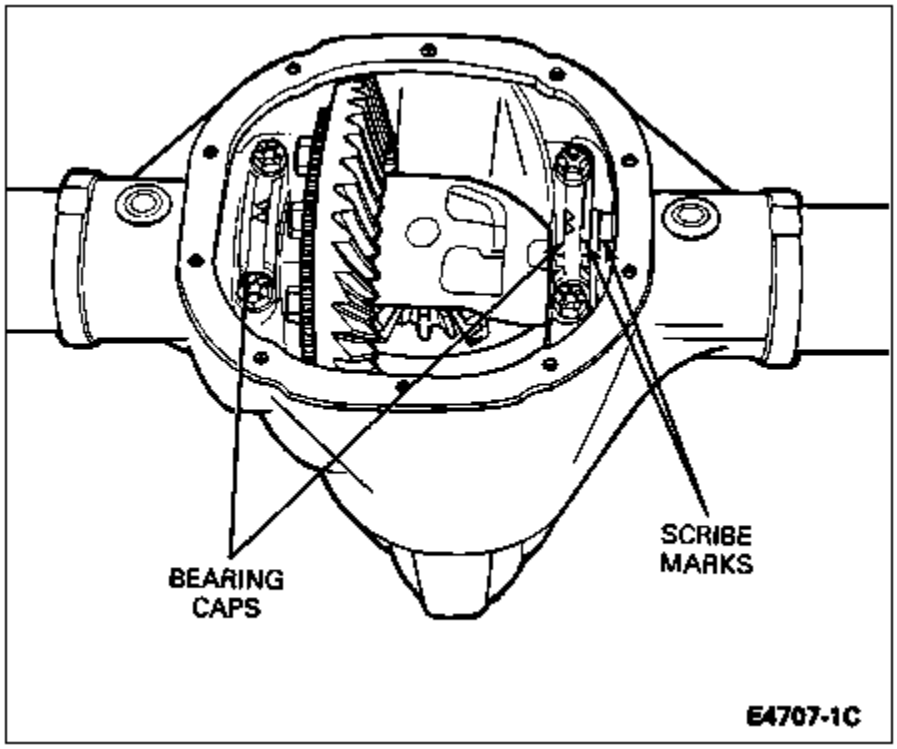
Differential Case Removal

NOTE: Before removing the differential case (4204), check the ring gear runout as described under Inspection Before Disassembly in the Cleaning and Inspection portion of this section. If ring gear runout exceeds 0.10mm (0.004 inch), the differential case and ring gear and pinion must be removed to perform the Differential Runout Check. The Differential Case Runout Check in this section will isolate the cause of excessive ring gear runout.

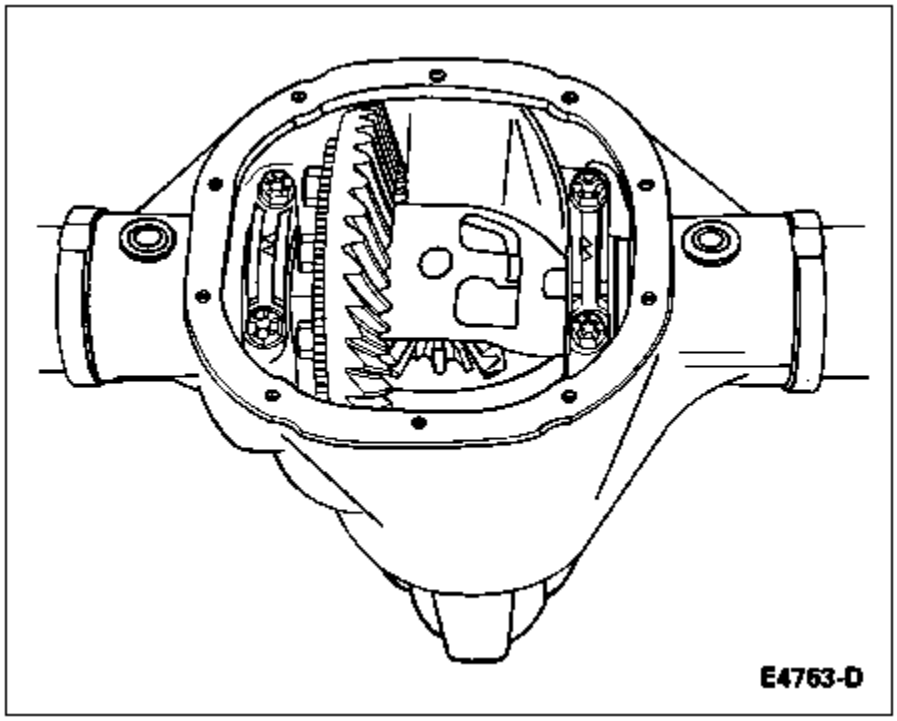
1. **CAUTION: Right and left bearing caps MUST NOT be interchanged.**

   NOTE: The direction and location of triangles on bearing retaining caps must be noted. When reassembled the triangles must be pointing in the same direction (outboard) as before removal.

   Mark one bearing cap to make sure the bearing caps will be installed in their original locations and positions with triangles pointing outboard.



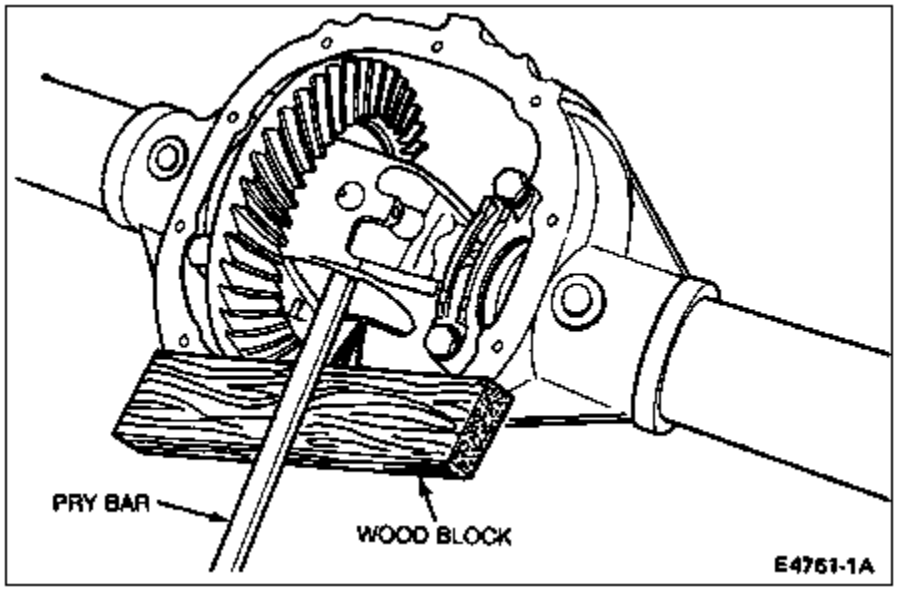
2. Loosen the differential bearing cap bolts.



3. **CAUTION: When using the pry bar in the following procedure, place a wood block**

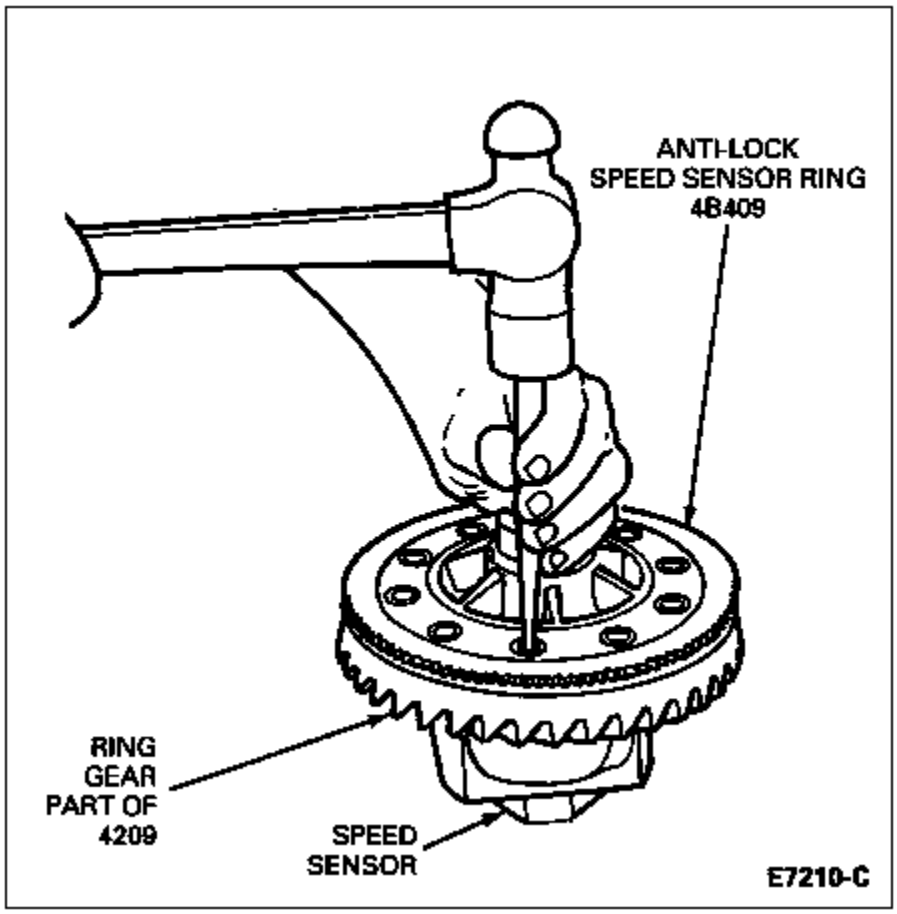
between the pry bar and the axle housing to protect the carrier from damage.

Pry the differential case, differential bearing cups (4222) and differential bearing shims (4067) out until they are loose in the bearing caps. Remove the bearing caps and remove the differential (4026) from the axle housing.



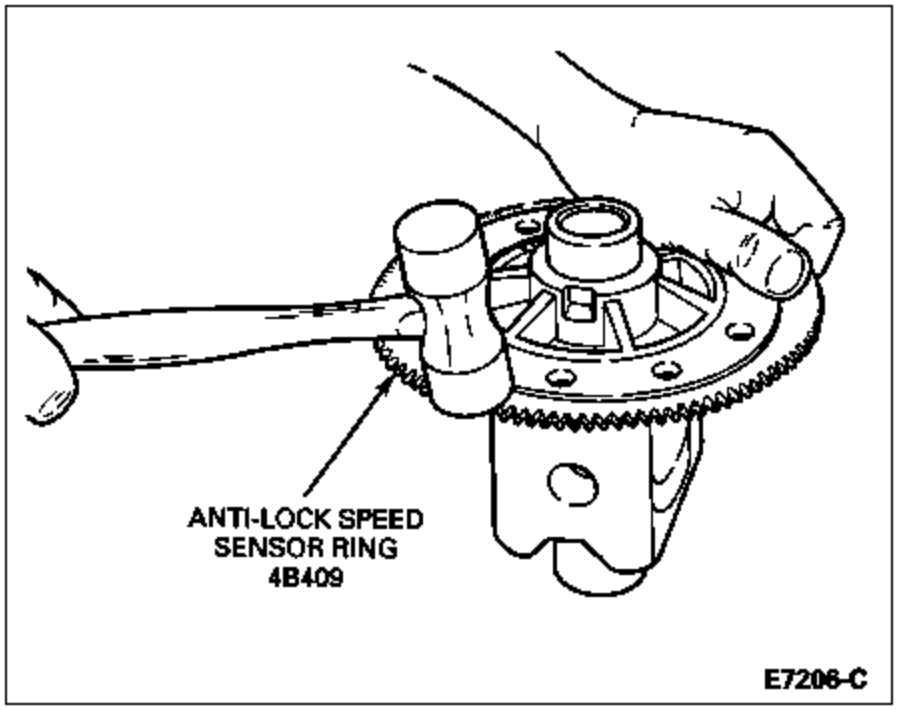
Ring Gear and Pinion Removal

1. Remove the bolts that attach the ring gear to the differential case. Remove the ring gear from the differential case by striking at alternate holes around the ring gear.



Anti-Lock Speed Sensor Ring Removal

1. If required, remove the anti-lock speed sensor ring with a soft faced hammer and discard. **Once removed, the anti-lock speed sensor ring cannot be reused. A new anti-lock speed sensor ring must be installed.**

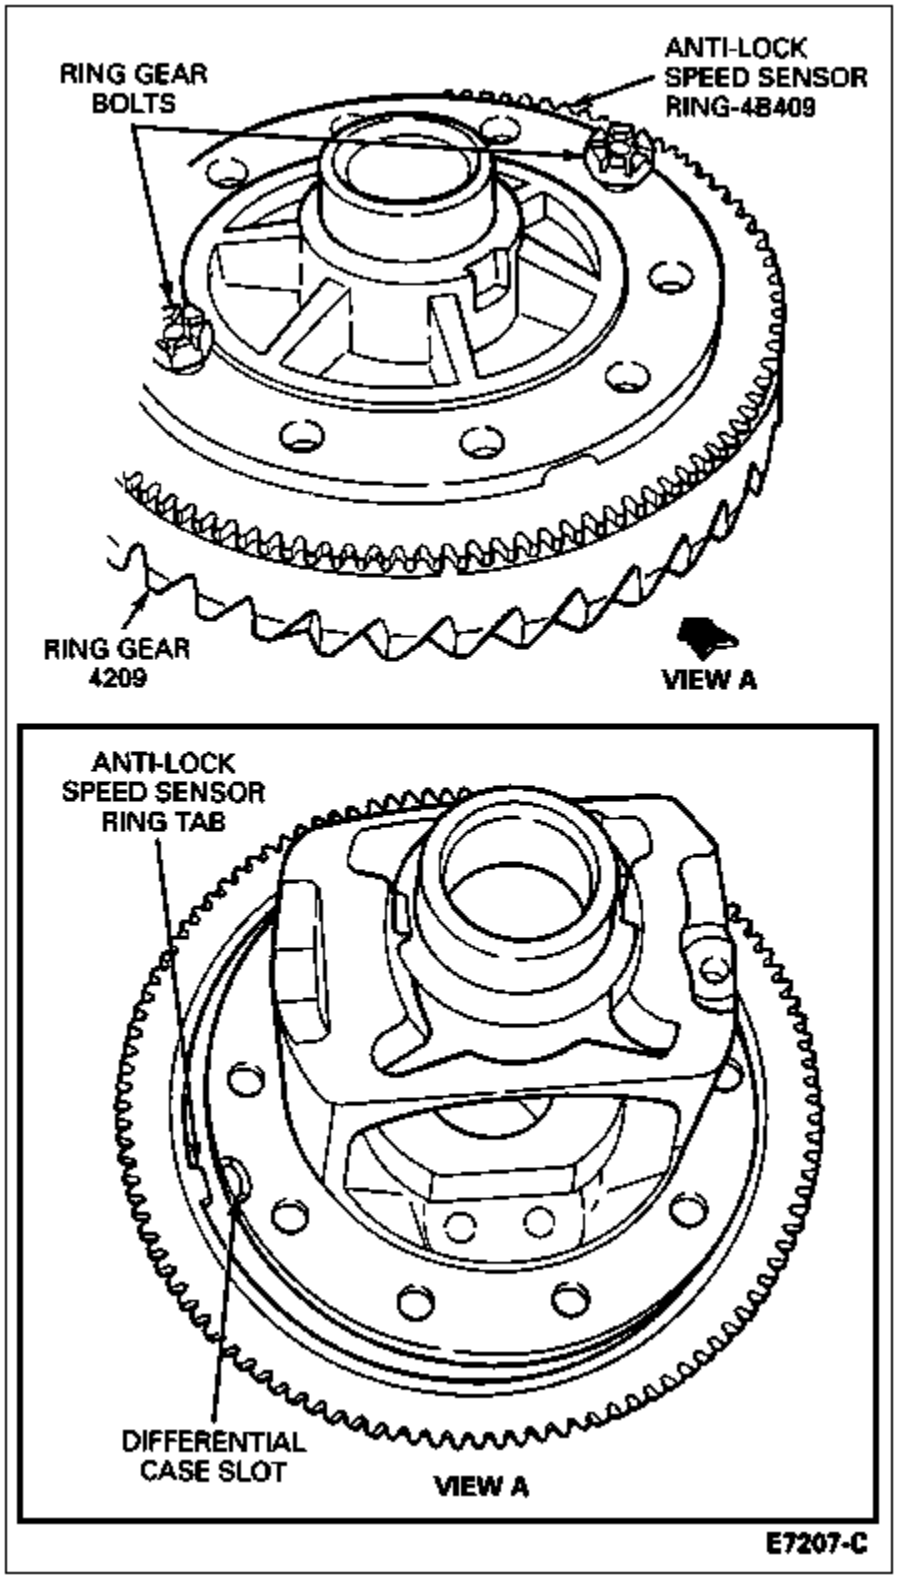


Anti-Lock Speed Sensor Ring Installation

1. **CAUTION: Tab on anti-lock speed sensor ring MUST BE aligned with slot in differential case.**

   Align tab on anti-lock speed sensor ring with slot in differential case.

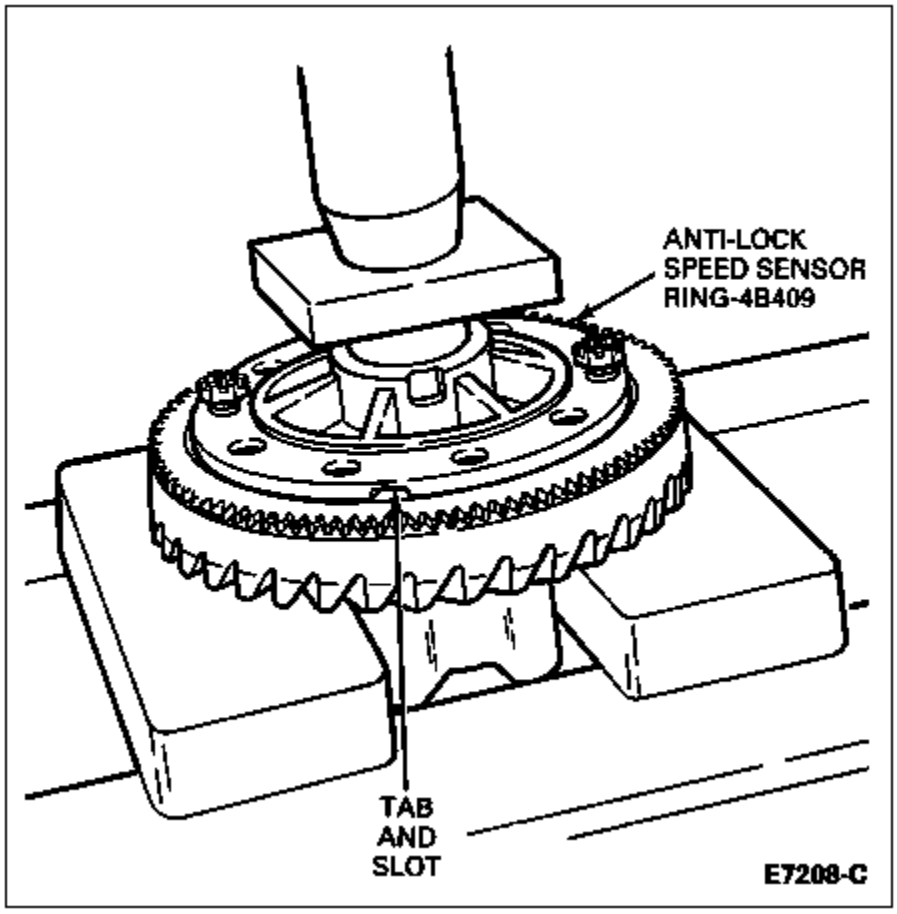
2. Start two ring gear bolts through the differential case into the ring gear to make sure differential case-to-ring gear bolt hole alignment is obtained.



3. Press the anti-lock speed sensor ring on the differential case using the ring gear as a pilot.

4. Apply Stud and Bearing Mount E0AZ-19554-BA or equivalent meeting Ford specification WSK-M2G349-A1 to ring gear bolts.

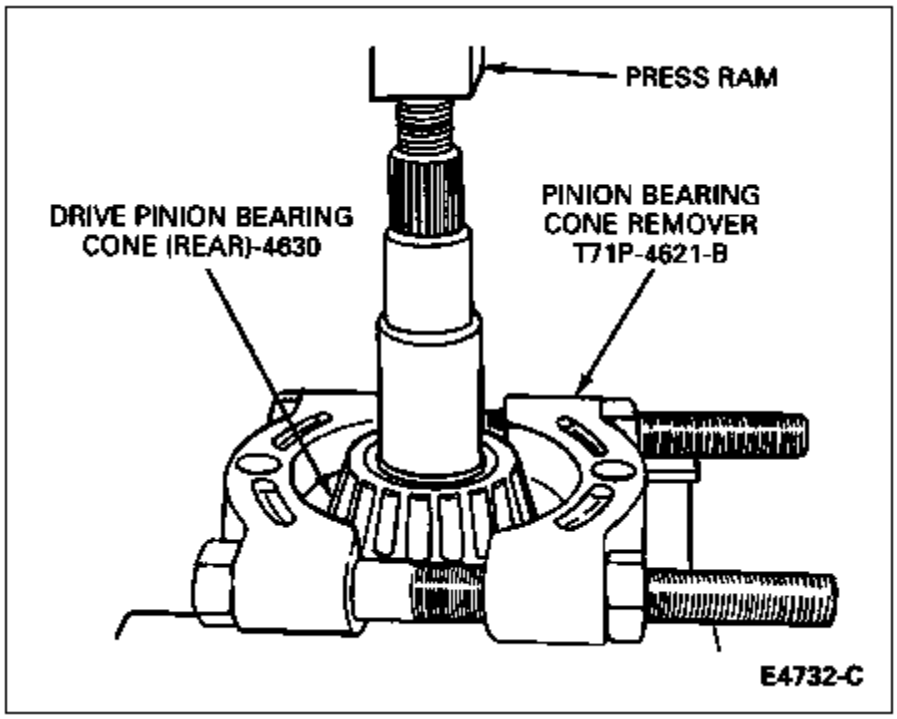
5. Install ring gear bolts and tighten to 95-115 Nm (70-85 lb-ft).



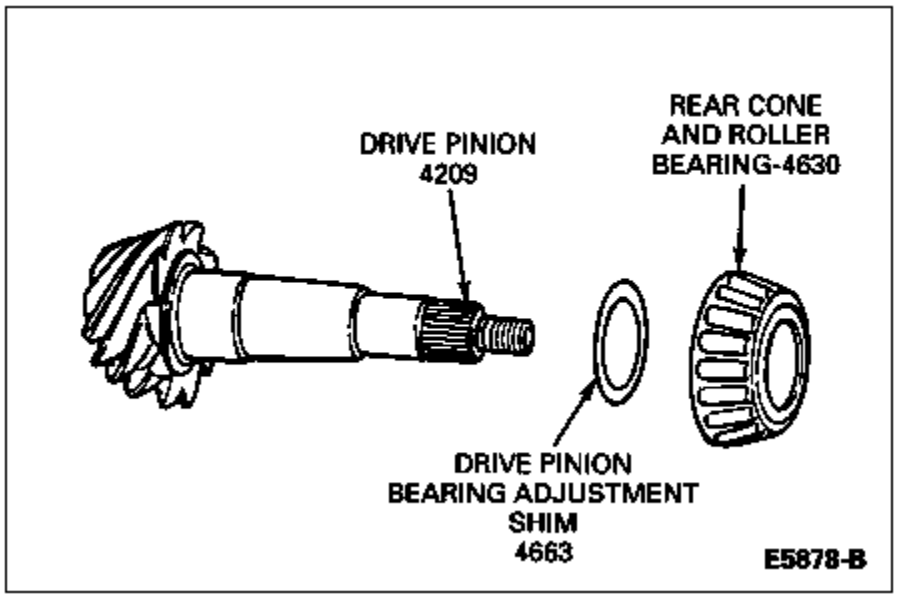
Drive Pinion Removal

1. With a soft-faced hammer, drive the pinion out of the drive pinion bearing cone and remove it through the rear of the carrier.

   To remove the pinion bearing cone and roller assembly, use the Pinion Bearing Cone Remover T71P-4621-B as shown.



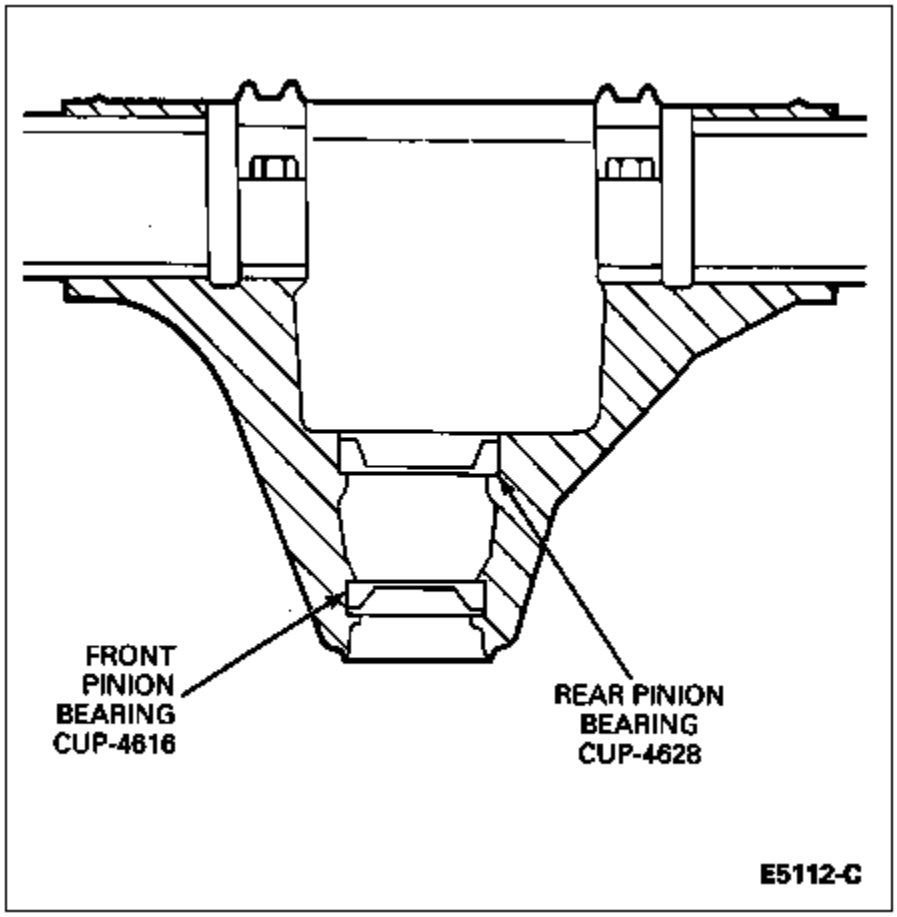
2. Measure the pinion shim, which is found under the drive pinion bearing cone and roller, with a micrometer and record the thickness (as a reference to be compared to the drive pinion bearing adjustment shim gauge reading prior to installing the drive pinion bearing cone and roller).



Pinion Bearing Cup Removal

1. **NOTE: Do not remove the pinion bearing cups from the axle housing casting unless the cups are damaged.**

If the pinion bearing cups are to be replaced, tap alternately (with a brass drift of suitable length) on the opposite side of the cups during removal to prevent cups from cocking in the casting.

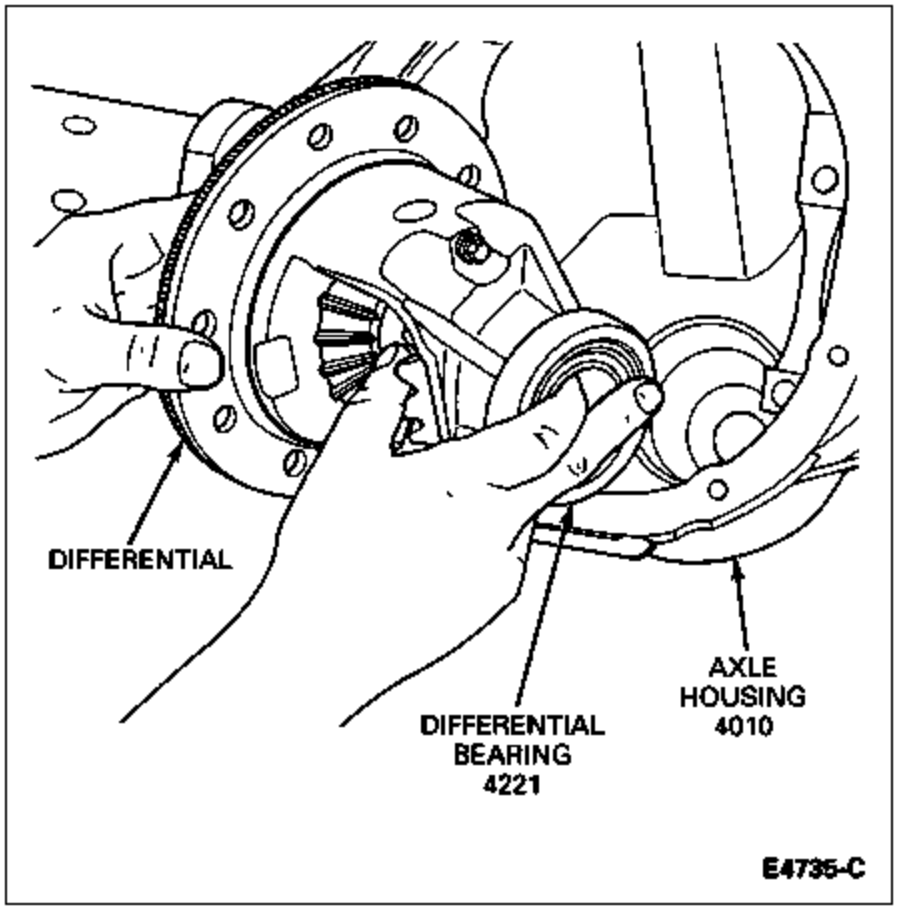


Differential Case Runout Check

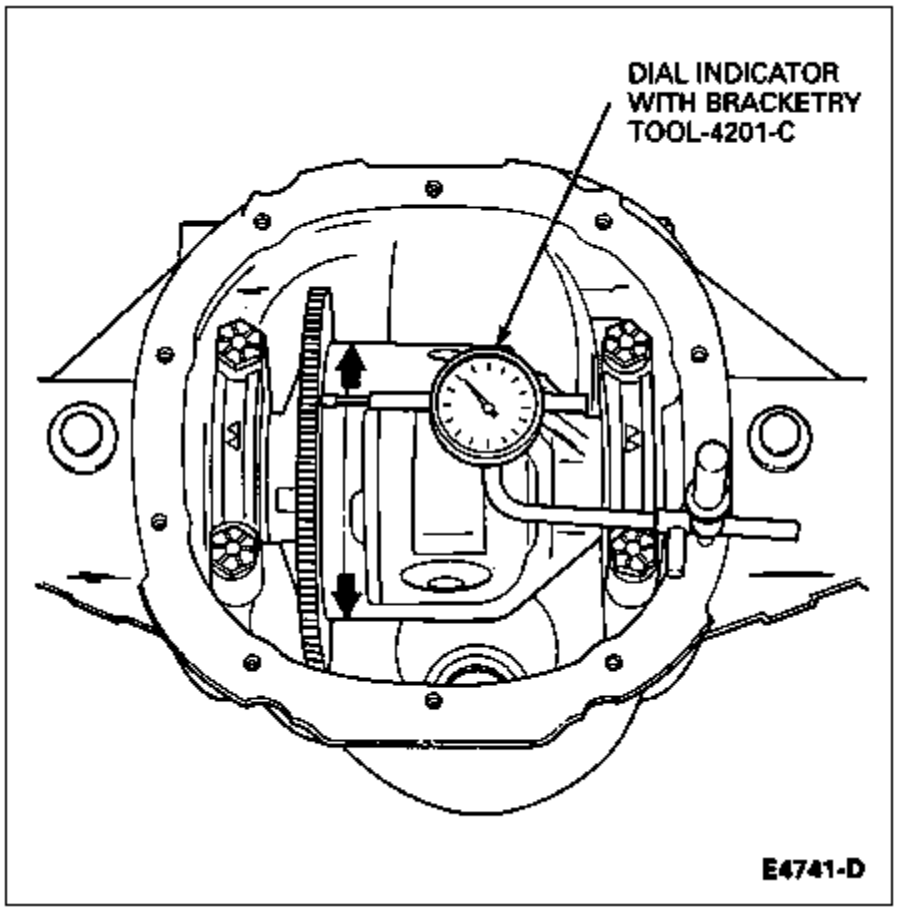
If the ring gear runout check (before disassembly) exceeds specification, the condition may be caused by a warped ring gear, a damaged differential case, excessively worn differential bearings (4221) or foreign material between mating surfaces (burrs, shavings, etc.). To determine the cause of excessive runout, proceed as follows:

1. Remove the differential case from the axle housing (refer to Differential Case Removal or Drive Pinion Removal in this section) and remove the bolts that attach the ring gear and pinion to the differential case. Remove the ring gear from the differential case with a hammer and drift.

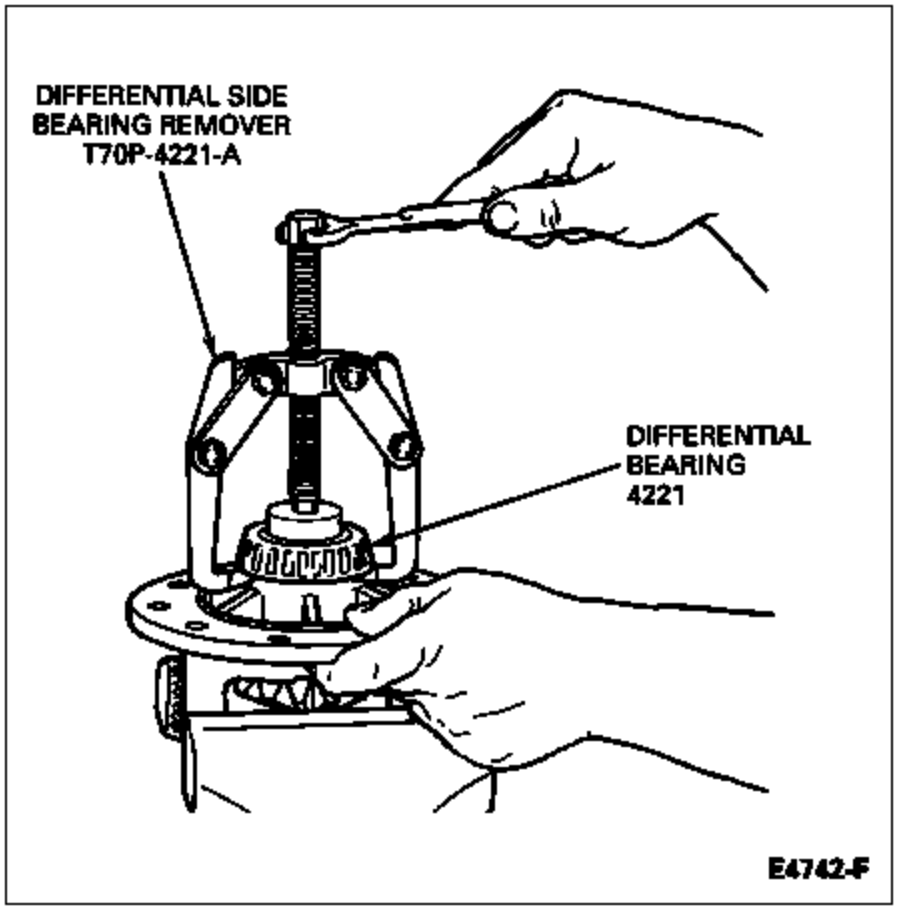
2. Install the differential case with the differential bearing cups, differential bearing caps, and differential bearing shims. Tighten the differential bearing cap bolts to 95-115 Nm (70-85 lb-ft).



3. Check the runout of the differential case flange using Dial Indicator with Bracketry TOOL-4201-C or equivalent. If the runout is within specification (maximum 0.076mm [0.003 inch]), install a new ring gear and pinion. If the runout exceeds specification, the ring gear and pinion is true and the concern is due to either a damaged differential case or differential bearings. Visually inspect the differential bearings. If differential bearings are not damaged replace both the differential case and differential bearings. Recheck the runout with new parts (differential case and differential bearings). Visually inspect the anti-lock speed sensor ring for damage and replace if required.

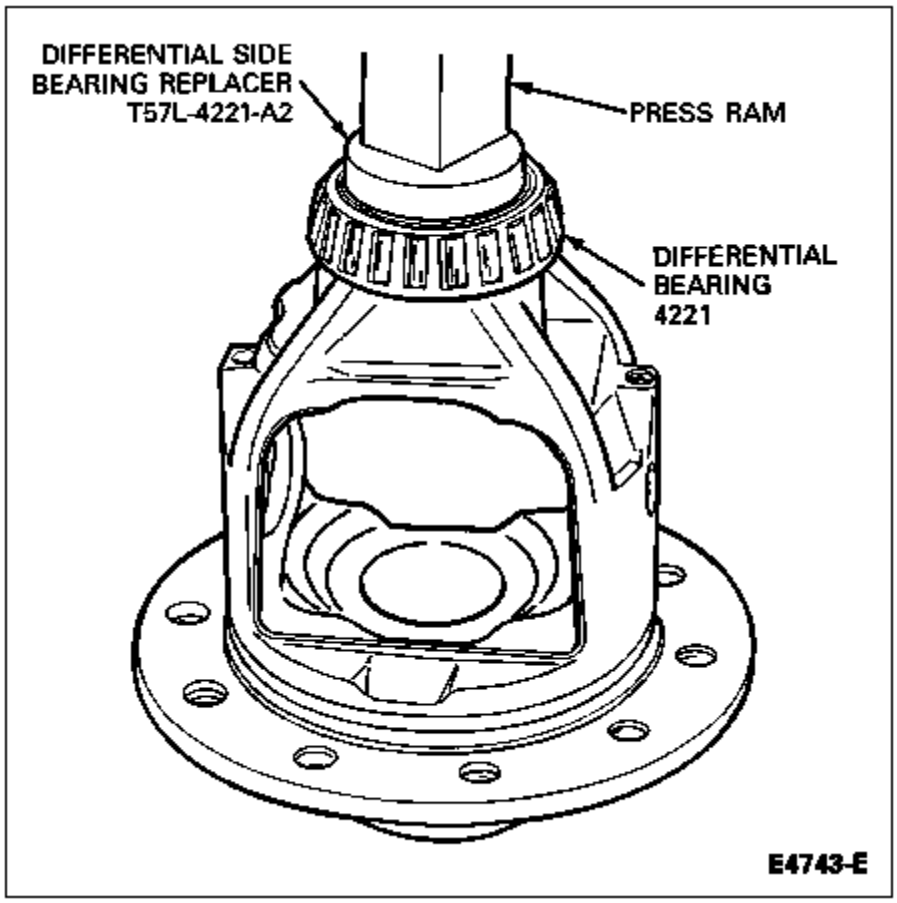


4. Remove the differential case from the carrier and remove the differential bearings from the differential case using Differential Side Bearing Remover T70P-4221-A or T57L-4220-A.

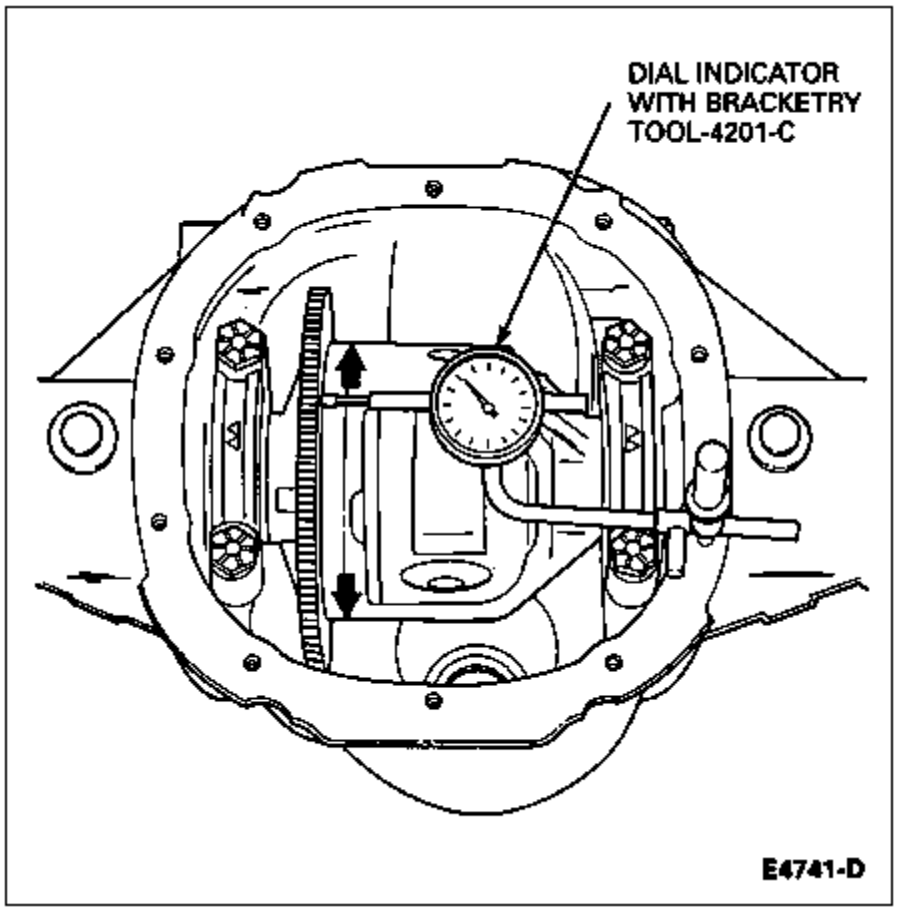


5. **NOTE: Press against the bearing cone only.**

   Install new differential bearings on the rear hubs (1109) using Differential Side Bearing Replacer T57L-4221-A2 and install the differential in the carrier without the ring gear and pinion.



6. Check the differential case runout again with the new differential bearings. If the runout is now within 0.076mm (max. 0.003 inch), use the new differential bearings for assembly. If the runout is still excessive, the differential case is damaged and should be replaced.



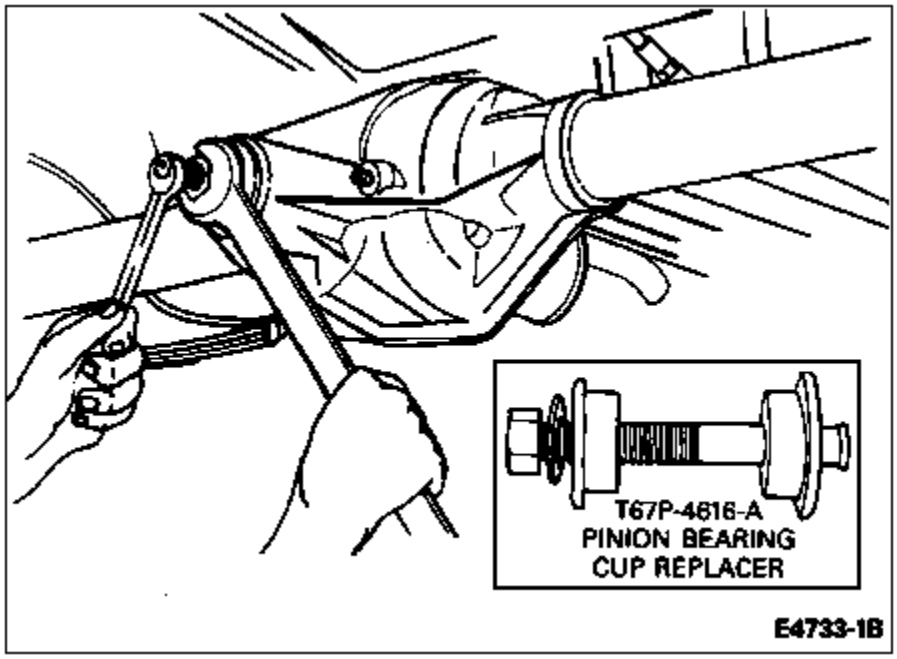
DIAL INDICATOR
WITH BRACKETRY
TOOL-4201-C
E4741-D

Axle Assembly

Pinion Bearing Cup Installation

1. **NOTE: Do not remove the pinion bearing cups from the carrier casting unless the pinion bearing cups are damaged.**

   Install the new cups with Pinion Bearing Cup Replacer T67P-4616-A as shown. Make sure the pinion bearing cups are properly seated in their bores. If a 0.038mm (0.0015 inch) feeler gauge can be inserted between a pinion bearing cup and the bottom of its bore at any point around the pinion bearing cup, the pinion bearing cup is not properly seated. Whenever the pinion bearing cups are replaced, the differential bearing (4221) should also be replaced.

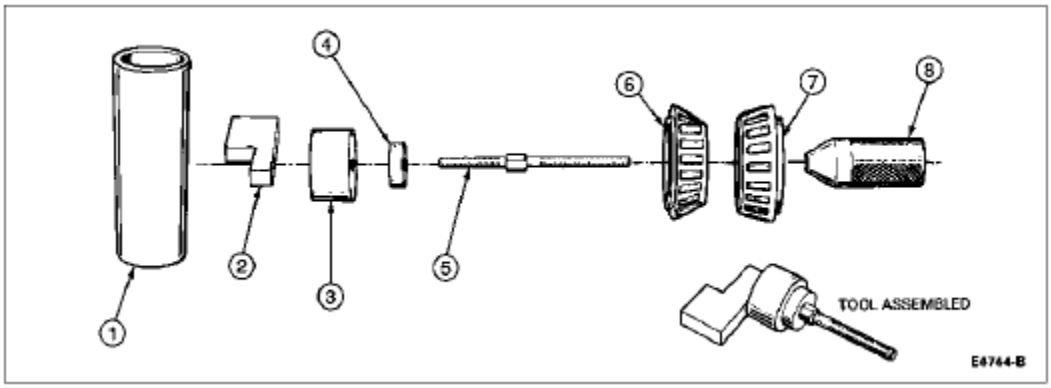


Drive Pinion Shim Selection

Individual differences in machining the rear axle differential carrier casting and the ring gear and pinion and variation in bearing widths require a pinion shim between the differential pinion bearing (4630) and pinion head, in order to locate the drive pinion shaft for correct tooth contact with the ring gear.

When replacing a ring gear and pinion, the correct pinion shim thickness for the new ring gear and pinion to be installed is determined by the following procedure using Pinion Depth Gauge T79P-4020-A.

Pinion Depth Gauge Set

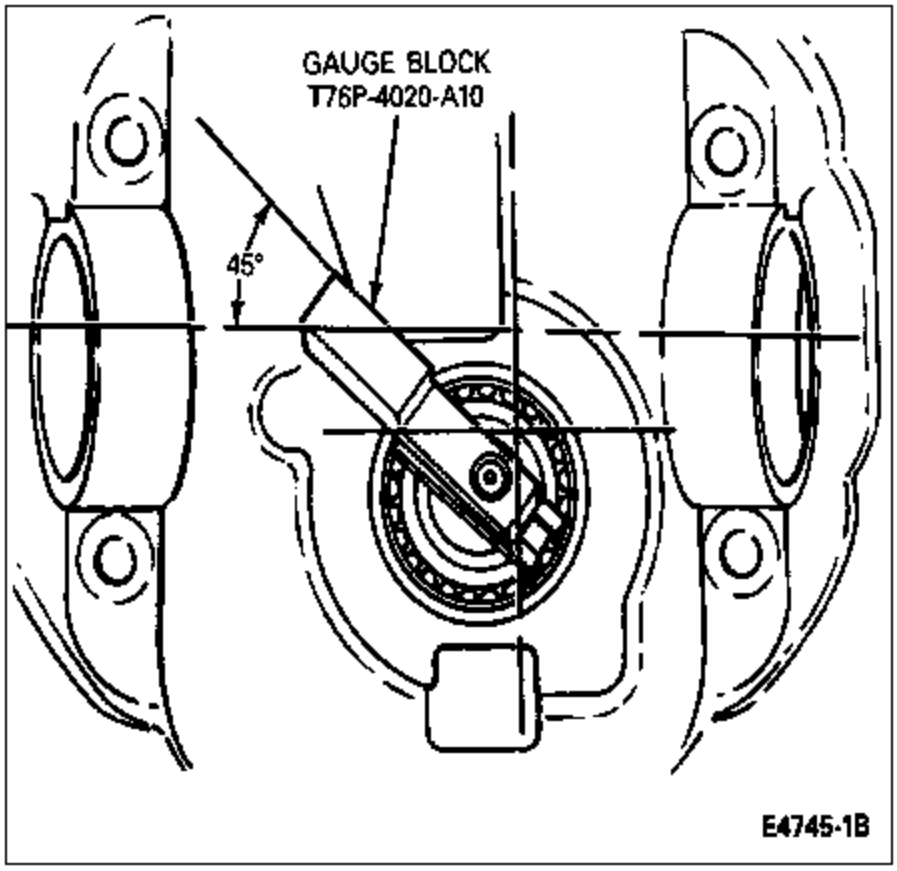


Item	Part Number	Description
1	T89P-4020-A	Gauge Tube
2	T76P-4020-A10	Gauge Block (Part of T79P-4020-A)
3	T79P-4020-A18	Gauge Disc (Part of T79P-4020-A)
4	T76P-4020-A3	Aligning Adapter (Part of T79P-4020-A)
5	T79P-4020-A9	Screw (Part of T79P-4020-A)
6	4630	Drive Pinion Bearing Cone and Roller (Rear)
7	4621	Front Bearing Cone and Roller
8	T76P-4020-A11	Handle (Part of T79P-4020-A)

1. **NOTE: The gauge block must be offset 45 degrees to obtain an accurate reading.**

   Assemble the appropriate aligning adapter, gauge disc and gauge block to the screw.

2. Place the drive pinion bearing cone and roller (new, or used if in good condition) over the aligning tool and insert it into the rear pinion bearing cup of the rear axle differential carrier. Place the front bearing cone and roller into the front pinion bearing cup and assemble the tool handle into the screw (refer to illustration).

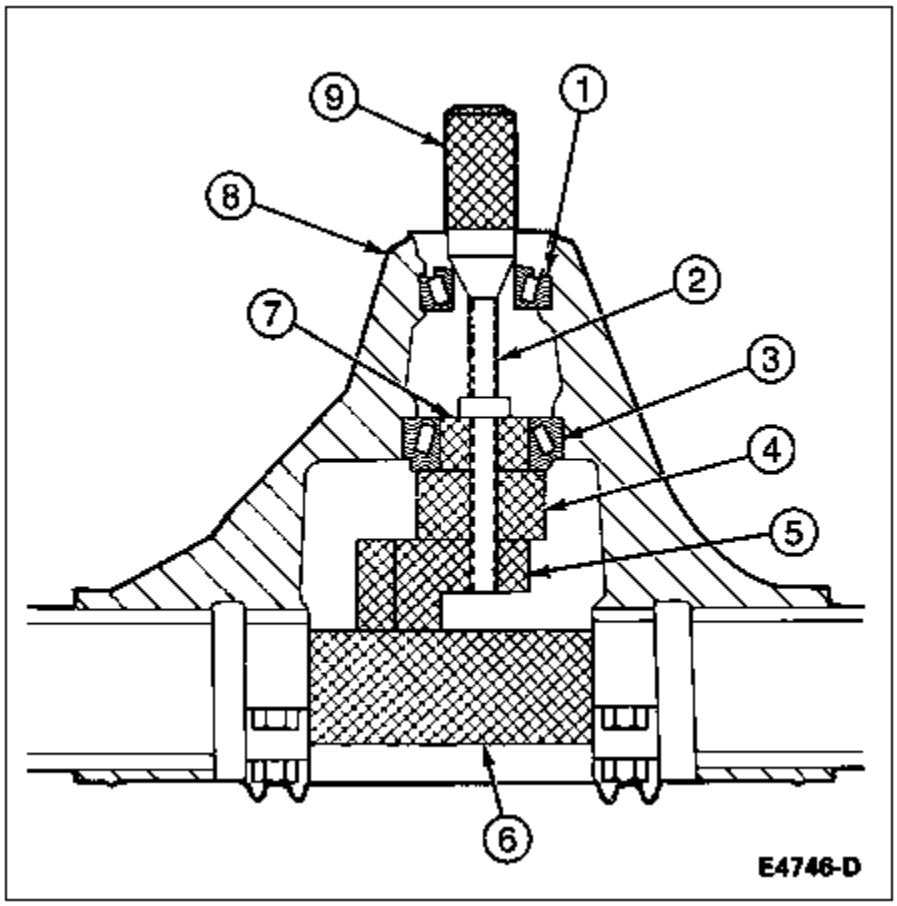


3. Roll the assembly back and forth a few times to seat the bearings while tightening the tool handle by hand. Tighten the tool handle to 27 Nm (20 lb-ft).

4. Center the gauge tube into the differential bearing bore. Install the bearing retaining caps and tighten the bolts to 95-115 Nm (70-85 lb-ft). (Bearing retaining caps are to be installed with the triangles pointing outboard.)

5. **NOTE: Shims must be flat. Do not use dirty, bent, nicked or mutilated shims as a gauge.**

   Utilize pinion shims as the gauge for shim selection. This will minimize errors in attempting to stack feeler gauge stock together or simple addition errors in calculating correct shim thickness. It is important to feel a slight drag on the shim for correct selection. Do not attempt to force the shim between the gauge block and the gauge tube. This will minimize the undesirable selection of a shim thicker than required, which results in deep tooth contact in final assembly of integral rear axles (4001).

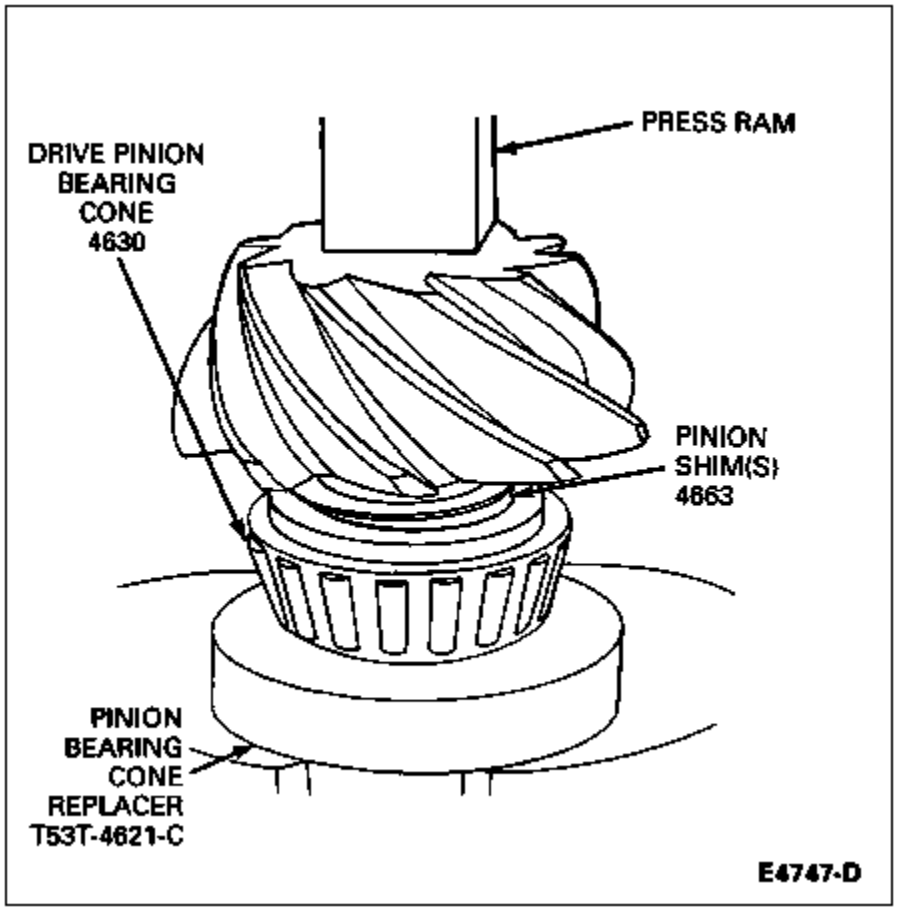


Item	Part Number	Description
1	4621	Front Bearing Cone and Roller
2	T79P-4020-A9	Screw (Part of T79P-4020-A)
3	4630	Drive Pinion Bearing Cone and Roller
4	T79P-4020-A18	Gauge Disc (Part of T79P-4020-A)
5	T76P-4020-A10	Gauge Block (Part of T79P-4020-A)
6	T89P-4020-A	Gauge Tube (Part of T79P-4020-A)
7	T76P-4020-A3	Aligning Adapter (Part of T79P-4020-A)
8	4010	Axle Housing
9	T76P-4020-A11	Handle (Part of T79P-4020-A)

6. **NOTE: The same drive pinion bearing cone and roller used in this procedure must be used in final assembly of the rear axle.**

   NOTE: Be sure that press load is not applied to the pinion bearing cage.

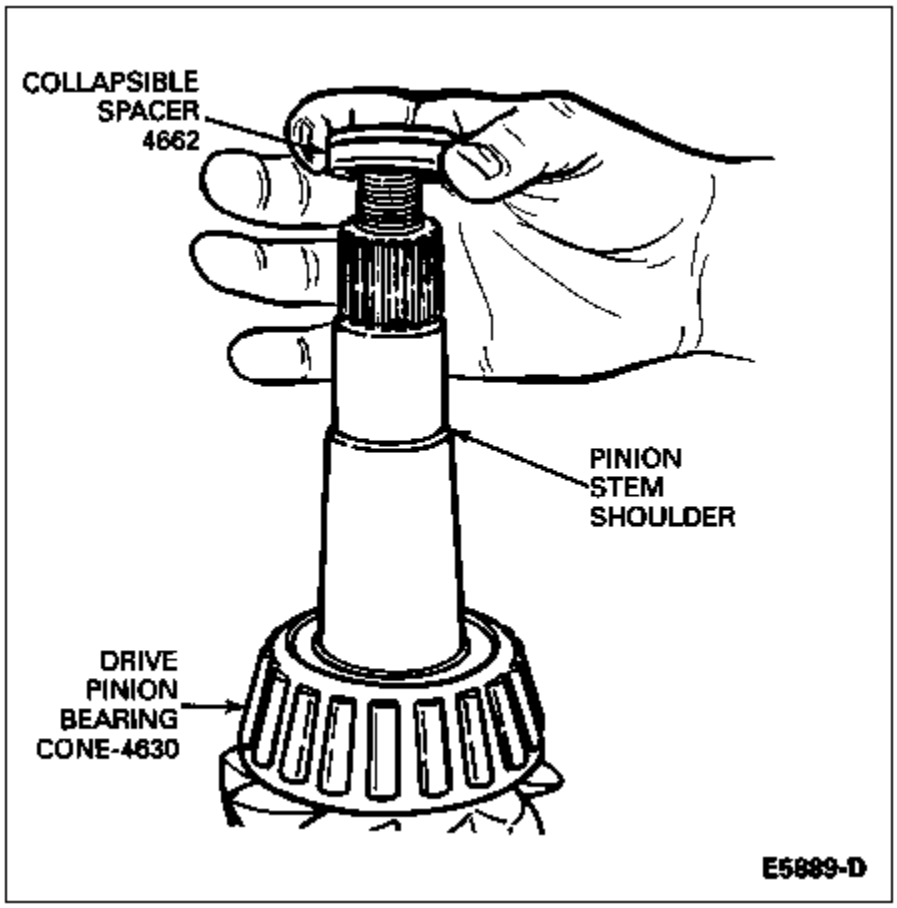
Place the selected pinion shims on the drive pinion shaft and press the drive pinion bearing cone and roller until it is firmly seated on the drive pinion shaft.



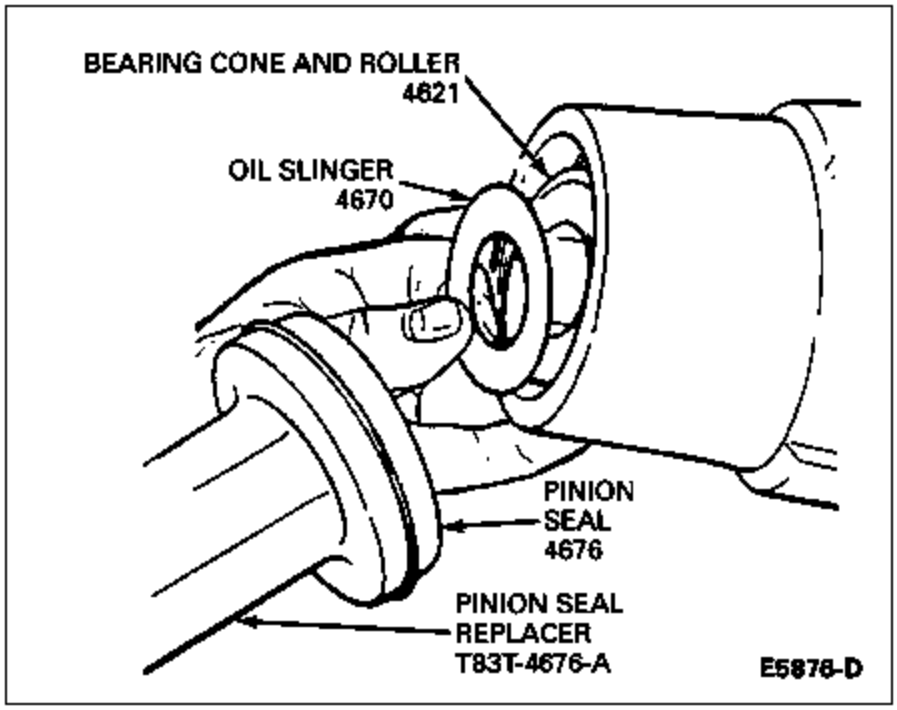
Drive Pinion and Flange Yoke Seal Installation

1. Check splines on the drive pinion shaft to be sure they are free of burrs. If burrs are evident, remove them by using a fine crocus cloth, working in a rotational motion. Wipe the pinion shaft clean.

2. Place the collapsible spacer on the pinion stem against the pinion stem shoulder.

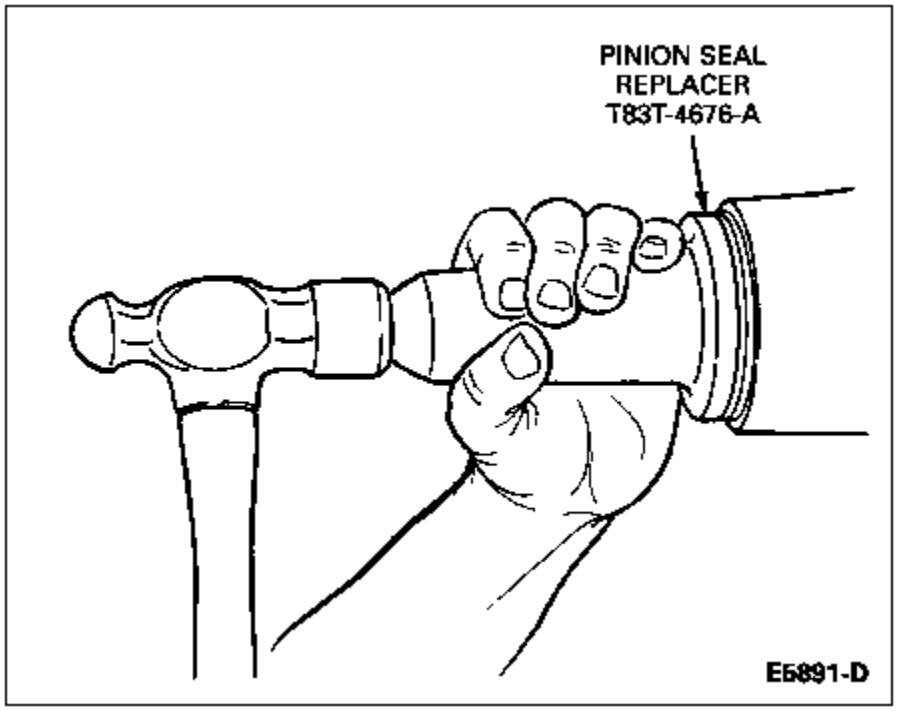


3. Install the bearing cone and roller and oil slinger in the axle housing bore, and install the pinion seal on the Pinion Seal Replacer T83T-4676-A.

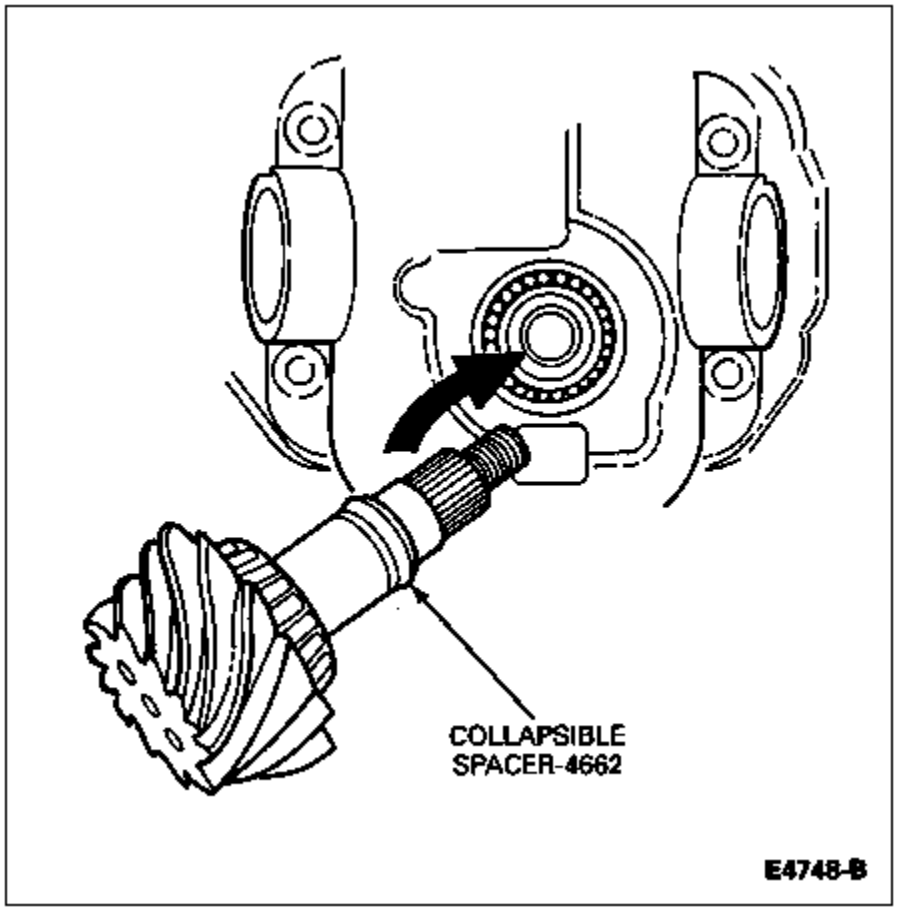


4. **CAUTION: Installation without the proper tool may result in early pinion seal failure. If pinion seal becomes cocked during installation, remove it and install a new one.**

   Clean the pinion seal seat surface. Install the pinion seal in the front bearing cone and roller using Pinion Seal Replacer T83T-4676-A. Coat the lips of the seal with Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B.



5. From the rear of the axle housing, install the drive pinion with pinion shims, cone and roller bearings, and collapsible spacer into the axle housing pinion bore.



Rear Axle Companion Flange Installation

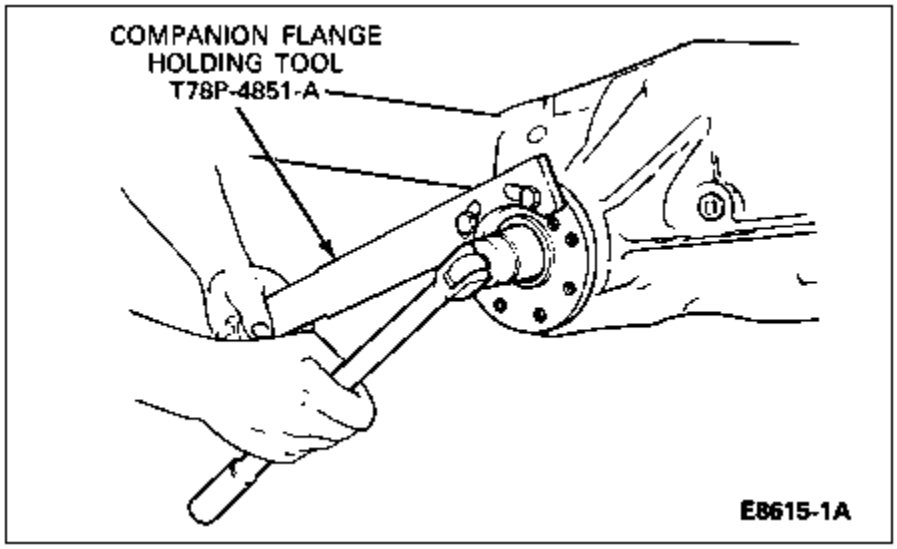
1. Apply a small amount of lubricant to the rear axle universal joint flange shaft splines. Align the mark on the rear axle companion flange with the mark on the drive pinion shaft. Install the rear axle companion flange using Companion Flange Replacer TOOL-4858-E or equivalent.

2. Install a new pinion nut on the pinion stem.

3. **NOTE: If a new rear axle companion flange is being installed, disregard the scribe mark on the drive pinion shaft.**

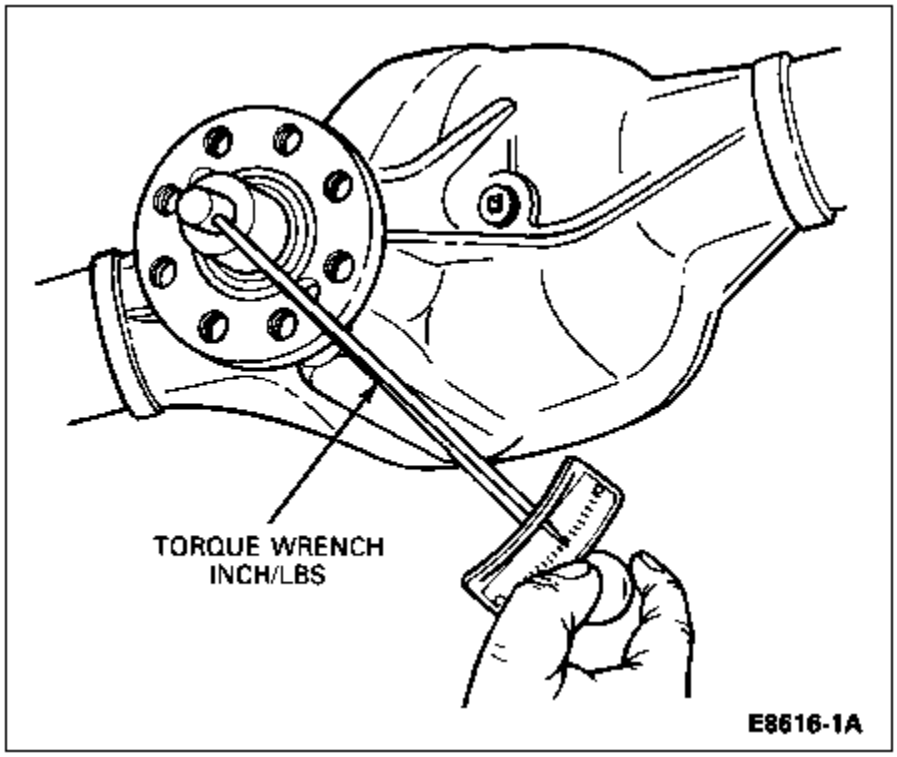
   NOTE: The rear axle companion flange must never be hammered on or installed with power tools.

   Using Companion Flange Holding Tool T78P-4851-A tighten the pinion nut, rotating the drive pinion occasionally to make sure proper pinion bearings are seated properly. Take frequent pinion bearing torque preload readings until the original recorded preload reading is obtained.



4. If the original recorded preload is lower than specification (used bearings 0.9-1.5 Nm [8-14 lb-in]; new bearings 1.8-3.3 Nm [16-29 lb-in]) tighten to specification. If the preload is higher than specification, tighten to original reading as recorded.

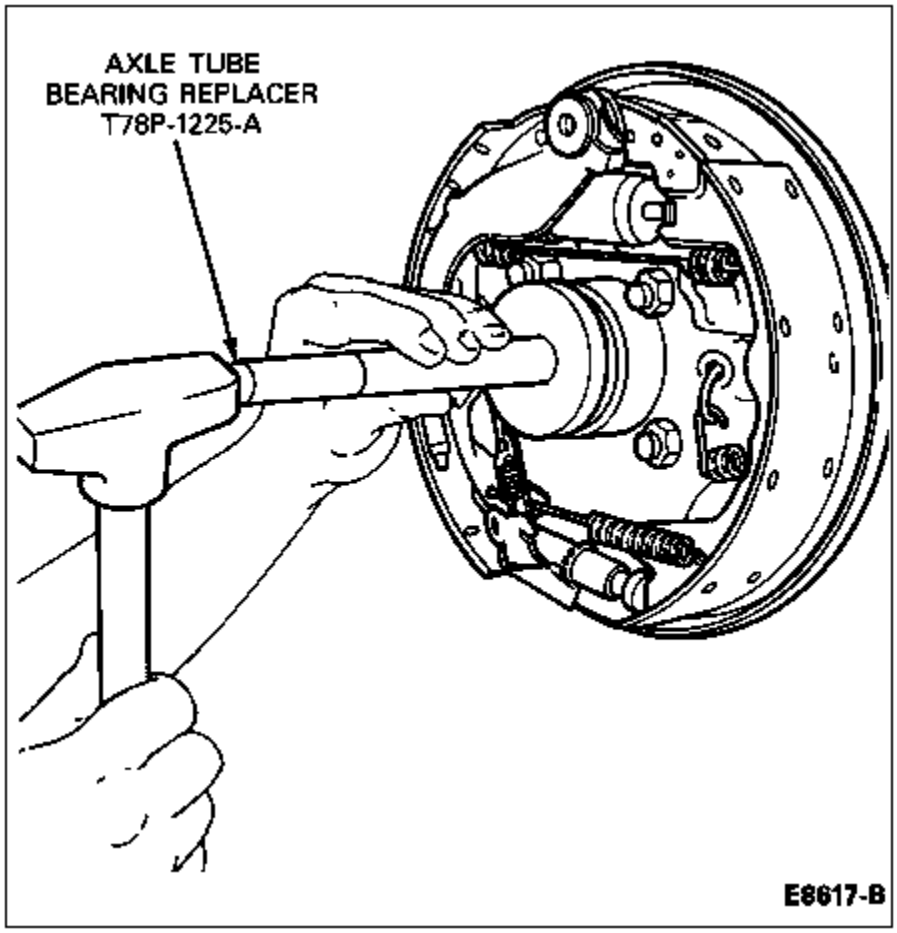
   Under no circumstances should the pinion nut be backed off to reduce preload. If reduced preload is required, a new collapsible spacer and pinion nut must be installed.



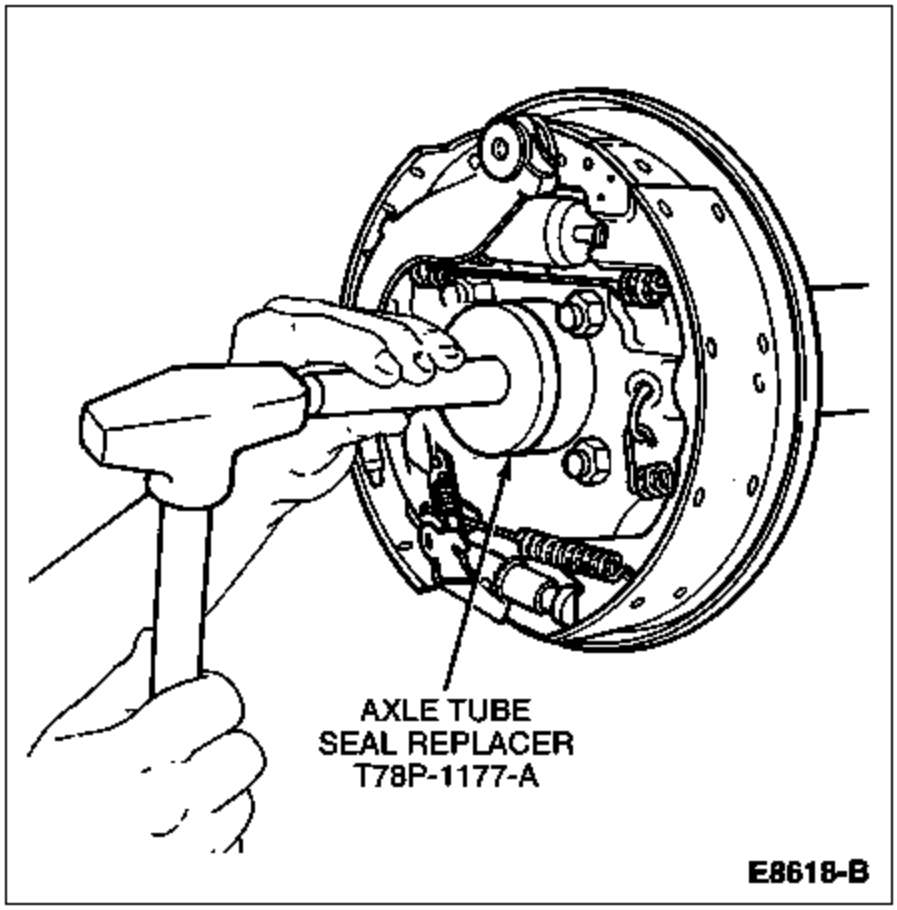
Wheel Bearing and Oil Seal Installation

1. **CAUTION: Installation of the rear wheel bearing (1225) or inner wheel bearing oil seal (1177) without the proper tool may result in an early rear wheel bearing or inner wheel bearing oil seal failure. If inner wheel bearing oil seal becomes cocked in the bore during installation, remove it and install a new one.**

   Lubricate the new rear wheel bearing with axle lubricant and install the rear wheel bearing into the axle housing bore using Axle Tube Bearing Replacer T78P-1225-A.

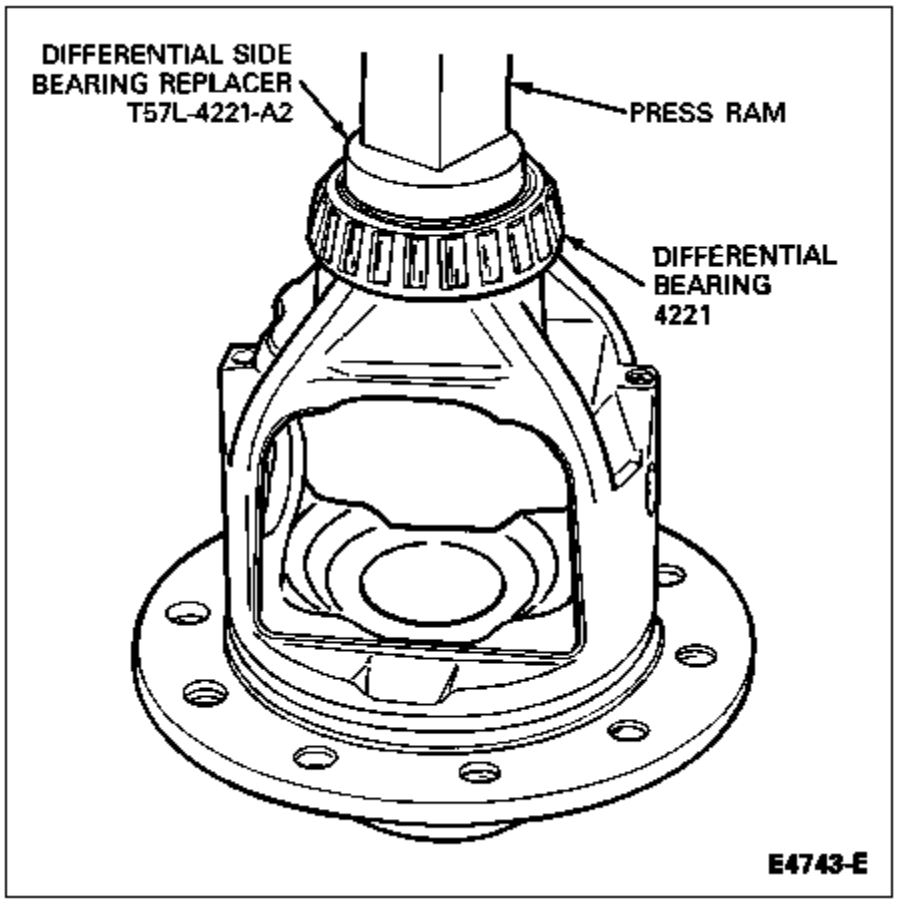


2. Coat the lips of the inner wheel bearing oil seal with Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B and install the inner wheel bearing oil seal using Axle Tube Seal Replacer T78P-1177-A.



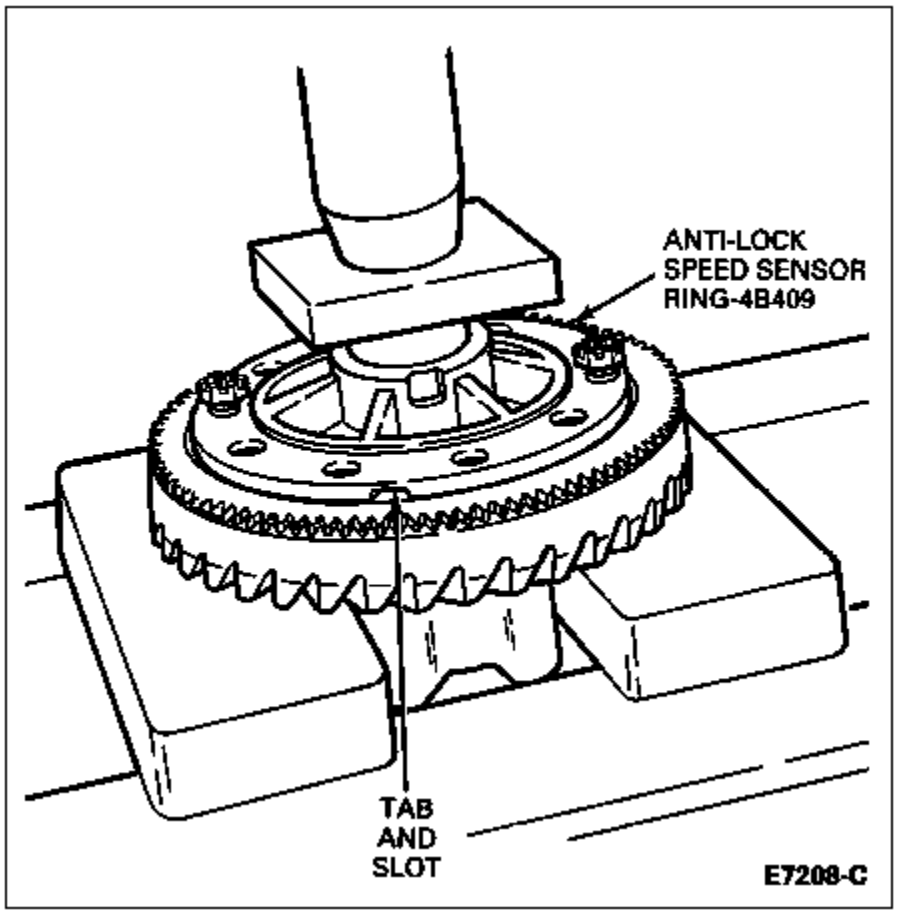
Differential Case Installation

1. Install differential bearings on the rear hubs (1109) using Differential Side Bearing Replacer T57L-4221-A2. Press against the differential bearing cones only.

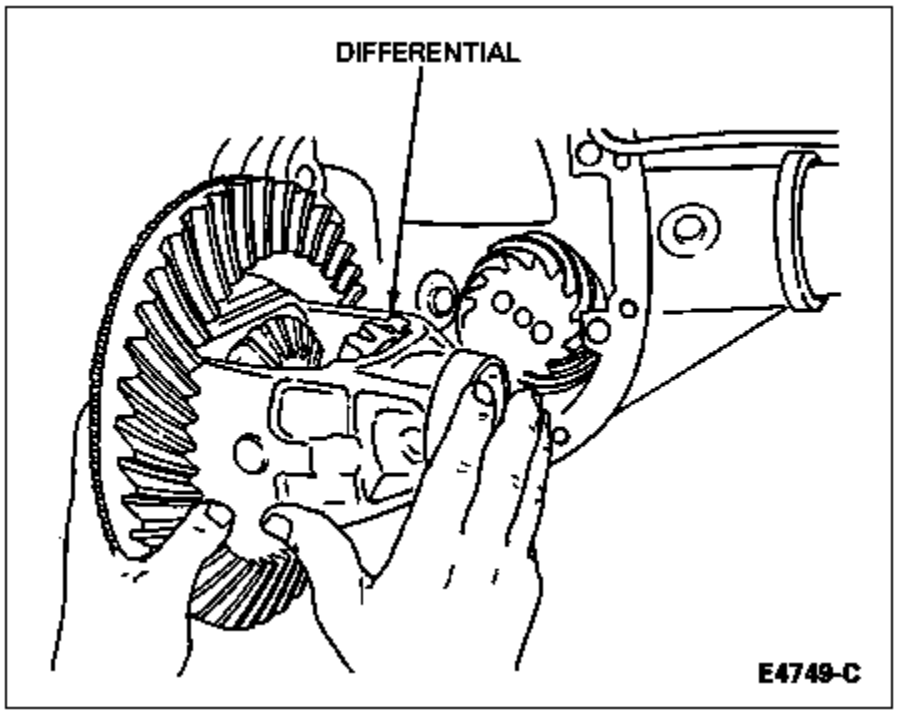


2. **CAUTION: Extreme care should be taken not to scratch, dent, chip or otherwise cause damage to speed sensor ring or teeth while handling or during assembly.**

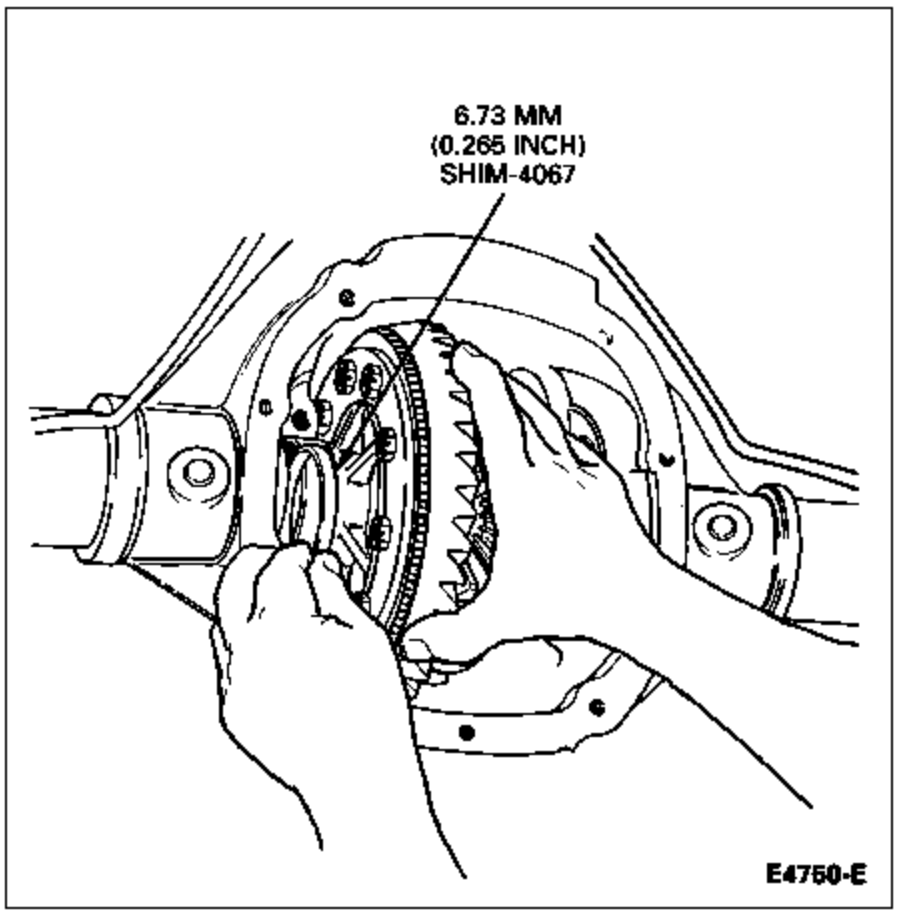
   Press on the NEW anti-lock speed sensor ring if removed, and ring gear onto the differential case (4204). Refer to procedure in this section. Apply Stud and Bearing Mount E0AZ-19554-BA or equivalent meeting Ford specification WSK-M2G349-A1 to ring gear and pinion bolts and install. Tighten the bolts to 95-115 Nm (70-85 lb-ft).



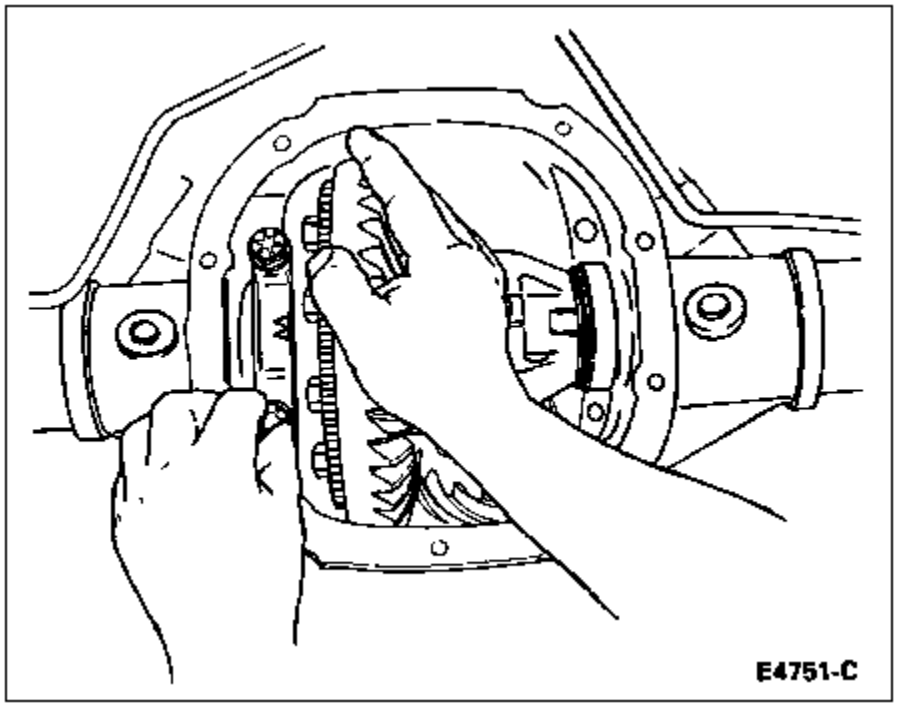
3. With pinion depth set and drive pinion installed, place differential assembly with bearings and cups in carrier.



4. Install a 6.73mm (0.265-inch) shim on left side.

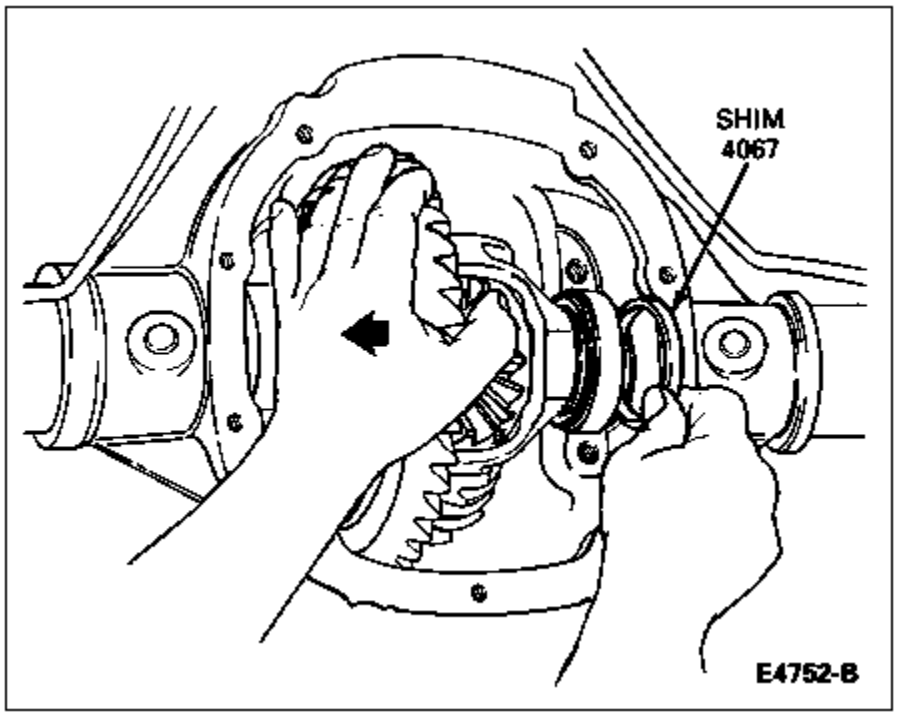


5. Install left bearing retaining cap and tighten bolts finger-tight.

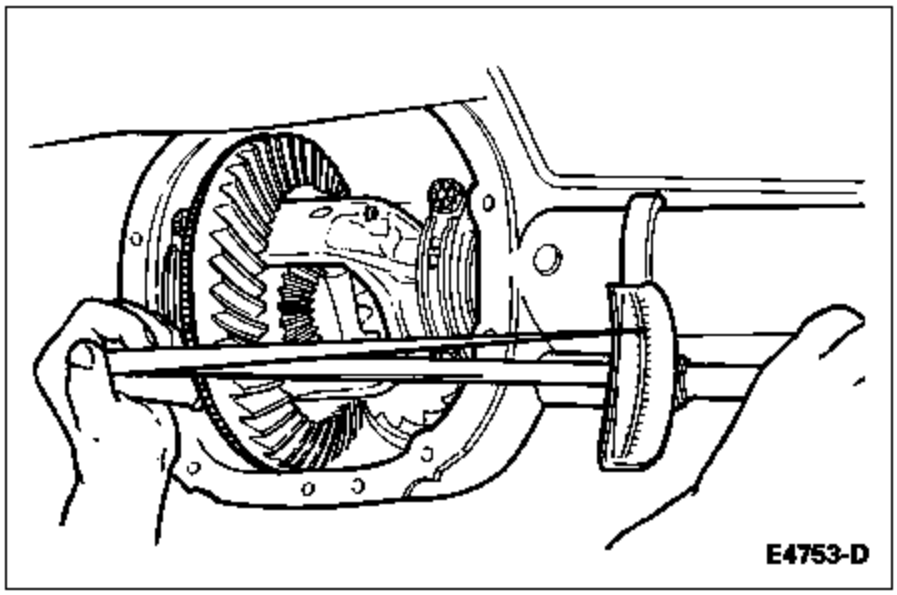


6. **NOTE: Triangles on bearing cups must point outboard.**

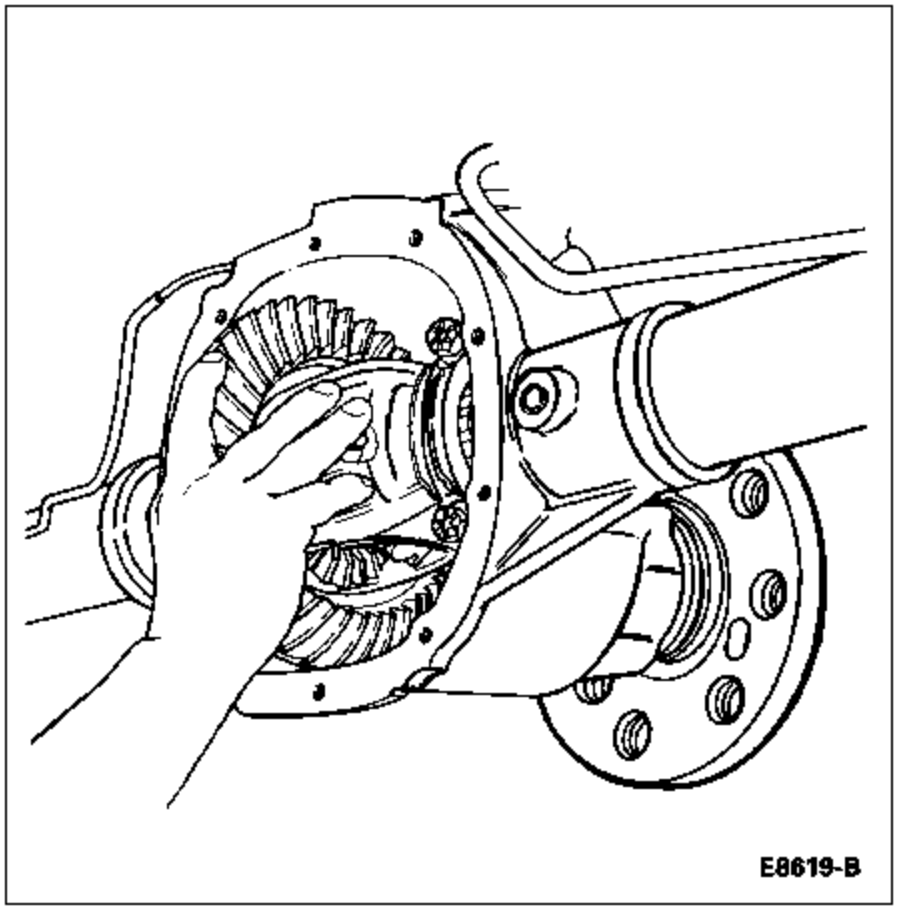
   Install progressively larger shims on the right side until the largest shim selected can be assembled with a slight drag feel. Apply pressure toward left side to make sure the left bearing cup is seated.



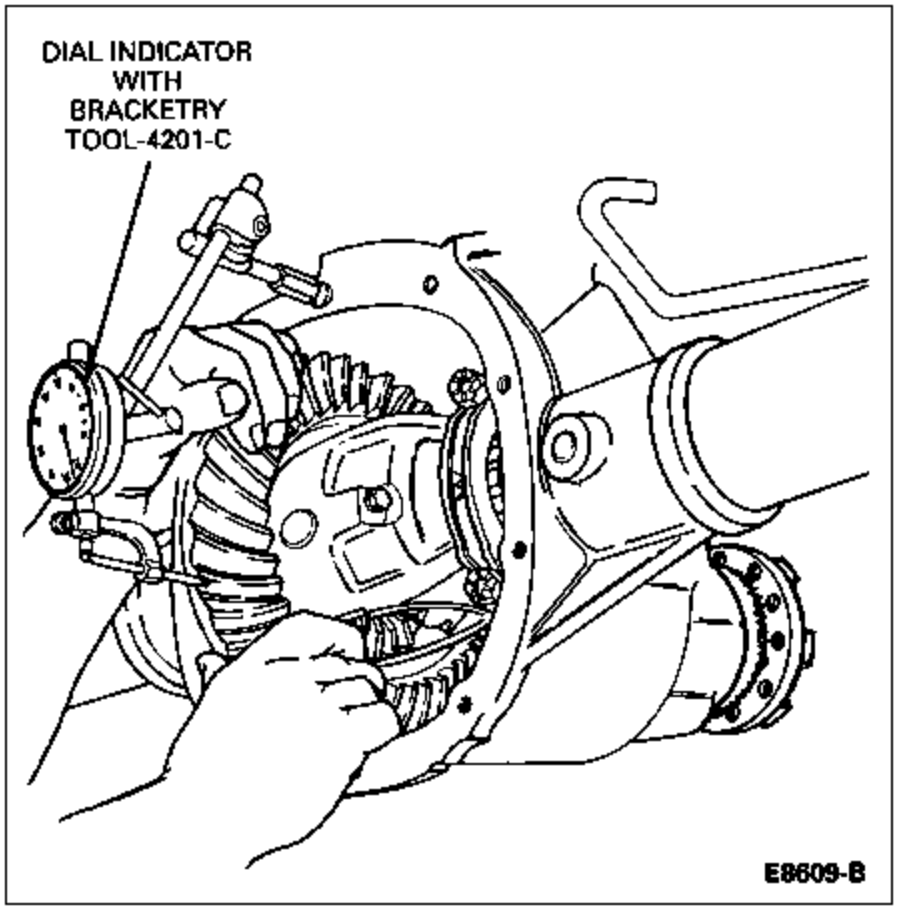
7. Install right side bearing cap and tighten bearing cap bolts to 95-115 Nm (70-85 lb-ft).



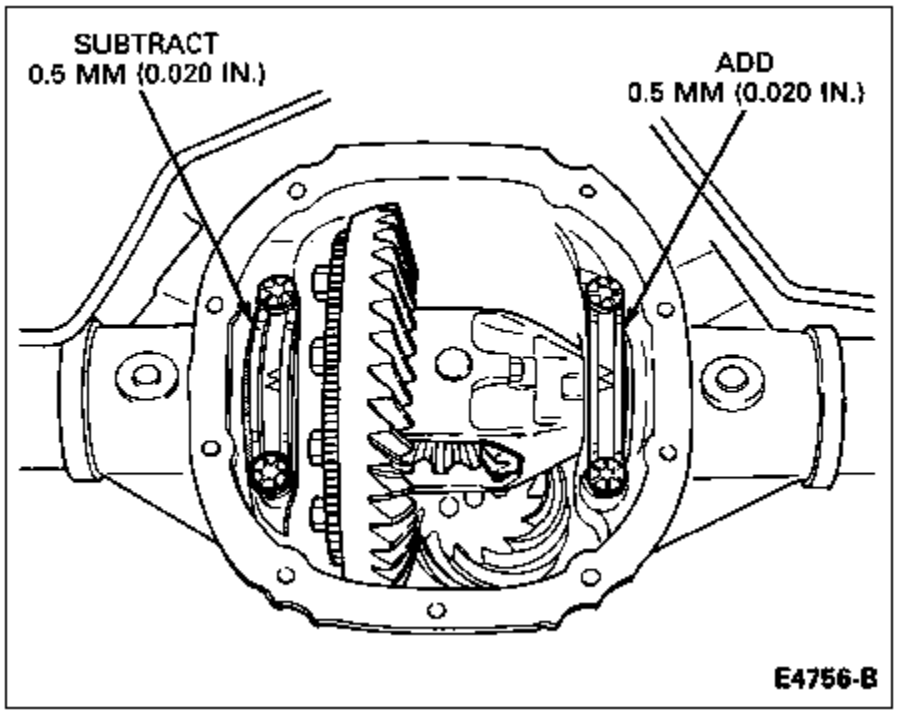
8. Rotate assembly to make sure free rotation is maintained.



9. Check ring gear and pinion backlash. If the backlash is 0.20-0.38mm (0.008-0.015 inch) (0.30-0.38mm [0.012-0.015 inch] preferred), proceed to Step 13. If the backlash is zero, go to Step 10. If the backlash is not zero, but is less than 0.20mm (0.008 inch) or more than 0.38mm (0.015 inch), go to Step 12.



10. If a zero backlash condition occurs, add 0.5mm (0.020 inch) to the right side and subtract 0.5mm (0.020 inch) from the left side to allow for a backlash reading.

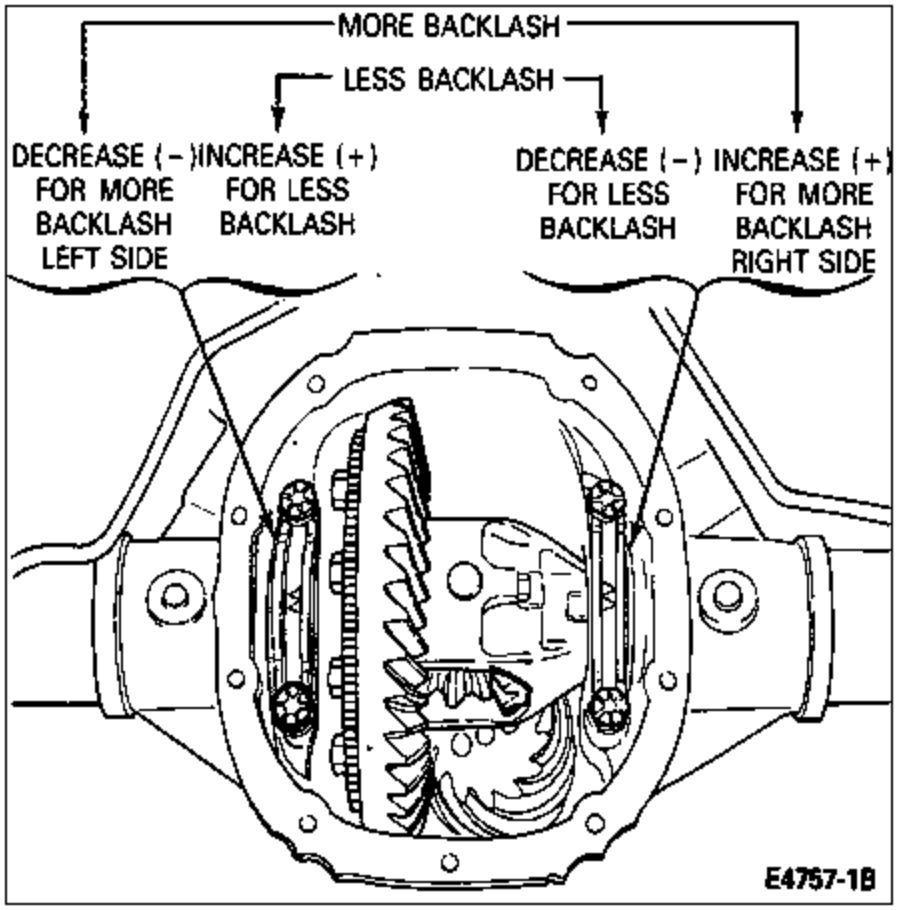


11. Recheck backlash. See Step 12 if backlash is not within specification. Backlash specification: 0.20-0.38mm (0.008-0.015 inch) (0.30-0.38mm [0.012-0.015 inch] preferred).

    If backlash is within specification, go to Step 13.

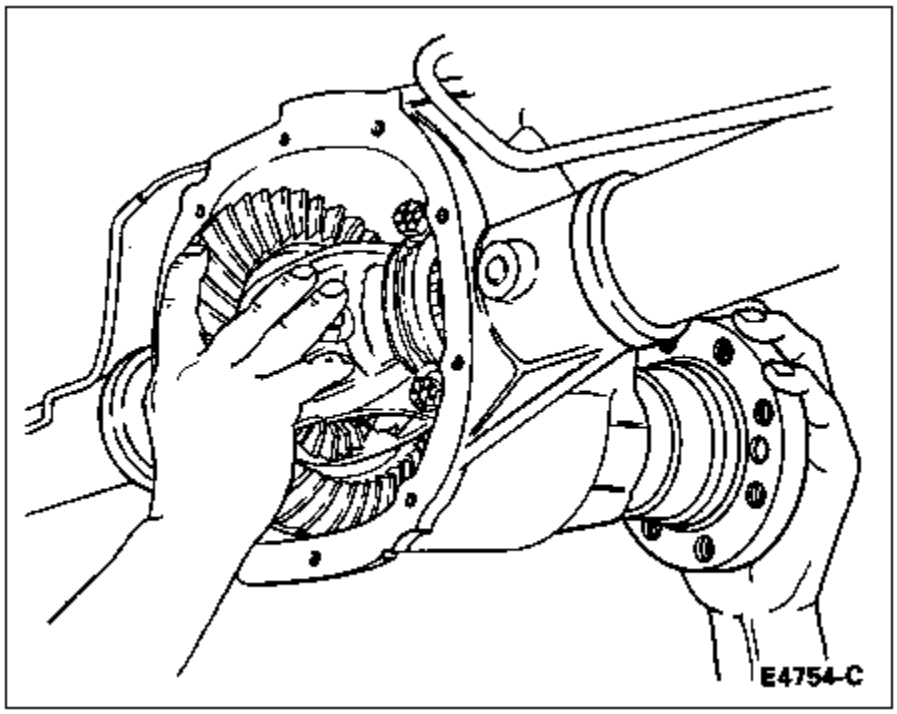
12. If backlash is not to specification, correct backlash by increasing thickness of one shim and decreasing thickness of the other shim by the same amount. Refer to chart for approximate shim change.

Backlash Change Required		Thickness Change Required		Backlash Change Required		Thickness Change Required	
mm	Inches	mm	Inches	mm	Inches	mm	Inches
.025	.001	.050	.002	.228	.009	.304	.012
.050	.002	.050	.002	.254	.010	.355	.014
.076	.003	.101	.004	.279	.011	.355	.014
.101	.004	.152	.006	.304	.012	.406	.016
.127	.005	.152	.006	.330	.013	.457	.018
.152	.006	.203	.008	.355	.014	.457	.018
.178	.007	.254	.010	.381	.015	.508	.020
.203	.008	.254	.010	—	—	—	—



13. Install shim and bearing retaining caps. Tighten cap bolts to 95-115 Nm (70-85 lb-ft).

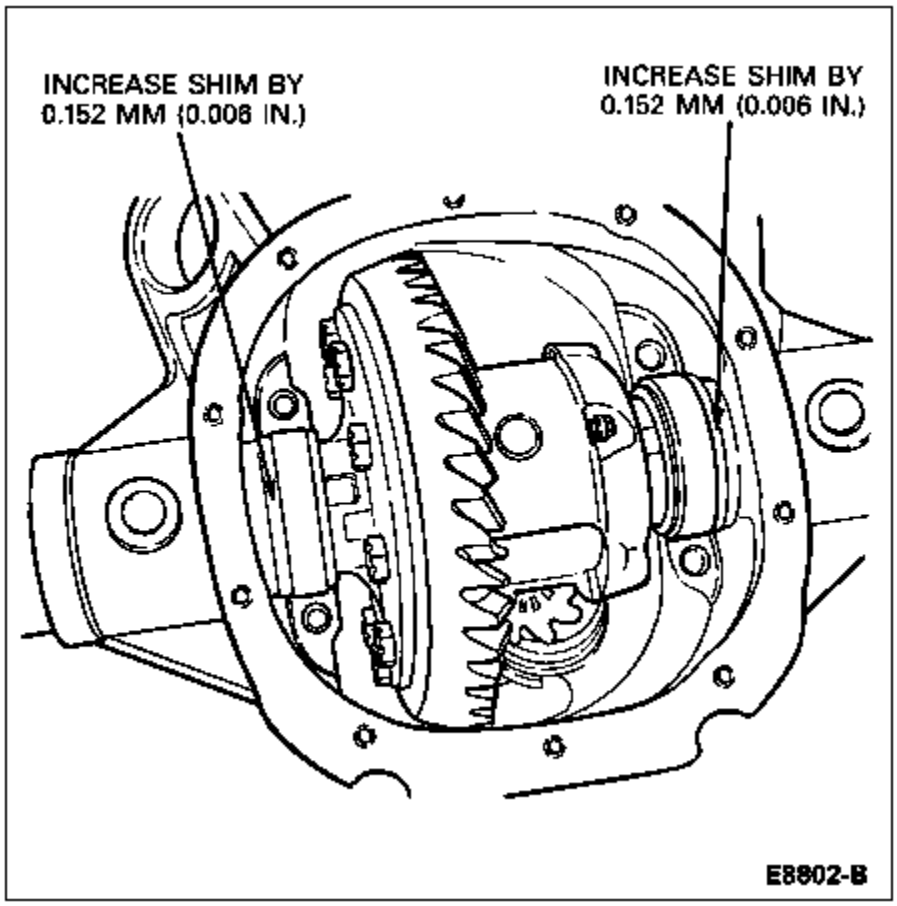
14. Rotate assembly several times to make sure differential bearings are properly seated.



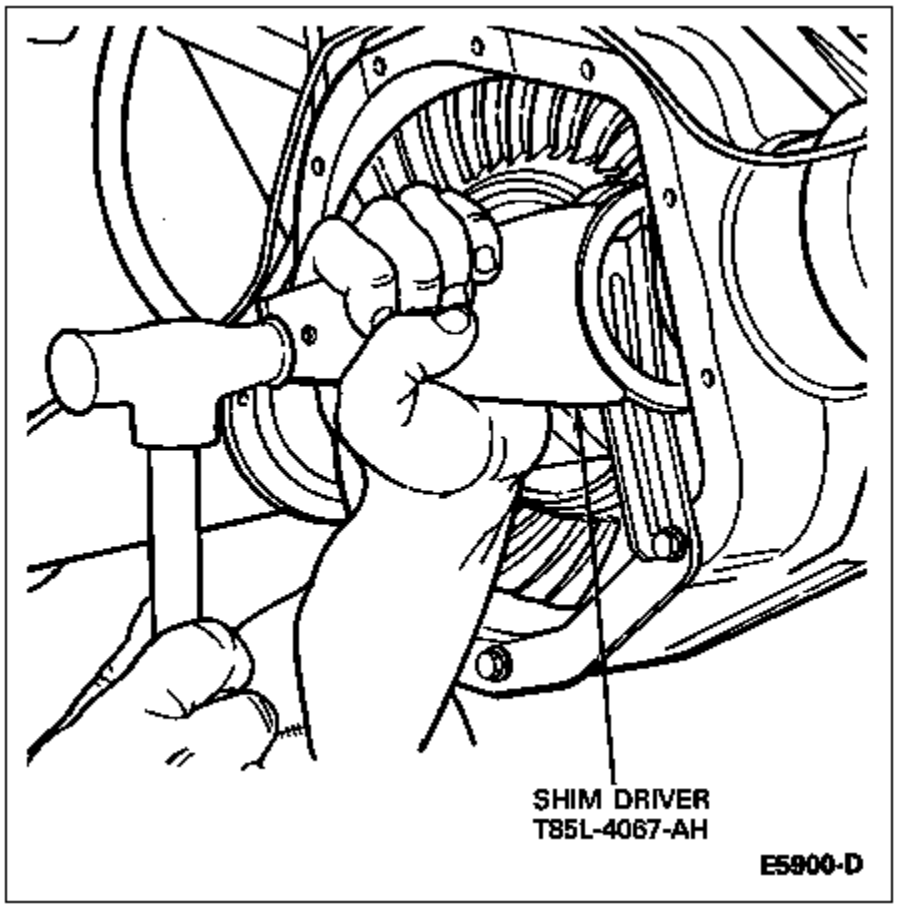
15. Recheck backlash. If backlash is within specification, go to Step 16. If backlash is not within specification, repeat Step 12.

    Backlash Specification: 0.20-0.38mm (0.008-0.015 inch) (0.30-0.38mm [0.012-0.015 inch] preferred).

16. Remove bearing caps and bolts. To establish differential bearing preload, increase both left and right shim sizes by 0.152mm (0.006 inch) and install using Shim Driver T85L-4067-AH. Make sure shims are fully seated and assembly turns freely.



INCREASE SHIM BY
0.152 MM (0.006 IN.)
INCREASE SHIM BY
0.152 MM (0.006 IN.)
E8802-B

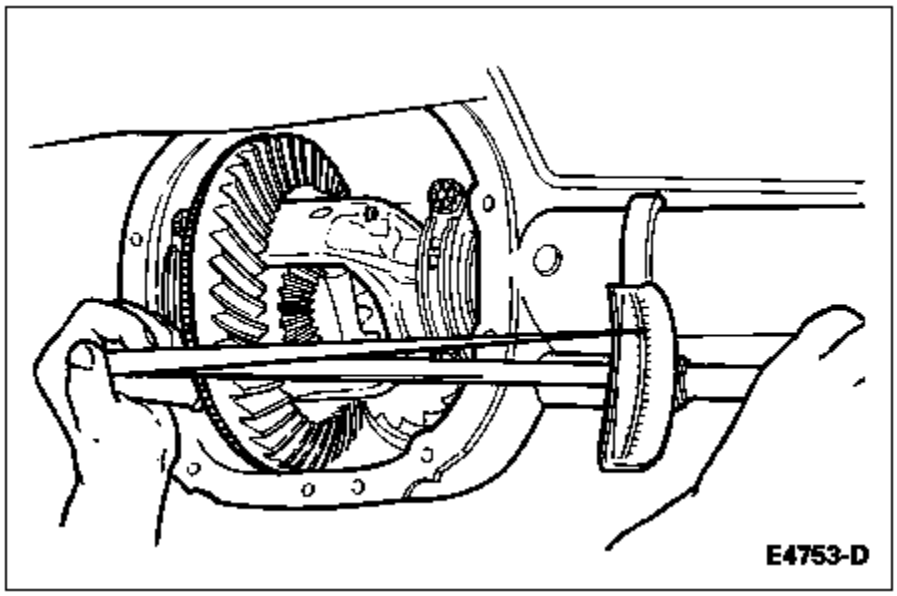


17. **NOTE: Triangles on bearing caps must point outboard.**

    Install bearing caps and tighten bolts to 95-115 Nm (70-85 lb-ft). Recheck backlash. If not to specification, repeat Step 12.

18. Utilize white marking compound to obtain a tooth mesh contact pattern in your assembly. Pattern legibility can be improved by connecting the driveshaft and rotating both tires in drive and coast direction.

    Reincorporation of pattern inspection is intended to allow technician the ability to detect gross errors in setup prior to complete reassembly. Pattern contact should be within the primary area of the ring gear and pinion tooth surface avoiding any "narrow" or "hard" contact with outer perimeter of tooth (top to root, toe to heel). Pattern inspection should be on the drive (pull) side. Assembly with correct drive pattern will result in satisfactory coast performance. If gross pattern error is detected with preferred backlash (0.30-0.38mm [0.012-0.015 inch]), recheck pinion shim selection.

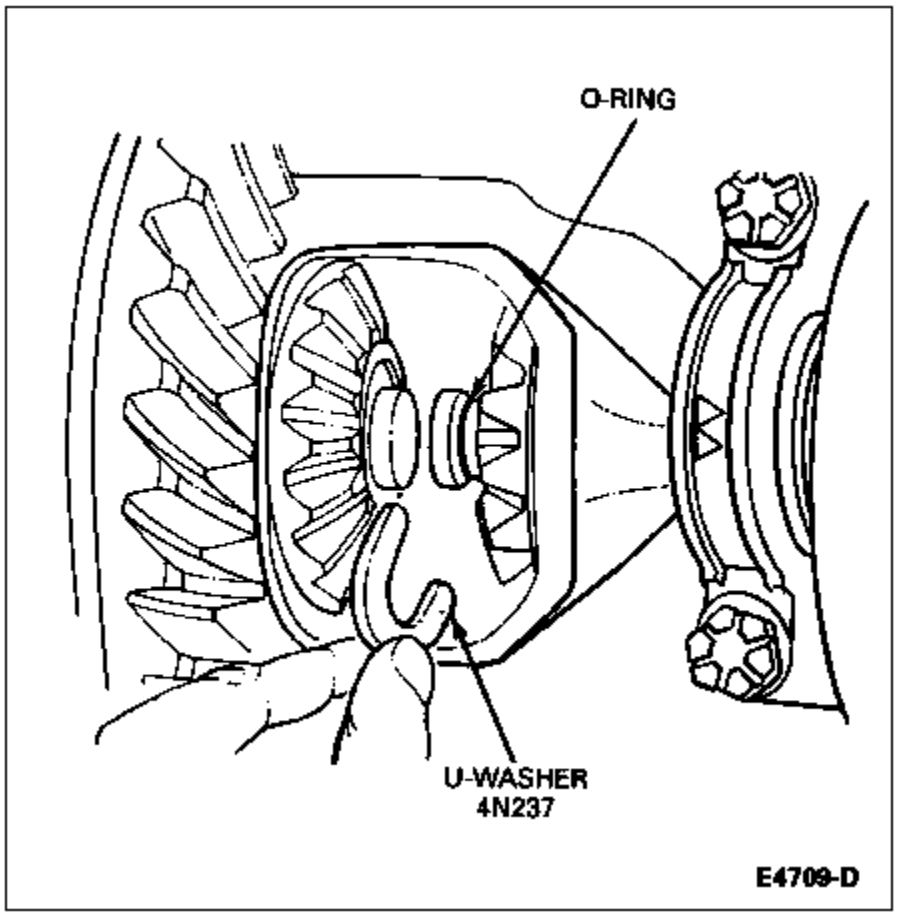


Axle Shaft Installation

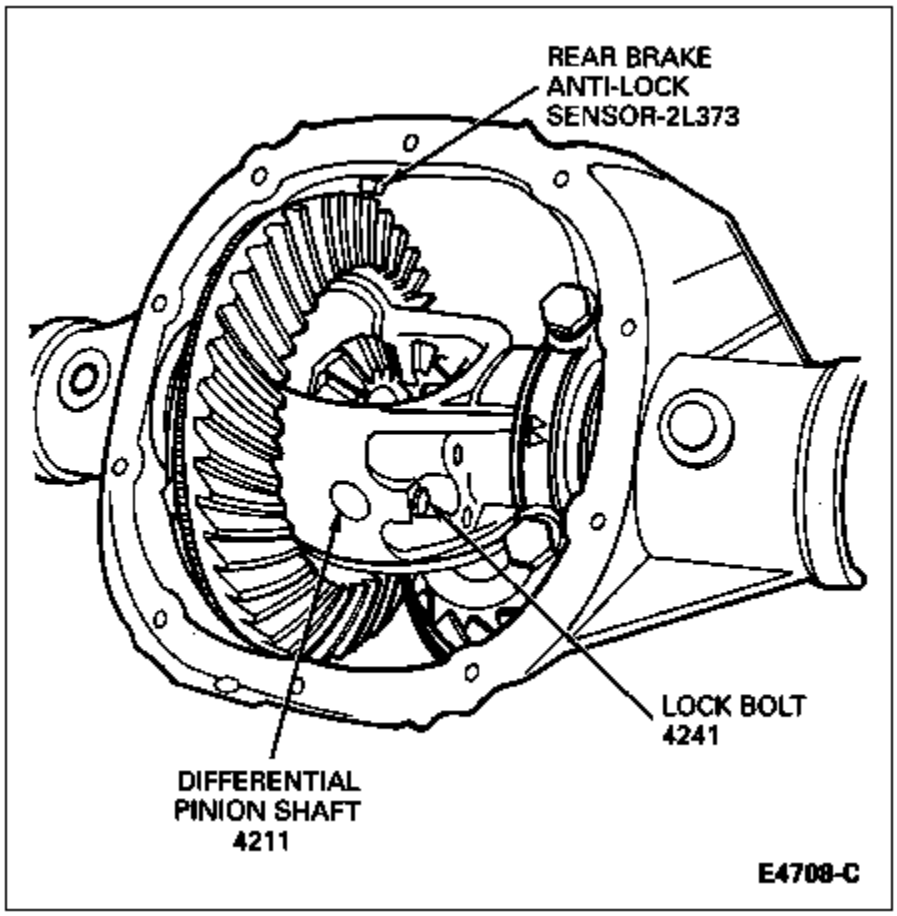
1. Slide the axle shafts (4234) into place in the axle housing. Exercise care so that the splines or any portion of the axle shafts do not damage the oil seals. Push the axle shafts inboard enough to allow installation of the U-washer.

2. **NOTE: A rubber O-ring is used to hold the U-washer in position on the axle shaft. Be sure that the O-ring is in the groove at the end of the axle shaft before installing the U-washer.**

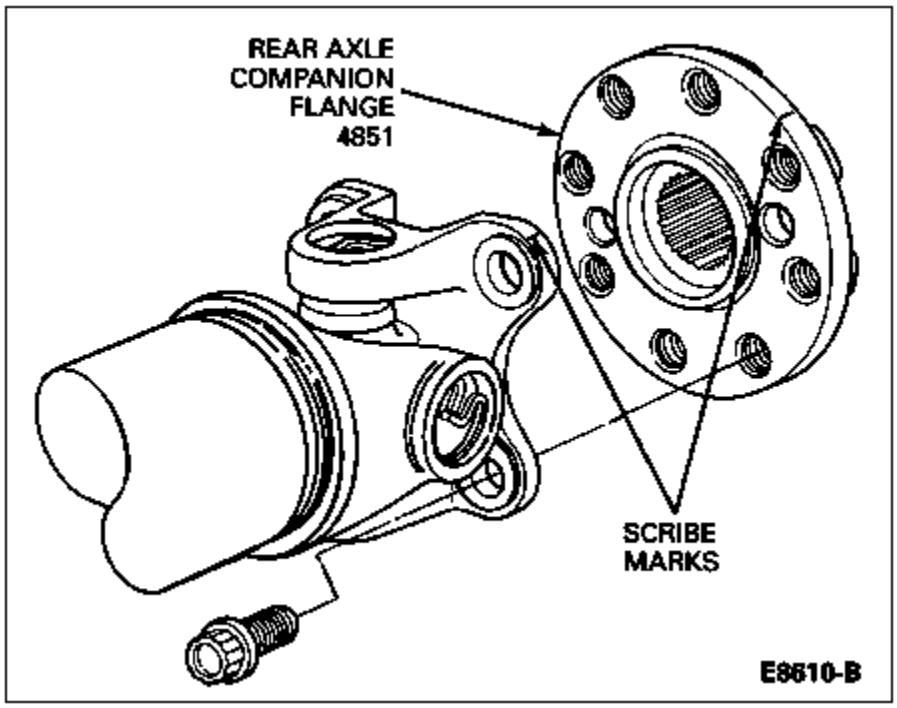
   Install the axle shaft U-washer on the button end of the axle shafts, and push the axle shafts outboard so that the axle shaft U-washer seats in the counterbore of the differential side gear (4236).



3. Position the differential pinion shaft (4211) through the differential case and pinions, aligning the hole in the differential pinion shaft with the lock bolt hole. Apply Stud and Bearing Mount E0AZ-19554-BA or equivalent meeting Ford specification WSK-M2G349-A1 to the lock bolt threads. Install lock bolt and tighten to 20-40 Nm (15-30 lb-ft).



4. Remove the oil seal replacer from the extension housing (7A039). Install the driveshaft in the extension housing. Align the scribe marks on the flange and driveshaft and connect the driveshaft at the rear axle companion flange. Tighten attaching bolts and nuts to companion 11-20 Nm (8-15 lb-ft) for half round rear axle companion flange and 95-128 Nm (70-95 lb-ft) for circular rear axle companion flange.



5. Install the brake drums (1126).

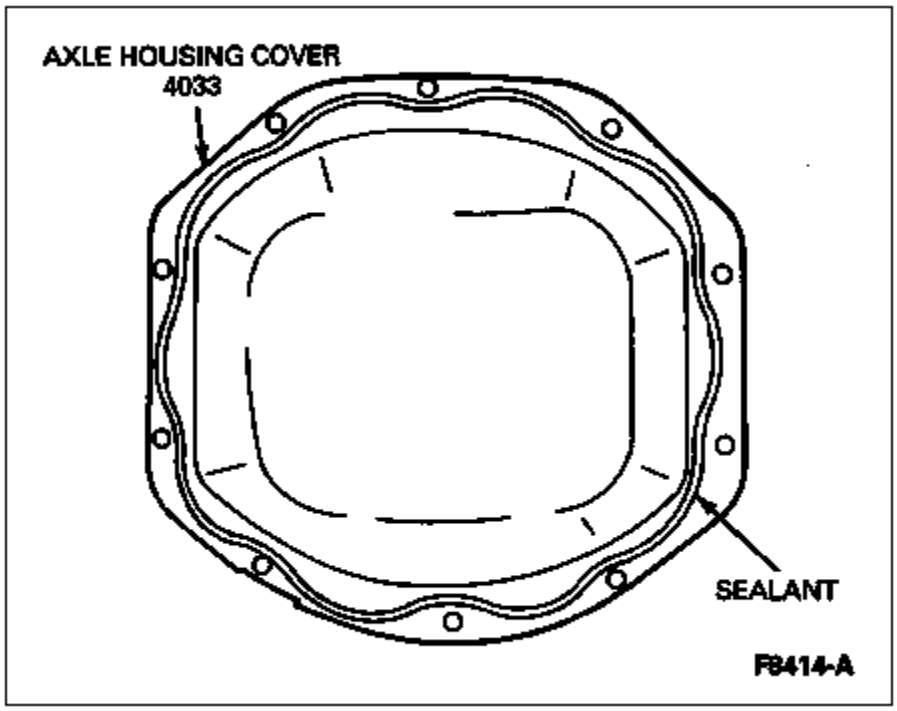
6. Install the wheels and tires. Tighten the wheel lug nuts to 115-156 Nm (85-115 lb-ft). Install the wheel covers.

Cover Installation

1. **CAUTION: Make sure machined surfaces on the carrier are clean and free of oil. Inside of rear axle must be covered when cleaning the machined surface to prevent contamination.**

   Thoroughly clean the gasket mating surface of the rear axle differential carrier casting.

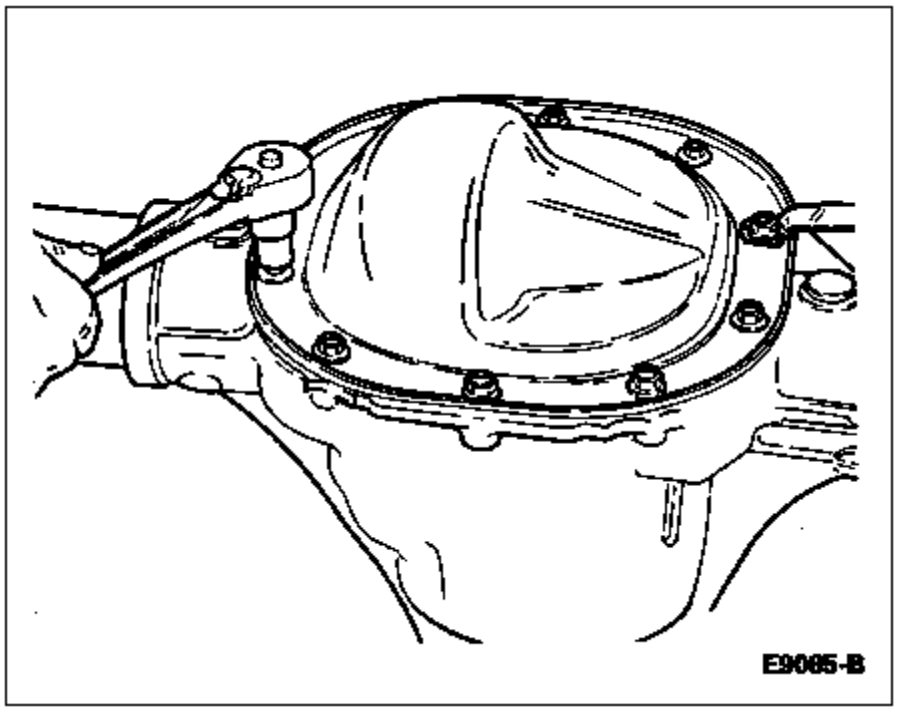
2. Apply a new continuous bead of Silicone Rubber D6AZ-19562-AA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A to the new axle housing cover (4033).



3. **NOTE: Ranger and Aerostar vehicles are equipped with SMC plastic axle housing covers. Always install new SMC plastic axle housing cover and bolts whenever removed.**

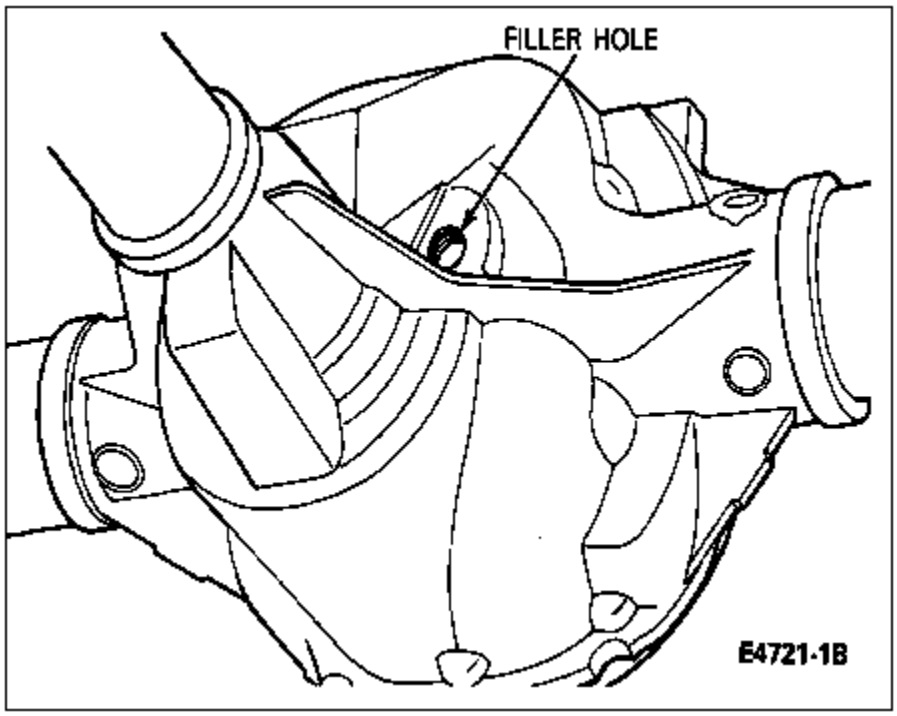
   NOTE: Axle housing cover must be installed within 15 minutes of application of the silicone or new sealant must be applied.

   Install new axle housing cover and tighten new rear axle housing cover bolts to 21-27 Nm (15-20 lb-ft) as shown. Tighten the bolts in a crosswise pattern to make sure axle housing cover seals properly.



4. Add lubricant through the filler hole until the lubricant level is 6.35mm (1/4 inch) to 14.28mm (9/16 inch) below the bottom of the filler hole with the rear axle in the running position. Use Premium Rear Axle Lubricant XY-80W90-QL or equivalent meeting Ford specification WSP-M2C197-A, plus two ounces of Friction Modifier F3TZ-19B546-MA or equivalent meeting Ford specification WSP-M2C196-A, for complete refill of Traction-Lok® Rear Axles. Install the filler plug and tighten to 20-40 Nm (15-30 lb-ft).

5. Lower vehicle and road test.



FILLER HOLE
E4721-1B

Sensor, Anti-Lock Brake

Removal

1. Remove rear anti-lock sensor hold-down bolt. Remove rear brake anti-lock sensor.

2. Clean rear axle mounting surface, using caution to prevent dirt from entering axle housing.

Installation

1. If new rear brake anti-lock sensor is to be installed, lightly lubricate O-ring with motor oil.

    a. Firmly grasp rear brake anti-lock sensor at sides (do not install by applying force on connector) and push into axle housing, aligning mounting flange hole with threaded hole in axle housing.
    b. Install hold-down bolt and tighten to 34-40 Nm (25-30 lb-ft).

2. If old rear brake anti-lock sensor is to be reinstalled, clean and blow off metal particles using shop air.

    a. Remove and replace O-ring with a new O-ring.
    b. Apply a light film of motor oil to O-ring.
    c. Firmly grasp rear brake anti-lock sensor at sides (do not install by applying force on connector) and push into axle housing, aligning mounting flange hole with threaded hole in axle housing.
    d. Install hold-down bolt and tighten to 34-40 Nm (25-30 lb-ft).

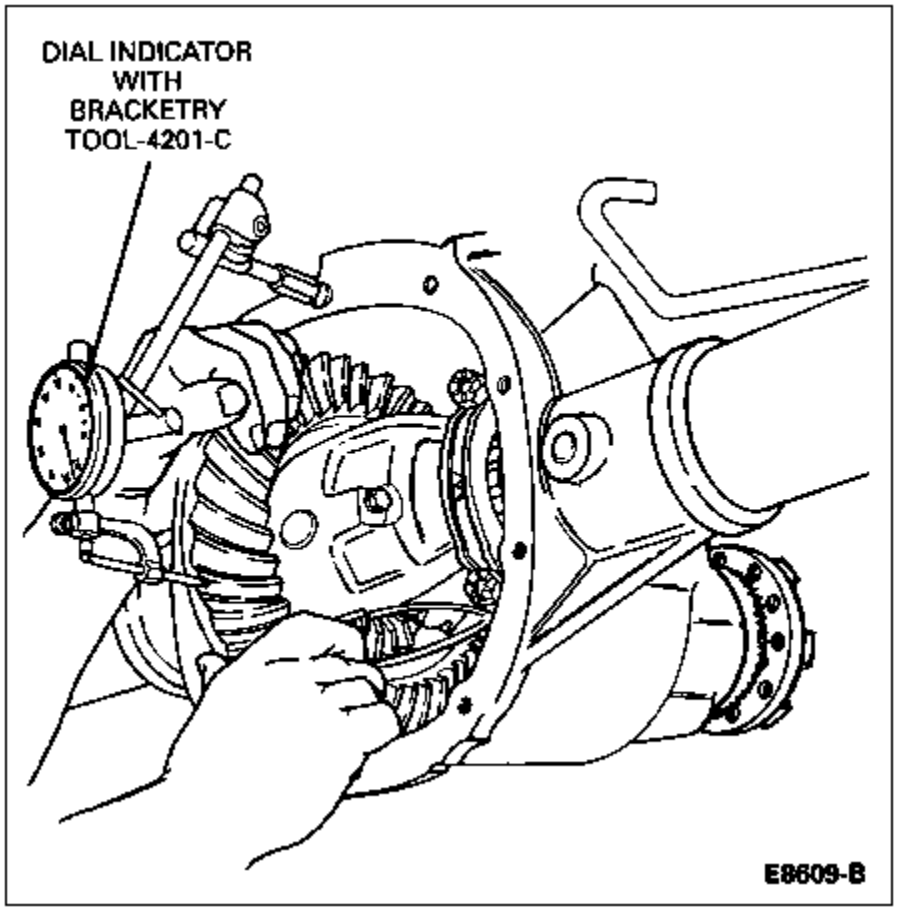
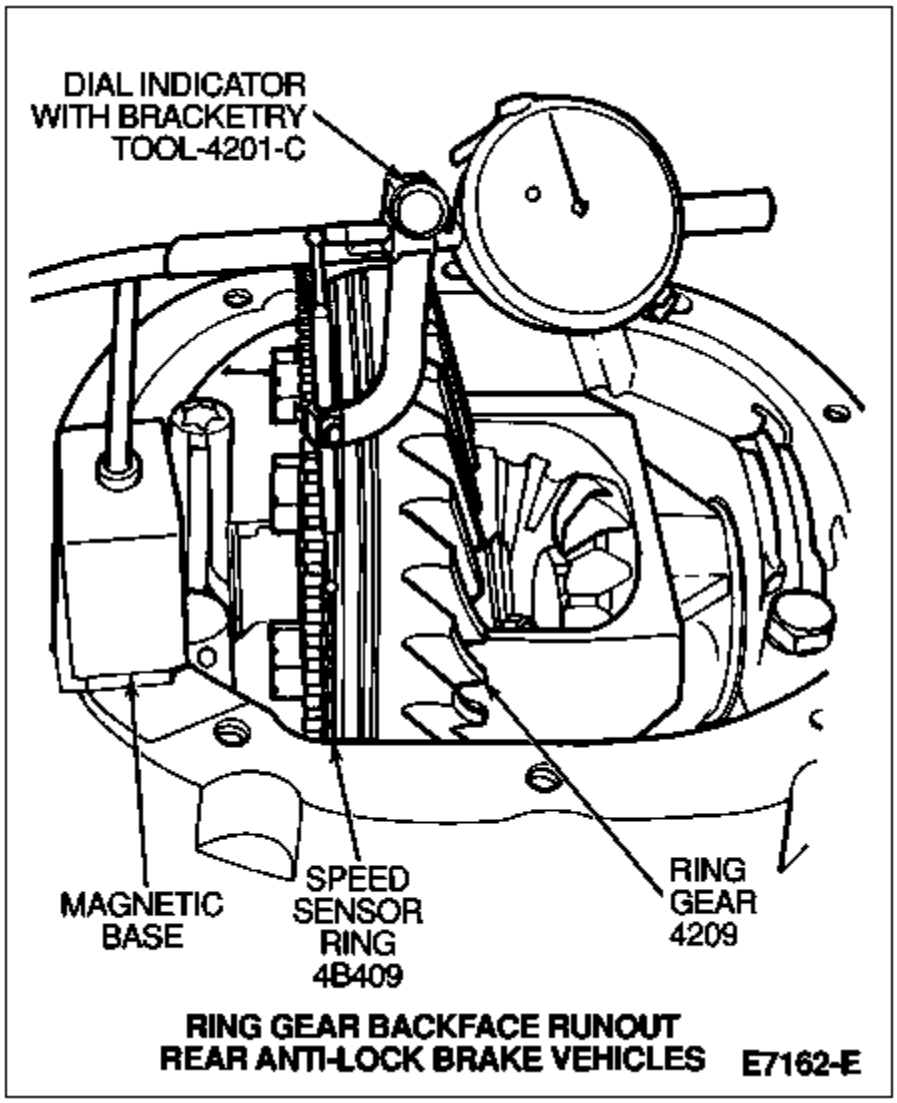
Inspection Before Disassembly of Carrier

The differential case (4204) and ring gear and pinion should be inspected before they are removed from the carrier. These inspections can find the cause of the concern and determine the resolution.

1. Remove axle housing cover. Refer to procedure in this section.
2. Wipe the lubricant from the internal working parts and visually inspect the parts for wear or damage.
3. Rotate the gears to see if there is any roughness which would indicate damaged bearings or gears.
4. Check the ring gear teeth for signs of scoring, abnormal wear, nicks or chips.
5. Set up a dial indicator, and check ring gear backlash and ring gear backface runout. Backlash should be 0.008-0.015 inch (0.012-0.015 inch preferred).





6. **NOTE: There is a space provided between the anti-lock speed sensor ring and the ring gear and pinion for measuring ring gear backface runout.**

   To check ring gear backface runout, mount Dial Indicator with Bracketry TOOL-4201-C or equivalent on the carrier so the tip of the dial indicator contacts the backface of ring gear and pinion. Backface runout should be no more than 0.101mm (0.004 inch).

7. A contact pattern may not always be an acceptable guide to check for noise. However, if the pattern is incorrect, the rear axle (4001) will probably be noisy. Refer to Section 00-04 for contact pattern example. Proper ring gear and pinion assembly must be checked using the Rear Axle Pinion Depth Gauge Tool set which shows the correct pinion shim required to assure acceptable running condition. Refer to Axle Assembly in this section.

8. Inspect the rear brake anti-lock sensor for loose metal particles and clean if required.

9. Examine the anti-lock speed sensor ring to see that it is firmly pressed onto the differential case and check it for dented, chipped or missing teeth that could result in erratic anti-lock brake systems performance. If damage is found, remove and replace anti-lock speed sensor ring.

Inspection After Disassembly of Carrier

1. Thoroughly clean all parts. Always use new solvent when cleaning bearings. Do not spin-dry bearings with compressed air.

2. Oil the bearings immediately to prevent rusting.

3. Inspect the parts for any major damage.

4. Clean the inside of the differential case (4204) before rebuilding. When a scored or chipped ring gear and pinion is replaced, the differential case must be washed thoroughly.

   Inspection procedures for individual parts follow.

Gears

Examine the pinion and ring gear and pinion teeth for scoring, excessive wear, nicks and excessive chipping. Worn, scored and damaged gears cannot be rebuilt to correct a noisy condition.

Bearing Cups

Check pinion bearing cups for deep scores, galling, or spalling. If a 0.038mm (0.0015 inch) feeler gauge can be inserted between a pinion bearing cup and the bottom of its bore at any point around the pinion bearing cup, the pinion bearing cup must be reseated.

Cone and Roller Assemblies

When operated in the pinion bearing cups, cone and roller bearings must turn without roughness. Examine the roller ends for step wear. If inspection reveals either a damaged pinion bearing cup or a damaged cone and roller, both parts should be replaced.

Carrier Housing

Make sure that the differential and differential pinion bearing bores are smooth. Remove any nicks or burrs from the mounting surfaces of the carrier housing.

Differential Case

Make sure the hubs where the differential bearings (4221) mount are smooth. Carefully examine the differential case bearing shoulders, which may have been damaged when the differential cases was removed. The differential bearings will fail if they do not seat firmly against the shoulders. Check the fit (free rotation) of the differential side gear (4236) in their counterbores.

SPECIFICATIONS

Clearance, Tolerance And Adjustments

Description	mm	Inches

Differential Case

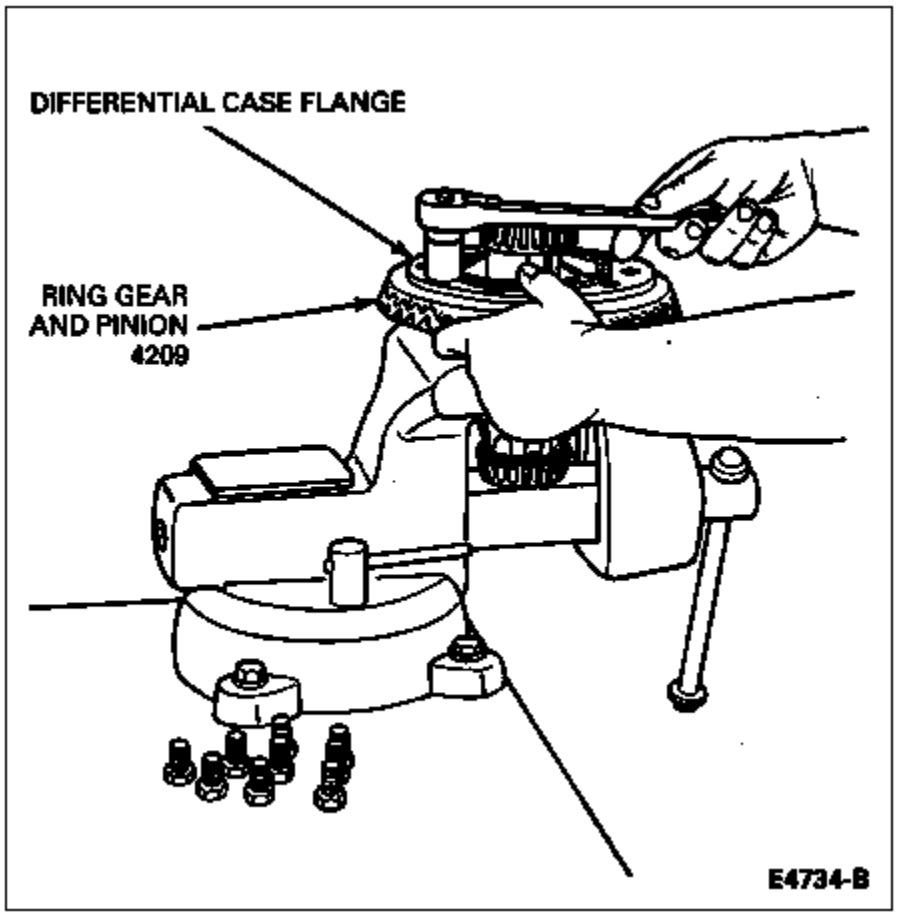
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Gear Rotator	T84P-4205-A
Traction-Lok Torque Tool	T59L-4204-A

Disassembly

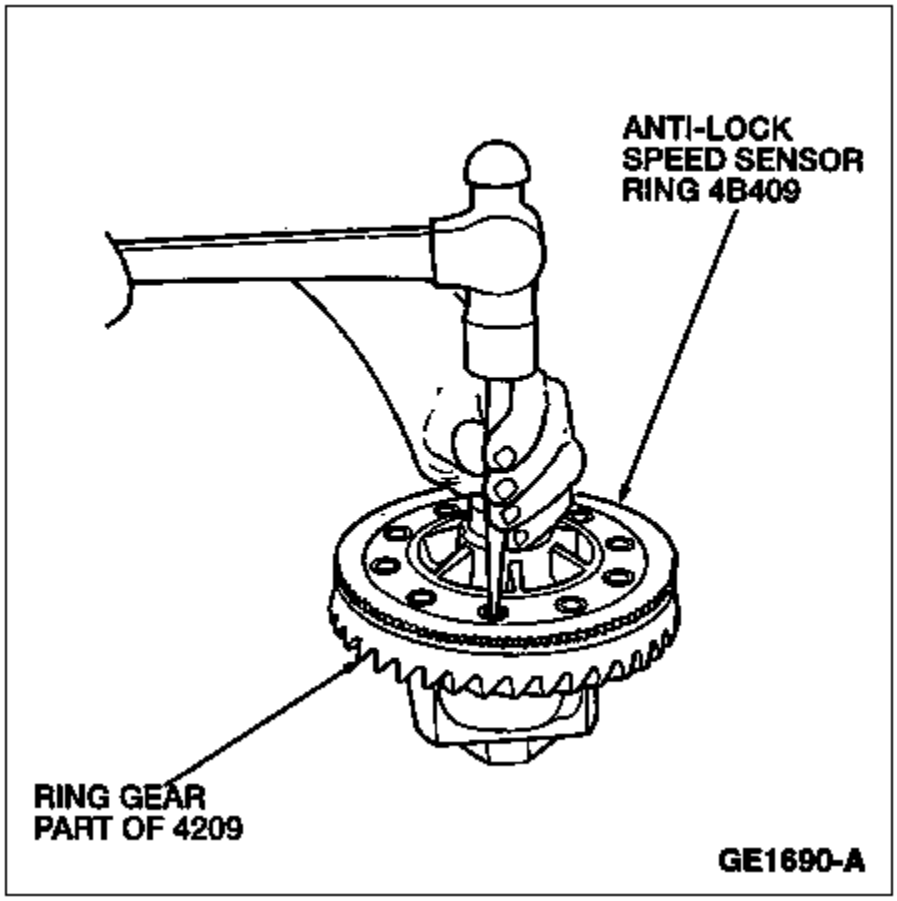
1. **NOTE: Refer to Section 05-02A , Axle, Integral Carrier, 7.5-Inch Ring Gear for Removal and Installation procedure.**

   Remove the bolts that attach the ring gear to the differential case (4204).



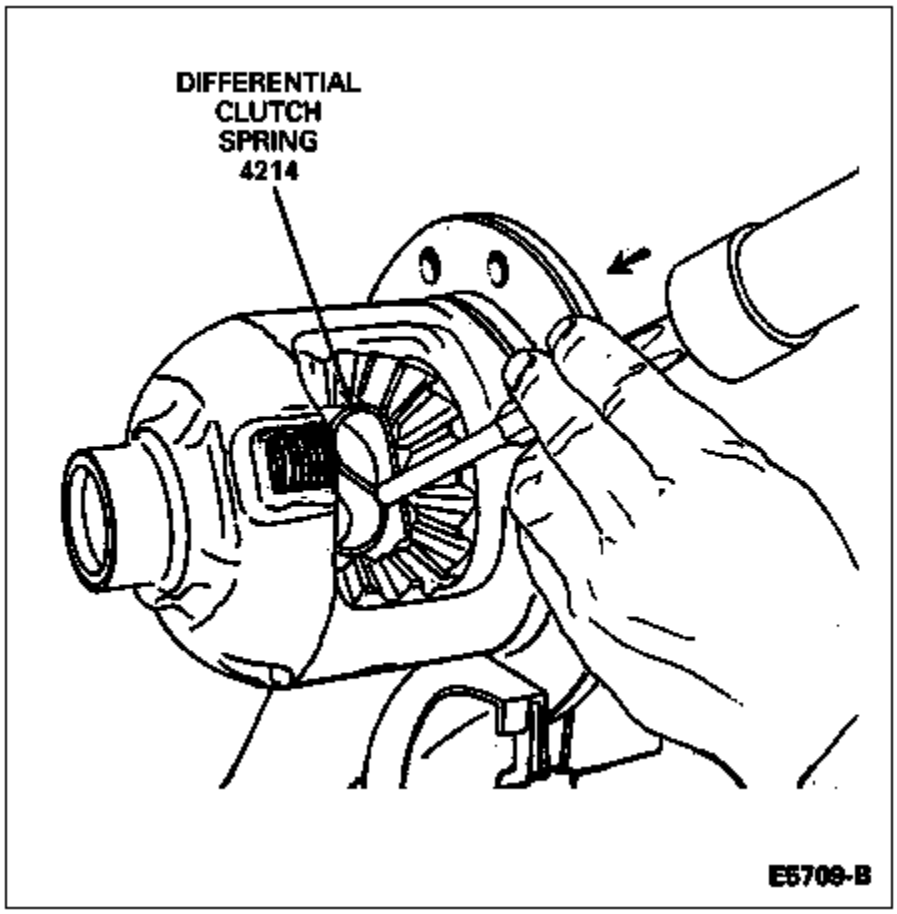
2. **CAUTION: If equipped, do not damage anti-lock speed sensor ring when removing ring gear. If anti-lock speed sensor ring is removed, it must be replaced with a new one.**

   Remove the ring gear from the differential case by striking at alternate holes around the gear.

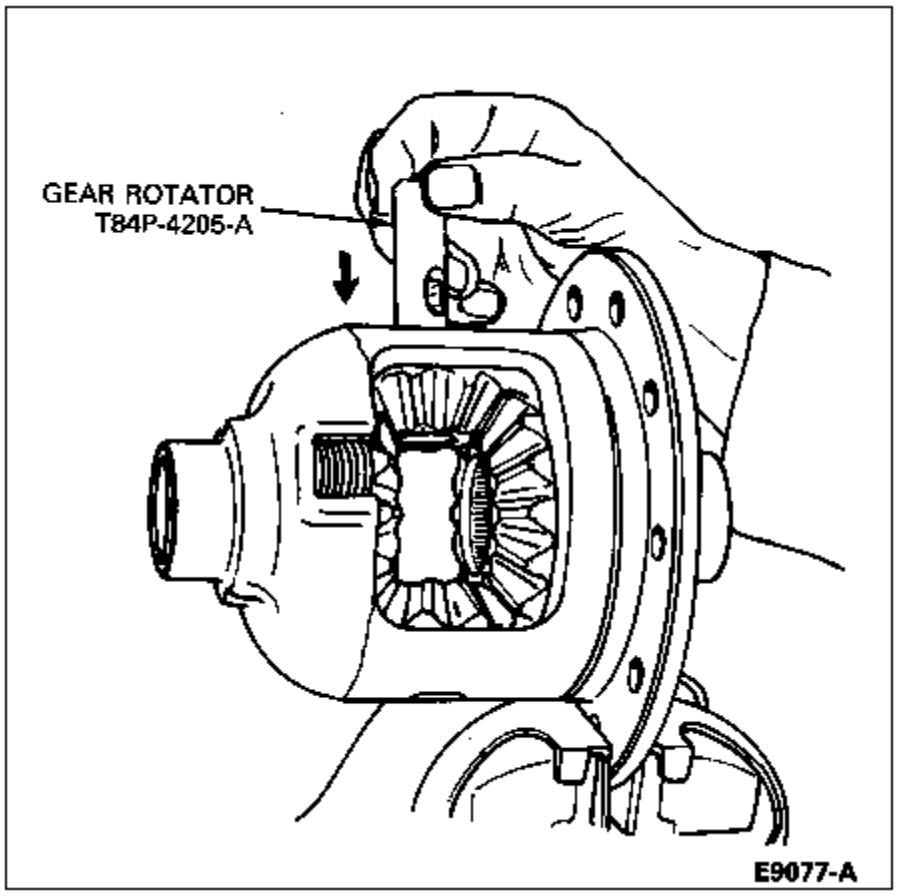


3. **WARNING: CARE MUST BE USED WHEN REMOVING THE DIFFERENTIAL CLUTCH SPRING (4214) DUE TO THE SPRING TENSION.**

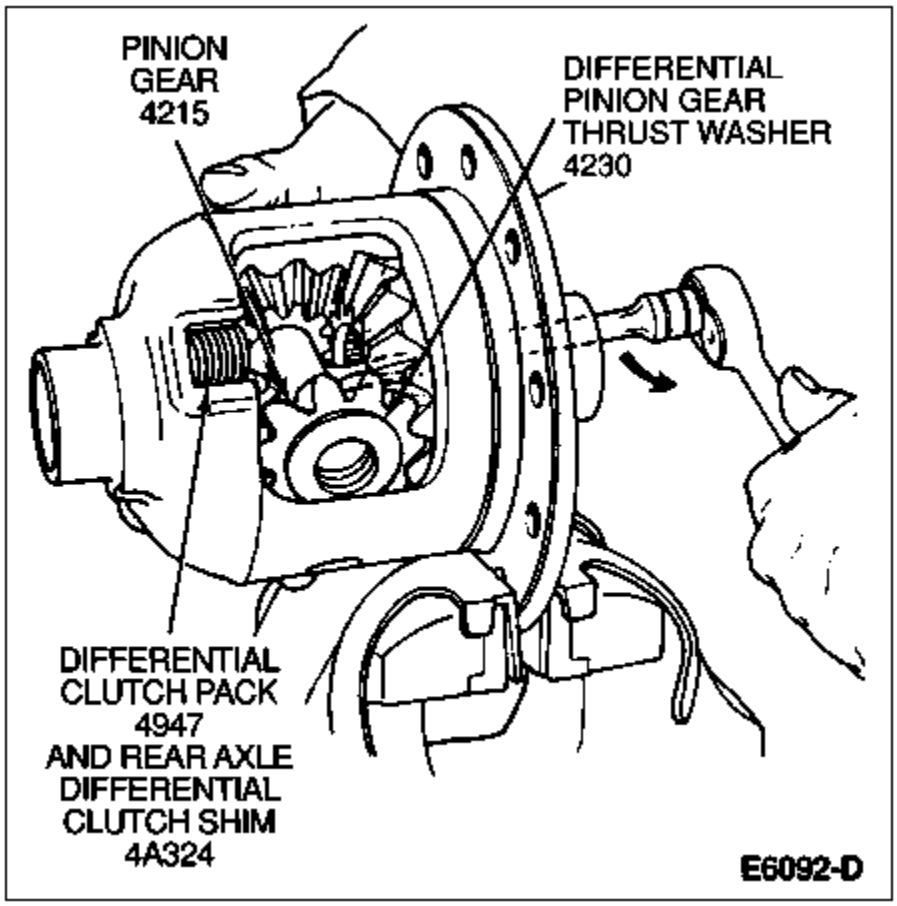
   With a suitable drift, drive out the differential clutch spring.



4. Using Gear Rotator T84P-4205-A rotate the differential pinion gears until the gears and differential pinion thrust washer (4230) can be removed.



GEAR ROTATOR
T84P-4205-A
E9077-A



5. Remove the differential side gears (4236), differential side gear thrust washers, clutch packs and rear axle differential clutch shims (4A324) from the right and left cavities and tag them "right" and "left."

6. **CAUTION: Do not use cleaning solvents on clutch plate friction surfaces. Wipe clean with a lint free cloth only.**

   Clean and inspect all parts for wear or damage and replace as necessary.

Assembly

1. **NOTE: Prior to differential case assembly, be sure the clutch pack shim selection has been determined.**

   Soak all friction plates for at least 15 minutes in Additive Friction Modifier C8AZ-19B546-A meeting Ford specification EST-M2C118-A.

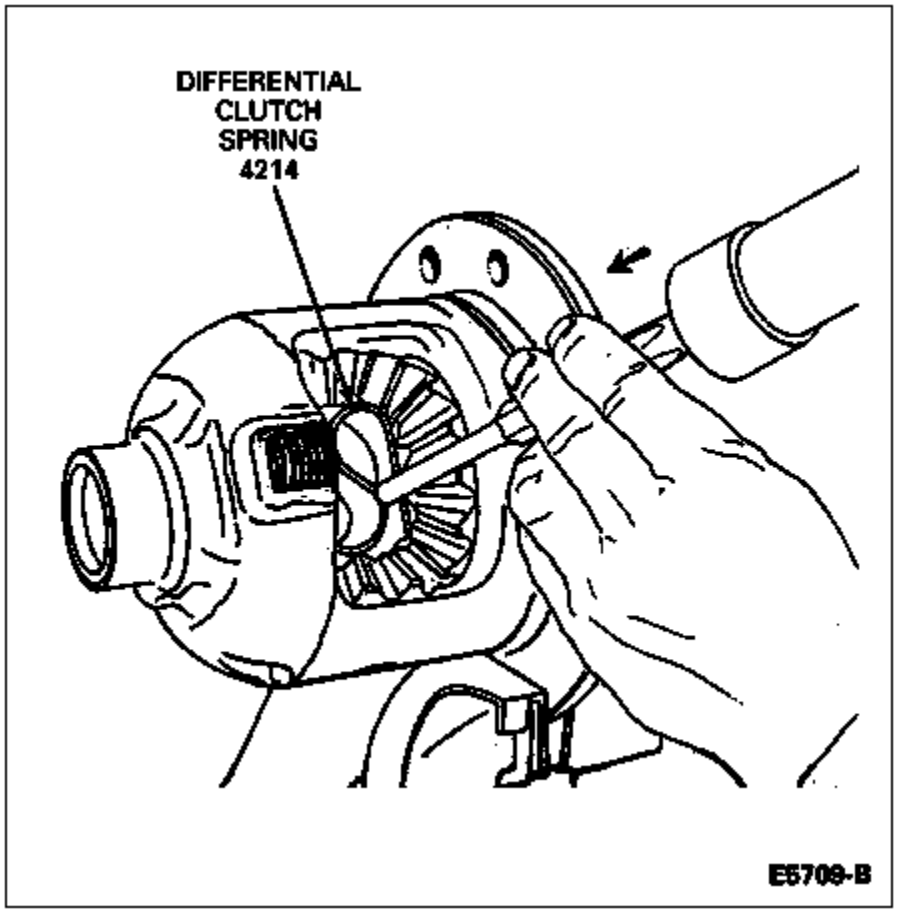
2. Mount the differential case in a soft-jawed vise and place the rear axle insulating spacers (4A947) and differential side gear in their proper cavities in the differential case.

3. Place the pinion gears and differential pinion thrust washers on the differential side gears.

4. Install Gear Rotator T84P-4205-A in the differential case, shown in Disassembly in this section.

5. Rotate the pinion gears until the bores in the gears are aligned with the pinion shaft holes in the differential case. Remove the tool from the differential case.

6. With a soft-faced hammer, install the differential clutch spring in the differential case. Inspect the differential clutch spring for damage.



7. **NOTE: Differential pinion shaft (4211) must be partially removed in order to install axleshafts.**

   Install the differential pinion shaft and lock bolt. Tighten lock bolt to specifications after the differential assembly and axleshafts have been installed in the axle housing.

8. Perform Bench Torque Test. Refer to Adjustments in this section.

9. Install differential case and differential ring gear and pinion (4209). Refer to Section 05-02A .

In-Vehicle Adjustments

SPECIAL SERVICE TOOL(S) REQUIRED

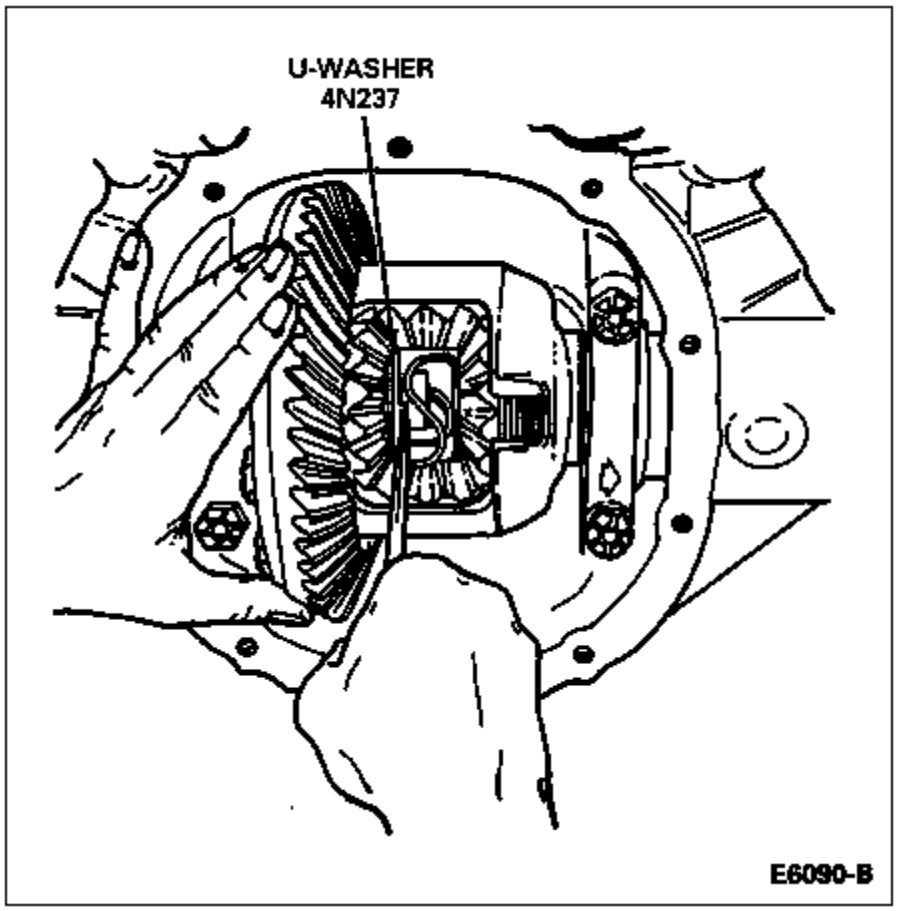
Description	Tool Number
Gear Rotator	T84P-4205-A
Traction-Lok Clutch Gauge Mandrel	T84P-4946-A
Traction-Lok Clutch Gauge Assembly	T80P-4946-A

In-vehicle adjustments are possible on this unit without removing the differential case (4204) from the axle housing. If the testing check was not to specification, the following procedure can be used to correct the condition.

Removal

1. Raise the vehicle on a hoist and install safety stands. Remove rear wheels and brake drums (1126).
2. Remove the axle housing cover (4033) from the rear face of carrier and drain the lubricant.
3. Perform the inspection before disassembly.
4. Working through the cover opening, remove the lock bolt and remove the differential pinion shaft (4211).
5. Push the axle shafts (4234) inward until the U-washer at the button end of the shafts is clear of the side gear recess.
6. **CAUTION: Care should be taken not to damage the inner wheel bearing oil seals (1177) when removing the axle shaft from the axle housing. In addition, the axle shaft must be completely removed from the axle housing.**

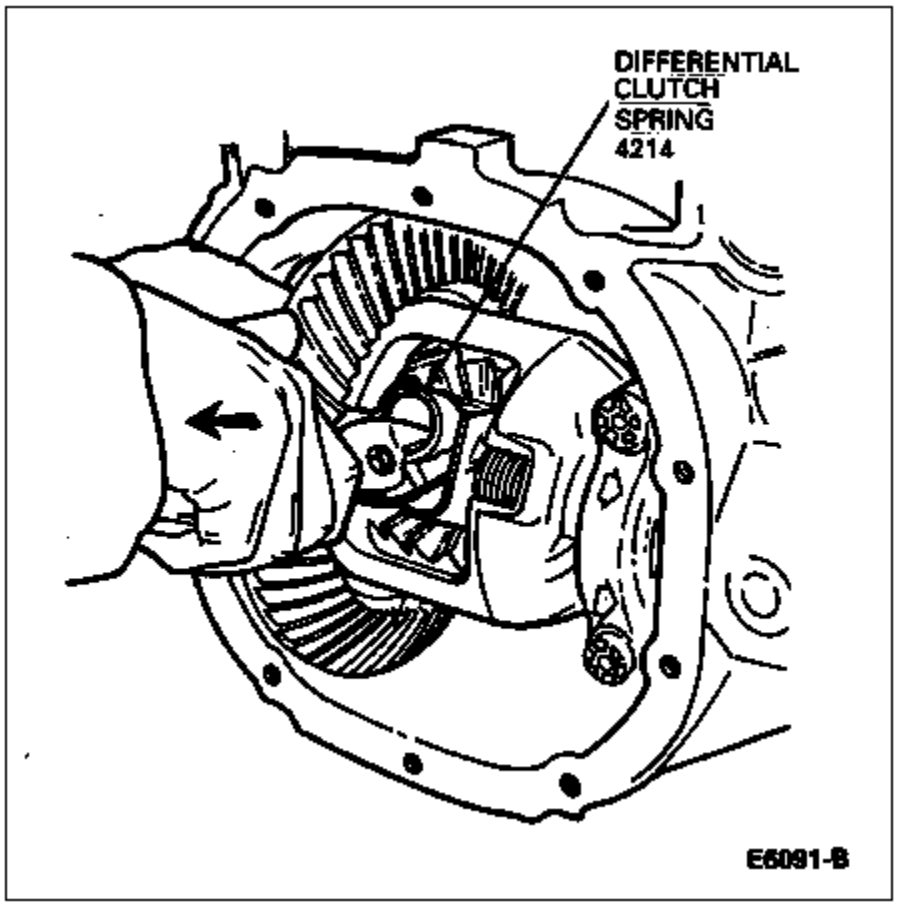
   Remove the U-washers and pull the axle shaft out of the axle housing.



7. With a suitable drift, drive the differential clutch spring (4214) half-way out of the differential case. Rotate the case 180 degrees.

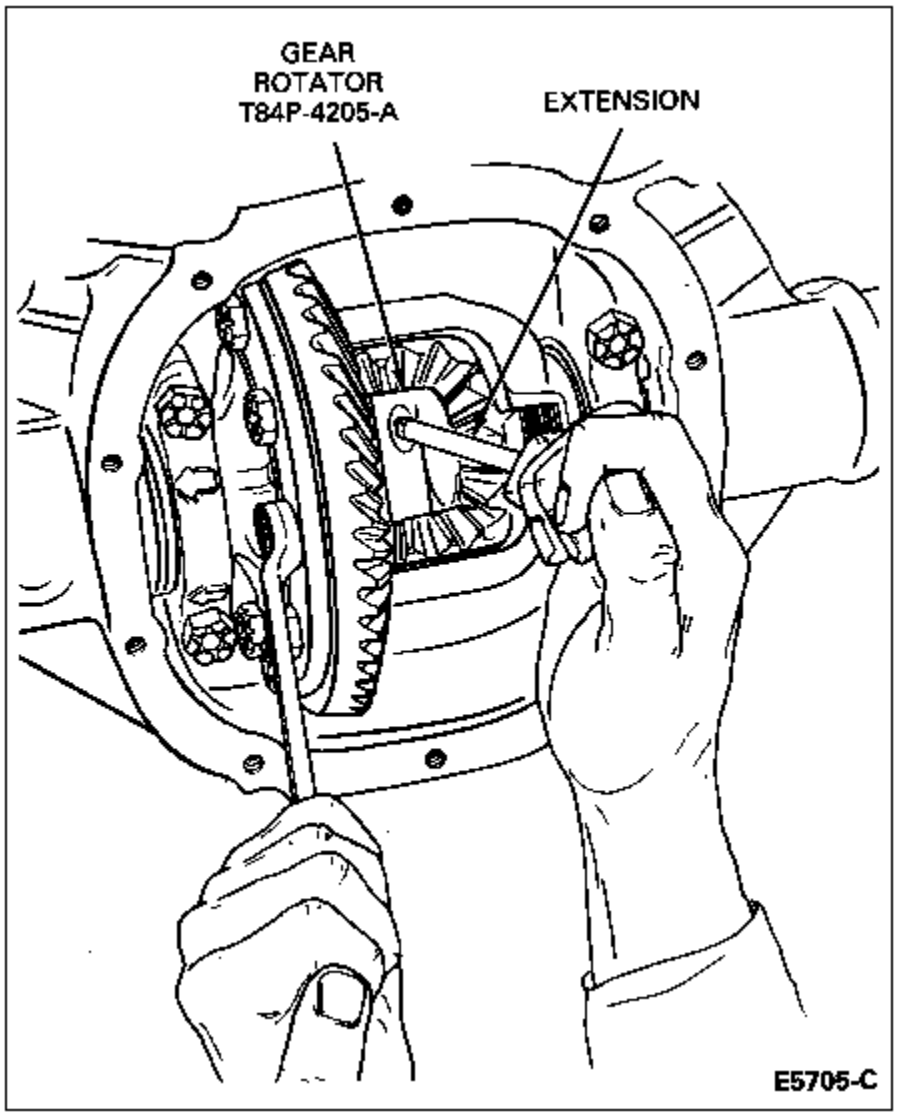
8. **WARNING: CARE MUST BE USED WHEN REMOVING THE DIFFERENTIAL CLUTCH SPRING DUE TO THE SPRING TENSION.**

   Hold the differential clutch spring with a pair of pliers and tap until it slides out of the differential case.



9. **NOTE: A 304.8mm (12-inch) extension is required to remove the pinion gears.**

   Using Gear Rotator T84P-4205-A rotate the pinion gears until they can be removed from the differential case.



10. Remove the right and left differential side gears (4236) and rear axle insulating spacers (4A947) with the rear axle differential clutch shim (4A324) and tag them "right" and "left."

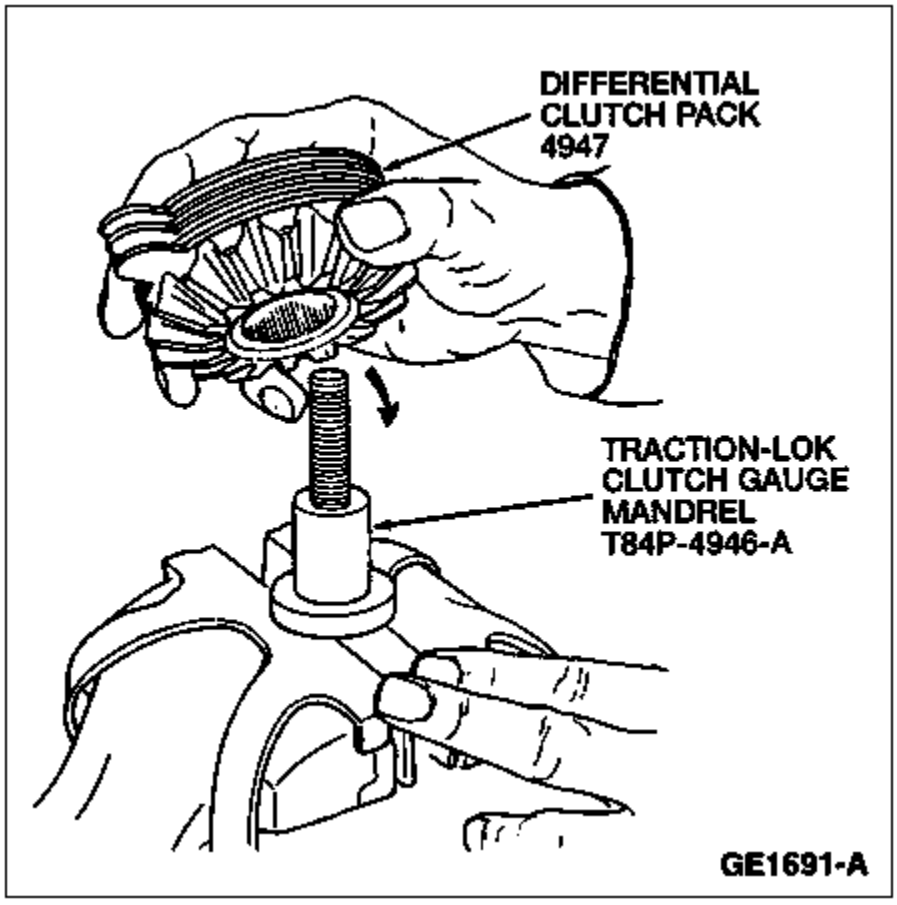
Clutch Pack Preload Adjustments

1. **NOTE: Do not use cleaning solution on clutch plate surfaces. Wipe clean with a dry cloth only.**

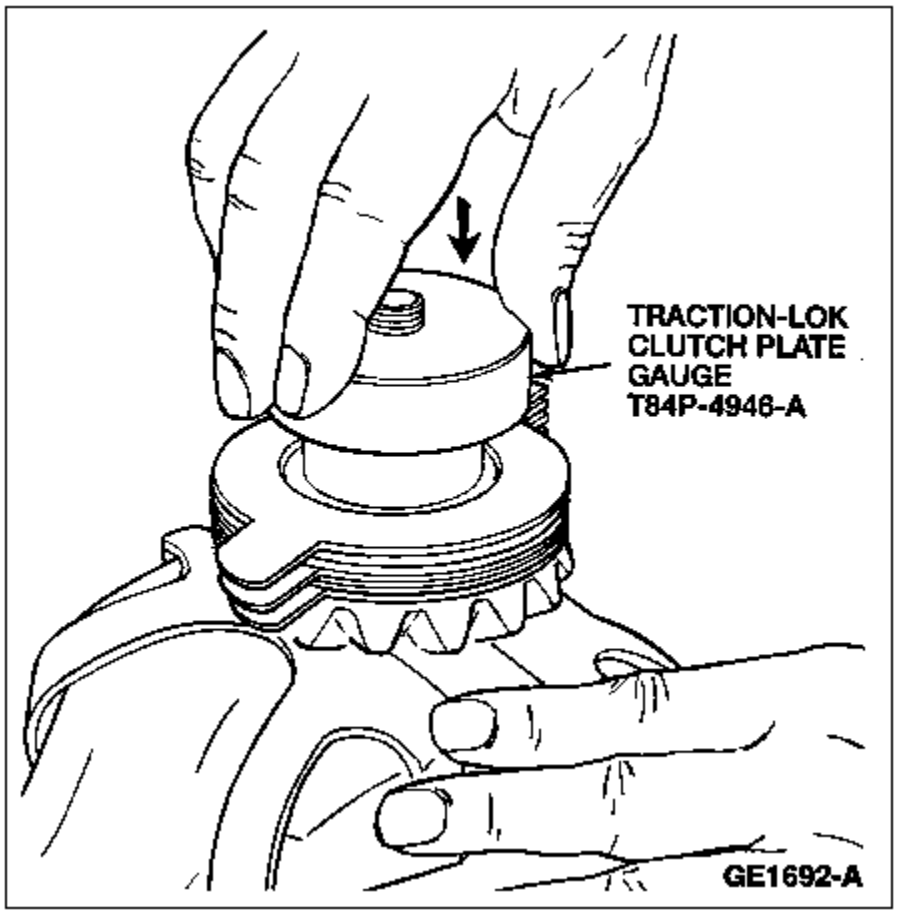
   Clean and inspect the rear axle insulating spacers (4A947) for wear and replace parts as necessary.

2. Proceed as outlined to determine the correct shim thickness required for each side gear differential clutch pack (4947).

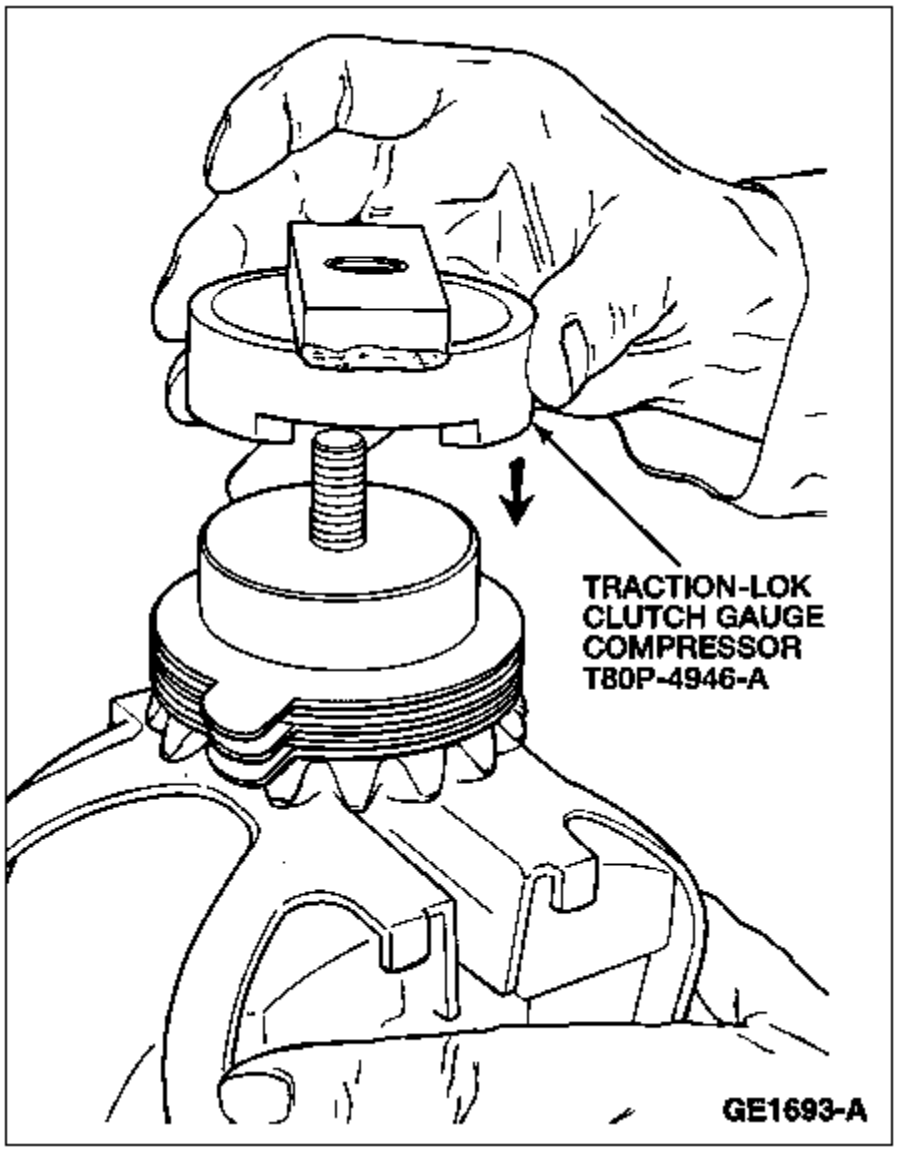
3. Clamp Traction-Lok Clutch Gauge Mandrel T84P-4946-A into a vise as shown. Assemble the differential clutch pack on the differential side gear (4236), without the rear axle differential clutch shim (4A324), over the shaft of the gauge mandrel.



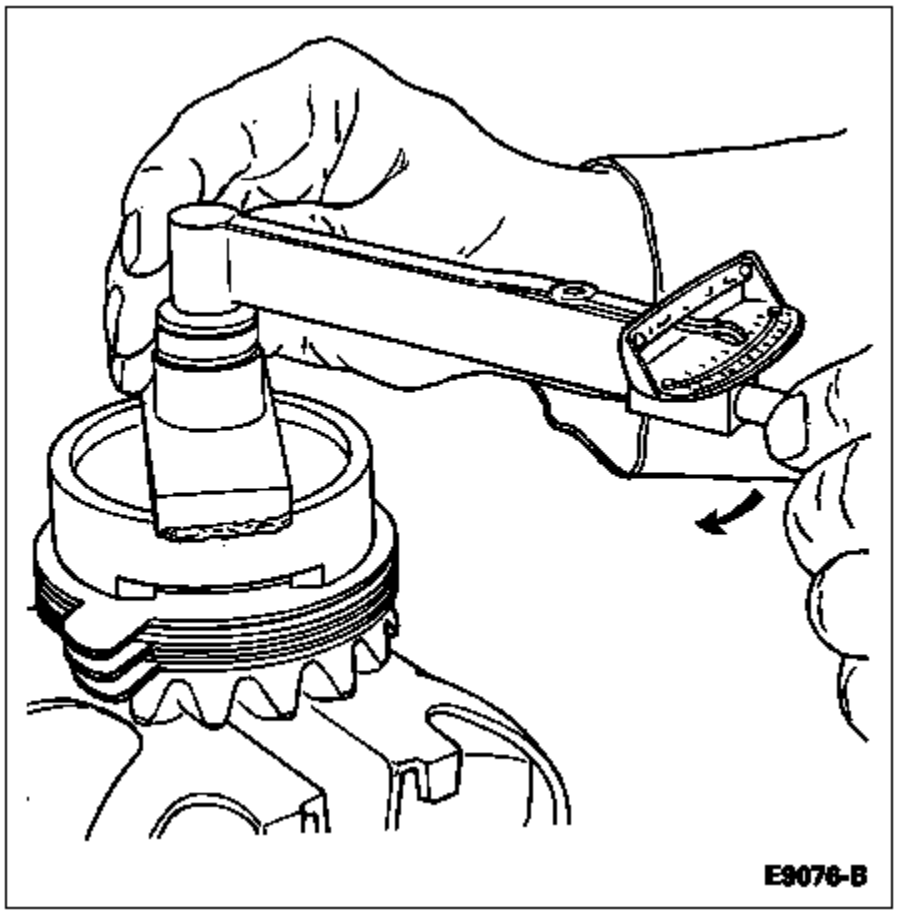
4. Install the gauge plate from Traction-Lok Clutch Gauge T80P-4946-A over the differential clutch pack as shown.



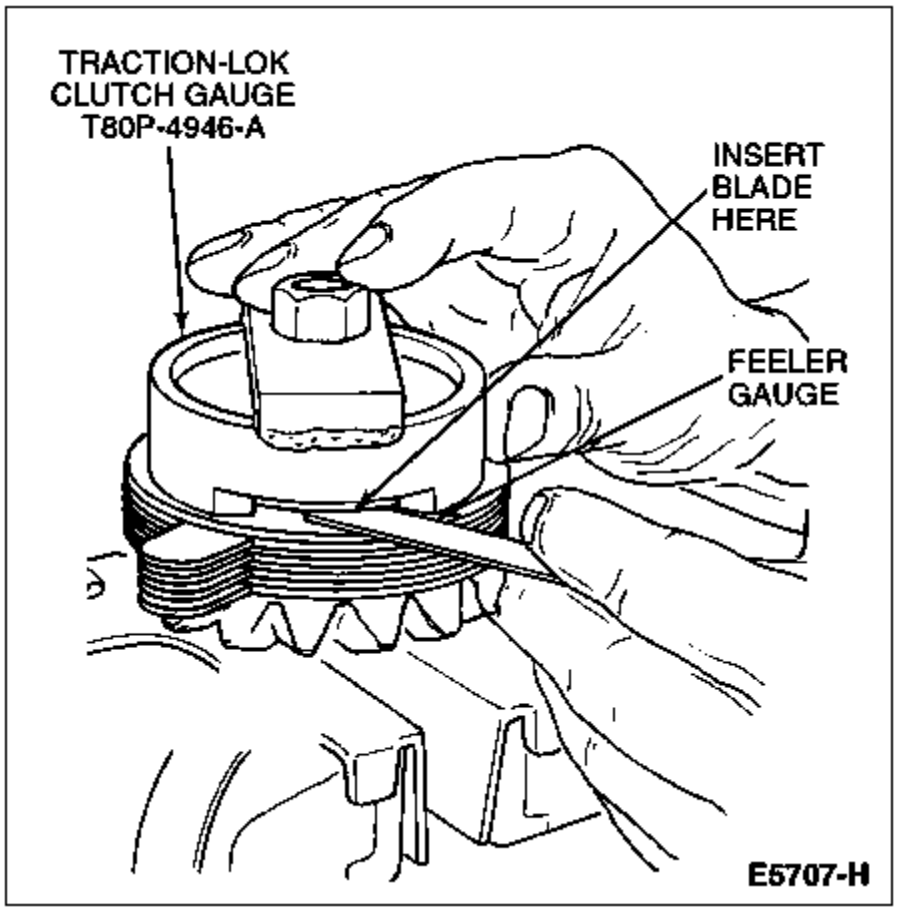
5. Position the Traction-Lok Clutch Gauge T80P-4946-A over the gauge plate.



6. Secure the assembly using the nut from the Traction-Lok Clutch Gauge T84P-4946-A and tighten to 7 Nm (60 lb-in).



7. Using a feeler tool, select the thickest blade that will enter between the tool and the differential clutch pack. This reading will be the thickness of the new rear axle differential clutch shim.



Installation

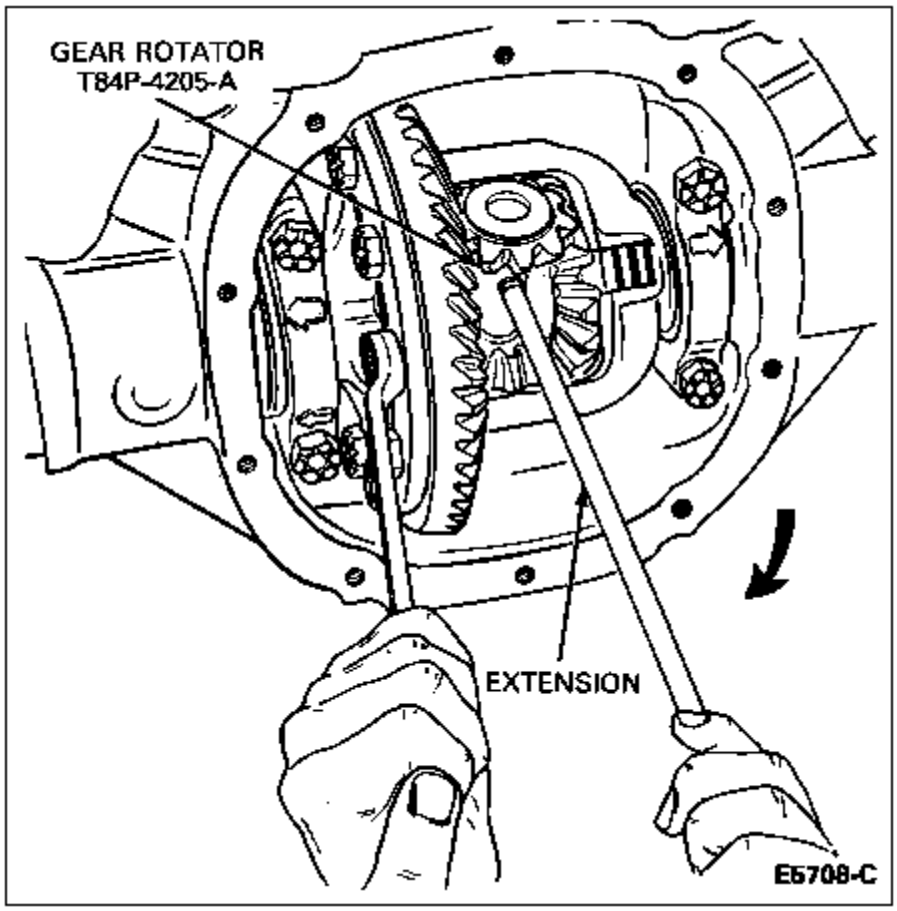
NOTE: Be sure all friction plates have been soaked for at least 15 minutes in Additive Friction Modifier C8AZ-19B546-A or equivalent meeting Ford specification EST-M2C118-A prior to reassembly.

1. Install the left side gear differential clutch pack and new rear axle differential clutch shim into the cavity in the differential case (4204). Repeat this step for the right side.

2. Place the pinion gears and differential pinion thrust washers (4230) 180 degrees apart on the differential side gears as shown.

3. **NOTE: A 304.8mm (12-inch) extension is required to install the differential pinion gears.**

   Install Gear Rotator T84P-4205-A as shown.



4. Rotate the tool until the pinion gears are aligned with the pinion shaft hole. Remove the tool from the differential case.

5. Hold the differential clutch spring (4214) up to the differential case window and with a soft-faced hammer, hammer the spring into position. Inspect the differential clutch spring for damage.

6. Install the axle shafts (4234) and U-washers into position. Push each axle shaft outboard as far as possible.

7. Install the differential pinion shaft (4211) and lock bolt and tighten the bolt to 20-40 Nm (15-30 lb-ft) using Stud and Bearing Mount E0AZ-19554-BA or equivalent meeting Ford specification WSK-M2G349-A1.

8. Install the rear brake drums (1126) and wheels. Perform the limited slip differential in-vehicle check to make sure that the unit is within specification. Refer to Section 05-00 .

9. **CAUTION: On Aerostar vehicles, always replace the plastic rear cover and bolts with a new rear cover and new bolts.**

   Using Silicone Rubber D6AZ-19562-BA or -AA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A install the axle housing cover (4033) and bolts and tighten steel cover bolts to 34-47 Nm (25-35 lb-ft). Tighten plastic cover bolts to 21-27 Nm (15-20 lb-ft).

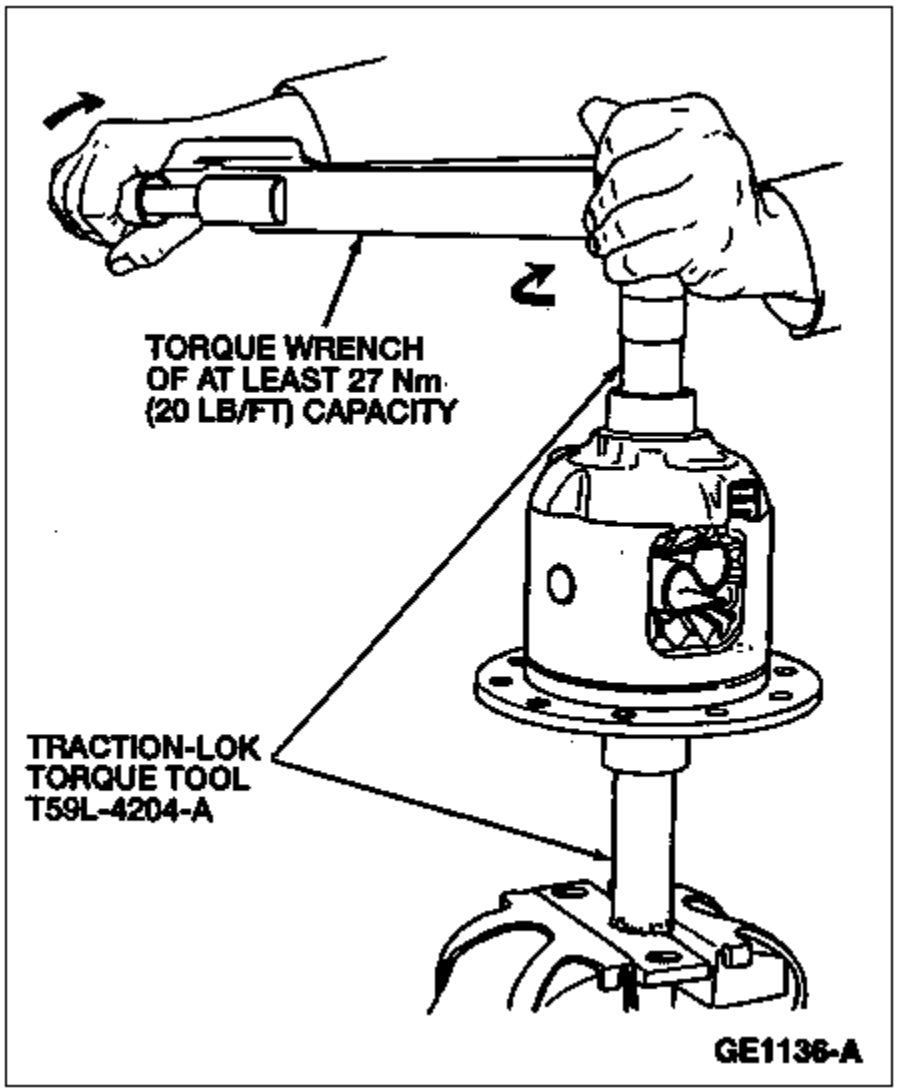
10. Service refill capacities are determined by filling the rear axle 6.4-14.2mm (1/4-9/16 inch) below the bottom of the filler space with the rear axle (4001) in the running position. The capacity for Aerostar

vehicles is 1.7 liters (3.5 pints). The capacity for Ranger vehicles is 2.4 liters (5 pints).

11. Install the filler plug and tighten to 20-40 Nm (15-30 lb-ft). Refer to Specifications for the quantity recommended.

Bench Torque Test

1. Prior to installation of the locking differential into a vehicle, a bench torque check must be made. With Traction-Lok Torque Tool T59L-4204-A check the torque required to rotate one differential side gear (4236) while the other is held stationary. The initial breakaway torque, if original clutch plates are used, should be no less than 27 Nm (20 lb-ft). The rotating torque required to keep the differential side gear turning with new clutch plates may fluctuate, with initial breakaway torque at least 27 Nm (20 lb-ft).



2. Lightly coat lock bolt threads with Threadlock and Sealer E0AZ-19554-AA or equivalent meeting Ford specification WSK-M2G315-A5. Install lock bolt in differential case (4204) and tighten to 20-40 Nm (15-30 lb-ft).

3. Clean the tapped holes in the ring gear and pinion with a suitable solvent. If the new bolts show a green coating over approximately 12.7mm (1/2 inch) of the threaded area, use as is. If not coated, apply a small amount of Threadlock and Sealer E0AZ-19554-AA or equivalent meeting Ford specification WSK-M2G315-A5. Tighten to 95-115 Nm (70-85 lb-ft).

SPECIFICATIONS

LUBRICANT CAPACITY

Differential Case

Refer to Section 05-02B for the procedures for removing and installing the limited slip differential (4026).

The limited slip differential is removed and installed in the same manner as a conventional differential.

To disassemble and assemble the differential case (4204), remove and install the ring gear and pinion and the differential bearing (4221) following the procedures used for the conventional differential.

NOTE: Do not remove the differential bearings from the case journals unless the differential bearings are damaged. If the bearings remain on the case during repair, keep them clean and free from foreign material.

To remove and install the differential clutch spring (4214), differential pinion shaft (4211), pinion gear and differential clutch pack (4947), follow the procedure under Adjustments in this section.

In-Vehicle Adjustments

NOTE: Refer to Section 05-02B for speed sensor ring service.

In-vehicle adjustments are possible on this unit without removing the differential case (4204) from the rear axle housing. If the operation check was not to specification, use the following procedure to correct the condition.

Clutch Pack Preload Adjustment

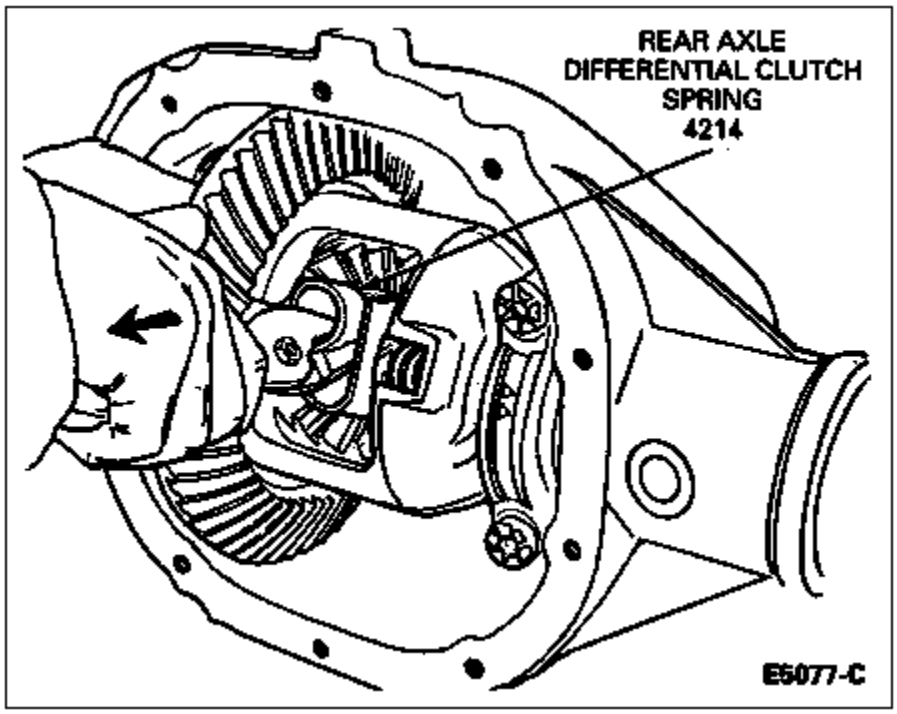
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Gear Rotator	T80P-4205-A
Traction-Lok Clutch Gauge	T87T-4946-A

1. **NOTE: Before preload can be adjusted, the axle shafts (4234) must be removed following the procedure in Section 05-02B . The axle shafts must be removed completely from the housing so that the inner wheel bearing oil seals (1177) will not be damaged. After adjustment, install the axle shafts following the procedure in Section 05-02B .**

   WARNING: DUE TO THE SPRING TENSION, CARE MUST BE USED WHEN REMOVING THE DIFFERENTIAL CLUTCH SPRING (4214).

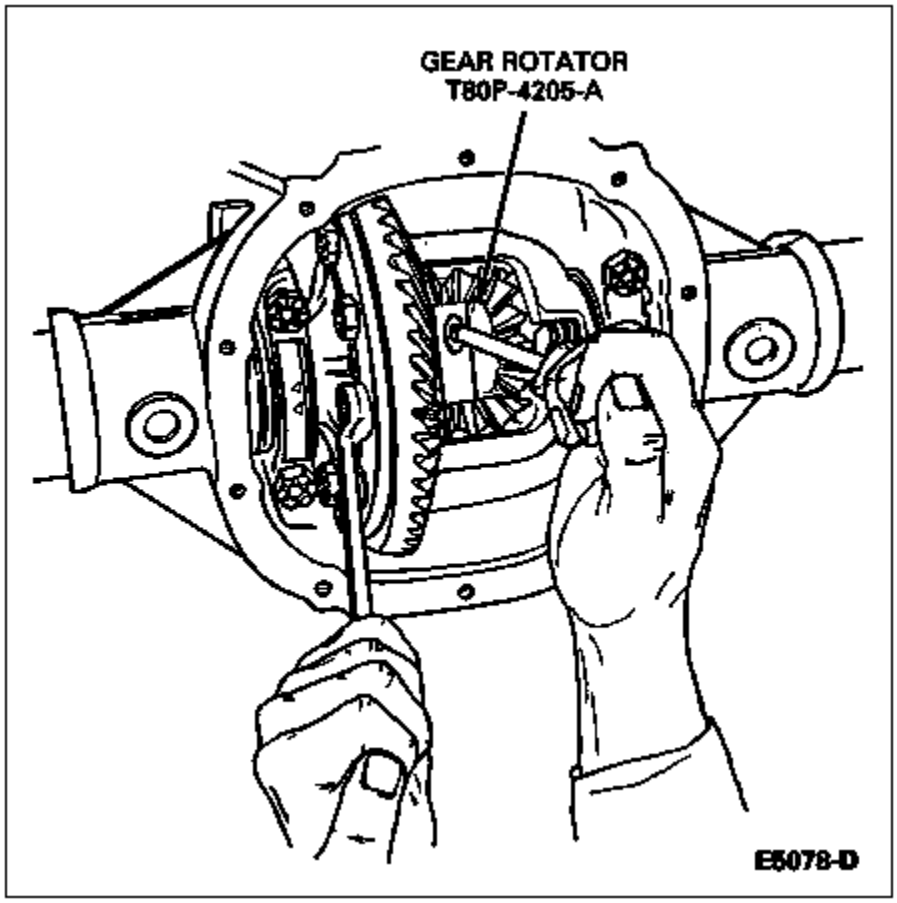
   With a suitable drift, drive the differential clutch spring half-way out of the differential (4026). Rotate the differential 180 degrees. Hold the differential clutch spring with a pair of pliers and tap the differential clutch spring until it is removed from the differential.



2. **NOTE: A 304.8mm (12 inch) extension is required to remove the pinion gears.**

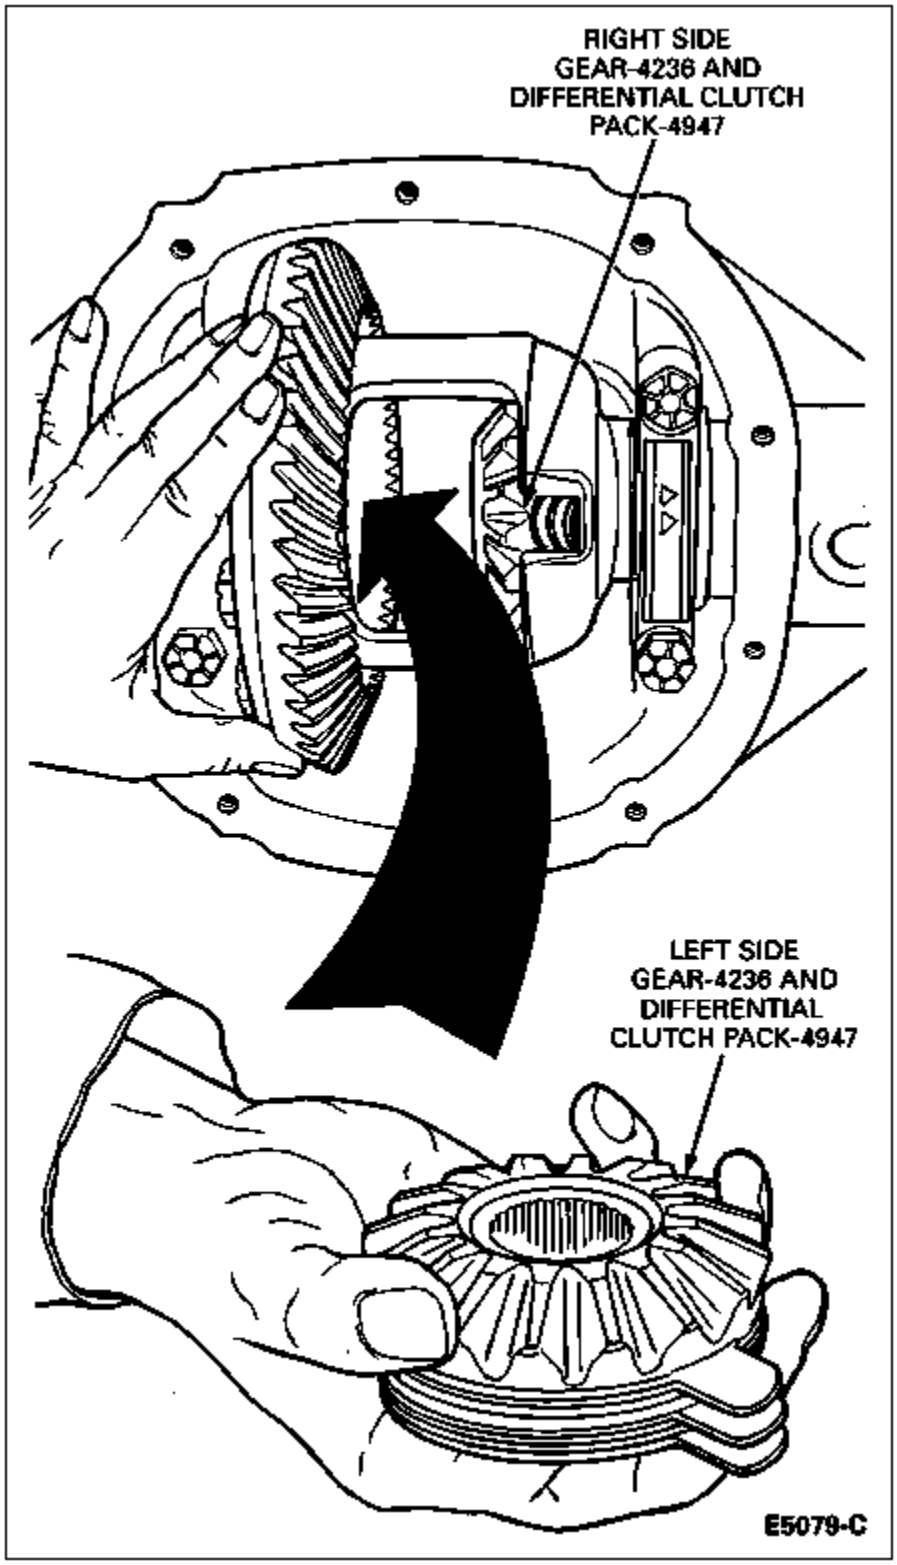
   Using Gear Rotator T80P-4205-A rotate the pinion gears until they can be removed from the

differential.



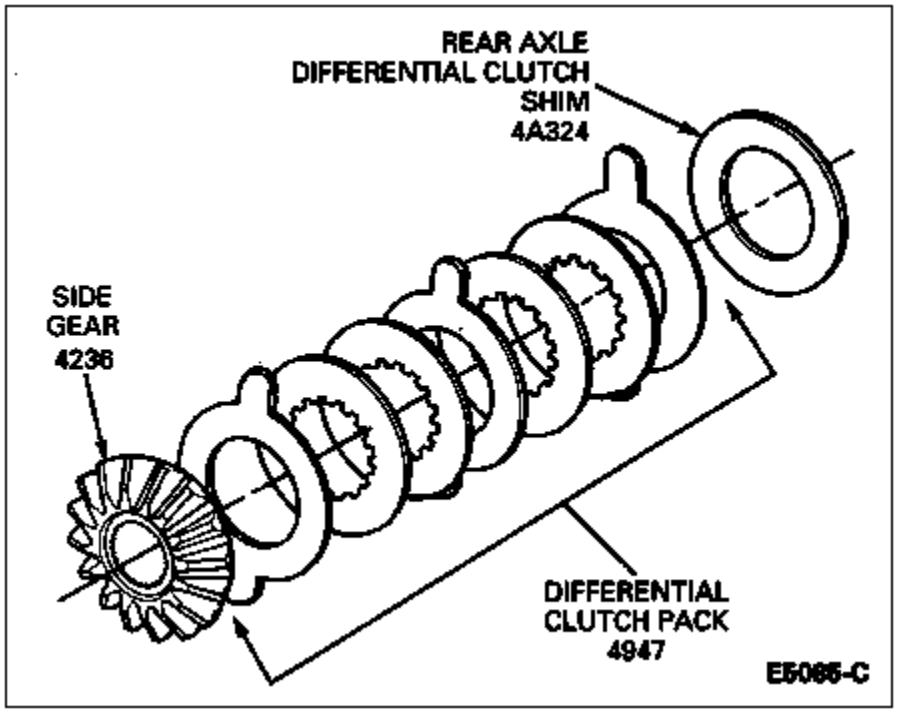
3. **NOTE: Do not mix differential clutch packs (4947) or rear axle differential clutch shims (4A324) from one side with the other.**

   Remove the right and left differential side gears (4236) and differential clutch pack with the rear axle differential clutch shim and tag them "right" and "left." Set them aside until Step 4. Clean and inspect the remaining parts of the differential case (4204) for wear or damage. Replace parts as required.



4. **NOTE: Do not use acids or solvents when cleaning clutch components. Wipe components with a clean lint-free cloth.**

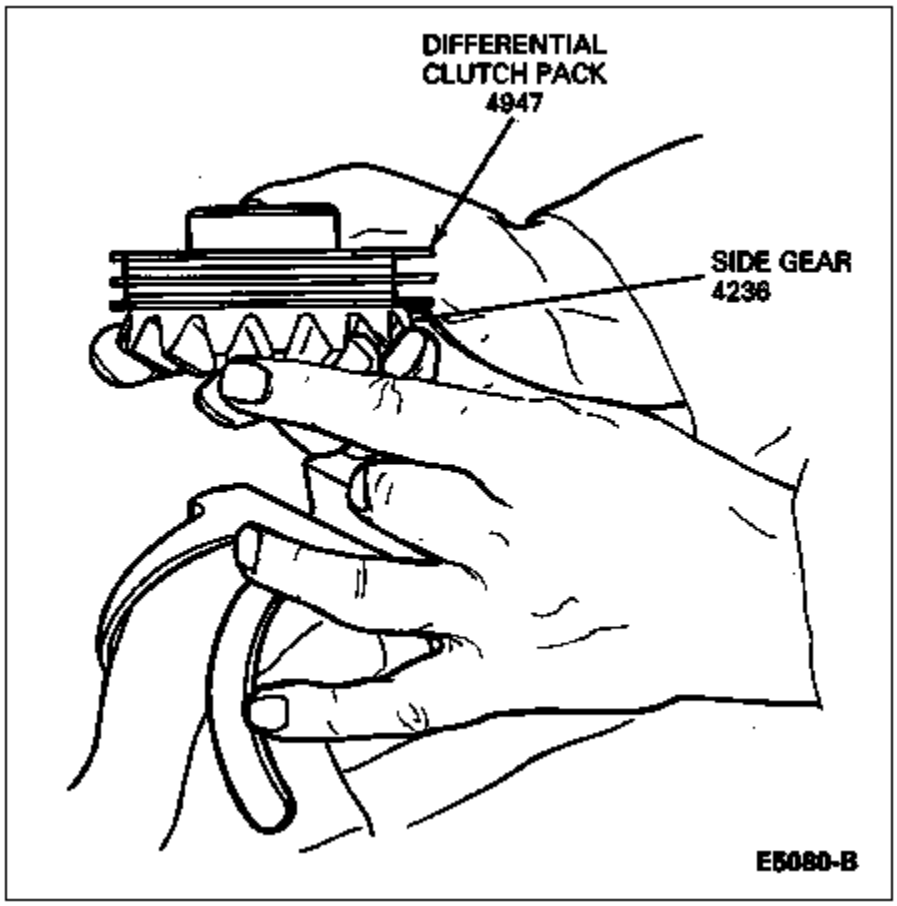
   Clean and inspect the differential clutch packs for wear and replace parts as necessary.



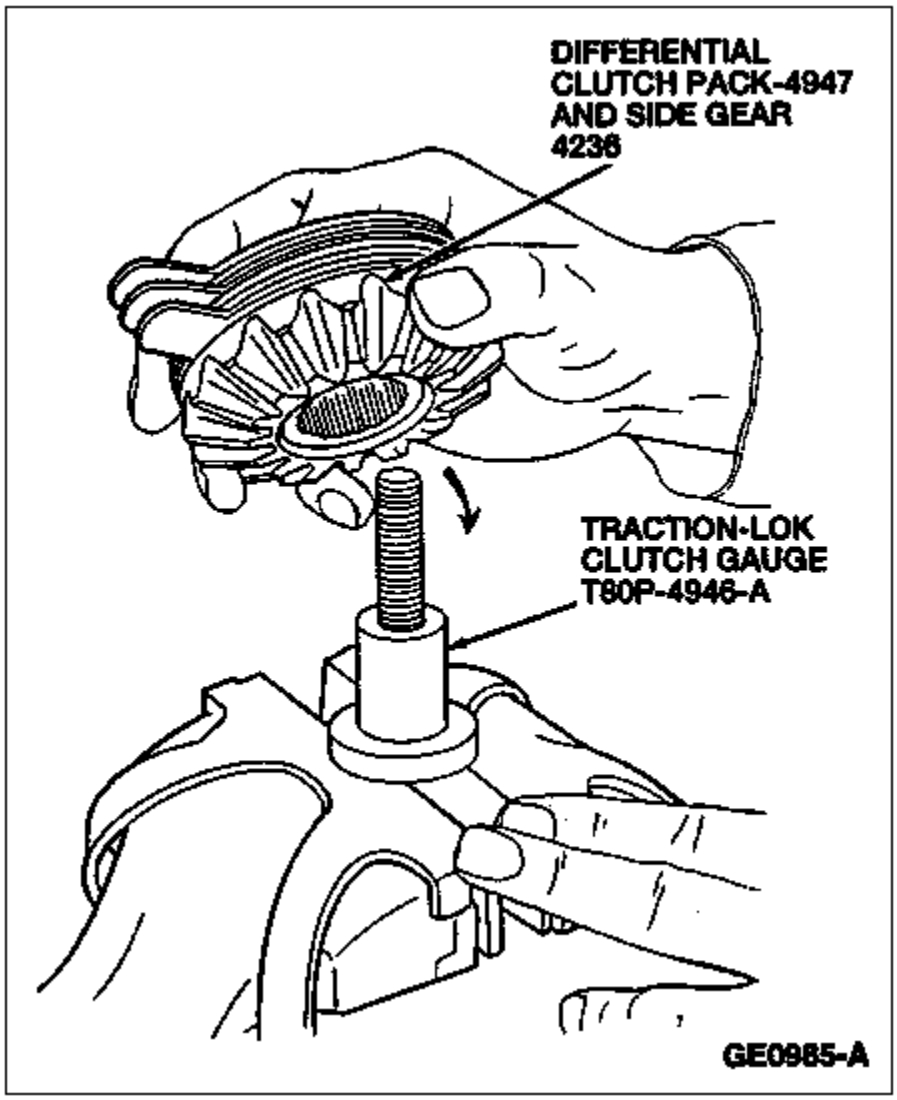
5. **CAUTION: Prelubricate all friction plates with Additive Friction Modifier C8AZ-19B546-A or equivalent meeting Ford specification EST-M2C118-A.**

   NOTE: Do not mix differential clutch packs or shims from one side with the other.

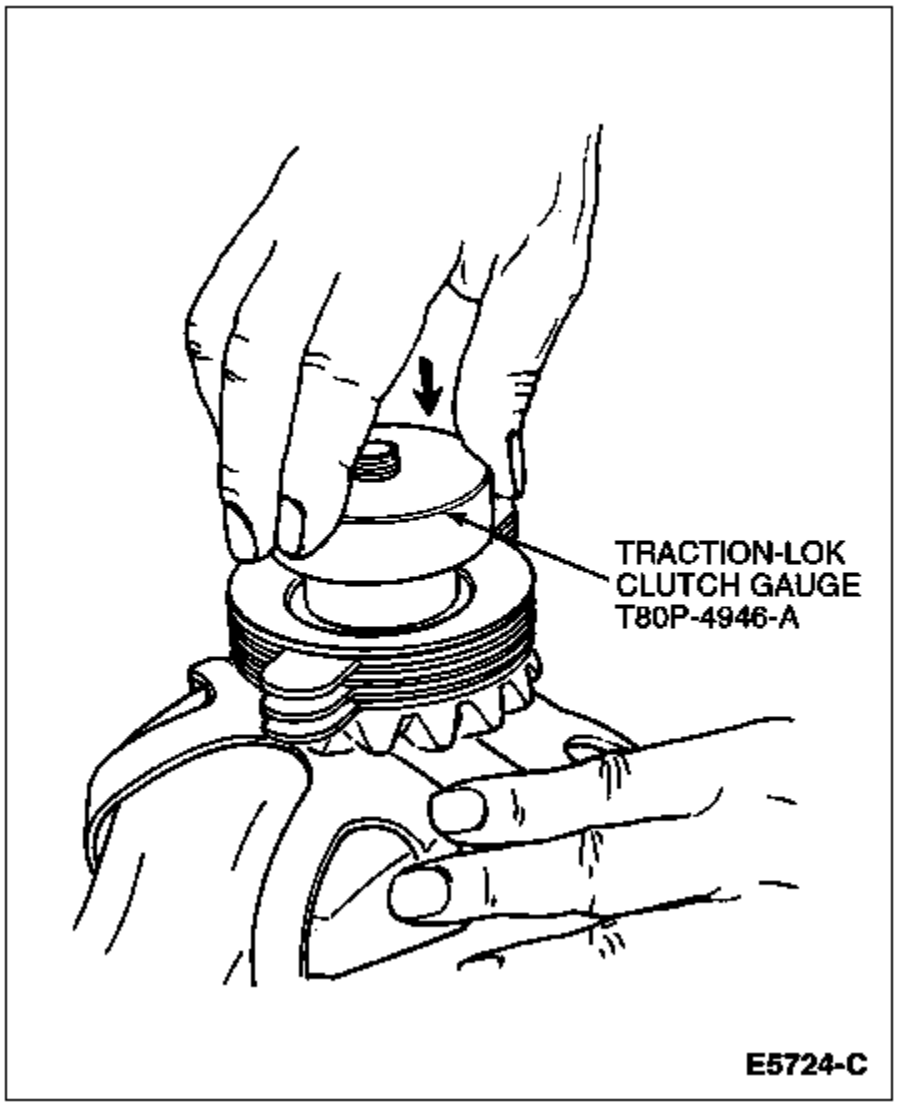
   Assemble the differential clutch packs (without rear axle differential clutch shims) on the respective differential side gears.



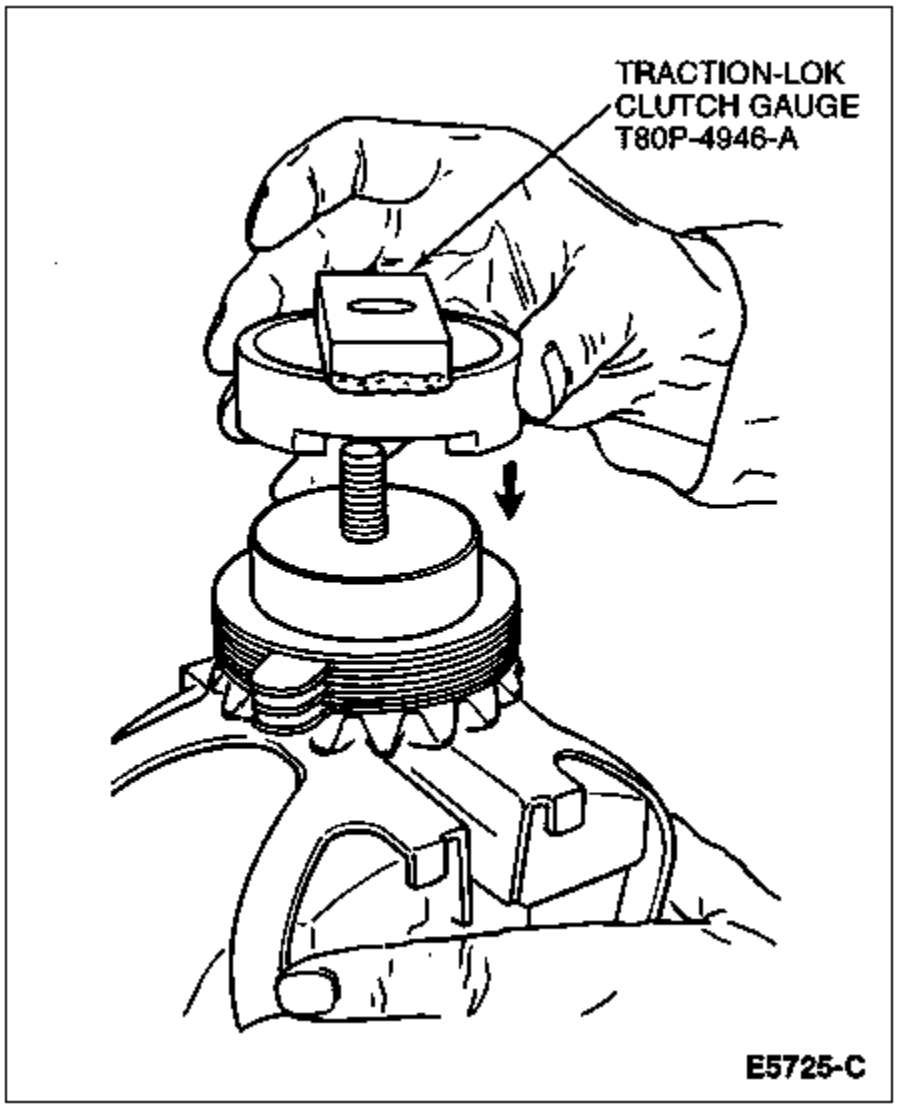
6. Place the base portion of Traction-Lok Clutch Gauge T80P-4946-A in a vise. Install the differential clutch pack and differential side gear (without the rear axle differential clutch shim) over the base.



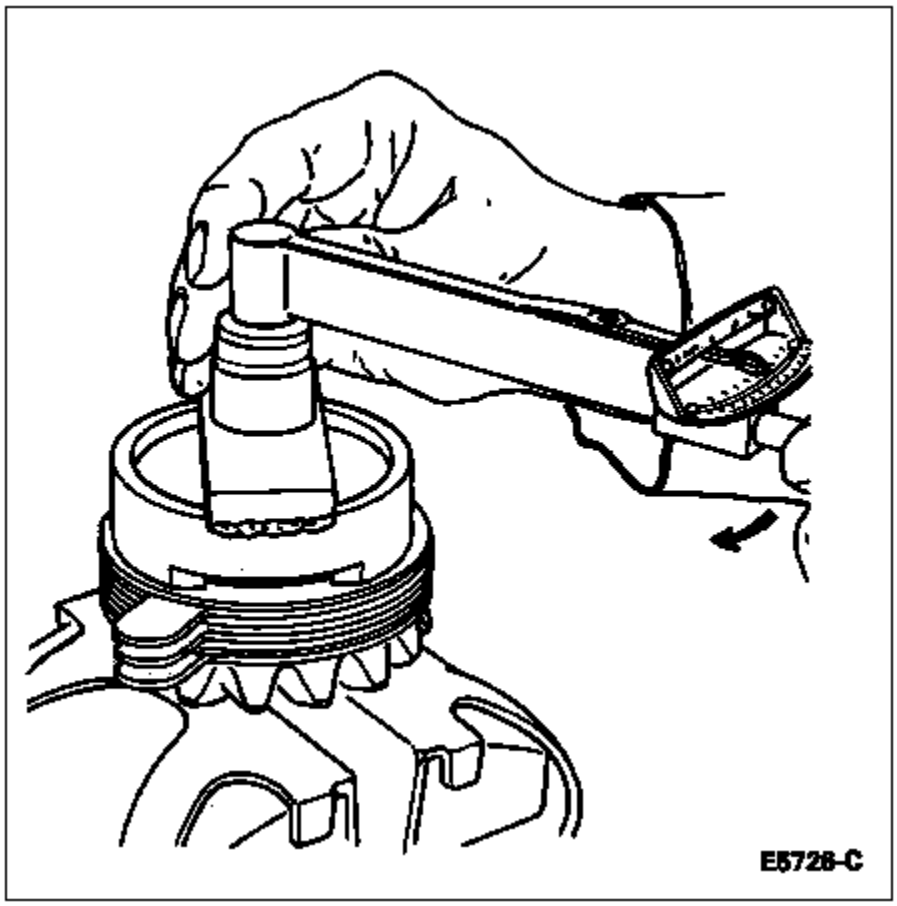
7. Install the disc of the Traction-Lok Clutch Gauge T80P-4946-A over the base and on top of the differential clutch pack.



8. Install the top portion of the Traction-Lok Clutch Gauge T80P-4946-A over the disc and base stud.



9. Install the nut of the Traction-Lok Clutch Gauge T80P-4946-A over the top and base stud. Tighten the nut to 6.7 Nm (60 lb-in).

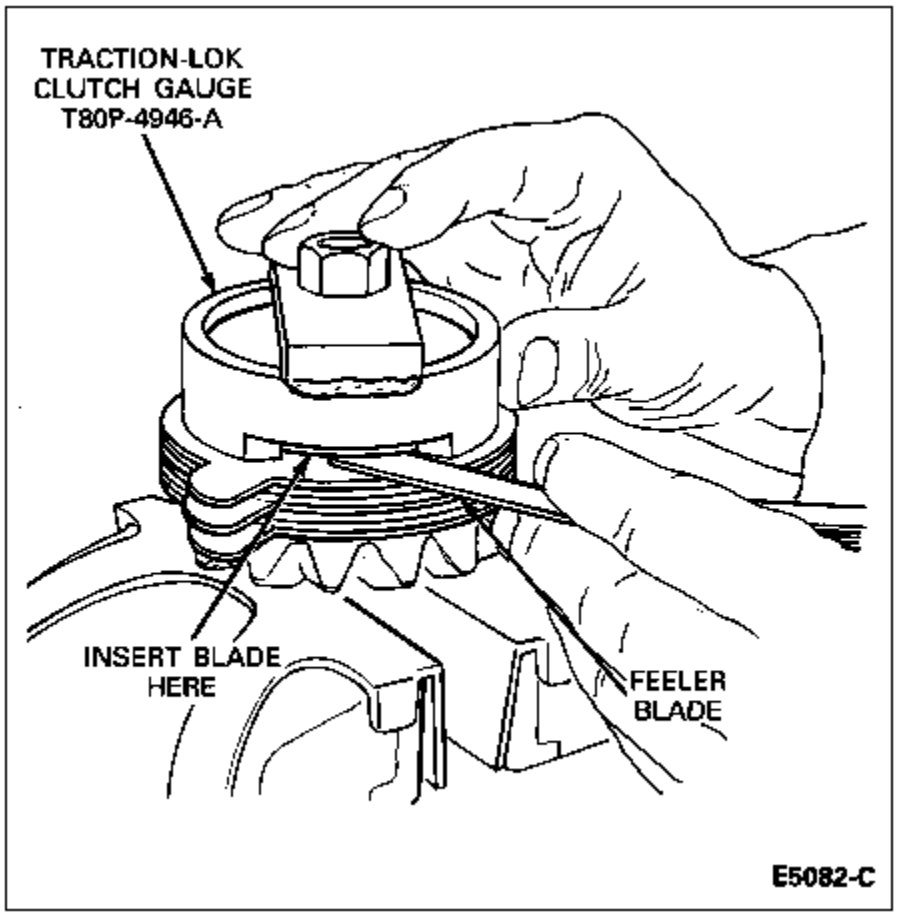


10. **NOTE: Be sure to lubricate friction clutch plates with Additive Friction Modifier C8AZ-19B546-A or equivalent meeting Ford specification EST-M2C118-A prior to reassembly.**

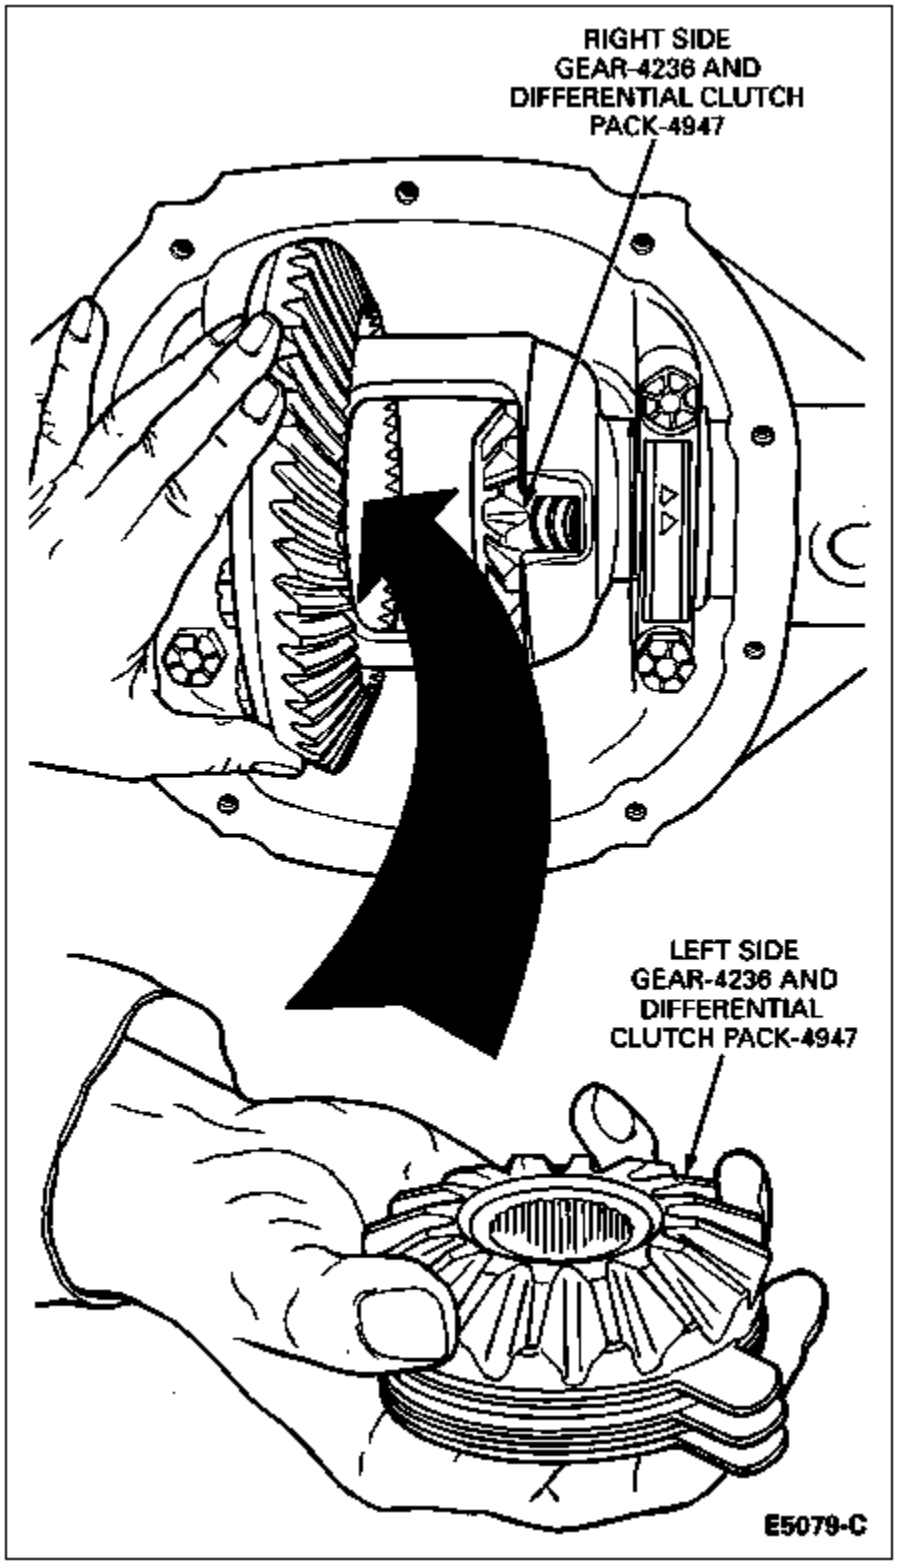
    NOTE: Only one shim should be required per clutch pack. However, two shims (maximum) per clutch pack may be used if necessary.

    Using a feeler gauge, select the thickest blade that will enter between the tool and the differential clutch pack. This reading will be the thickness of the new rear axle differential clutch shim.

Item	Specification
E4DZ-4A324-A	0.025 inch
E4DZ-4A324-B	0.030 inch
E4DZ-4A324-C	0.035 inch
E4DZ-4A324-D	0.040 inch
E4DZ-4A324-E	0.045 inch

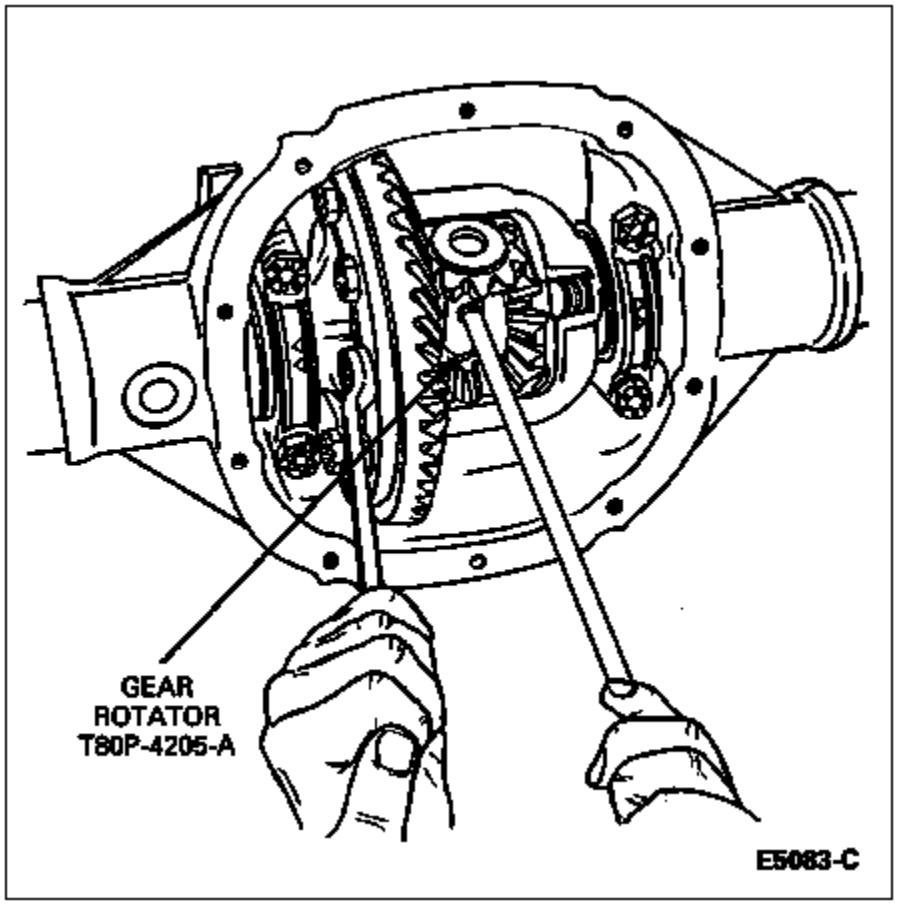


11. Install the right differential side gear, differential clutch pack and new rear axle differential clutch shim into the cavity in the differential case. Repeat this step for the left side.

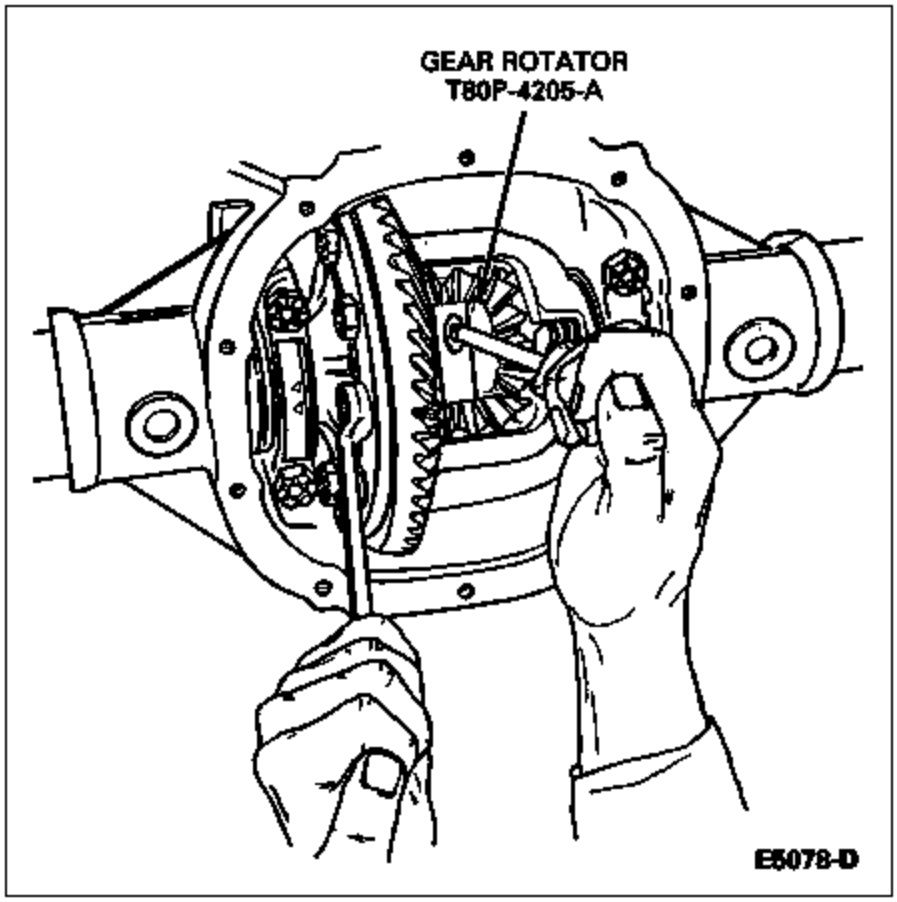


12. **NOTE: A 304.8mm (12-inch) extension is required to install the pinion gears.**

    Place the pinion gears and differential pinion thrust washers (4230) 180 degrees apart on the differential side gears. Install Gear Rotator T80P-4205-A as shown.



13. Rotate the tool until the pinion gears are aligned with the pinion shaft hole as shown. Remove the tool from the differential case.



14. **NOTE: Inspect the rear axle differential clutch spring for damage.**

    Hold the differential clutch spring up to the differential case window and, with a soft-faced hammer, hammer the differential clutch spring into position.

NOISE CONCERNS

Condition	Possible Source	Action
• Ratcheting or Buzzing Noise in Front Axle in Two-Wheel Drive, Shortly After Four-Wheel Drive Usage	• Right or left side hublock.	• REPLACE hublocks as necessary.
• Popping Sound from Front Axle When in Four-Wheel Drive, Especially While Cornering	• Right or left side hublock.	• REPLACE hublocks as necessary. REFER to Pinpoint Test A .

tomsn048@gmail.com

Pinpoint Test (for Automatic Locking Hubs Only)

PINPOINT TEST A: NOISE WHILE ENGAGING IN FOUR-WHEEL DRIVE

A1 VERIFY LUBRICANT

- Drain and refill front axle differential with 1.66 liters (56 oz.) of 4x4 gear oil F1TZ-19580-A meeting Ford specification WSL-M2C191-A.

  NOTE: There is no equivalent for F1TZ-19580-A meeting Ford specification WSL-M2C191-A. Do not substitute any other lubricant.

Is lubricant to specifications?

Yes	No
GO to **A2** .	REPLACE differential lubricant with 1.66 liters (56 oz.) of 4x4 gear oil F1TZ-19580-A meeting Ford specification WSL-M2C191-A. GO to **A2** .

A2 VERIFY HUBLOCKS ARE OPERATIONAL

- Verify that the hubs lock and unlock using the procedure in this section.

Do hublocks work properly?

Yes	No
ROAD TEST vehicle. GO to **A3** .	INSPECT right and left side hublocks and REPLACE as necessary. REPEAT **A2** . If hublock is satisfactory, GO to **A3** .

A3 VERIFY OUTPUT OF TRANSFER CASE CLUTCH

- While road testing vehicle, push 4x4 button.

Does vehicle shift to 4x4 mode without ratcheting?

Yes	No
	REPLACE clutch coil, housing, lockup collar, lockup fork, return spring and sleeve spring.

tomsn048@gmail.com

REPAIR is complete.	REFER to Section 07-07D Disassembly and Assembly. REPEAT road test procedure.

tomsn048@gmail.com

Hub Diagnosis, Locking and Unlocking Hubs

Hubs, Manual Locking

Manual locking hubs are simple to diagnose. Place the transfer case (7A195) in two-wheel drive and raise the front wheels (1007) off the ground. When in the unlocked position, the wheels should be able to turn freely. Then lock each of the front hubs and rotate the front wheels. The additional load of the drivetrain components should be felt once the hub has been engaged. In addition, the front axle and front driveshaft should be moving along with the wheel. Disengage the hubs and repeat the procedure to check that the hubs have smoothly disengaged.

Hubs, Automatic Locking

Raise vehicle on hoist with engine off. Turn front driveshaft by hand to engage front hubs. Front wheels should turn if hubs lock properly. Spin front wheels by hand in opposite direction to disengage hubs (an audible "click" should be heard). Turn front driveshaft by hand in opposite direction and wheels should turn in opposite direction also if the hubs are locking properly. Disengage hubs by spinning front wheels by hand opposite of the direction they spun while turning the driveshaft.

When checking front hubs for proper operation, road test the vehicle to ensure that the hubs will remain engaged while under load. This can be accomplished by engaging four-wheel drive and taking the vehicle through several turns (both forward and backward) on dry pavement.

Driving through several turns while traveling in different directions will ensure that both sides of the hub teeth have been tested under load. Hubs that are not sufficiently engaged will "pop" out when loaded. This is due to the driveline releasing windup and is an indication of hub malfunction.

If slippage is suspected, mark the tire and axle with chalk (after locking the hub) and apply a heavy torque load several times. Then inspect your original indexing marks. If they are no longer aligned, the hubs are not remaining locked when under load. They will have to be replaced.

Should manual or automatic hublocks become submerged in water or mud for a long period of time, water may get past the seals and into the hubs and axle. In this case, all water must be expelled from the system. For automatic hublocks, the axle must be drained by siphoning out old lubricant through the drain hole in the axle arm which also serves as the carrier cover. Use new 4x4 Gear Oil F1TZ-19580-A meeting Ford specification WSL-M2C191-A to refill the axle (F1TZ-19580-A has no equivalent). Replace hubs using Automatic Locking Hub Front Wheel Bearing Adjustments procedure in this section.

tomsn048@gmail.com

tomsn048@gmail.com

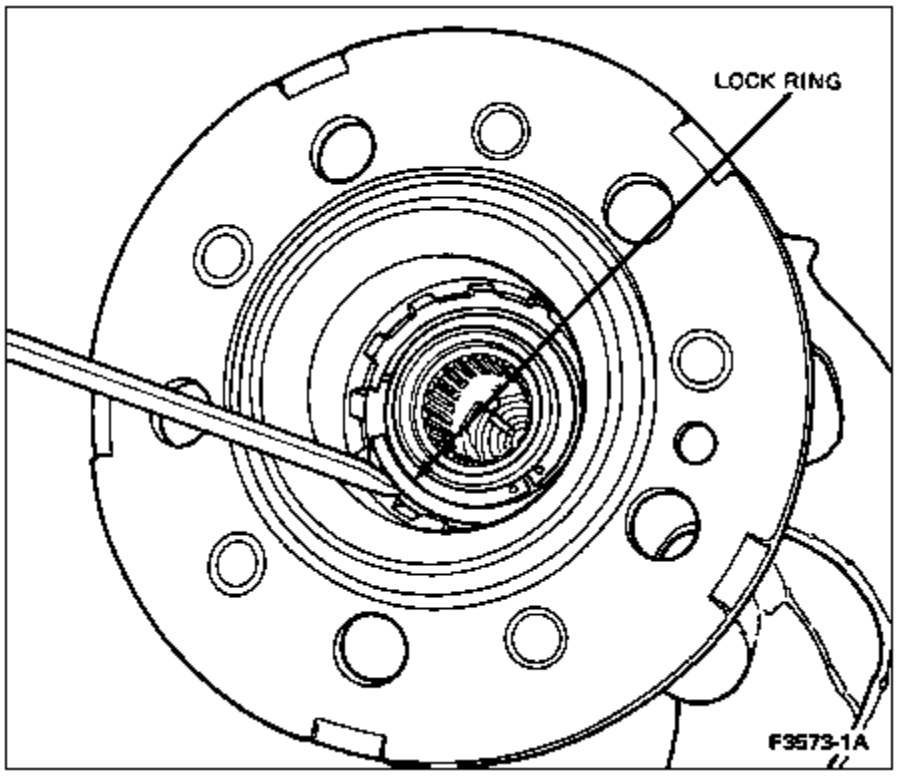
Locking Hubs, Manual, Ranger

Removal and Installation

1. Raise the vehicle and install Rotunda Car/Truck Stands 077-00018 or equivalent.
2. Remove lug nuts (1012) and the wheel and tire assembly. Refer to Section 04-04 .
3. Remove lugnut retainer washer from studs.
4. Remove the manual locking hub assembly.
5. **CAUTION: Do not remove the screw from the plastic dial.**

   Slide internal hub lock assembly, spring and clutch gear out of hub body.

   For installation, follow removal procedures in reverse order. Tighten lugnuts to 135 Nm (100 lb-ft).



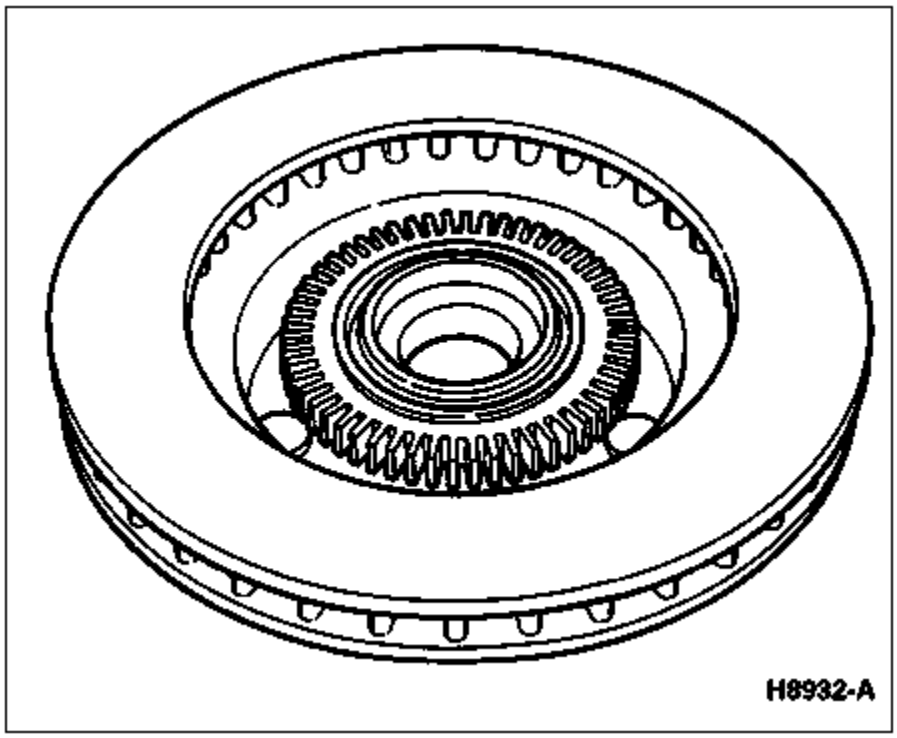
tomsn048@gmail.com

tomsn048@gmail.com

Speed Sensor Indicator Ring, Ranger

Removal

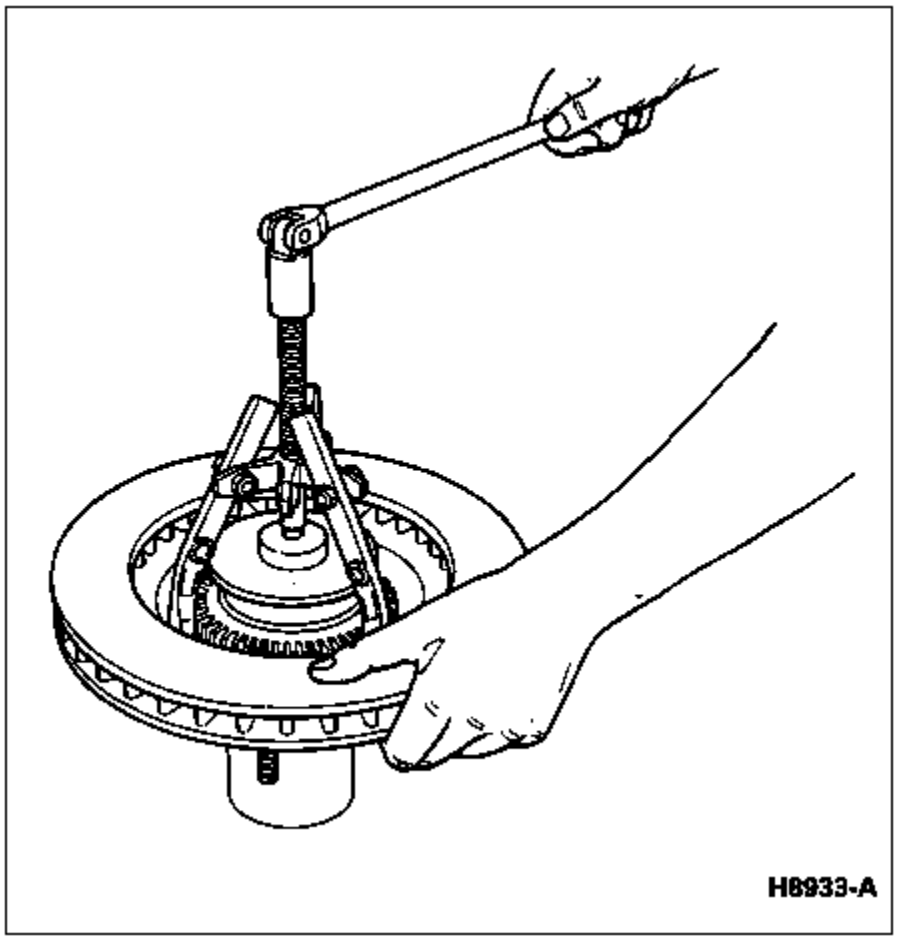
1. Raise vehicle on hoist.
2. Remove wheel and tire assembly.
3. Remove front disc brake caliper (2B121), and hub and rotor assemblies. Refer to Section 06-03 . Refer also to Ranger Locking Hub exploded views in this section.



4. **CAUTION: Discard speed sensor ring after removal. Do not reuse old ring.**

   Using a 3-jaw puller, remove front brake anti-lock sensor indicator (2C182) from hub.

tomsn048@gmail.com



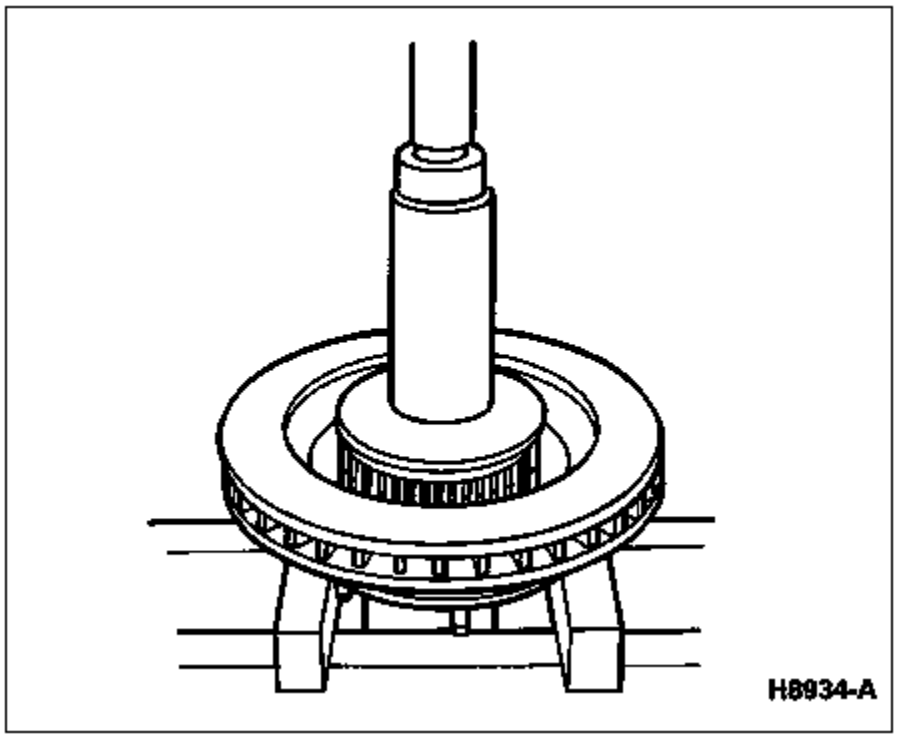
Installation

1. Support center of hub so that wheel studs do not rest on work surface.

2. **CAUTION: When performing the following step, make sure indicator ring is pressed on straight.**

   Position new front brake anti-lock sensor indicator on hub. Using a cylinder with 79mm (3.1-in.) ID and 96mm (3.8-in.) OD, press the front brake anti-lock sensor indicator onto the hub. The front brake anti-lock sensor indicator must be fully seated against the shoulder in the hub.

tomsn048@gmail.com



3. Install hub, rotor and caliper assemblies. Refer to Section 06-03 .
4. Install wheel and tire assembly. Tighten wheel lugnuts to 135 Nm (100 lb-ft).

tomsn048@gmail.com

Wheel Grease Seal and Bearing, Front

Replacement and Repacking

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Impact Slide Hammer	T50T-100-A
Bearing Cup Replacer	T80T-4000-P
Driver Handle	T80T-4000-W
Seal Replacer	T80T-4000-T
Spindle Seal Replacer	T95T-3132-D

The recommended wheel bearing lubricant is lithium-base High-Temperature Constant Velocity Joint Grease E43Z-19590-A or equivalent meeting Ford specification ESP-M1C207-A.

CAUTION: Sodium-base grease is not compatible with lithium-base grease. Do not intermix. Clean all old lubricant grease prior to lubricating front/rear wheel bearing. Use of incompatible bearing lubricant could result in premature lubricant breakdown.

NOTE: If bearing adjustment does not eliminate looseness or rough and noisy operation, clean, inspect and repack the hub and wheel bearings with specified wheel grease. If wheel bearing cup or the cone and roller assemblies are worn or damaged, they should be replaced.

Manual Locking Hub, Ranger

13	4221	Wheel Bearing Outer

tomsn048@gmail.com

14	4221	Wheel Bearing Inner
15	1175A	Excluder Seal

Disassembly

1. Raise the vehicle and install Rotunda Car/Truck Stands 077-00018 or equivalent.
2. Remove the wheel and tire assembly.
3. Remove the retainer washers and remove the hub assembly. Refer to Manual Locking or Automatic Locking Hubs under Front Wheel Bearing Adjustment in this section for removal.
4. Remove the disc brake caliper (2B120) as described in Section 06-03 .
5. Remove the hub and rotor. Remove the outer wheel bearing cone.
6. Remove the wheel hub grease seal (1190) from the rotor with Seal Remover TOOL-1175-AC or equivalent and Impact Slide Hammer T50T-100-A. Discard wheel hub grease seal and replace upon assembly.
7. Remove excluder seal.
8. Remove the inner wheel bearing.
9. **NOTE: If new wheel bearing cups are installed, install new cone and roller assemblies.**

   Inspect the wheel bearing cups for pits or cracks. If necessary, remove them with Internal Puller D80L-943-A or equivalent and Impact Slide Hammer T50T-100-A.

Assembly

1. Lubricate the wheel bearings with High Temperature Constant Velocity Grease E43Z-19590-A or equivalent meeting Ford specification ESP-M1C207-A. Clean all grease from the hub. Pack the cones and rollers. If a bearing packer is not available, work as much lubricant as possible between the rollers and the cages.
2. If wheel bearing cups are to be installed, position wheel bearing cups in rotor and drive in place with Bearing Cup Replacer T80T-4000-P and Driver Handle T80T-4000-W.
3. Position excluder seal on spindle and drive into position using Spindle Seal Replacer T95T-3132-D.
4. Position the inner wheel bearing in the inner wheel bearing cup in the rotor. Install the wheel hub grease seal by driving in place with Seal Replacer T80T-4000-T and Driver Handle T80T-4000-W.
5. Carefully install the rotor onto the front wheel spindle (3105). Refer to Section 06-03 .
6. Install outer wheel bearing into rotor.
7. Refer to Automatic Locking Hubs under Front Wheel Bearing Adjustment in this section for remainder of installation.

tomsn048@gmail.com

Front Wheel Bearing

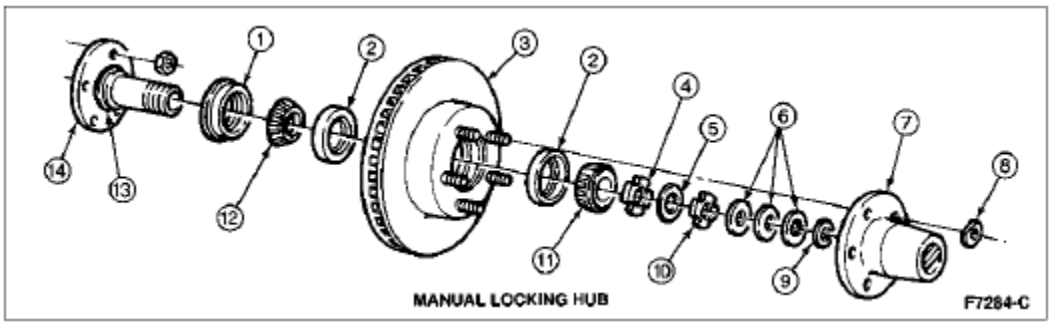
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Hub Locknut Wrench Prong	T83T-1197-B
Hex Locknut Wrench	T70T-4252-B

Manual Locking Hubs, Ranger

1. Raise the vehicle and install safety stands.
2. Remove the lug nuts (1012) and wheel and tire assembly. Refer to Section 04-04 in the Body, Chassis Manual.
3. Remove the retainer washers from the wheel hub bolt nut studs and the manual locking hub assembly from the front wheel spindle (3105).
4. Remove the snap ring from the end of the shaft of the front wheel spindle.

Manual Locking Hub, Exploded View, Ranger

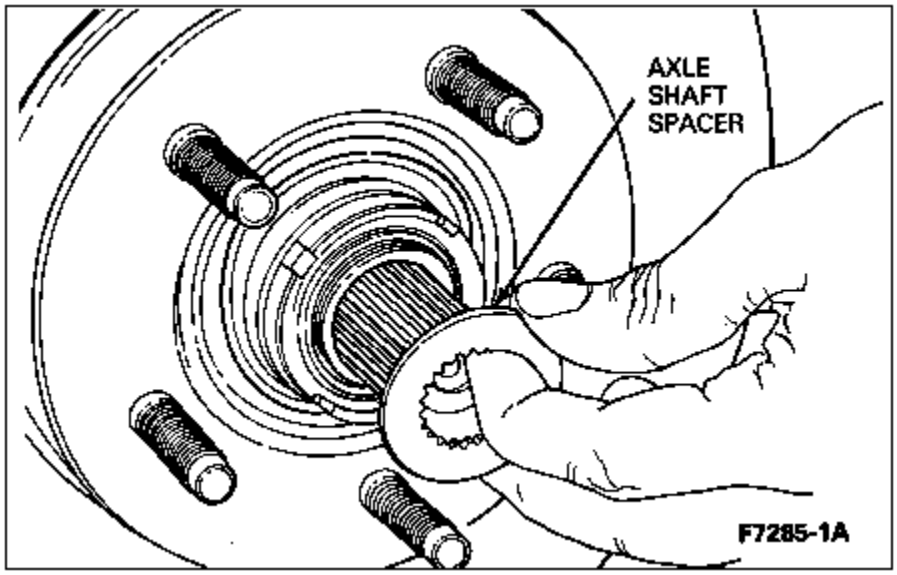


Item	Part Number	Description
1	1175B	Wheel Hub Grease Seal
2	4222	Wheel Bearing Cup
3	1102	Rotor
4	1197	Inner Locknut
5	3B549	Washer

tomsn048@gmail.com

6	3B548	Axle Shaft Spacer
7	3B396	Hub
8	1A107	Retainer Washer
9	3B457	Snap Ring
10	1197	Outer Locknut
11	4221	Wheel Bearing (Outer)
12	4221	Wheel Bearing (Inner)
13	1175A	Excluder Seal
14	3105	Front Wheel Spindle

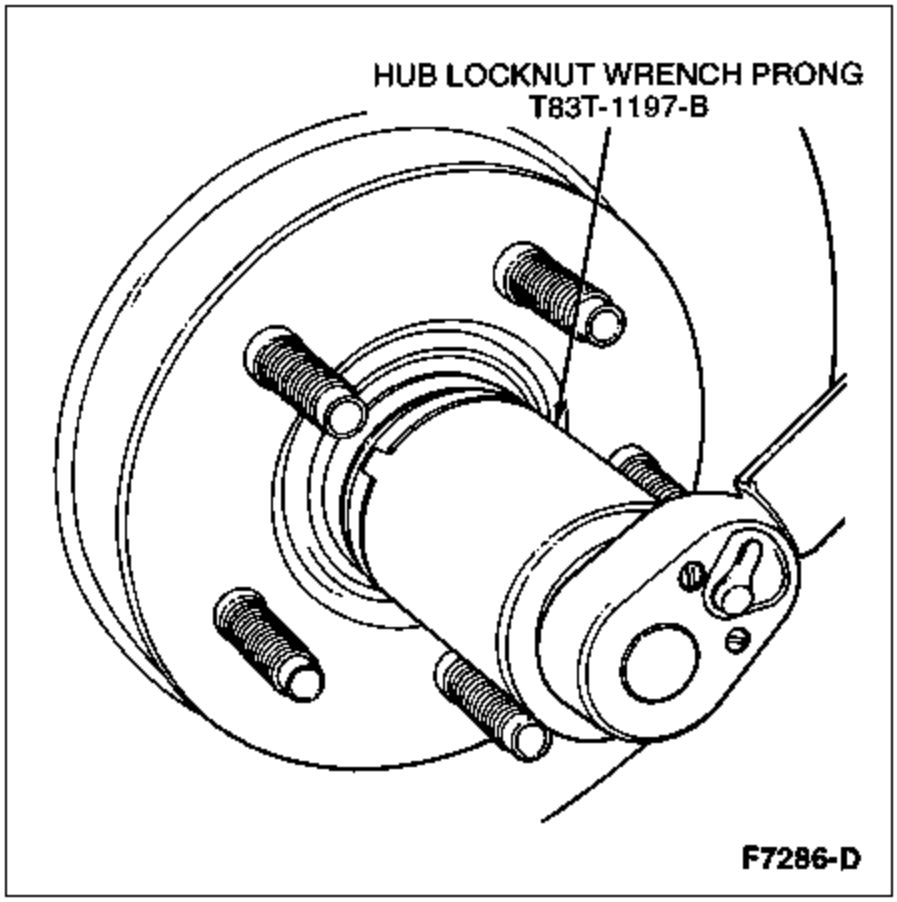
5. Remove the axle shaft spacers.



6. Remove the outer wheel bearing locknut from the front wheel spindlej using Hub Locknut Wrench Prong T83T-1197-B. Engage tool tabs into locknut slots.

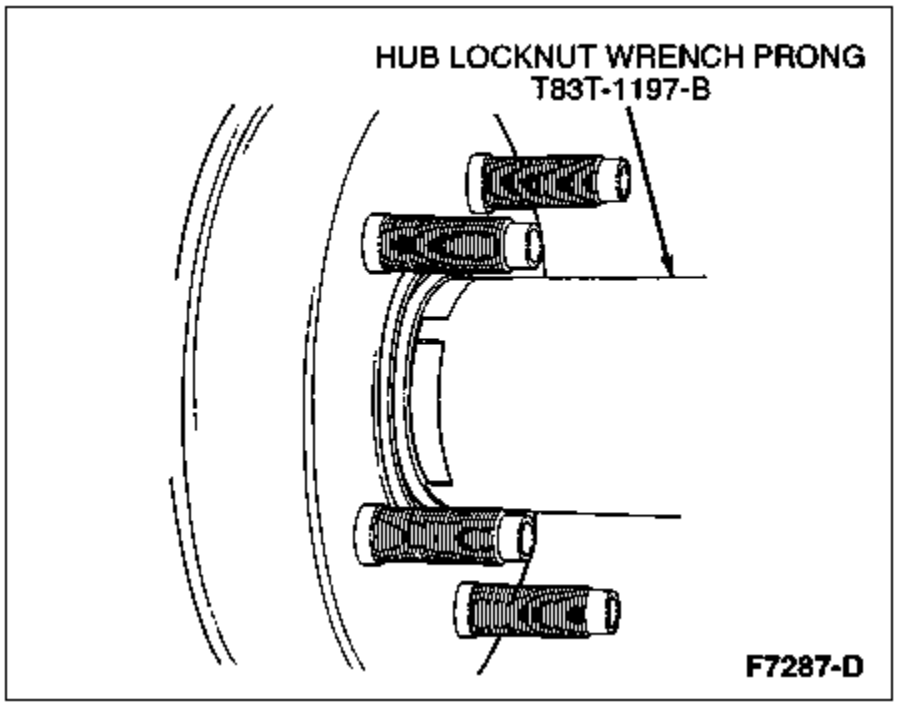
7. Remove locknut washer from front wheel spindle.

tomsn048@gmail.com



8. Loosen the inner wheel bearing locknut. Engage tool tab in locknut slots. Make sure tool is centered over the locknut pin.

tomsn048@gmail.com



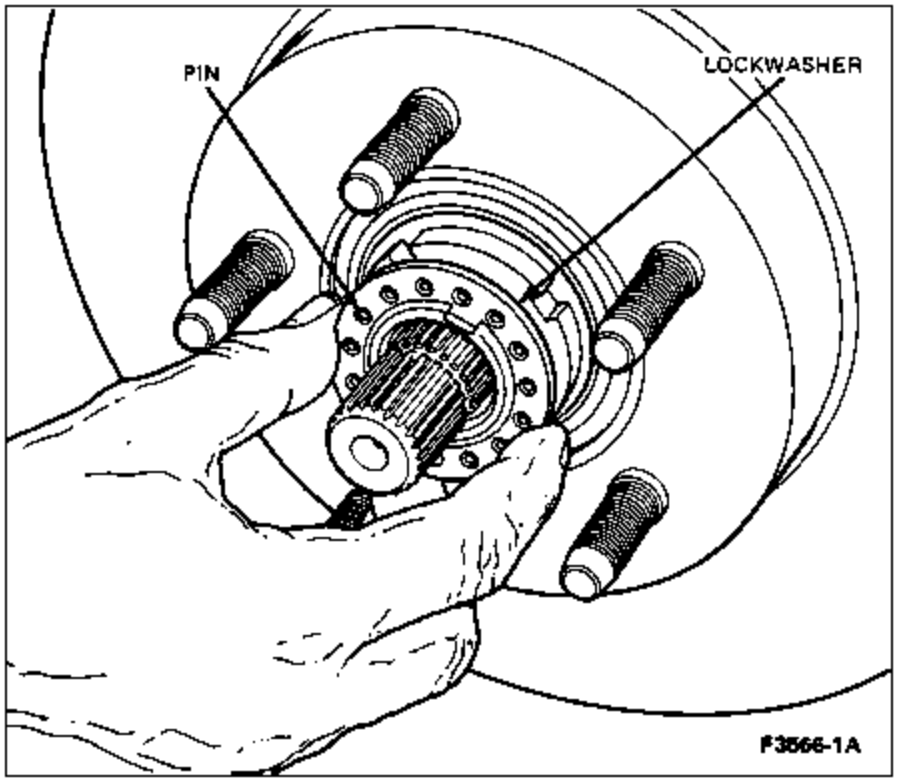
9. Tighten the inner locknut to 47 Nm (35 lb-ft) while turning the rotor in the opposite direction to seat wheel bearings.

10. **NOTE: If necessary, tighten inner locknut slightly to align the locknut pin with lockwasher hole.**

    Spin the rotor and back off the inner locknut one-quarter turn. Retighten the inner locknut to 1.8 Nm (16 lb-in).

11. Install the lockwasher on the front wheel spindle.

tomsn048@gmail.com



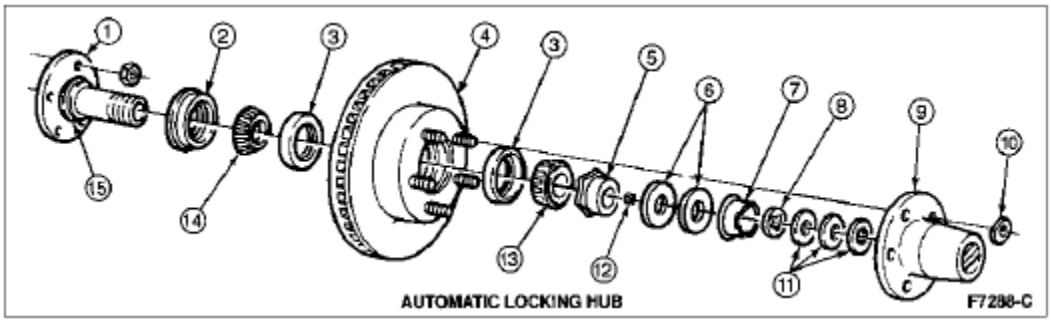
12. Install the outer wheel bearing locknut using locknut wrench. Tighten locknut to 203 Nm (150 lb-ft).
13. Check the end play of the wheel and tire assembly on the front wheel spindle. Final end play should be 0.00-0.08mm (0.000-0.003 inch). The maximum torque to rotate the hub is 2.8 Nm (25 lb-in).
14. Install the axle shaft spacer.
15. Clip the snap ring onto the end of the shaft of the front wheel spindle.
16. Install the manual hub assembly over the front wheel spindle. Install the retainer washers.
17. Install the wheel and tire assembly. Install and tighten lug nuts to 135 Nm (100 lb-ft).

Automatic Locking Hubs, Ranger

1. Raise the vehicle and install safety stands.
2. Remove the lug nuts and the wheel and tire assembly. Refer to Section 04-04 .
3. Remove the retainer washers from the wheel hub bolt nut studs. Remove the automatic locking hub assembly from the front wheel spindle.

Automatic Locking Hub, Ranger

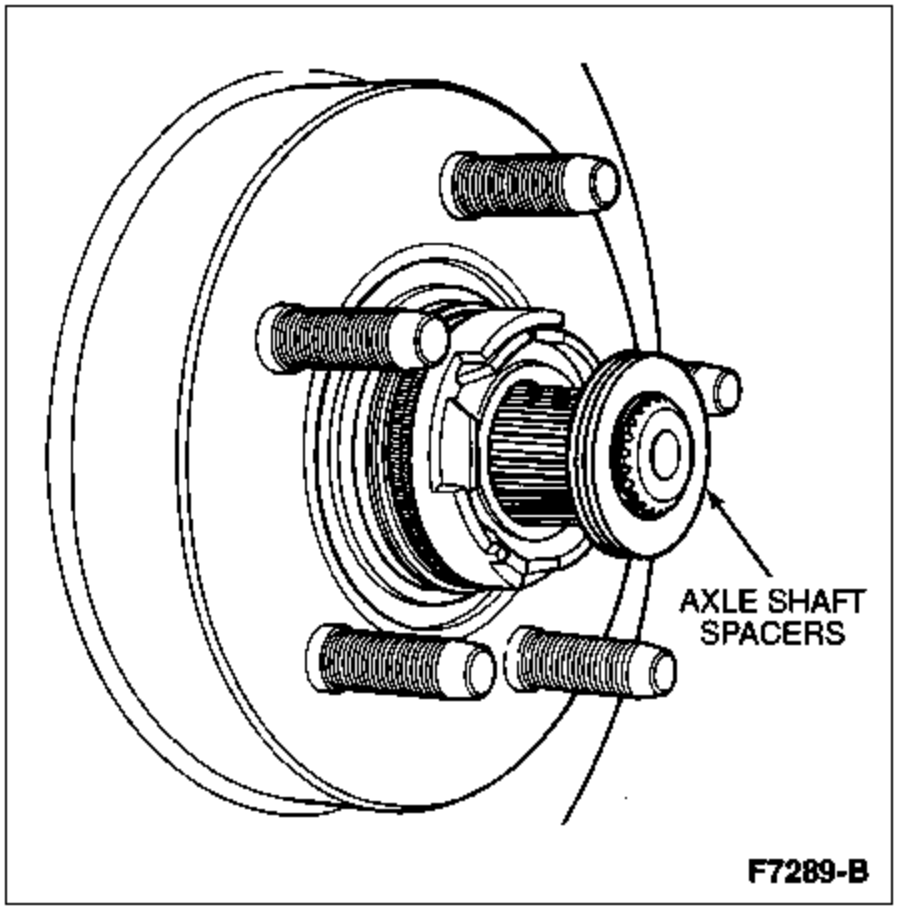
tomsn048@gmail.com



Item	Part Number	Description
1	3105	Front Wheel Spindle
2	1175B	Wheel Hub Grease Seal
3	4222	Wheel Bearing Cup
4	1102	Rotor
5	3N105	Wheel Bearing Adjusting Nut
6	3N105	Thrust Spacers
7	3B477	Front Axle Wheel Hub Retainer
8	3B458	Axle Shaft Spacer
9	3B396	Hub
10	1A107	Retaining Washer
11	3B548	Axle Shaft Spacers
12	3B549	Single Hump Locking Key
13	4221	Wheel Bearing (Outer)
14	4221	Wheel Bearing (Inner)
15	1175A	Excluder Seal

4. Remove the snap ring from the end of the shaft of the front wheel spindle.
5. Remove the axle shaft spacer.

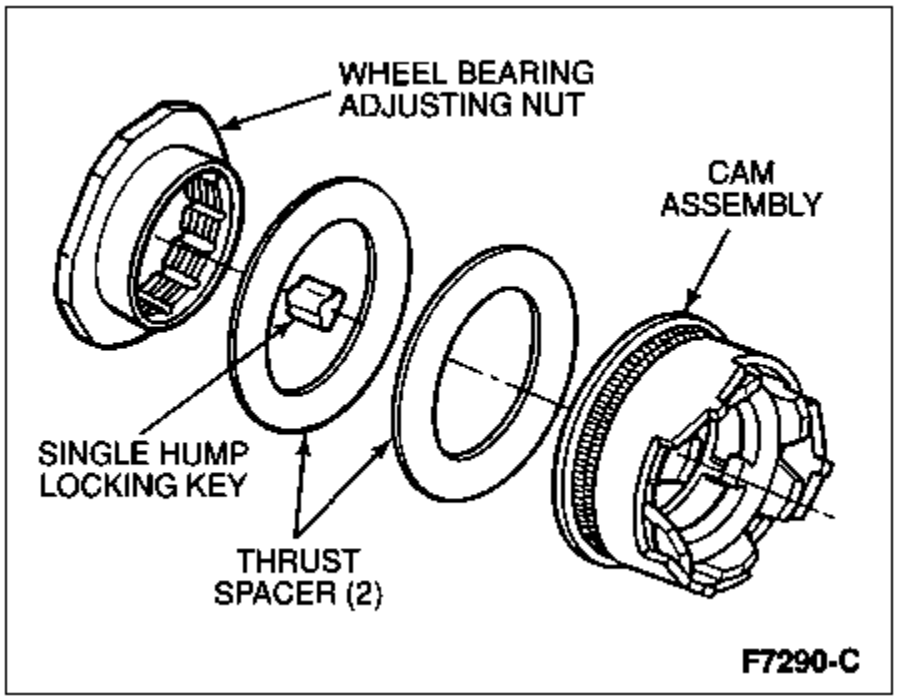
tomsn048@gmail.com



6. **CAUTION: Do not pry on the cam or thrust spacers during removal. Prying may damage the cam or spacers.**

   Pull cam assembly off the wheel bearing adjusting nut and remove the two metal thrust spacers from the adjusting nut.

tomsn048@gmail.com



7. **CAUTION: To prevent damage to the threads of the front wheel spindle, look into the keyway of the front wheel spindle under the adjusting nut and remove the separate locking key before removing the adjusting nut.**

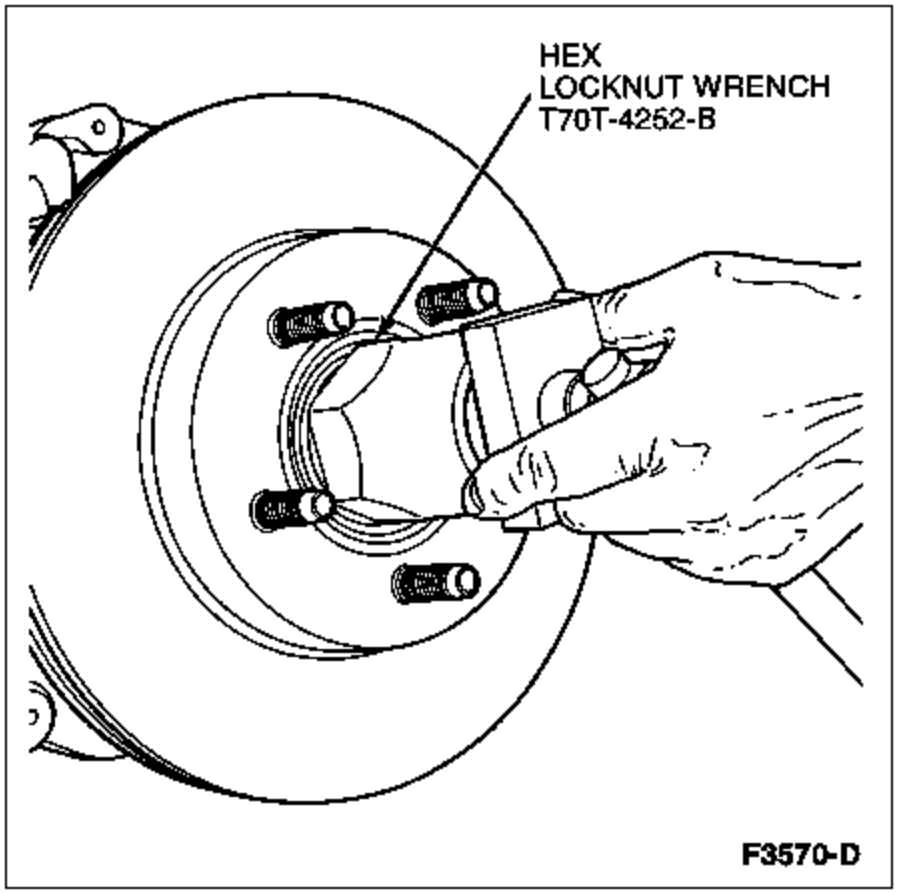
   NOTE: If required, rotate the adjusting nut slightly to relieve pressure against the locking key, before the key can be removed.

   Using a magnet, remove the locking key.

8. Loosen the wheel bearing adjusting nut from the front wheel spindle using a Hex Locknut Wrench T70T-4252-B.

9. While rotating the hub and rotor assembly, tighten the wheel bearing adjusting nut to 47 Nm (35 lb-ft) to seat the wheel bearings. Spin the rotor and back off the nut one-quarter turn (90 degrees).

tomsn048@gmail.com



10. Retighten the adjusting nut to 1.8 Nm (16 lb-in) using a torque wrench.

11. Make sure the final end play of the wheel on the front wheel spindle is 0.00-0.08mm (0.000-0.003 inch). The maximum torque to rotate the hub is 2.8 Nm (25 lb-in).

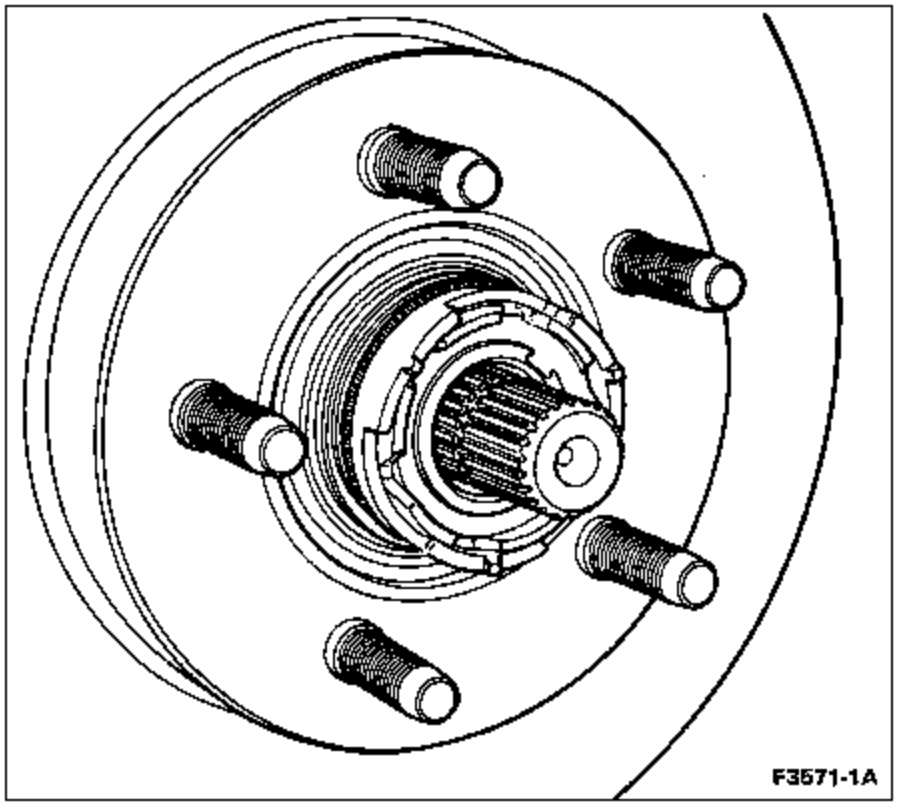
12. **WARNING: EXTREME CARE MUST BE TAKEN WHEN ALIGNING THE NUT OF THE FRONT WHEEL SPINDLE ADJUSTMENT LUG WITH THE CENTER OF THE KEYWAY SLOT OF THE FRONT WHEEL SPINDLE TO PREVENT DAMAGE TO THE SEPARATE LOCKING KEY. THE WHEEL AND TIRE ASSEMBLY MAY COME OFF WHILE THE VEHICLE IS IN MOTION IF THE KEY IS DAMAGED.**

    Align the closest lug in the wheel bearing adjustment nut with the center of the keyway slot of the front wheel spindle. Advance the nut to the next lug if required. Install the separate locking key in the keyway of the front wheel spindle under the adjusting nut.

13. **CAUTION: Extreme care must be taken when aligning the fixed cam key with the keyway of the front wheel spindle to prevent damage to the fixed cam.**

    Install the two thrust spacers and push or press the cam assembly onto the locknut by lining up the key in the fixed cam with the keyway of the front wheel spindle.

tomsn048@gmail.com

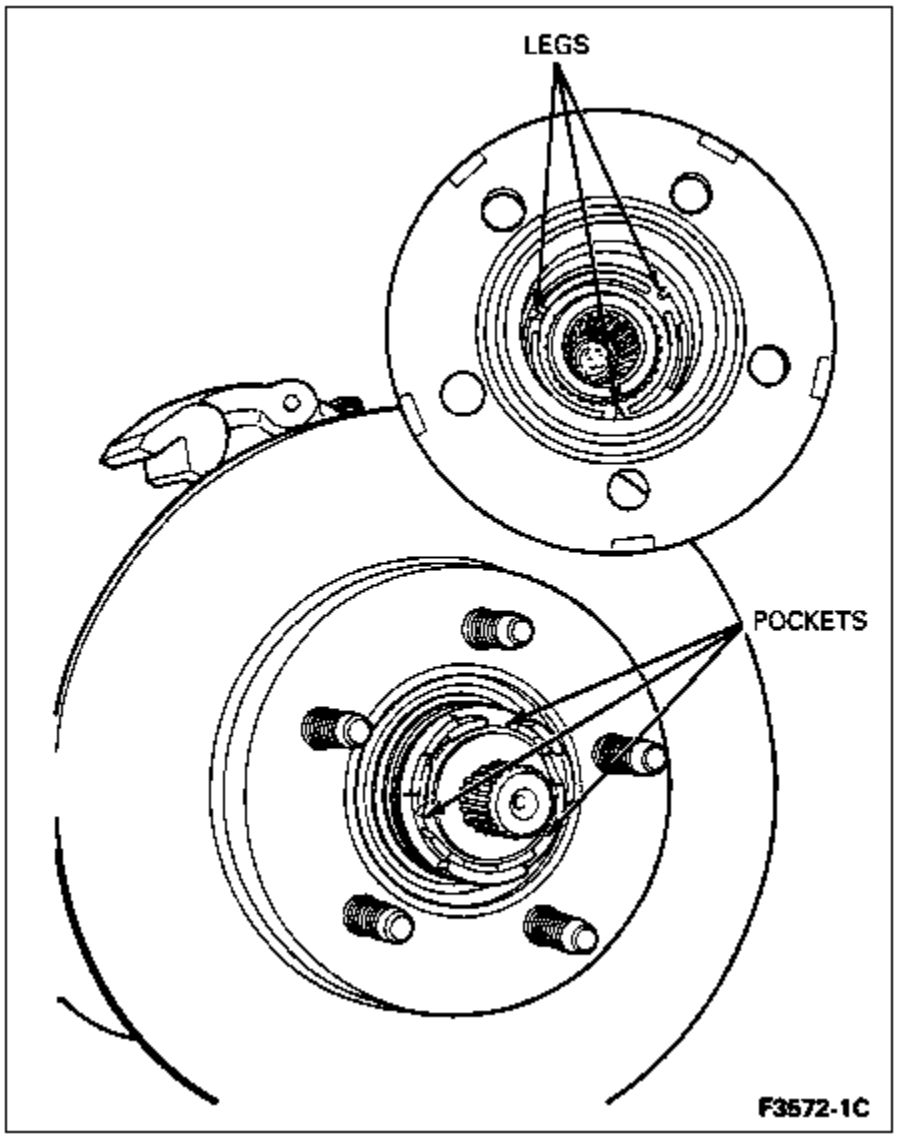


14. Install the axle shaft spacer.

15. Clip the snap ring onto the end of the shaft of the front wheel spindle.

16. Install the automatic locking hub assembly over the front wheel spindle. Align three hub assembly legs with three pockets in cam assembly. Install the retainer washers.

tomsn048@gmail.com



17. Install the wheel and tire assembly. Install and tighten lug nuts to 135 Nm (100 lb-ft).

tomsn048@gmail.com

tomsn048@gmail.com

Axle, Front Drive

Removal

1. From inside the engine compartment, disconnect sensor two-pin connector from wiring harness.
2. Separate sensor cable from brake hose clips.
3. Remove retaining bolt of the front brake anti-lock sensor (2C204) from front wheel spindle (3105) and slide front brake anti-lock sensor out of mounting hole.
4. Raise the vehicle on a hoist or jack. Place safety stands under the radius arm brackets.
5. **NOTE: Before removing the driveshaft from the front axle yoke, mark the yoke and driveshaft for reassembly, eliminating driveshaft imbalance.**

   Remove the driveshaft from the front axle yoke. Refer to Section 05-01 .
6. **NOTE: Do not let the front disc brake caliper (2B121) hang by the brake lines. Support the front disc brake caliper on a frame rail and tie it in place with a piece of wire.**

   Remove the wheels (1007) and tires.
7. Remove the cotter pin and nut retaining the steering linkage to the knuckle. Disconnect the linkage from the knuckle and position it out of the way.
8. Remove the front stabilizer bar (5482) and front stabilizer bar links (5K483). Refer to Section 04-01B .
9. Position a jack under the axle arm assembly and slightly compress the front coil spring (5310). Remove the nut which retains the lower portion of the front coil spring to the axle arm.
10. Slowly lower the jack, and remove the front coil spring, spacer and seat.
11. Remove the nut and disconnect the shock absorber from the radius arm bracket.
12. Remove the radius arm bracket and radius arm stud and bolts to the axle arm.
13. Remove the bracket and radius arm.
14. Remove the pivot bolt securing the right axle arm to the front crossmember (5019). Remove the front wheel driveshaft joint boot clamps (3B478) securing the axle shaft boot to the axle shaft slip-yoke and axle shaft.
15. Disconnect the outer axle shaft from the slip-yoke.
16. Lower the jack and remove the right axle arm.
17. Position another jack under the differential housing. Remove bolt connecting the left axle arm to front

tomsn048@gmail.com

crossmember.

18. Lower jacks and remove left axle arm.

F	—	Tighten to 163-203 Nm (120-150 Lb-Ft)
G	—	Tighten to 57-97 Nm (42-72 Lb-Ft)
H	—	Tighten to 7-10 Nm (62-89 Lb-In)
J	—	Tighten to 37-50 Nm (27-37 Lb-Ft)
K	—	Tighten to 258-311 Nm (190-229 Lb-Ft)

Installation

1. **NOTE: Do not yet remove the jack from under the differential housing.**

   With the vehicle on a hoist or jacked up, position a jack under the left support arm assembly. Raise the support arm until the arm is in position in the left pivot bracket. Install the nut and bolt and tighten to 163-203 Nm (120-150 lb-ft).

2. Place new front wheel driveshaft joint boot clamps for the axle shaft boot on the axle shaft assembly.

3. **NOTE: When installing the outer axle shaft into the inner slip-yoke, the yoke ears must be in alignment with each other to ensure proper phasing.**

   Position the right support arm on a jack and raise the right support arm so the right outer axle shaft slides onto the slip-yoke and the support arm is in position in the right pivot bracket. Install the nut and bolt and tighten to 163-203 Nm (120-150 lb-ft).

4. **NOTE: Do not remove the jack from the right support arm at this time.**

   Position the radius arm and front bracket on the support arms.

5. Install a new support arm stud on the top of the axle and radius arm assembly and tighten to 258-311 Nm (190-229 lb-ft).

6. Install the radius arm and front bracket bolts and tighten to 37-50 Nm (27-37 lb-ft).

7. Install the seat, spacer retainer and front coil spring on the stud. Raise the jack to compress the front coil spring. Install the nut and tighten to 95-135 Nm (70-100 lb-ft).

tomsn048@gmail.com

8. Connect the shock absorber to the radius arm. Install nut and tighten to 57-97 Nm (42-72 lb-ft).
9. Connect the tie rod ball joint to the knuckle. Install nut and tighten to 68-101 Nm (50-75 lb-ft).
10. Lower the jacks from the support arms.
11. Install the front stabilizer bar. Refer to Section 04-01B .
12. Install the front disc brake caliper as described in Section 06-03 .
13. Install the wheels. Tighten the lug nuts to 115-155 Nm (85-115 lb-ft).
14. **NOTE: Reassemble the yoke and driveshaft to the marks made during disassembly.**

    Connect the front drive shaft to the front axle yoke. Install U-bolts and tighten the front driveshaft U-bolt nuts to 11-20 Nm (8-15 lb-ft).
15. Remove the jacks and lower the vehicle.
16. From inside the engine compartment, slide front brake anti-lock sensor into mounting hole and install the bolt. Tighten the front brake anti-lock sensor bolt to 5-6 Nm (44-53 lb-in).
17. Install sensor cable inside brake hose clips.
18. Connect sensor two-pin connector into wiring harness.

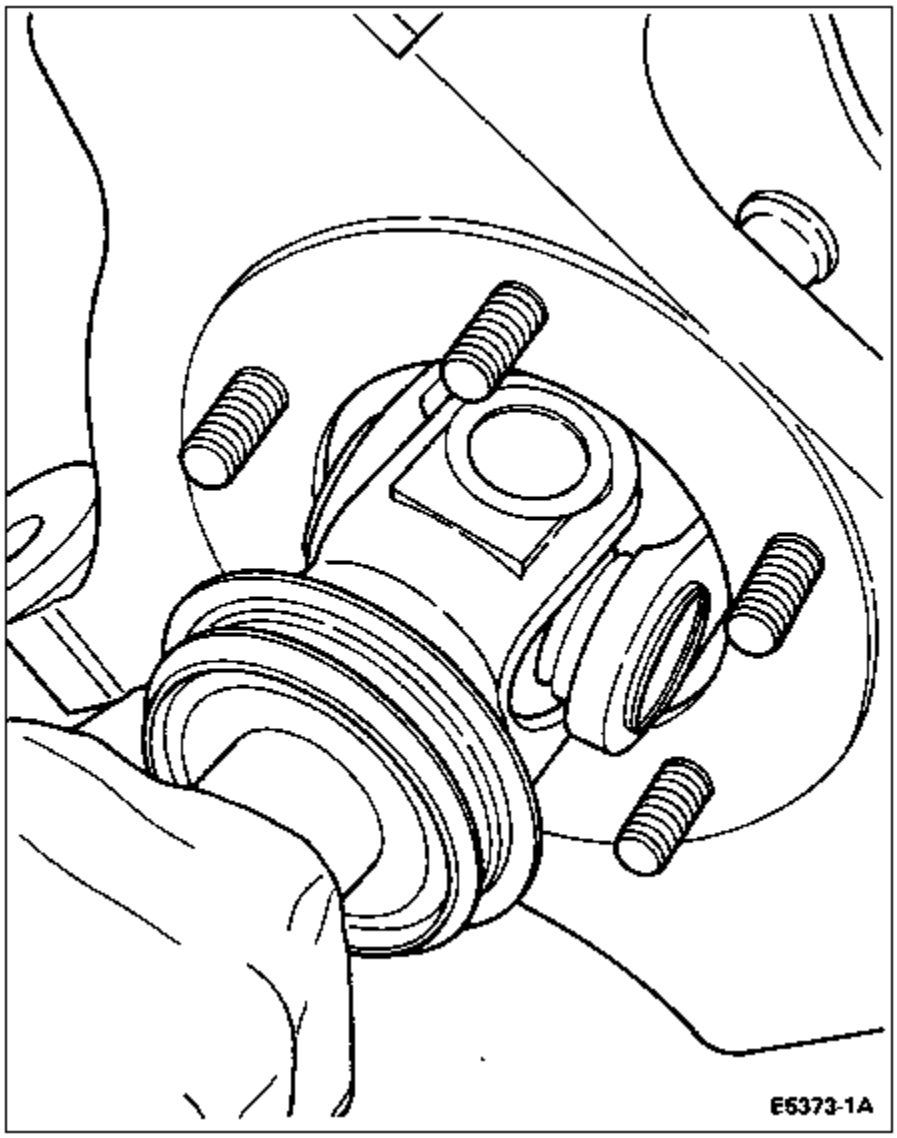
6. Remove the nuts retaining the front wheel spindle (3105) to the steering knuckle. Tap the spindle with a plastic or rawhide hammer to jar the spindle from the knuckle.

7. Remove the front disc brake rotor shield (2K004).

8. On the left side of the vehicle remove the shaft and joint by pulling the assembly out of the carrier.

tomsn048@gmail.com

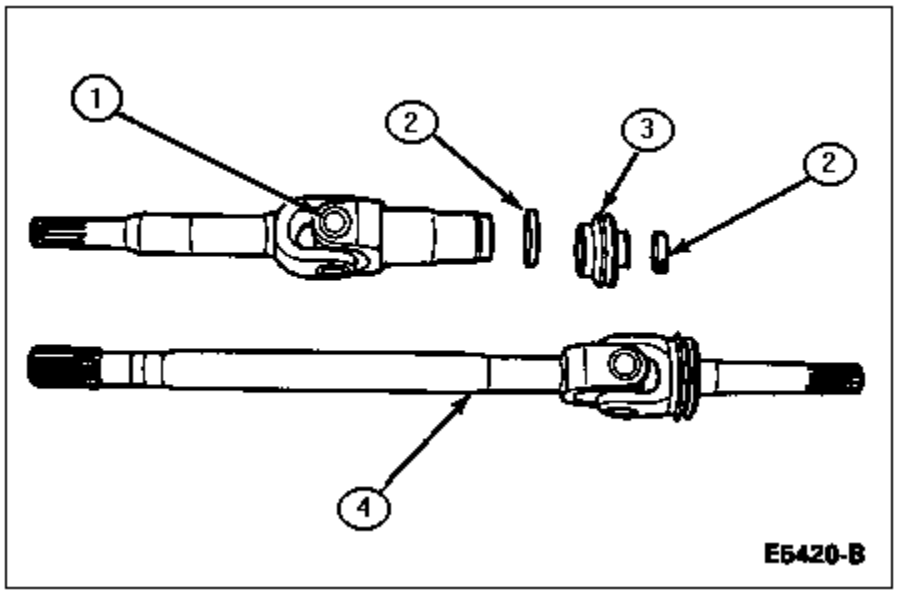


9. On the right side of the carrier, remove and discard the front wheel driveshaft joint boot clamp (3B478) from the outer shaft and joint assembly.

10. **NOTE: Stub shaft will remain engaged to carrier. For stub shaft removal, refer to Removal and Installation, Slip-Yoke, RH and Stub Shaft Assembly, Carrier, Carrier Oil Seal and Bearing in this section.**

    Pull the shaft and joint from the splines of the stub shaft.

tomsn048@gmail.com



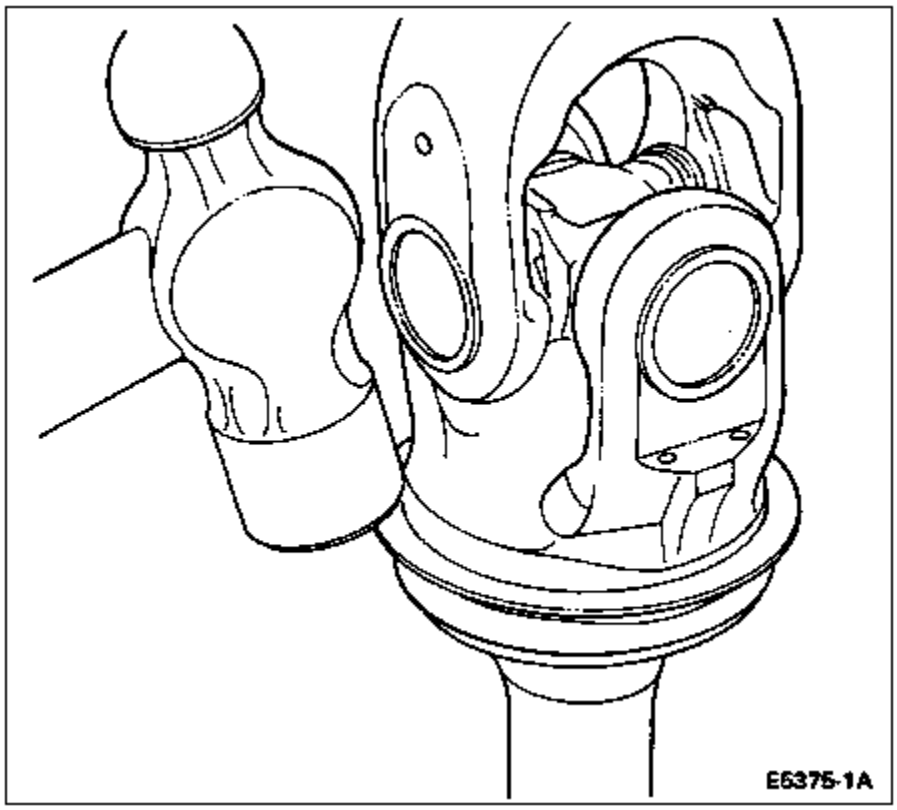
Item	Part Number	Description
1	3L387	Axle Shaft Slip Yoke
2	3B478	Front Wheel Driveshaft Joint Boot Clamp
3	3A429	Rubber Boot
4	3220	Shaft and Joint

11. Place the front wheel spindle in a vise on the second step of the spindle. Wrap a shop towel around the spindle or use a brass-jawed vise to protect the spindle.

12. Remove the wheel hub grease seal and needle bearing from the front wheel spindle with an impact slide hammer and a suitable seal puller.

13. If required, remove the slinger from the shaft, by driving off with a hammer.

tomsn048@gmail.com

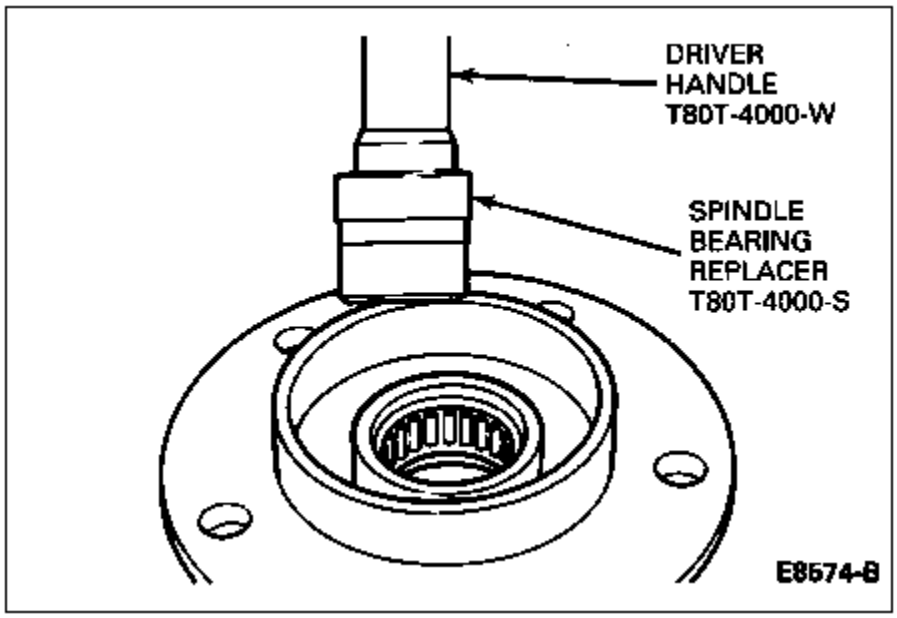


Installation

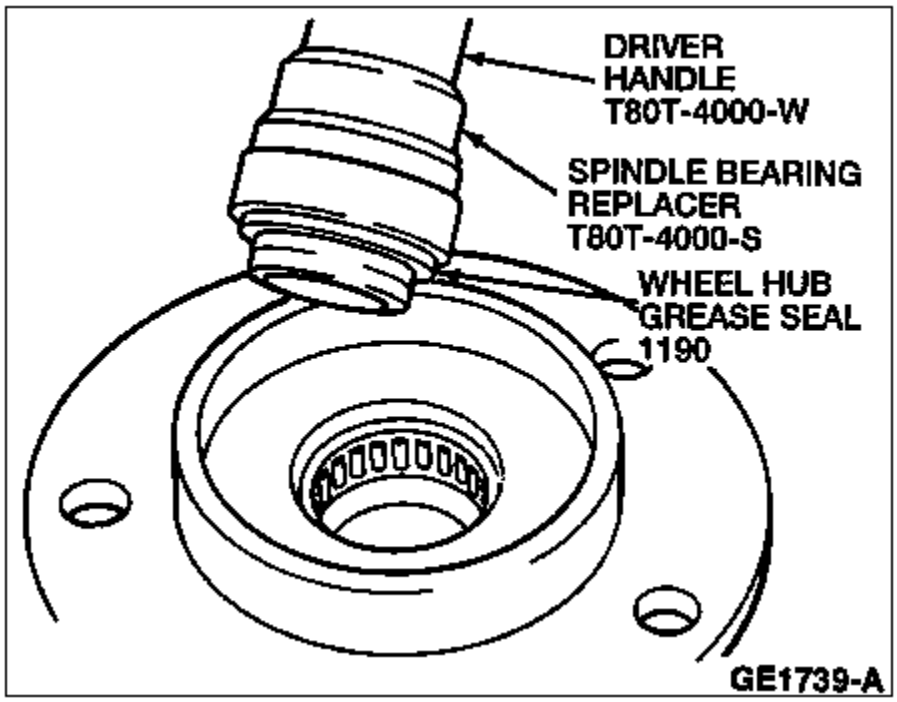
1. Clean all dirt and grease from the bearing bore of the front wheel spindle. Bearing bores must be free from nicks and burrs.

2. Place the spindle needle bearing in the bore with the manufacturer's identification facing outward. Drive the spindle needle bearing into the bore using Spindle Bearing Replacer T80T-4000-S and Driver Handle T80T-4000-W.

tomsn048@gmail.com

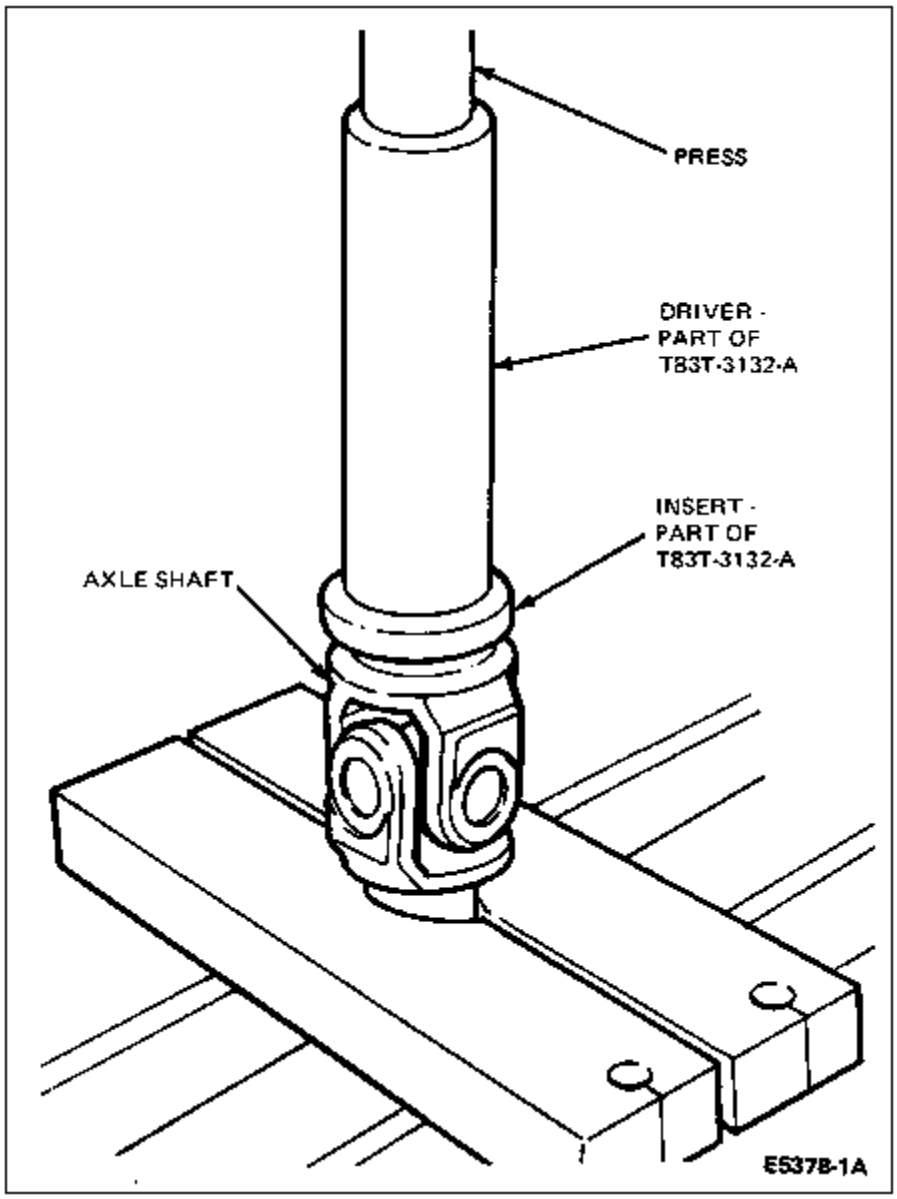


3. Install the wheel hub grease seal (1190) in the bearing bore with the lip side of the seal facing towards the tool. Drive the seal in the bore with Spindle Bearing Replacer T80T-4000-S and Driver Handle T80T-4000-W. Coat the bearing seal lip with High Temperature Lubricant E8TZ-19590-A or equivalent meeting Ford specification ESA-M1C198-A.



4. If removed, install a new shaft slinger. Place the axle shaft in a press, and install the slinger with Spindle/Axle Seal Installer T83T-3132-A.

tomsn048@gmail.com



5. On the right side of the carrier, install the rubber boot and new front wheel driveshaft joint boot clamps on the stub shaft slip-yoke.

6. **NOTE: The Model 35 axle does not have a blind spline. Therefore, special attention should be made to make sure the yoke ears are in line (in phase) during assembly.**

   Slide the right shaft and joint into the slip-yoke. Engage splines fully.

7. Slide the boot over the assembly and crimp the front wheel driveshaft joint boot clamp using Keystone Clamp Pliers T63P-9171-A.

8. On the left side of the carrier, slide the shaft and joint through the knuckle and engage the splines on the shaft in the carrier.

9. Install the front disc brake rotor shield (2K005) and front wheel spindle onto the steering knuckle. Install and tighten the spindle nuts to 54-68 Nm (40-50 lb-ft).

tomsn048@gmail.com

10. Install the rotor on the front wheel spindle. Install the outer differential bearing into differential bearing cup (4222).

11. Install the wheel bearing, locknut, thrust bearing, snap ring, and locking hubs. Refer to Section 05-03A for service procedures for either manual or automatic locking hubs.

---

tomsn048@gmail.com

Slip-Yoke, RH and Stub Shaft Assembly, Carrier, Carrier Oil Seal and Bearing

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Bench Mounted Holding Fixture	T57L-500-B
Spreader Adapters	T90T-4000-A
Seal Puller	T74P-77248-A
Axle Bearing Remover	T90T-1225-A
Axle Bearing and Seal Replacer	T90T-1175-A
Driver Handle	T80T-4000-W

Removal

1. **NOTE: Mark the axle companion flange and driveshaft to assure reassembly in the same location.**

   Remove the nuts and U-bolts connecting the driveshaft to the axle companion flange.

2. Disconnect the driveshaft from the axle companion flange. Wire the driveshaft out of the way.

3. Remove both front wheel spindles (3105) and the left and right shaft and U-joints; refer to the procedure in this section.

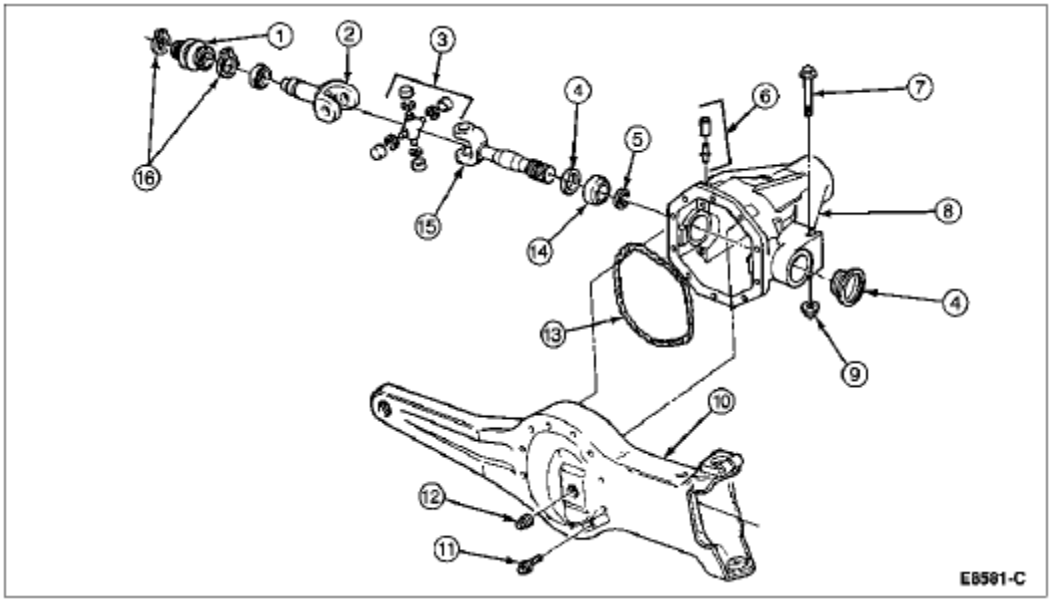
4. Support the carrier with a suitable jack and remove the bolts retaining the carrier housing to the support arm.

5. Separate the carrier from the support arm and drain the lubricant from the carrier housing.

6. Remove the carrier housing from the vehicle.

Carrier, Right Slip-Yoke and Stub Shaft Assembly

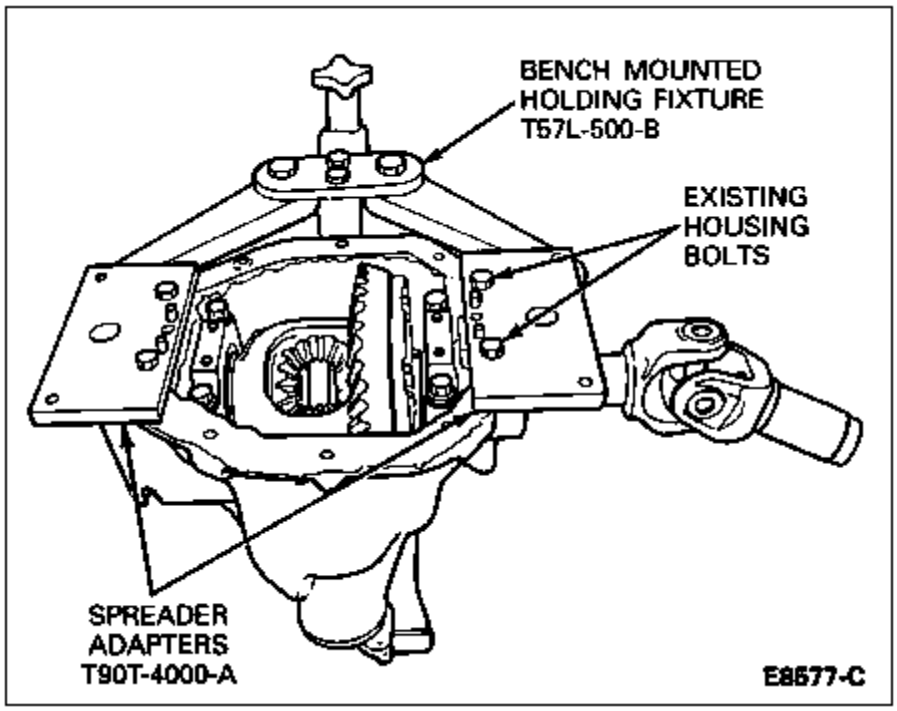
tomsn048@gmail.com



Item	Part Number	Description
1	3A429	Rubber Boot
2	3L387	Slip Yoke
3	3249	Front Axle Shaft Universal Joint
4	3254	Axle Shaft Oil Seal
5	3167	C-Clip
6	4022	Breather Vent
7	3E323	Pinch Bolt
8	3010	Carrier Housing
9	3E323	Pinch Bolt Nut
10	3B403	Left Axle Arm
11	3C323	Carrier to Axle Arm Bolt
12	358035	Fill Plug
13	D6AZ-19562-AA or -BA	RTV Sealant
14	3C123	Bearing
15	3N387	Stub Shaft
16	3B478	Front Wheel Driveshaft Joint Boot Clamp

7. Place the carrier in Bench Mounted Holding Fixture T57L-500-B with Spreader Adapters T90T-4000-A and suitable spacers.

tomsn048@gmail.com



8. Rotate the slip-yoke and shaft so the open side of the snap ring is exposed. Remove the snap ring from the shaft.

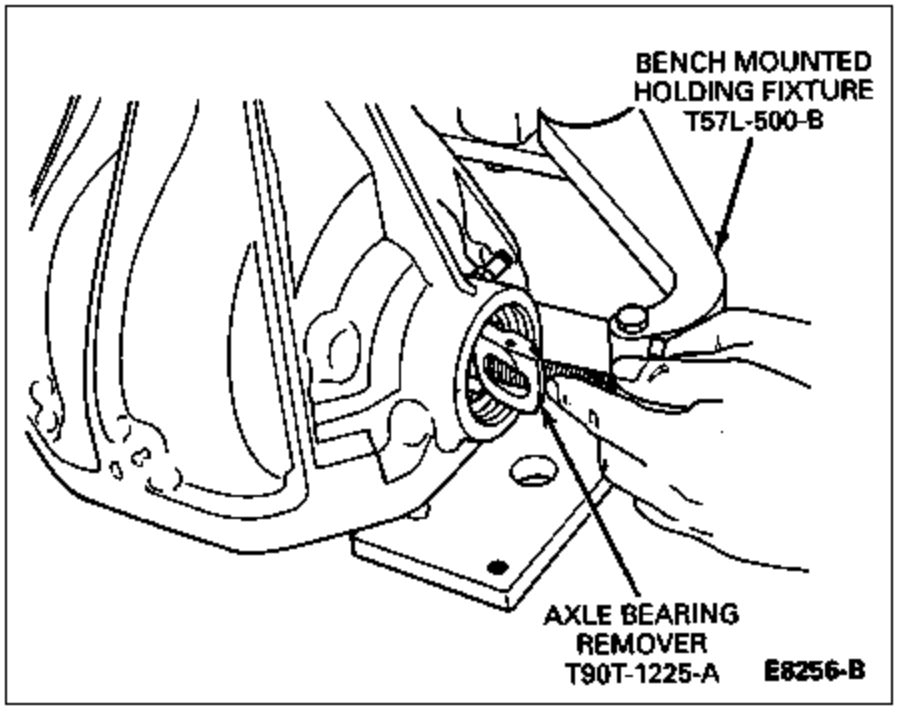
9. Remove the slip-yoke and shaft from the carrier.

10. Remove the right side axle shaft oil seal (3254) using Impact Slide Hammer T50T-100-A and a suitable seal remover.

11. Remove the left side axle shaft oil seal using an impact slide hammer and Axle Bearing Puller T90T-1225-A.

12. Remove both caged needle bearings using an impact slide hammer and Axle Bearing Remover T90T-1225-A.

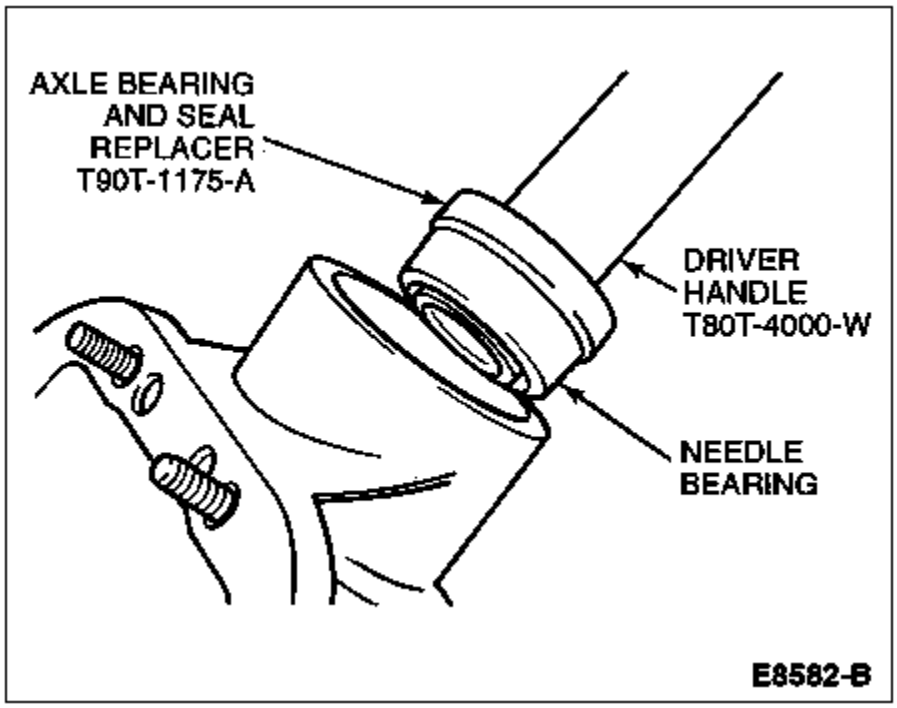
tomsn048@gmail.com



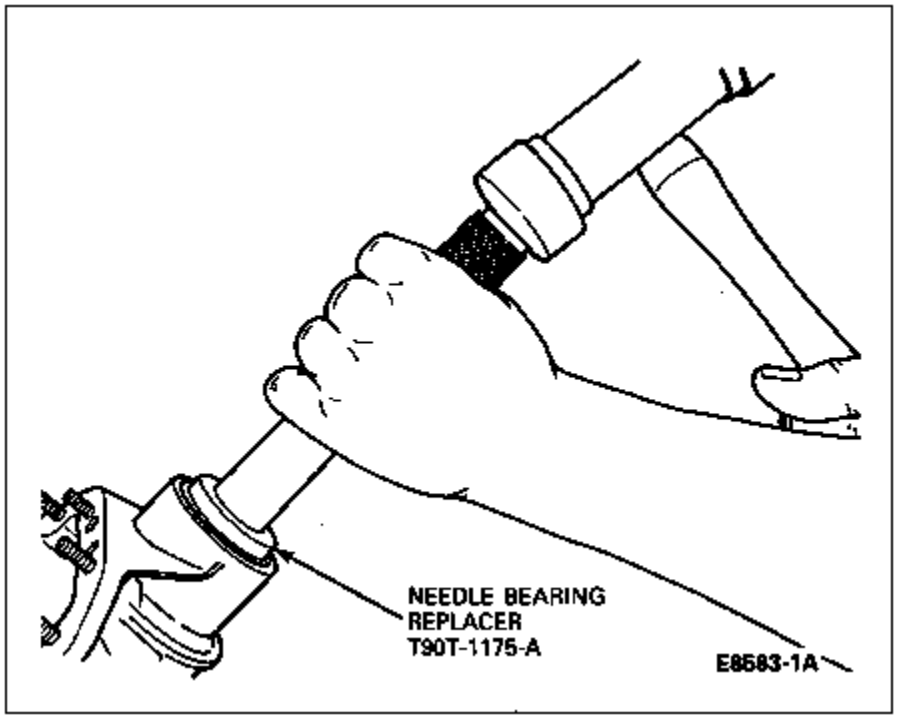
Installation

1. Inspect bearing bore for nicks and burrs.
2. Install a new caged needle bearing on Axle Bearing and Seal Replacer T90T-1175-A with the manufacturer name and part number facing outward towards the tool.
3. Using Driver Handle T80T-4000-W, drive the needle bearing until it is seated in the bore.

tomsn048@gmail.com



4. Coat the axle shaft oil seal with High Temperature 4x4 Front Axle and Wheel Bearing Grease E8TZ-19590-A or equivalent meeting Ford specification ESA-M1C198-A. Drive the seal into the carrier using Driver Handle T80T-4000-W and Axle Bearing and Seal Replacer T90T-1175-A.



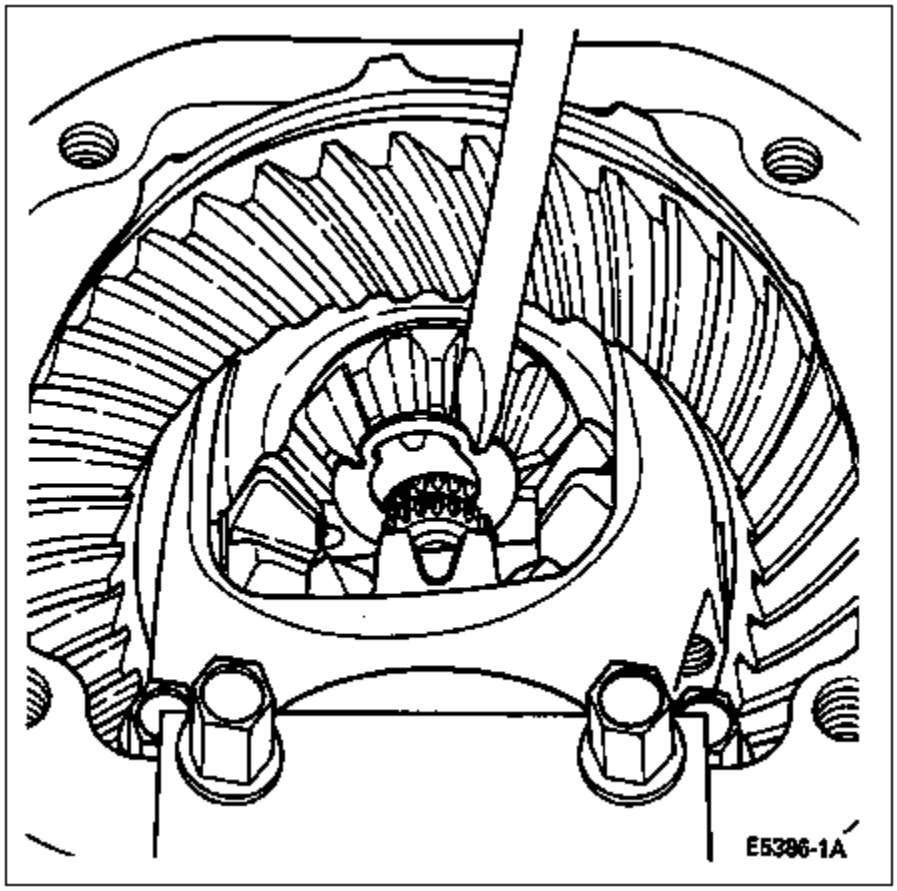
5. Install the slip-yoke and shaft into the carrier so the groove in the shaft is visible in the differential case.

tomsn048@gmail.com

6. **NOTE: Do not tap on the center of the snap ring. This may damage the snap ring.**

   Install snap ring into groove in the shaft. Force the snap ring into position with a screwdriver.

7. Remove the carrier from the holding fixture.



8. **NOTE: Clean all traces of gasket RTV sealant from the surfaces of the carrier and support arm and make sure the surfaces are free of dirt and oil.**

   Apply a bead of Silicone Rubber RTV sealant D6AZ 19562-AA (clear) or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A, in a bead between 6.35-9.53mm (1/4-3/8 inch) wide. The bead should be continuous and should not pass through or outside the holes.

9. **NOTE: The carrier must be installed on the support arm within five minutes after applying the RTV sealant.**

   Position the carrier on a suitable jack. Position carrier on the support arm using guide pins to align. Hand-tighten carrier to support arm attaching bolts. Tighten the carrier to support arm attaching bolts in a clockwise or counterclockwise pattern to 54-68 Nm (40-50 lb-ft).

10. Install the carrier shear bolt retaining the carrier to the axle arm and tighten to 102-129 Nm (75-95 lb-ft).

11. Install both front wheel spindles and the left and right shaft and joint; refer to the procedure in this

tomsn048@gmail.com

section.

12. Connect the driveshaft to the yoke. Install the nuts and U-bolts and tighten the front driveshaft U-bolt nuts to 11-20 Nm (8-15 lb-ft).

---

tomsn048@gmail.com

Steering Knuckle and Ball Joints

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Pitman Arm Puller	T64P-3590-F
U-Joint Tool	T74P-4635-C
4WD Ball Joint Set	T80T-3010-A
Axle Service Set	T83T-4000-A

Removal

1. **NOTE: Refer to Section 04-00 for caster and camber adjustment.**

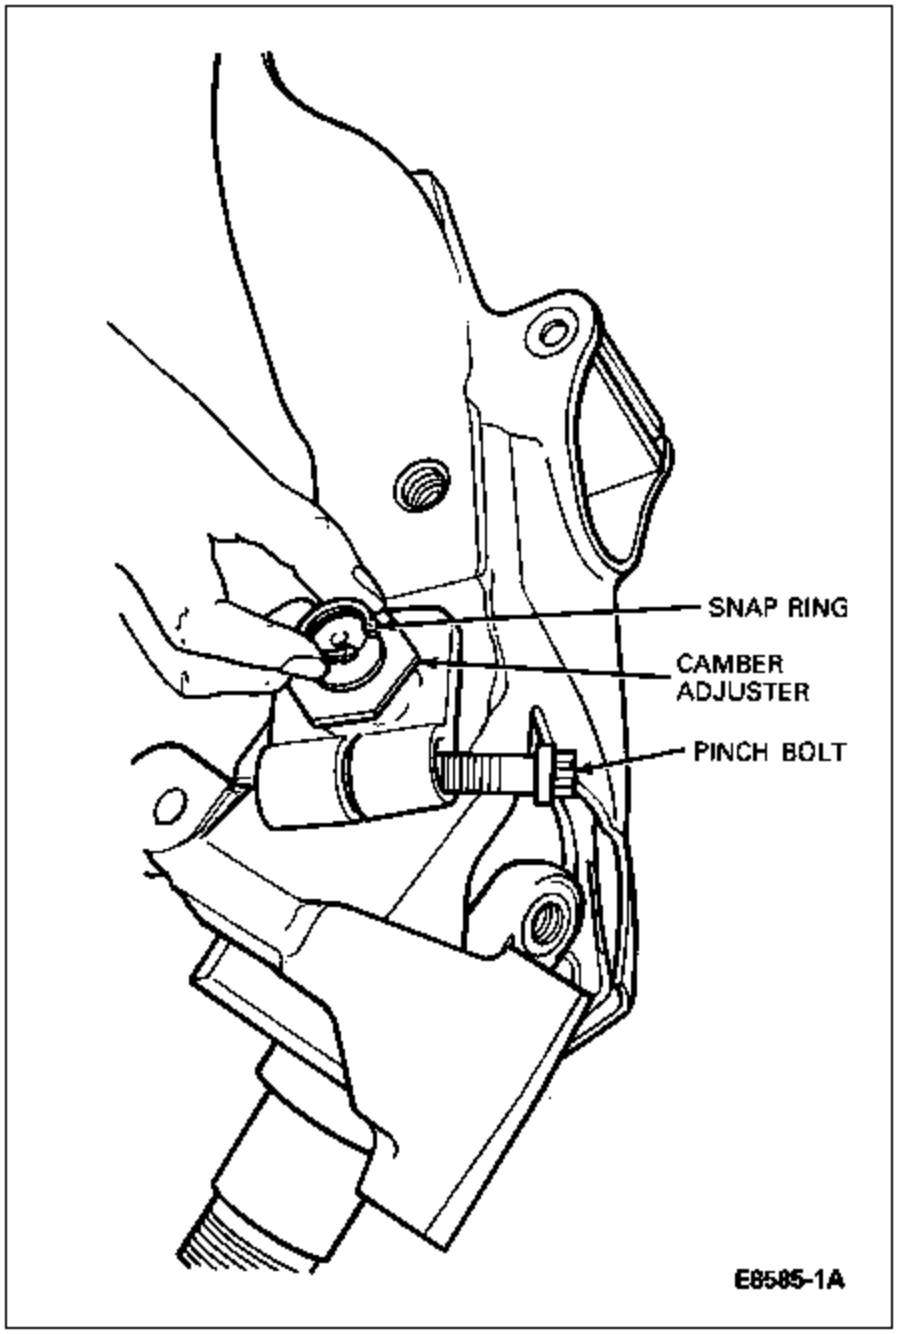
   Remove the front wheel spindle (3105) and shaft and joint; refer to the procedure in this section.

2. If the steering linkage has not been removed, remove cotter pin from the tie rod nut and remove the tie rod nut.

3. Tap on the tie rod stud to free it from the steering arm.

4. Remove the snap ring and the upper ball joint pinch bolt.

tomsn048@gmail.com



5. Loosen the lower ball joint nut to the end of the stud.

6. Strike the inside of the knuckle near the front suspension upper ball joint (3049) and front suspension lower arm ball joint (3050) to break the knuckle loose from the ball joint studs.

7. **NOTE: Mark the orientation of the slot in the camber adjuster. If necessary, scribe a line or mark the position with a grease pencil. The slot should be installed in the same position during reassembly to maintain alignment.**

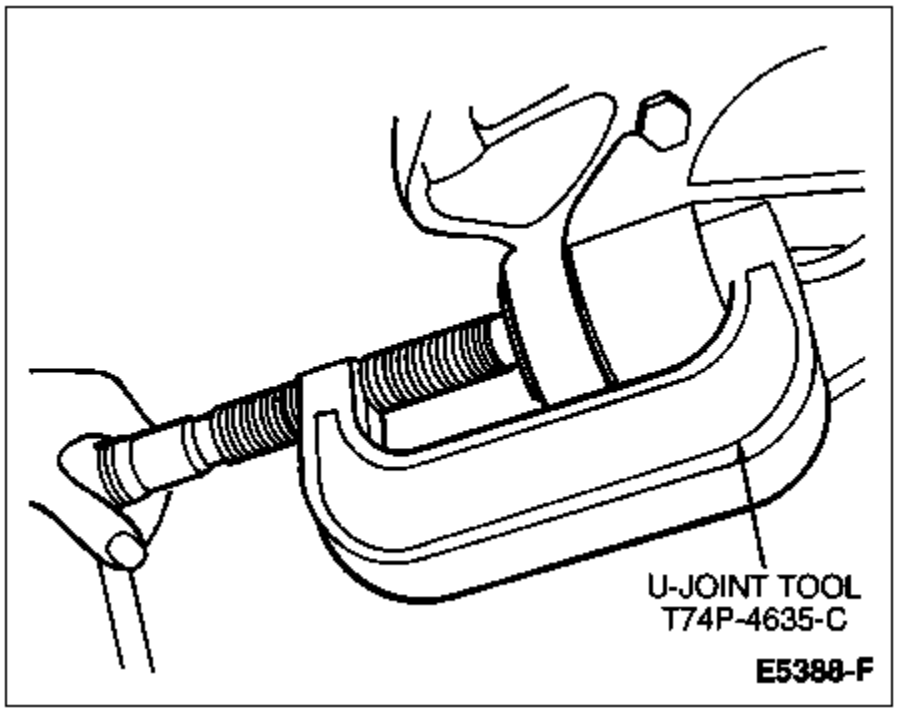
   Remove the camber adjuster sleeve. If required, use Pitman Arm Puller T64P-3590-F to remove the adjuster out of the knuckle.

8. Remove lower ball joint nut.

tomsn048@gmail.com

9. Place knuckle in vise and remove snap ring from bottom ball joint socket if so equipped.

10. Assemble U-Joint Tool T74P-4635-C and suitable ball joint remover on the front suspension lower arm ball joint.



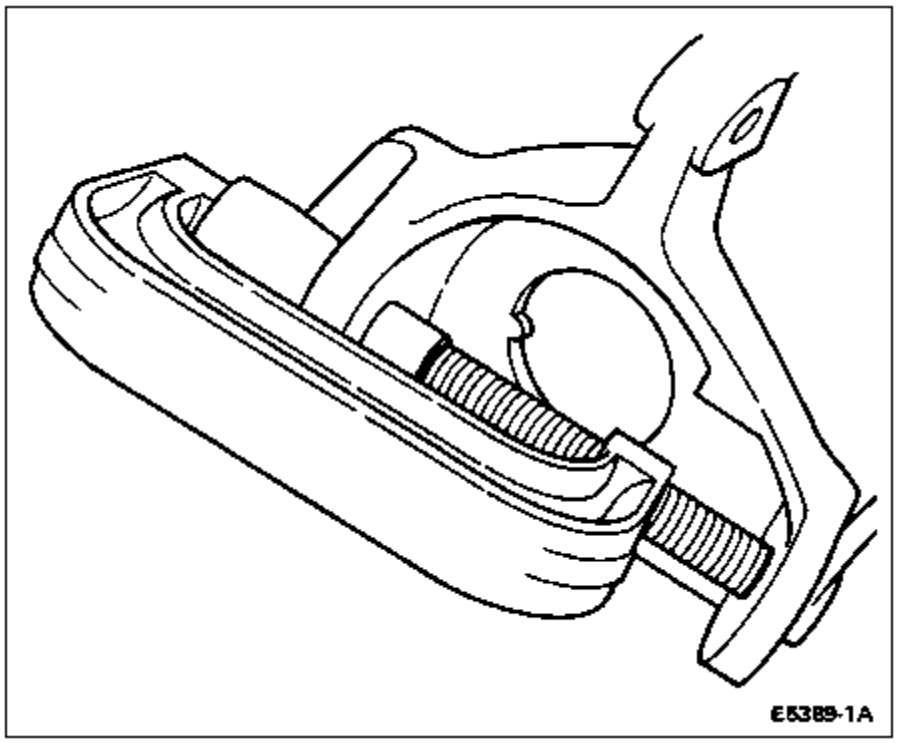
11. Turn forcing screw clockwise until the front suspension lower arm ball joint is removed from the steering knuckle.

12. **NOTE: Always remove front suspension lower arm ball joint first.**

    Assemble U-Joint Tool T74P-4635-C and suitable ball joint remover on the upper front suspension upper ball joint.

13. Turn forcing screw clockwise until the front suspension upper ball joint is removed from the knuckle.

tomsn048@gmail.com



Installation

1. **NOTE: The front suspension lower arm ball joint must always be installed first.**

   Clean the steering knuckle bore and insert front suspension lower arm ball joint in knuckle as straight as possible.

2. Assemble U-Joint Tool T74P-4635-C and Receiver Cup to install the front suspension lower arm ball joint.

3. Turn the forcing screw clockwise until the front suspension lower arm ball joint is firmly seated.

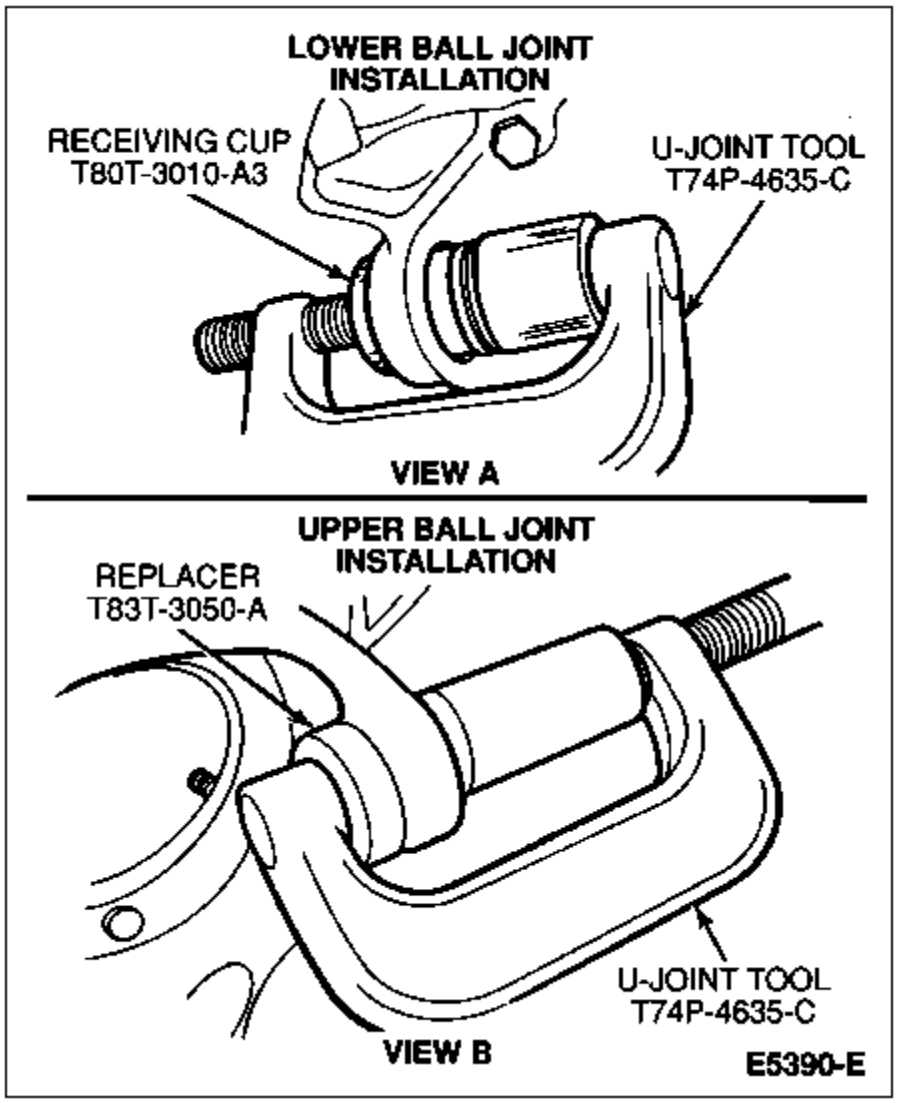
4. **NOTE: If the ball joint cannot be installed to the proper depth, realignment of the receiver cup and C-Frame tool will be necessary.**

   Install the snap ring on the front suspension lower arm ball joint.

5. To install the front suspension upper ball joint, install the U-Joint Tool T74P-4635-C and Replacer T80T-3010-A3 in the knuckle.

6. Turn the forcing screw clockwise until the ball joint is firmly seated.

tomsn048@gmail.com



7. Position the knuckle in the axle arm and install the camber adjuster into the support arm. Position the slot in the original position.

8. **NOTE: Nut on lower ball joint stud must be tightened before pinch bolt or binding of the steering system will result.**

   Install a new lower ball joint nut on the bottom ball joint stud. Tighten the lower ball joint nut to 129-149 Nm (95-110 lb-ft) minimum. Then tighten to align to the next slot in the lower ball joint nut with the hole in the stud. Install a new cotter pin.

9. Install the snap ring on the upper ball joint stud.

10. Install the upper ball joint pinch bolt and tighten to 88-115 Nm (65-85 lb-ft).

11. Connect the steering linkage to the steering arm. Install the steering linkage to steering arm nut and tighten to 70-100 Nm (52-74 lb-ft).

12. Install the front wheel spindle and shaft and arm assembly; refer to the procedure in this section.

tomsn048@gmail.com

tomsn048@gmail.com

Axle Pivot Bushing

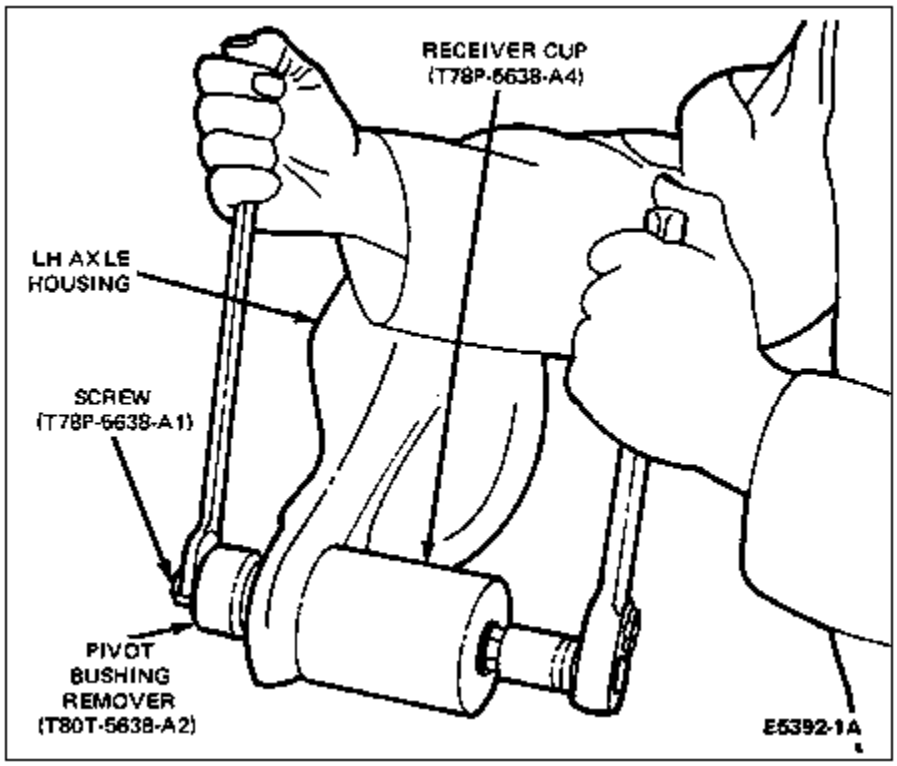
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Forcing Screw	T78P-5638-A1
Receiver Cup	T78P-5638-A4
Front Suspension Bushing Pivot Bushing Remover	T80T-5638-A T80T-5638-A2

Removal

1. Lower the axle housing after removing the axle pivot bolt and nut, loosening the radius arm bushing.

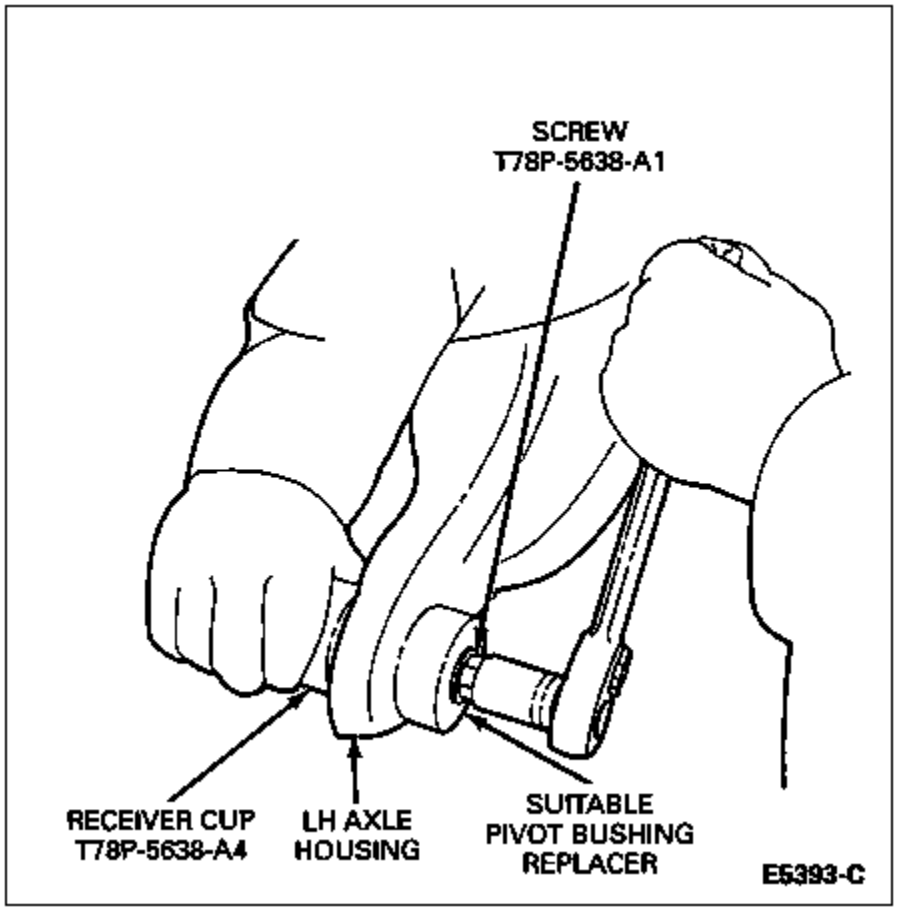
2. Install Forcing Screw T78P-5638-A1, Pivot Bushing Remover T80T-5638-A2 and Receiver Cup T78P-5638-A4 onto the pivot bushing. Turn the forcing screw and remove the pivot bushing.



Installation

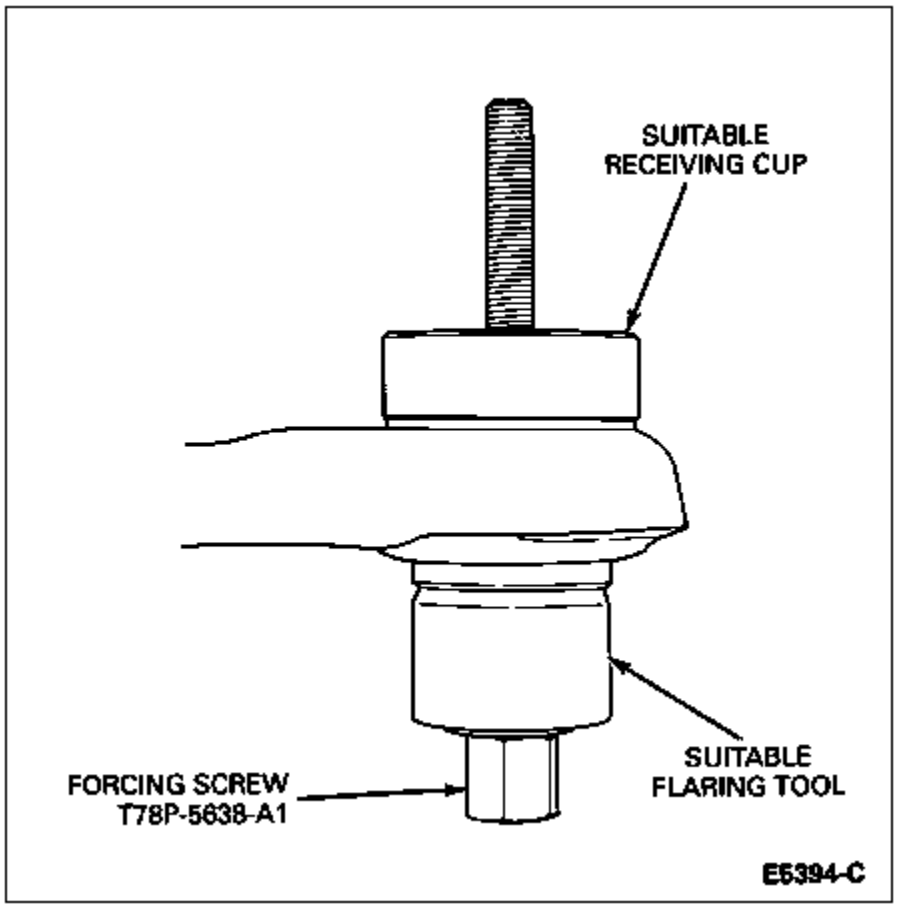
1. Place pivot bushing in axle housing. Install Receiver Cup T78P-5638-A4, Forcing Screw T78P-5638-A1 and Front Suspension Bushing Tool T80T-5638-A into housing and install bushing.

tomsn048@gmail.com



2. After installing, the "lead in" end of the bushing must be flared to prevent movement. Install Forcing Screw T78P-5638-A1, suitable Flaring Tool and suitable Receiving Cup and flare the bushing.

tomsn048@gmail.com



3. Install the axle pivot bolt and nut; tighten the axle pivot nut to 163-203 Nm (120-150 lb-ft).

tomsn048@gmail.com

Driveshaft, Front

Removal

1. **NOTE: Mark the driveshaft and the axle companion flange before removal so that they can be installed in the same position.**

   Remove the nuts and U-bolts retaining the front driveshaft to the axle companion flange.

2. Remove attaching bolts retaining driveshaft to the transfer case (7A195). Remove driveshaft from the vehicle.

Installation

1. Position driveshaft to transfer case companion flange and install driveshaft to transfer case flange bolts; tighten to 88-119 Nm (65-87 lb-ft).

2. Position driveshaft to the axle companion flange. Install the U-bolts and nuts. Tighten the front driveshaft U-bolt nuts to 11-20 Nm (8-15 lb-ft).

tomsn048@gmail.com

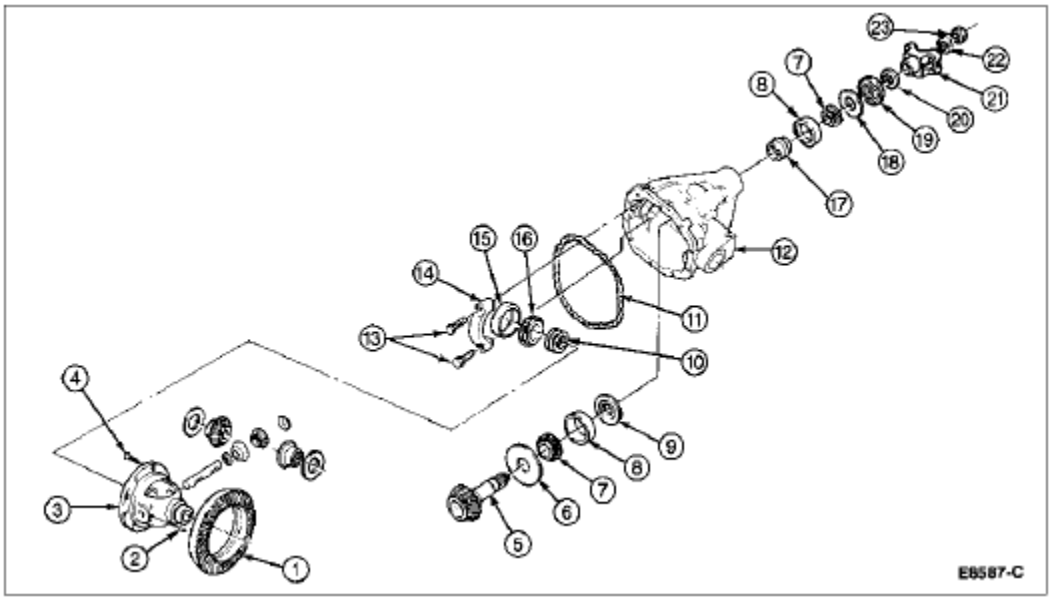
Carrier Disassembly

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Bench Mounted Holding Fixture	T57L-500-B
Companion Flange Holding Tool	T57T-4851-B
Differential Side Bearing Puller	T77F-4220-B1
Differential Housing Spreader Adapter	T80T-4000-B
Driver Handle	T80T-4000-W
Inner Pinion Bearing Cup Remover	T86T-4628-AH
Outer Pinion Bearing Cup Remover	T86T-4628-BH
Spreader Adapter	T90T-4000-A

1. Remove carrier and the right hand stub shaft as described under Removal and Installation Slip-Yoke, RH and Stub Shaft Assembly, Carrier, Carrier Oil Seal and Bearing , in this section.

Dana 35 IFS Axle Carrier Assembly



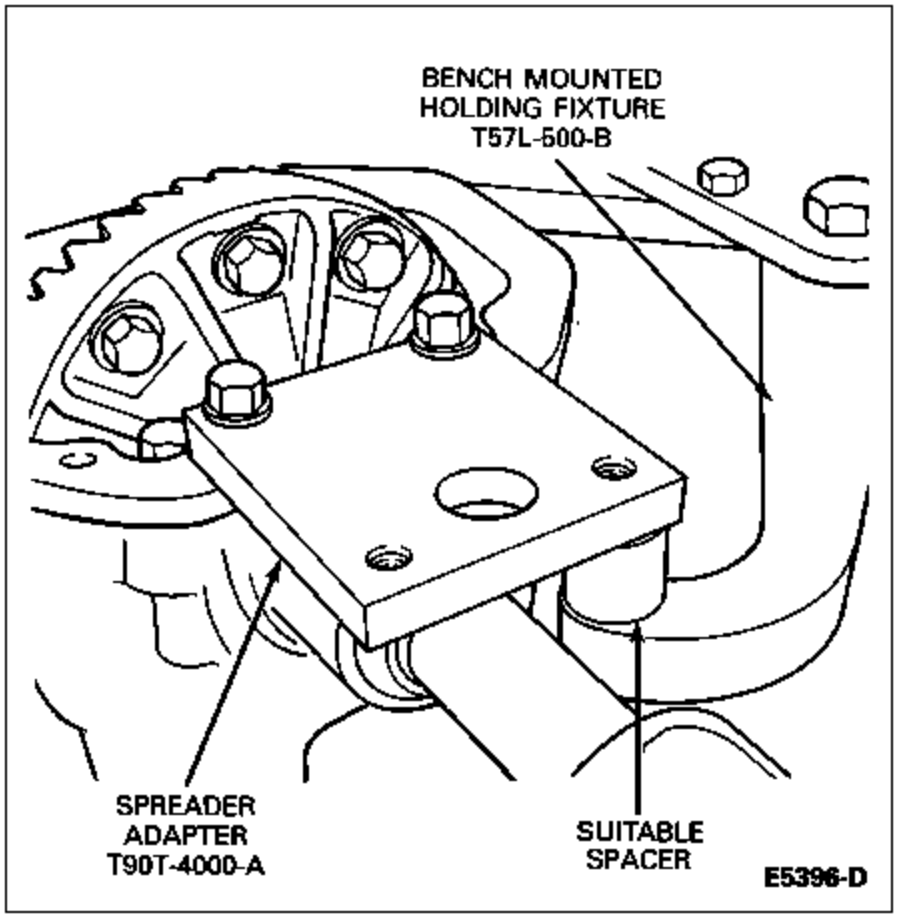
Item	Part Number	Description
1	—	Differential Ring Gear (Part of 3222)
2	357228-S	Lock Pin
3	3204	Differential Case

tomsn048@gmail.com

4	3L222	Ring Gear Bolt
5	—	Drive Pinion (Part of 3222)
6	3B067	Oil Slinger/Selective Shim
7	4621	Pinion Bearing Cone and Roller
8	4616	Drive Pinion Bearing Cup
9	3070	Oil Baffle
10	3A067	Differential Bearing Shims
11	D6AZ-19562-AA or -BA	RTV Gasket Sealant
12	3010	Carrier Housing
13	—	Bearing Cap Bolts (Part of 3010)
14	—	Bearing Cap (Part of 3010)
15	4222	Differential Bearing Cup
16	4221	Differential Bearing
17	3A222	Collapsible Spacer
18	3070	Oil Slinger
19	4676	Pinion Seal
20	4859	Drive Pinion Oil Seal Deflector
21	4851	Axle Companion Flange
22	356504-S	Companion Flange Washer
23	3T222	Companion Flange Nut

2. Place the carrier housing in a holding fixture such as Bench Mounted Holding Fixture T57L-500-B, using Spreader Adapter T90T-4000-A and Suitable Spacers.

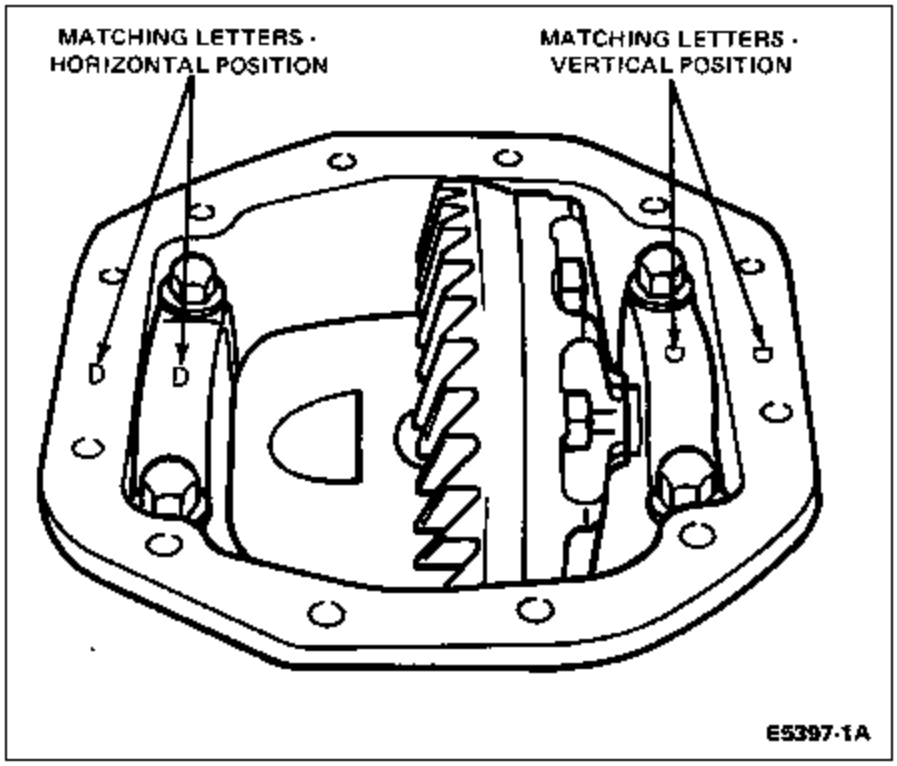
tomsn048@gmail.com



3. **NOTE: The matched numbers or letters stamped on the bearing cap and carrier housing must correspond in both position and direction upon assembly.**

   Remove and clean all gasket surfaces and remove the bearing caps.

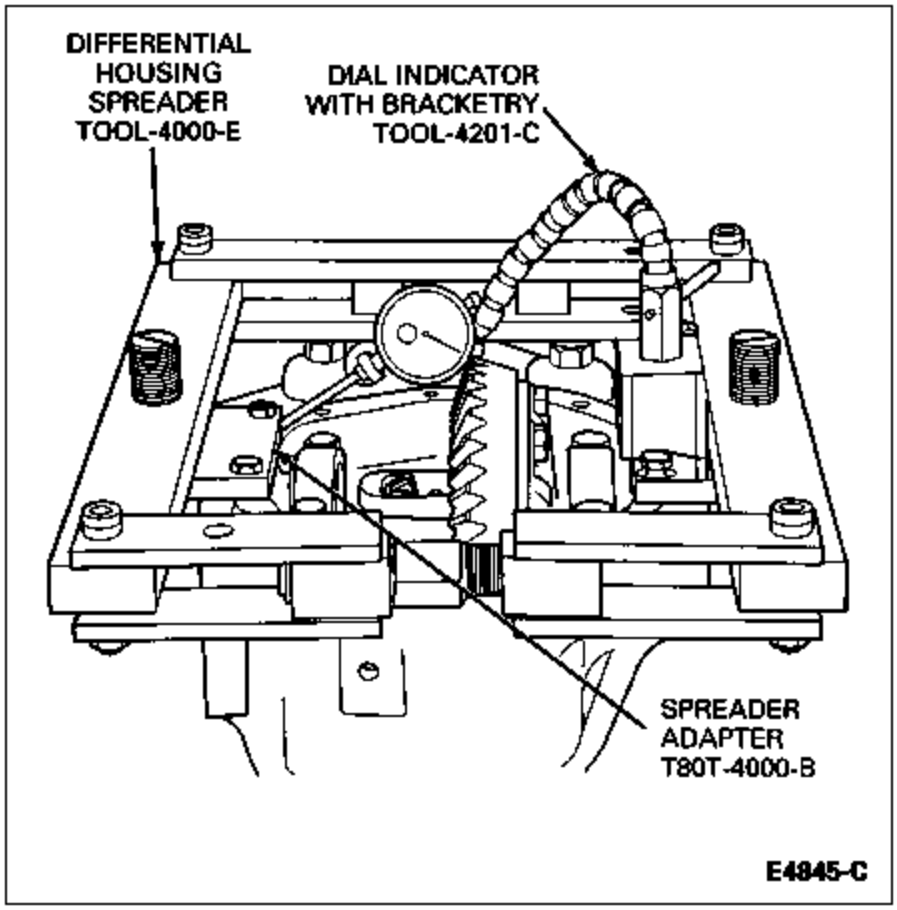
tomsn048@gmail.com



4. **NOTE: Do not spread the carrier housing over 0.25mm (0.010 inch).**

   Mount the Differential Housing Spreader TOOL-4000-E or equivalent and Spreader Adapter T80T-4000-B on the carrier housing. Place Dial Indicator with Bracketry TOOL-4201-C or equivalent on the carrier housing and spread the carrier housing.

tomsn048@gmail.com



5. **CAUTION: Avoid damaging any machined surfaces.**

   Remove the differential case from the carrier housing. It may be necessary to pry the differential case from the carrier housing with pry bars.

6. Remove and tag differential bearing cups (4222) to indicate from which side of the carrier housing they were removed.

7. Remove the spreader tool.

8. **NOTE: Check outboard differential bearing shims for damage (bent or deep grooves caused by worn bearings). If damaged, replace with new shims during reassembly.**

   Remove and tag the outboard differential bearing shims located on each side of the differential bearing bore. Shims will be reused during assembly, unless damaged or worn.

9. Turn the nose of the carrier housing up. Hold the rear axle companion flange with Companion Flange Holding Tool T57T-4851-B and remove the companion flange nut and washer from the pinion shaft.

10. Remove the axle companion flange with Differential Side Bearing Puller T77F-4220-B1. If the axle companion flange shows any signs of wear in the area of seal contact, replace the axle companion flange.

11. **WARNING: GEAR TEETH MAY HAVE SHARP EDGES. WHEN HANDLING GEAR, USE**

tomsn048@gmail.com

CARE TO AVOID PERSONAL INJURY.

Remove the drive pinion by tapping on the drive pinion shaft with a rawhide or plastic hammer. Catch the drive pinion to prevent damage to the drive pinion teeth.

12. Remove the pinion seal from the carrier bore by using suitable seal puller and impact slide hammer. Replace the oil seal with a new seal during assembly.

13. Remove the pinion bearing cone and roller, oil baffle and collapsible spacer from the carrier. Discard the collapsible spacer. Replace with a new collapsible spacer upon assembly.

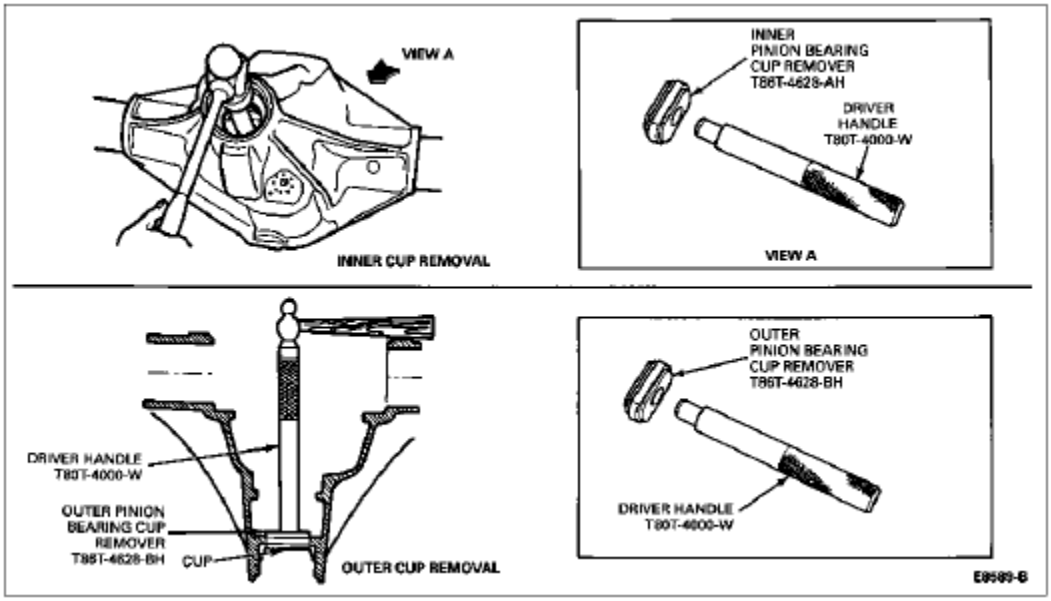
14. To remove the rear drive pinion bearing cup, pass Inner Pinion Bearing Cup Remover T86T-4628-AH and Driver Handle T80T-4000-W through the front drive pinion bearing cup and against the rear drive pinion bearing cup. Drive out the rear drive pinion bearing cup.

15. **NOTE: An oil baffle is located between the rear drive pinion bearing cup and carrier bore. Replace with an oil baffle of equal thickness. If an oil baffle of the same thickness cannot be obtained, select adjustment shims, located behind the head of the drive pinion, to compensate for the difference.**

    Remove the oil baffle from the drive pinion bearing cup bore.

16. To remove the front drive pinion bearing cup, pass the Outer Pinion Bearing Cup Remover T86T-4628-BH and Driver Handle T80T-4000-W through the rear cup bore and against the drive pinion bearing cup. Drive the front drive pinion bearing cup out with a hammer.

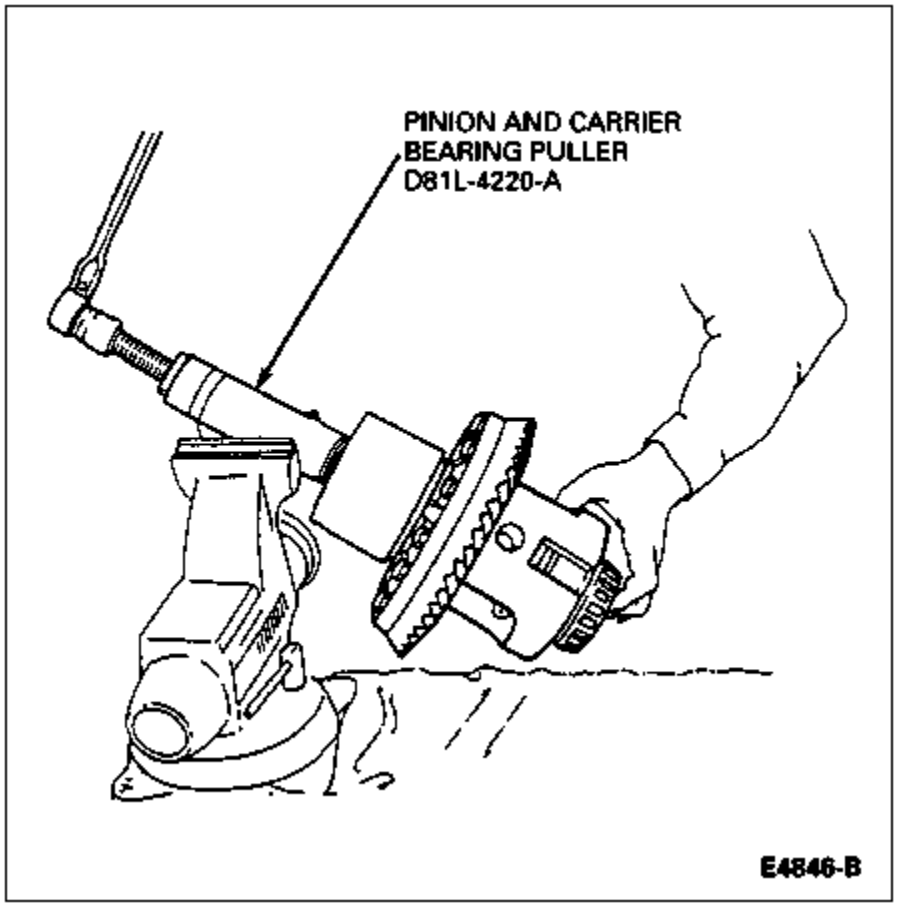
Pinion Bearing Cup Removal



17. **NOTE: It is recommended that bearings be replaced.**

    Remove the differential bearings (4221) from the differential case. Place Step Plate D80L-630-4 or equivalent under bearing to protect the bearing. Install Pinion and Carrier Bearing Puller D81L-4220-A or equivalent and remove the bearing. Turn the differential case over and remove the other bearing.

tomsn048@gmail.com



18. Wire the differential bearing cup and cone together and identify from which side of the differential case they were removed.

19. **NOTE: Place a few shop towels over the vise to prevent the ring gear teeth from being nicked, after it is free from the case.**

    NOTE: Whenever removing the ring gear bolts, discard the bolts. Replace with new bolts upon assembly.

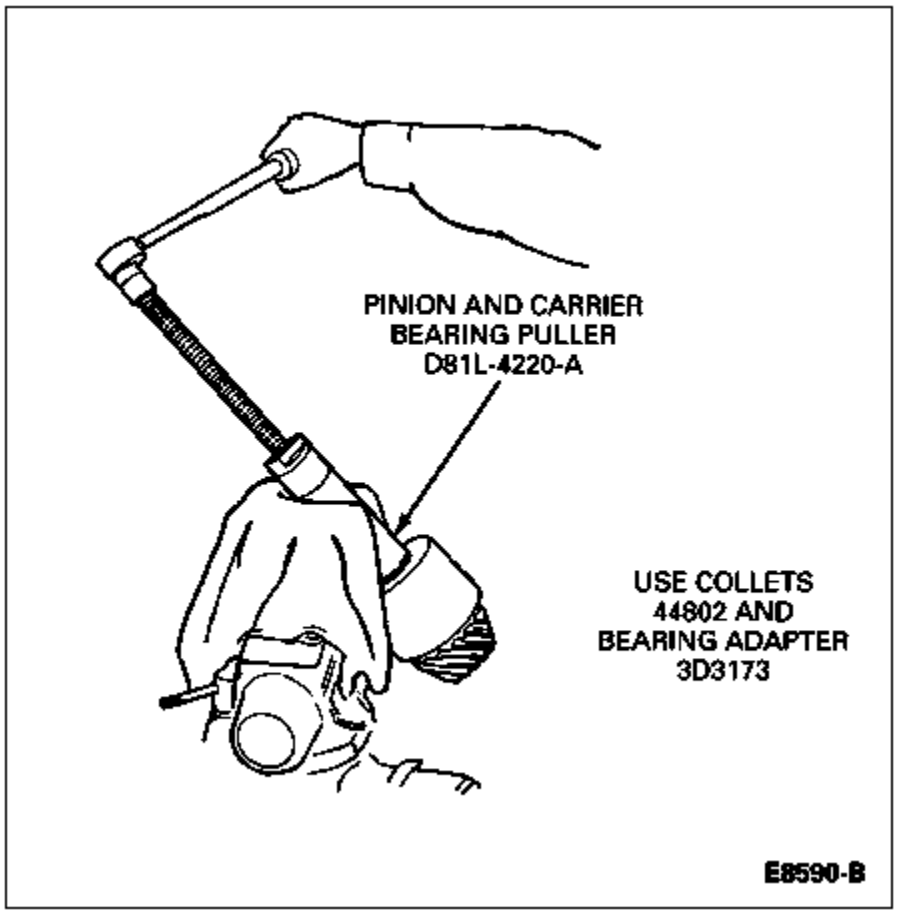
    Place the differential case in a vise. Remove the ring gear bolts. Tap the ring gear with a rawhide hammer to free it from the differential case.

20. Remove the differential case and ring gear from the vise.

21. **NOTE: For controlling drive pinion depth, an oil baffle with a selected thickness is located between the inner pinion bearing cone and drive pinion head. Be careful not to damage the oil baffle when removing the bearing. If the oil baffle is damaged, measure the thickness and replace with an oil baffle of equal thickness.**

    Remove the inner differential pinion bearing and oil baffle from the drive pinion with Pinion and Carrier Bearing Puller D81L-4220-A or equivalent.

tomsn048@gmail.com



22. Inspect all parts for damage and replace as required.

tomsn048@gmail.com

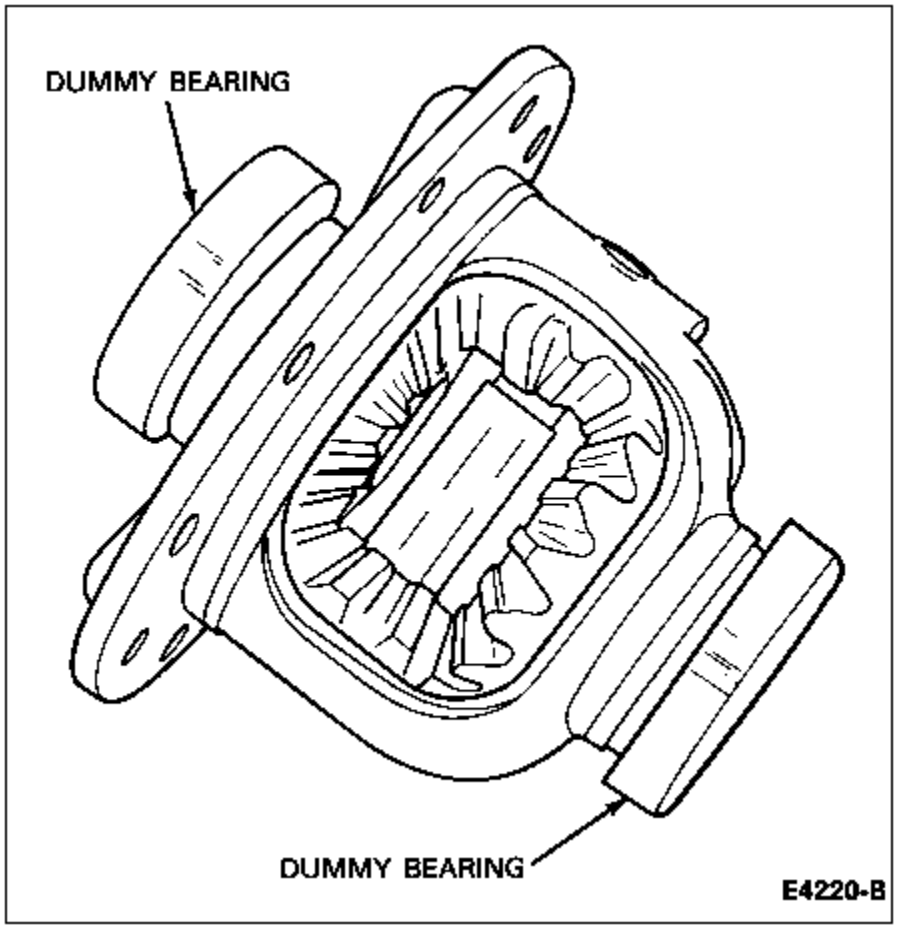
Total Differential Case End Play

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Dummy Bearings	T86T-4222-AH

1. **NOTE: Remove all burrs and nicks from hubs so master bearings rotate freely.**

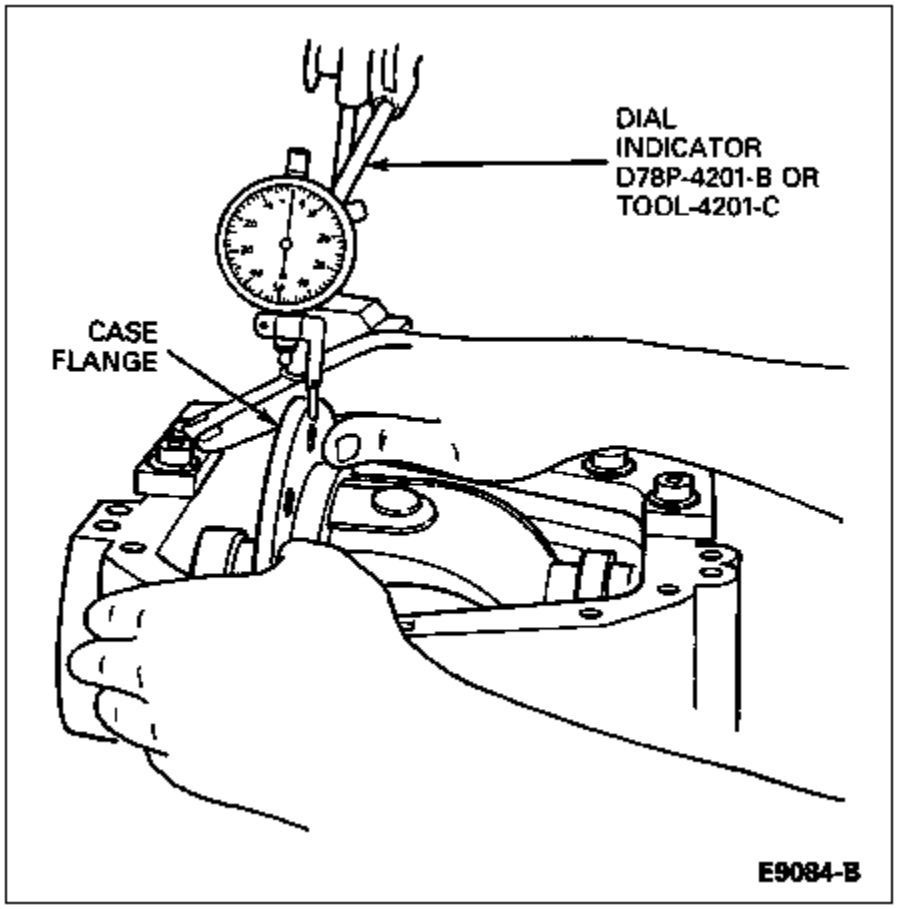
   Clean the trunnions on the differential and install the Dummy Bearings T86T-4222-AH onto the differential case.



2. Place the differential case into carrier (without pinion). The differential case should move freely in the carrier. Mount Dial Indicator D78P-4201-B or TOOL-4201-C or equivalent against the differential case flange.

3. Locate the tip of the indicator on the flat surface of one ring gear bolt.

tomsn048@gmail.com



4. **NOTE: Dial indicator should have a minimum travel capability of 8.89mm (0.350 inch).**

   Force the differential case toward the dial indicator as far as possible and zero the dial indicator with force still applied.

5. **NOTE: This reading indicates the amount of shims needed behind the differential side bearings to take up total clearance between the differential bearing cup and carrier. This reading will be used under Pinion and Ring Gear Backlash .**

   Force the differential case away from the dial indicator as far as it will go. Repeat this procedure until the same reading is obtained. Record the dial indicator reading as Measurement "A" on the worksheet for calculating ring gear backlash and differential bearing preload shims.

6. Remove the differential case from the carrier housing. Do not remove the master differential bearings at this time.

tomsn048@gmail.com

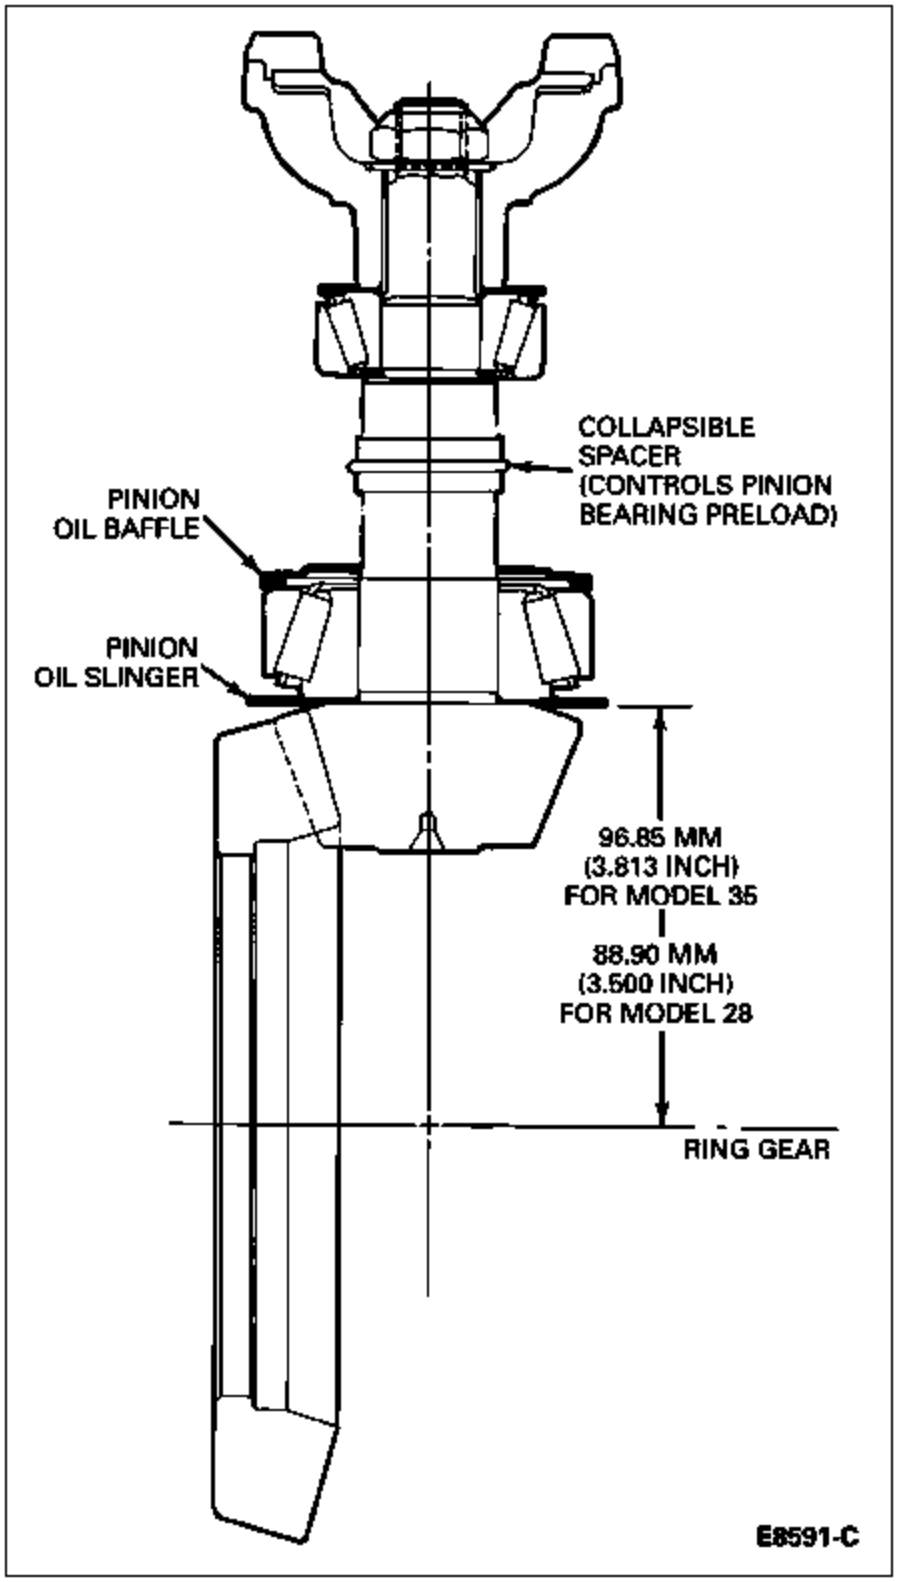
tomsn048@gmail.com

Drive Pinion Installation

Two separate adjustments affect contact between the ring gear and drive pinion: pinion depth and pinion to ring gear backlash. Refer to Adjustments in this section.

Pinion depth is controlled by an oil slinger (with a selective thickness) located between drive pinion head and inner differential pinion bearing and an oil baffle located between the rear drive pinion bearing cup and carrier bore.

tomsn048@gmail.com

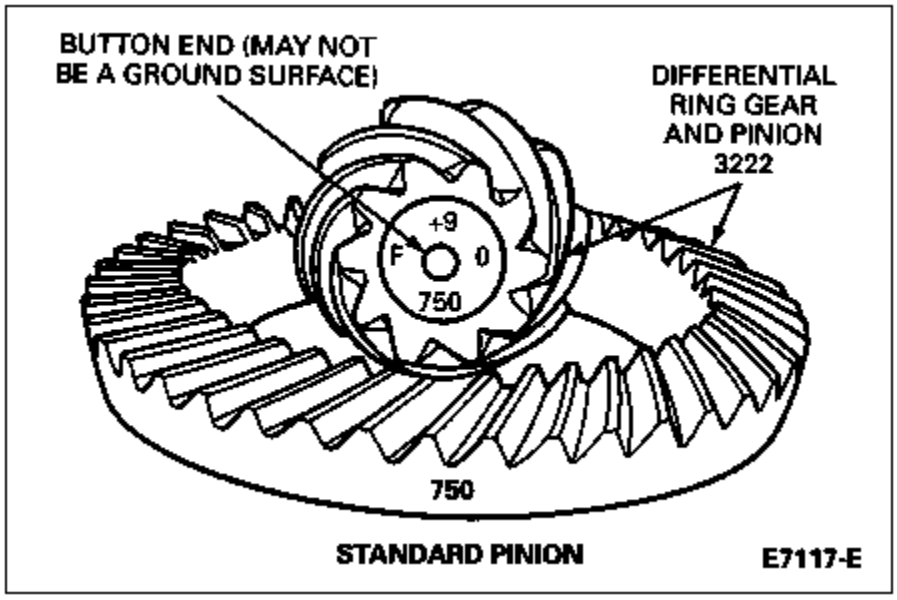


Pinion to ring gear backlash is controlled by a selective preload spacer located between the drive pinion bearing cup and the carrier. This adjustment is described in Assembly to Carrier, Pinion and Ring Gear Backlash in this section.

In the pinion depth adjustment, the size of the selected thickness oil slinger and the oil baffle controls the

tomsn048@gmail.com

pinion position. Increasing the oil slinger thickness moves the pinion toward the ring gear (-). Decreasing the oil slinger thickness moves the pinion away from the ring gear (+).



On the button of each drive pinion is marked a plus figure (+), a minus figure (-) or a zero (0). These figures indicate the position for each gear set. The position is determined by the thickness of the baffle between the inner pinion bearing cup and carrier bearing bore and the thickness of the selective oil slinger between the pinion head and inner pinion bearing. Any pinion depth change is made by changing the thickness of the selective oil slinger. Refer to the charts shown below.

- For example, a drive pinion that is etched "0" should be 96.85mm (3.813 inch) from the centerline of the ring gear to the back face of the pinion. A pinion that is etched +3 (m+8) should be 96.93mm (3.816 inch) from the ring gear centerline. If the baffle thickness remains the same, then the +3 (m+8) pinion requires a selective oil slinger that is 0.08mm (0.003 inch) thinner than the selective slinger used with the "0" etched drive pinion.

If the original gear set is being reused, measure the original baffle and selective slinger. If either the baffle or selective slinger needs to be replaced, use a new one of the exact same thickness.

If a new gear set is used, notice the plus (+), minus (-), or zero (0) etching on both the original and the new drive pinion and adjust the thickness of the new selective oil slinger according to the charts shown below.

- For example, if the original pinion is etched +4 (m+ 10) and the new pinion is etched "0", then the new selective slinger is 0.08mm (0.004 inch) thicker than the original selective oil slinger.

If the original pinion is etched "0" and the new pinion is etched + 3 (m+8), the new selective slinger should be 0.08mm (0.003 inch) thinner than the original slinger.

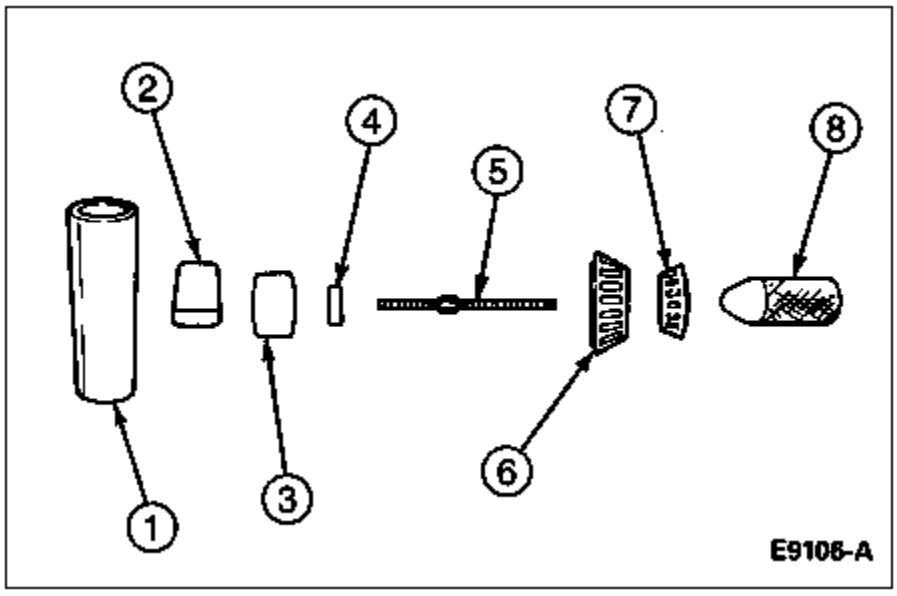
Screw	T76P-4020-A9
Gauge Block	T76P-4020-A10
Handle	T76P-4020-A11
Pinion Depth Gauge	T79P-4020-A
Pinion Bearing Replacer	T85M-4221-B
Gauge Disc	T90T-4020-B

1. **NOTE: If any of the gauge surfaces become nicked, the high spots must be removed with a medium india oilstone to make sure there will be no erroneous readings.**

   Refer to chart shown below for the correct tools for the particular axles.



Item	Part Number	Description
1	D80T-4020-F49	Gauge Tube

tomsn048@gmail.com

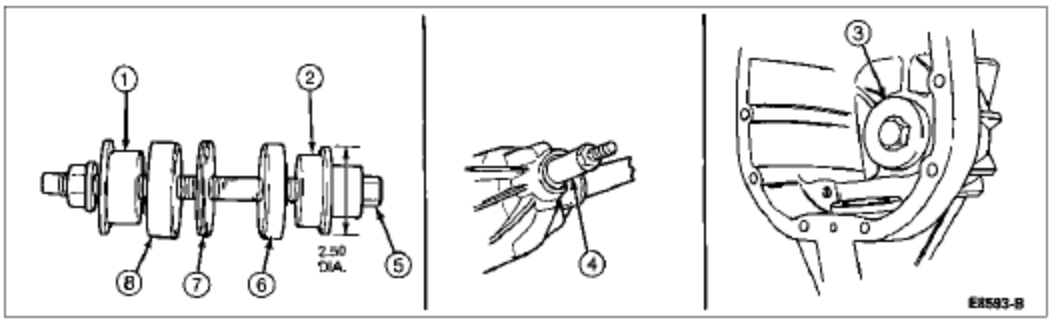
2	T76P-4020-A10	Gauge Block
3	T90T-4020-B	Gauge Disc
4	T75P-4020-A2	Aligning Adapter
5	T76P-4020-A9	Screw
6	4621	Inner Pinion Bearing
7	4621	Outer Pinion Bearing
8	T76P-4020-A11	Handle

2. Install the oil baffle in the inner bearing cup bore in the carrier.

3. **NOTE: Prior to installing pinion bearing cups into aluminum or magnesium housings, a dry graphite lubricant such as Lubrikote Type A-1040 CR (Mealy Industrial Lubricants) or equivalent should be applied to the bearing cup bore to prevent metal particles from being picked up as the cup is pressed into the bore.**

   Install inner and outer pinion cups with Threaded Draw Bar T75T-1176-A, Pinion Bearing Cup Replacer T60K-4616-A and Pinion Bearing Cup Replacer T71P-4616-A.

Pinion Bearing Cups Installation



Item	Part Number	Description
1	T60K-4616-A	Pinion Bearing Cups Replacer
2	T71P-4616-A	Pinion Bearing Cups Replacer
3	4621	Inner Cup Installation View
4	4621	Outer Cup Installation View
5	T75T-1176-A	Threaded Drawbar
6	4616	Outer Cup
7	3070	Shims
8	4616	Inner Cup

4. Place a new inner pinion bearing over the proper aligning adapter and insert into the pinion bearing retainer.

5. Place the outer differential pinion bearing (new or used if in good condition) into the drive pinion

tomsn048@gmail.com

bearing cup in the carrier and assemble the handle onto the screw and hand tighten. Note the 3/8-inch square drive in the handle to be used for obtaining the proper pinion bearing preload.

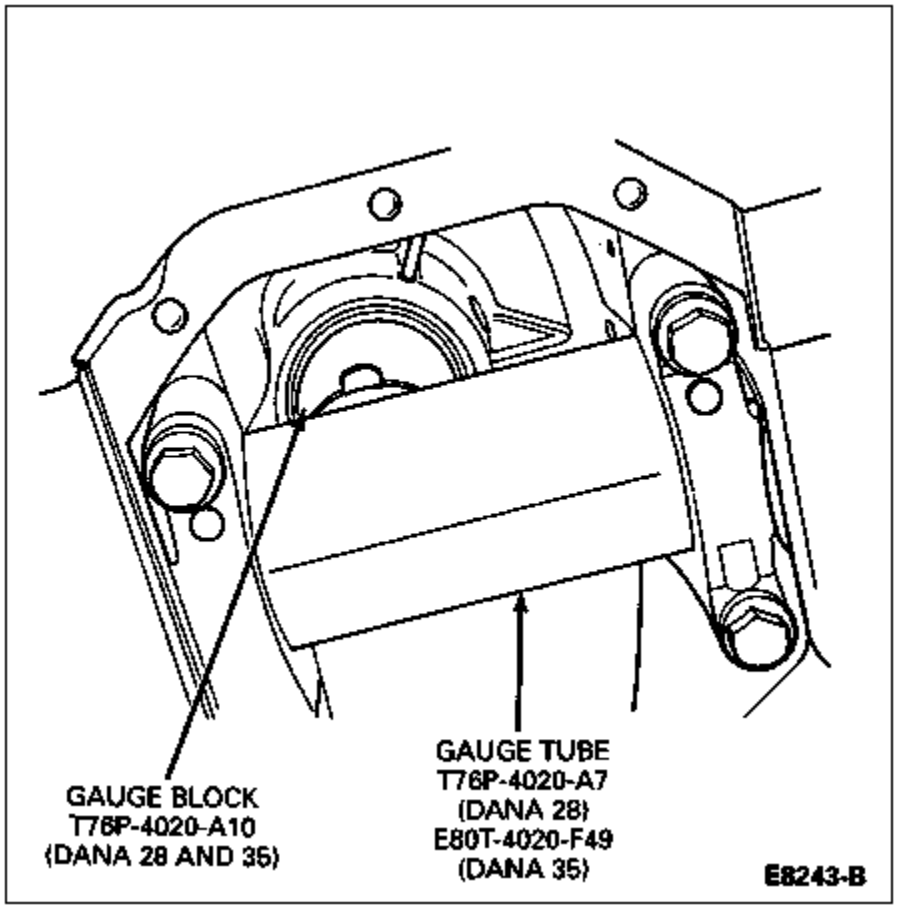
6. Center the proper gauge tube into the differential bearing bore. Install the bearing caps and bolts and tighten to 64-91 Nm (47-67 lb-ft) for the Model 35 or 41-61 Nm (30-45 lb-ft) for the Model 28.

7. To preload the differential pinion bearing, tighten the handle to 1.7-3.9 Nm (15-35 lb-in).

8. Using a feeler gauge tool, select the thickest feeler shim that will enter between the gauge tube and the gauge block.

9. **NOTE: The feeler gauge fit between the gauge tube and the gauge block should have a slight drag-type feeling.**

   Insert the feeler gauge directly along the gauge block. Verify correct reading.

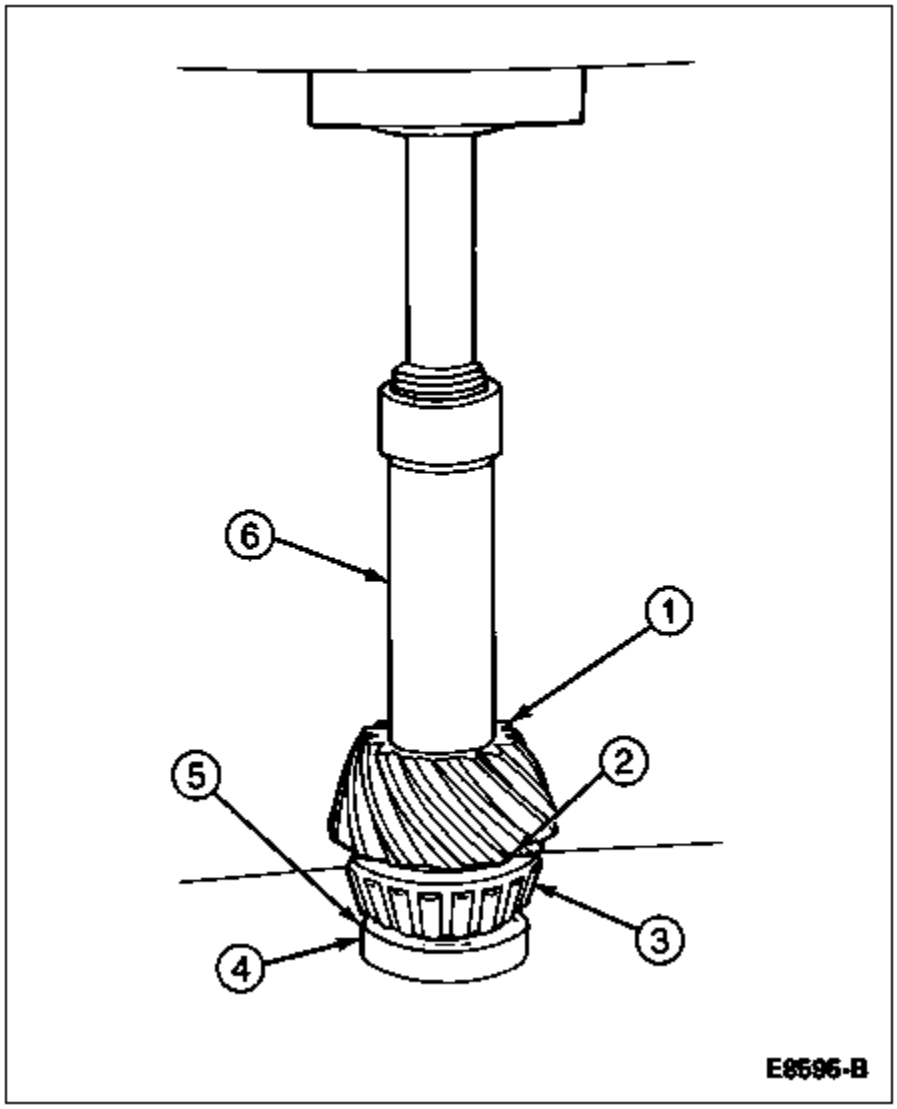


10. **NOTE: If the service pinion gear is marked with a plus (+) reading, this amount must be subtracted from the thickness dimension obtained in Steps 8 and 9. (Example: +2 [+ 0.002]). If the service pinion gear is marked with a minus (-) reading, this amount must be added to the thickness dimension obtained in Steps 8 and 9. (Example: -2 [0.002]). In addition, use same new inner differential pinion bearing as in the previous steps.**

    After the correct feeler gauge feel is obtained, check the reading and this is the thickness of the oil slinger required providing that upon inspection of the service pinion gear, there are no markings.

tomsn048@gmail.com

11. Measure oil slinger with a micrometer to verify the slinger size. Place the oil slinger on the pinion and press on the bearing using suitable pinion bearing replacer and Axle Bearing/Seal Plate T75L-1165-B as shown.



Item	Part Number	Description
1	—	Drive Pinion (Part of 3222)
2	3B067	Oil Slinger
3	4621	Rear Pinion Bearing Cone and Roller
4	T75L-1165-B	Axle Bearing Seal Plate
5	T85M-4221-B	Differential Bearing Replacer
6	—	Press

12. Lubricate the ends of outer pinion bearing rollers with High Temperature 4x4 Front Axle and Wheel Bearing Grease E8TZ-19590-A or equivalent meeting Ford specification ESA-M1C198-A.

tomsn048@gmail.com

tomsn048@gmail.com

Drive Pinion Preload Check and Final Depth Check

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Pinion Seal Replacer	T79P-4676-A
Companion Flange Replacer	T85T-4851-AH

1. Install the drive pinion into the carrier housing.

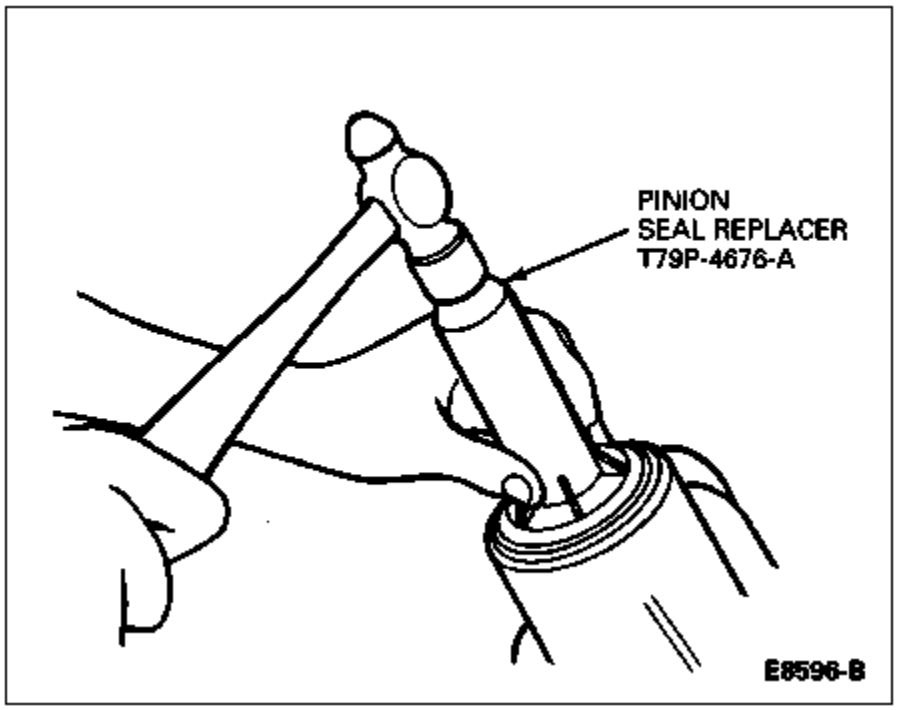
2. **CAUTION: Never reuse a collapsible spacer. Upon removal, always discard the old spacer and install the new spacer for assembly.**

   Install a new collapsible spacer.

3. Assemble the outer pinion bearing cone and roller and thrust washer.

4. **NOTE: After installation, make sure the garter spring did not pop off. If the garter spring pops off, remove and replace the seal.**

   Coat the pinion seal with Motorcraft Synthetic Rear Axle Lubricant F1TZ-19580-A meeting Ford specification WSL-M2C192-A. Install the seal with Pinion Seal Replacer T79P-4676-A.



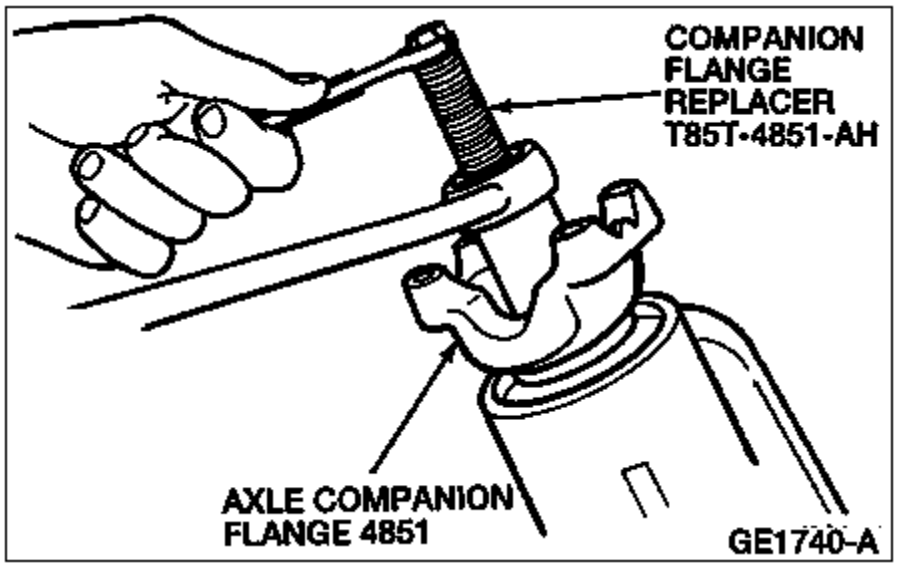
5. Install the rear axle companion flange with Companion Flange Replacer T85T-4851-AH. Install the

tomsn048@gmail.com

companion flange washer and nut and tighten the companion flange nut to 271 Nm (200 lb-ft). Check torque required to rotate pinion 1.7-2.8 Nm (15-25 lb-in). If required torque is not to specifications, continue to tighten companion flange nut in small increments until proper torque is obtained.

6. **CAUTION: Never tighten the pinion nut more than 475 Nm (350 lb-ft), or the collapsible spacer will be compressed too far.**

   If the reading is more than 1.7-2.8 Nm (15-25 lb-in), the collapsible spacer must be replaced.



tomsn048@gmail.com

Differential Case

SPECIAL SERVICE TOOL(S) REQUIRED

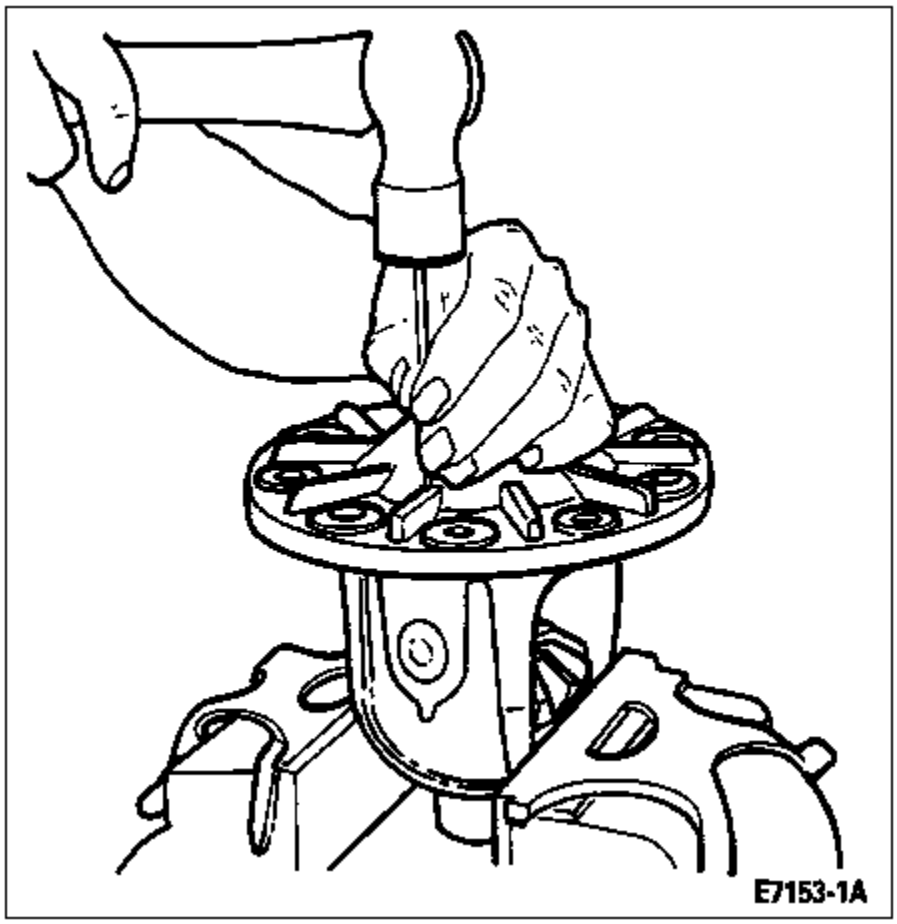
Description	Tool Number
Dummy Bearings	T86T-4222-AH
Driver Handle	T80T-4000-W
Differential Bearing Replacer	T85M-4221-A
Pinion Bearing Cone Replacer	T53T-4621-C
Spreading Adapters	T90T-4000-A

Disassembly

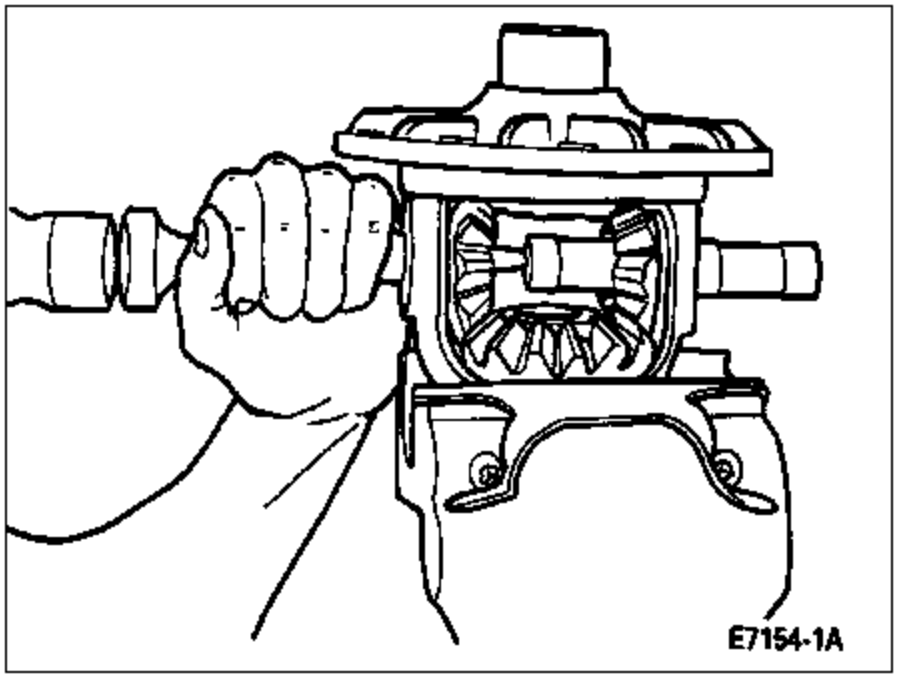
1. Remove retainer bolts and remove ring gear from the carrier housing.

2. Place the differential case in a vise and drive out the lock pin that retains the differential pinion shaft (4211) to the differential case.

tomsn048@gmail.com



3. Remove differential pinion shaft with a drift.

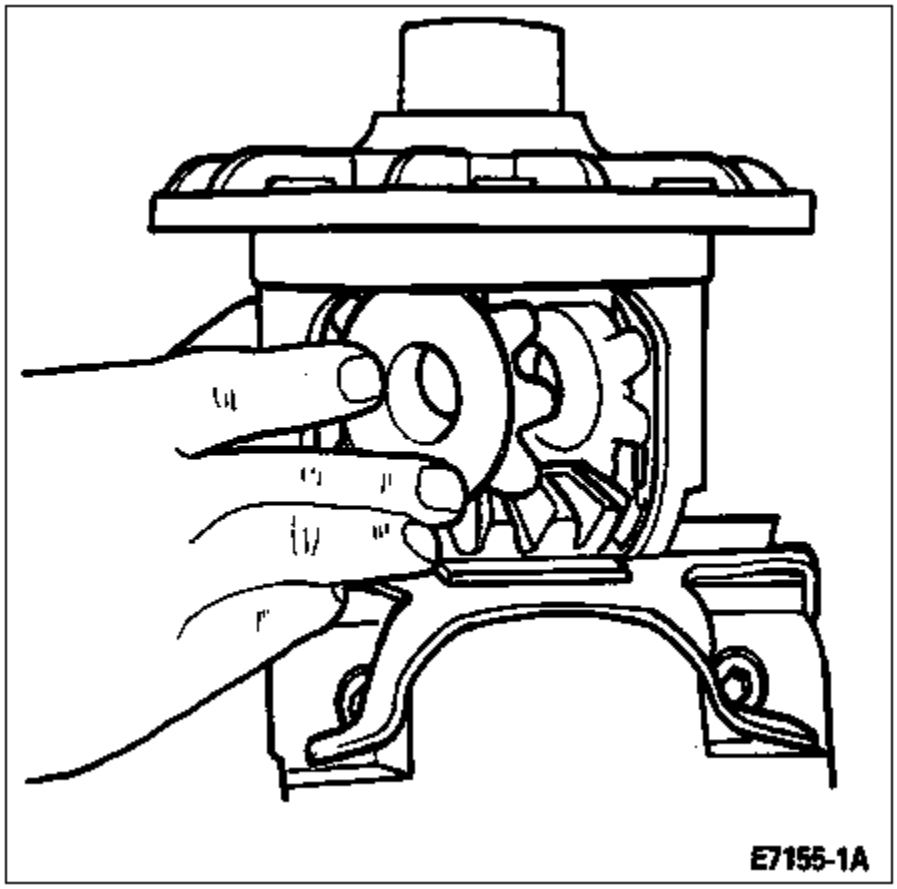


tomsn048@gmail.com

4. Rotate the pinion mate gears and side gears until the pinion mate gears turn to the differential case windows.

5. Remove a pinion mate gears and differential pinion thrust washers (4230).

6. Lift side gears and thrust washers from differential case.



Assembly

1. **NOTE: Always replace gears as a complete set. Do not mix new gears with old gears, as this may cause uneven wear and short gear life.**

   Inspect components for wear and replace as required.

2. Apply High Temperature 4x4 Front Axle and Wheel Bearing Grease E8TZ-19590-A or equivalent meeting Ford specification ESA-M1C198-A to side gear thrust washers, hub and thrust face of side gears.

3. Lubricate pinion mate gears and differential pinion thrust washer with High Temperature 4x4 Front Axle and Wheel Bearing Grease E8TZ-19590-A or equivalent meeting Ford specification ESA-M1C198-A.

tomsn048@gmail.com

4. Hold side gears in place in the differential case with one hand and install pinion mate gears and differential pinion thrust washers with other hand.

5. Rotate the side gears and pinion mate gears until holes in washers and pinion mate gears line up exactly with holes in the differential case.

6. Insert the differential pinion shaft in the differential case. Align the lock pin hole in the shaft with lock pin holes in the differential case.

7. Insert lock pin. Note the location of the slot in the roll pin. Peen some metal of the differential case over the pin in two places, 90 degrees away from the slot, to lock it in place.

8. Install the ring gear and ring gear bolts. Tighten to 95-122 Nm (70-90 lb-ft).

Assembly to Carrier, Pinion and Ring Gear Backlash

1. Assemble ring gear to differential case. Use new bolts and tighten alternately and evenly to 95-122 Nm (70-90 lb-ft).

2. Place the differential case into position in the carrier. Dummy Bearings T86T-4222-AH should still be installed.

3. Force the differential case away from the drive pinion gear until it is completely seated against the cross bore face of the carrier housing.

4. Position a dial indicator so the indicator tip rests on a ring gear bolt head, or a flat machined surface. Zero the dial indicator.

5. Force ring gear against pinion gear. Rock ring gear slightly to make sure gear teeth are in contact.

6. Force ring gear away from drive pinion gear, making sure the dial indicator returns to zero.

7. Repeat this procedure, until the dial indicator reading is the same. This reading should be recorded on the worksheet as Measurement "B".

   Measure master differential bearing (tool) width. Use A or B depending on width.

Dana Model	Bearing Assembly/Cone	Bearing Stack Height 20/-0mm (.008/-0 In.)	Tool Width	Step or Example
28	LM29710/LM20749	18mm (.710 In.)	18.1mm (.710 In.) 18mm (.714 In.)	A B
35	LM501314/LM501349	21.4mm (.8437 In.)	21.4mm (.8437 In.) 21.5mm (.8477 In.)	A B

tomsn048@gmail.com

Worksheet for Calculating Ring Gear Backlash and Differential Bearing Preload Shims

EXAMPLE "A"

1. Total amount of space measured without gear set assembled into carrier (Housing). Measurement A

2. Total amount of space measured with gear set assembled into carrier (Housing). Measurement B

   ADJUSTMENTS:

3. Measurement A less .20mm (.008 In.) = C

4. Measurement B less .10mm (.004 In.) = D

5. C - D = E

   After measurements and calculations have been made, assemble the shim packs using the figures determined in D and E and adjusting the pack as described.

   RING GEAR SIDE:

   D - .13mm (.005 In.) = Total shim pack thickness.

   OPPOSITE SIDE:

   E + .25mm (.010 In.) = Total shim pack thickness.

   Assemble shim packs onto differential case hubs and assemble new differential bearing cones. Continue to build the axle assembly as described.

Worksheet for Calculating Ring Gear Backlash and Differential Bearing Preload Shims

EXAMPLE "B"

1. Total amount of space measured without gear set assembled into carrier (Housing). Measurement A

2. Total amount of space measured with gear set assembled into carrier (Housing). Measurement B

3. Measurement A minus Measurement B = Measurement C

   After the measurements and calculations have been made, assemble the shim packs using figures determined in A, B and C and adjusting the pack as described below.

   RING GEAR SIDE:

   B - .13mm (.005 In.) = Total shim pack thickness.

   OPPOSITE SIDE:

   C + .25mm (.010 In.) = Total shim pack thickness.

   Assemble shim packs onto differential case hubs and assemble new differential bearing cones.

tomsn048@gmail.com

Continue to build the axle assembly as described.

4. **NOTE: Dana Model 35 axles use outboard selective spacers.**

   Remove the differential case from the carrier and remove the dummy bearings from the case.

5. **NOTE: Outboard shims are used on the Model 35 I.F.S.**

   As determined in Steps 5 through 7, place the required amount of shims on the ring gear side and opposite side of the differential case. For example, if the reading was 4.04mm (0.159 inch) minus 0.20mm (.008 inch), place 3.84mm (0.151 inch) shim on the ring gear side between the differential bearing cup (4222) and housing.

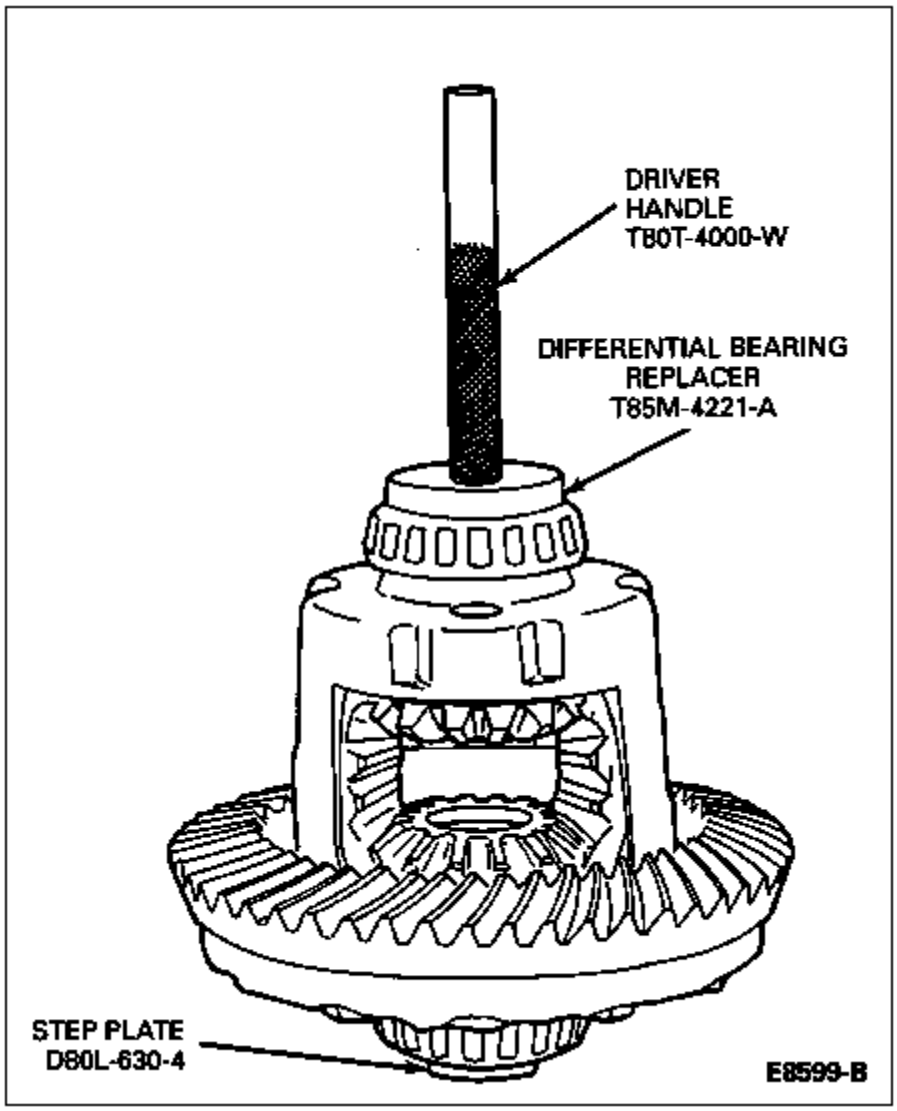
6. Install the differential bearings (4221) on both hubs of the differential case. Drive the bearing onto the hub using Driver Handle T80T-4000-W and Differential Bearing Replacer T85M-4221-A.

7. **NOTE: Dana Model 35 axles use outboard selective spacers.**

   Install the differential bearing on the hub of the drive pinion side of the differential case. Place Step Plate D80L-630-4 or equivalent on the ring gear side differential bearing to protect the bearing.

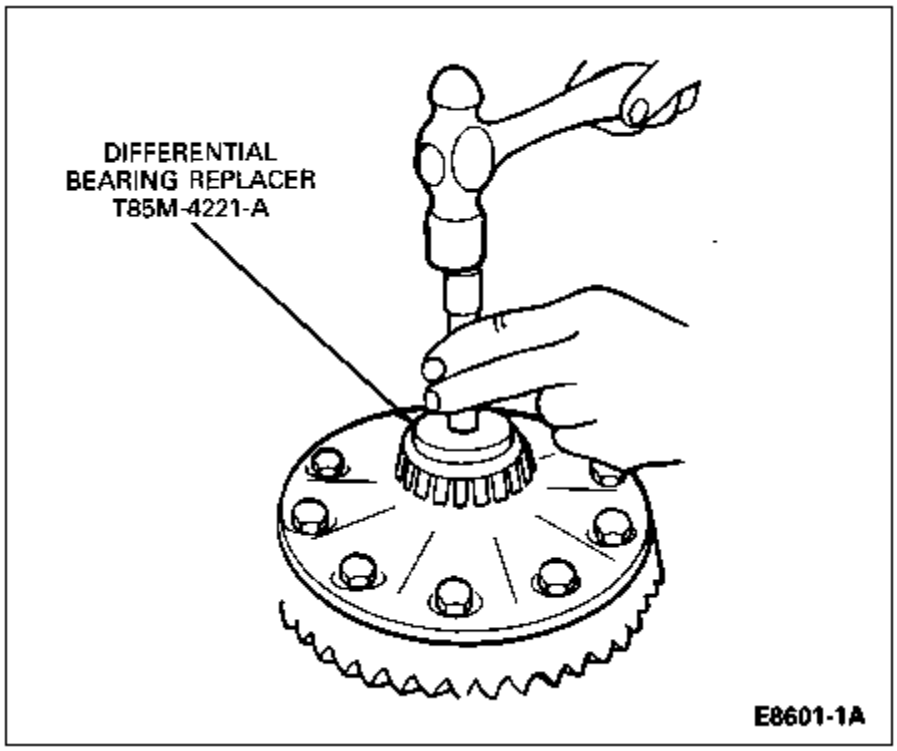
8. Drive the differential bearing onto the hub of the drive pinion side of the differential case using Driver Handle T80T-4000-W and Differential Driver Bearing Replacer T85M-4221-A.

tomsn048@gmail.com



9. Install bearing cone on the pinion side of the differential case with Differential Bearing Replacer T85M-4221-A. Place the Pinion Bearing Cone Replacer T53T-4621-C on the ring gear bearing to prevent damage.

tomsn048@gmail.com



10. Install the differential bearing cups on the bearing cones.

11. Place Differential Housing Spreader TOOL-4000-E or equivalent on the differential case, using Spreading Adapters T90T-4000-A and suitable spacers. Install Dial Indicator TOOL-4201-C or equivalent on the carrier housing. Do not spread the housing more than 0.25mm (0.010 inch).

12. **NOTE: Be careful to not nick the teeth of the ring gear or drive pinion.**

    Install the differential case in the carrier housing. If necessary, use a rawhide or plastic hammer to seat the differential case into the carrier housing cross bore.

13. With partial and non-hunting/partial ring gear and pinion sets, align the marks on the ring gear and drive pinion if applicable. Some gear sets do not have marks, depending upon ratio.

14. Remove the spreader and dial indicator from the differential case.

15. **NOTE: The matched numbers or letters stamped on the cap and carrier must correspond in both position and direction upon assembly.**

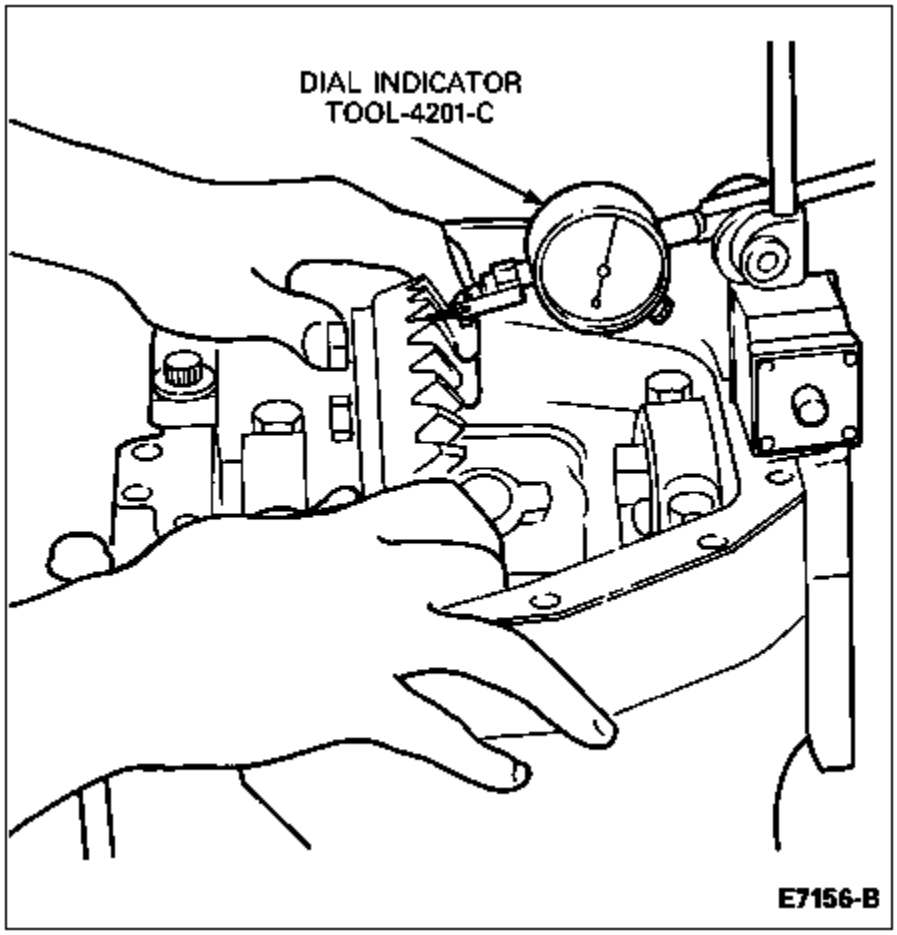
    Install bearing caps and bolts. Tighten bolts to 64-91 Nm (47-67 lb-ft) for the Model 35 and 41-61 Nm (30-45 lb-ft) for the Model 28.

16. **NOTE: Backlash tolerance is 0.13-0.20mm (0.005-0.008 inch) and cannot vary more than 0.08mm (0.003 inch) between the three points. If backlash is high, the ring gear must be moved closer to the pinion by increasing the thickness of the outboard spacer on the ring gear side and decreasing the thickness of the spacer on the opposite side by an equal amount. If backlash is low, the ring gear must be moved away from the pinion by decreasing the thickness of the outboard spacer on the ring gear side and increasing the thickness of the spacer on the opposite side by an equal amount.**

    Install the dial indicator on the case. Check ring gear and pinion backlash at three equally spaced

tomsn048@gmail.com

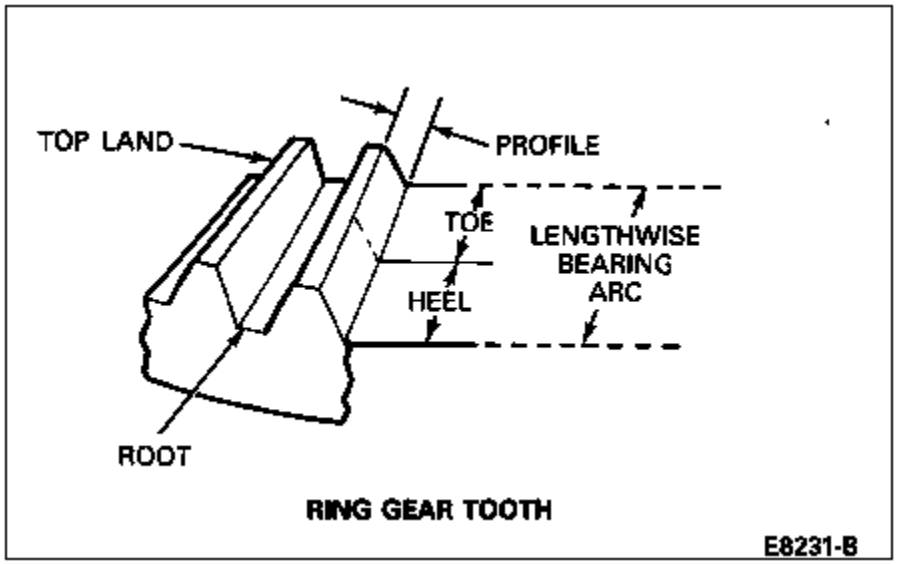
points on the ring gear.



Ring Gear and Pinion Tooth Pattern Interpretation

1. The final pinion position will be verified by using the gear contact pattern method described as follows:

tomsn048@gmail.com



2. **NOTE: When making pinion position changes, shims should be changed in the range of .05-.10mm (.002-.004 inch) until correct pattern has been obtained.**

   The toe of the gear tooth is the portion of the tooth surface at the end towards the center. The heel of the gear tooth is the portion of the tooth surface at the outer end. The top land of a gear tooth is the surface of the top of the tooth. Every gear has a characteristic pattern. The illustrations show typical patterns only, and explain how patterns shift as gear location is changed.

3. **WARNING: GEAR TEETH MAY HAVE SHARP EDGES. WHEN HANDLING GEARS, USE CARE TO AVOID PERSONAL INJURY.**

   NOTE: When making changes, note that two variables are involved. For example, if you have the backlash set correctly to specifications and you change the pinion position shim, you may have to readjust the backlash to the correct specification before checking the pattern. Refer to pattern interpretation.

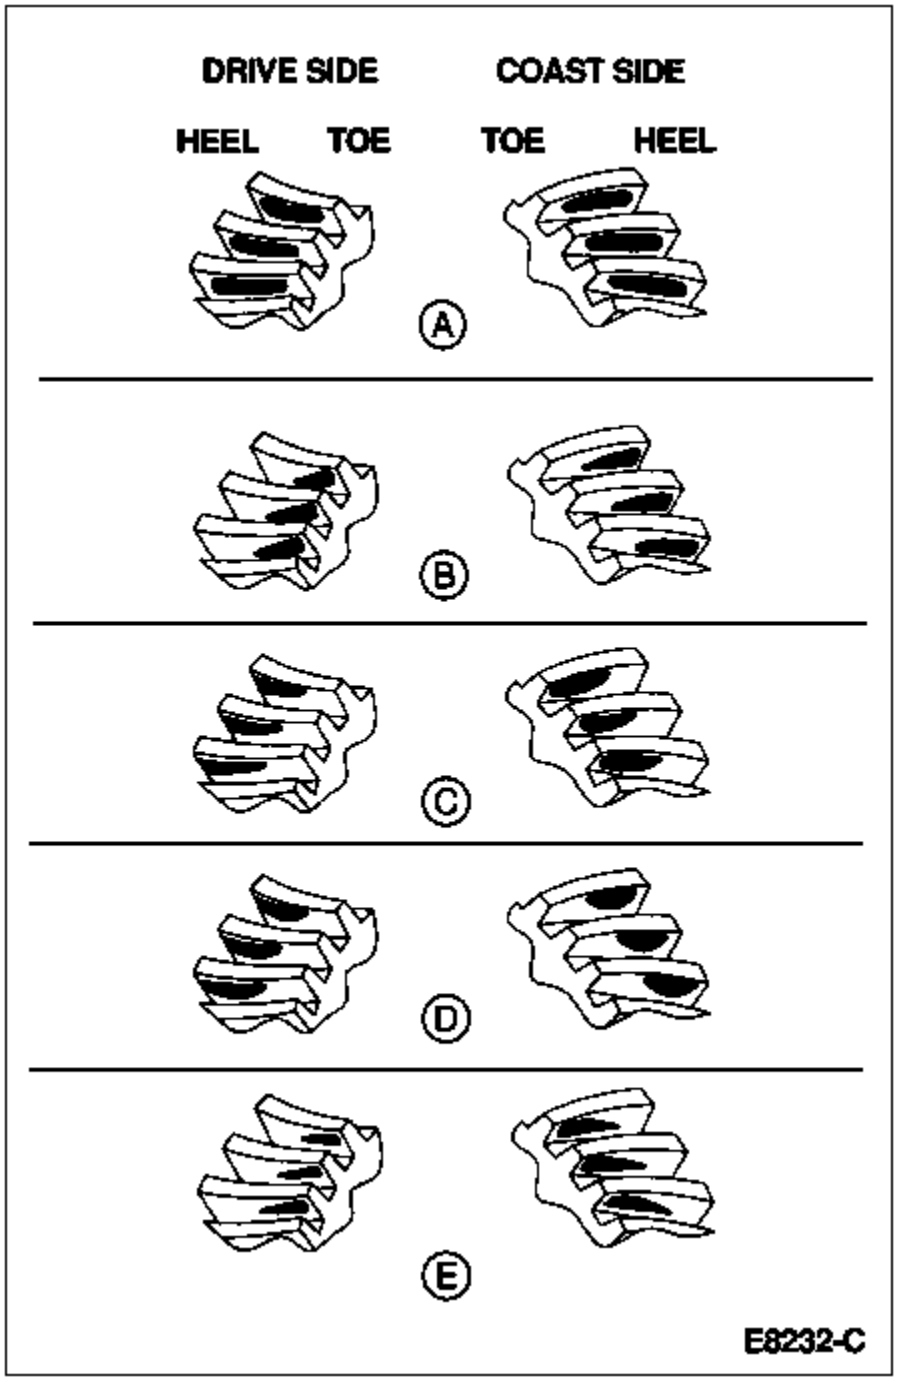
   When a change in backlash is required, backlash shims should be changed in the range of 1-1/2 times the amount of backlash required to bring the gears into specification. For example, if the backlash needed to be changed by .10mm (.004 inch), the shim pack should be changed by .15mm (.006 inch) as a starting point. The actual amount of backlash change obtained will vary depending upon the ratio and gear size. High backlash is corrected by moving the ring gear closer to the pinion. Low backlash is corrected by moving the ring gear away from the pinion. These corrections are made by increasing or decreasing the thickness of the outboard spacers.

4. Paint ring gear teeth with a marking compound on both the drive and coast side.

5. Rotate ring gear one complete revolution in both directions while load is being applied with a large screwdriver or similar tool between the carrier casting and differential case flange.

Ring Gear Patterns

tomsn048@gmail.com



Item	Part Number	Description
A	—	Normal or Desirable Pattern
B	—	Backlash Correct. Thinner Pinion Position Shim Required
C	—	Backlash Correct. Thicker Pinion Position Shim Required
D	—	Pinion Position Shim Correct. Decrease Backlash

tomsn048@gmail.com

E	—	Pinion Position Shim Correct. Increase Backlash

Pattern Movements Summarized

1. The following summarizes how pinion and ring gear movements will obtain satisfactory roll patterns:

    a. Decreasing backlash moves the ring gear closer to the pinion.

    Drive pattern (convex side of gear) moves slightly lower and toward the toe.

    Coast pattern (concave side of gear) moves lower and toward the toe.

    b. Increasing backlash moves the ring gear away from the pinion.

    Drive pattern moves slightly higher and toward the heel.

    Coast pattern moves higher and towards the heel.

    c. Thicker pinion position shim with the backlash constant moves the pinion closer to the ring gear.

    Drive pattern moves deeper on the tooth (flank contact) and slightly toward the toe.

    Coast pattern moves deeper on the tooth and toward the heel.

    d. Thinner pinion position shim with the backlash constant moves the pinion further from the ring gear.

    Drive pattern moves toward the top of the tooth (face contact) and toward the heel.

    Coast pattern moves toward the top of the tooth and slightly toward the toe.

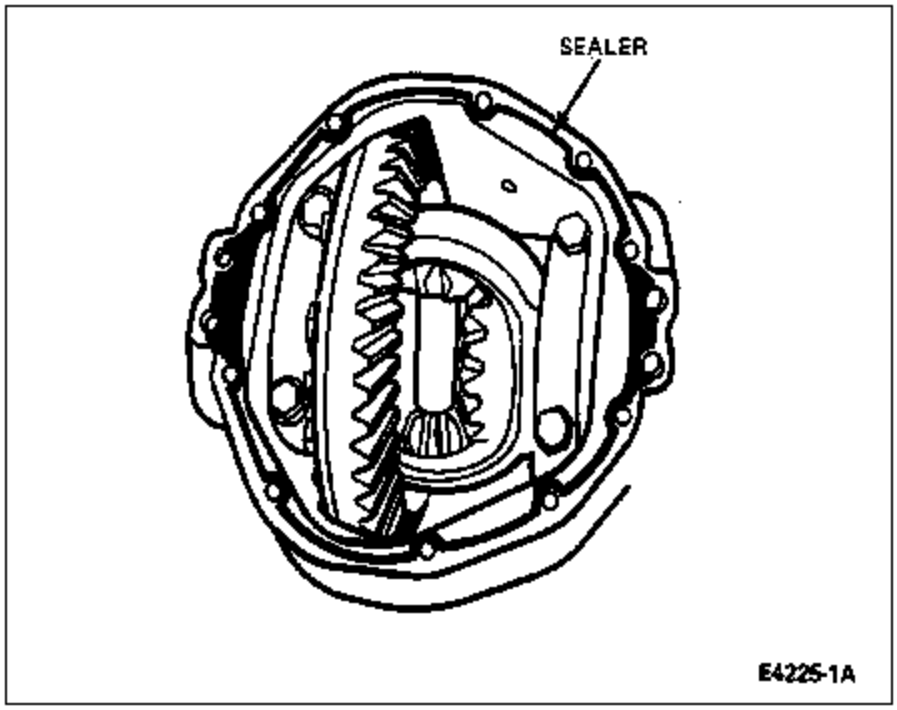
2. Apply a bead 3.175-6.35mm (1/8-1/4 inch) high and 3.175-6.35mm (1/4-1/2 inch) wide of Silicone Rubber RTV sealant D6AZ-19562-AA (clear) or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A on the mating surfaces of the carrier mounting face support arm.

3. Mount the differential assembly to the left hand axle arm, using two guide pins being careful not to smear gasket sealant. Install and tighten bolts to 54-68 Nm (40-50 lb-ft). Tighten one bolt and then tighten the bolt directly opposite it. Tighten the rest of the bolts in either a clockwise or counterclockwise direction.

4. **NOTE: Allow one hour curing time after the axle carrier is assembled to the axle arm before adding lubricant and operating vehicle.**

    Assemble the carrier shear bolt and nut. Tighten to 102-129 Nm (75-95 lb-ft).

tomsn048@gmail.com



tomsn048@gmail.com

Axle Shaft U-Joint

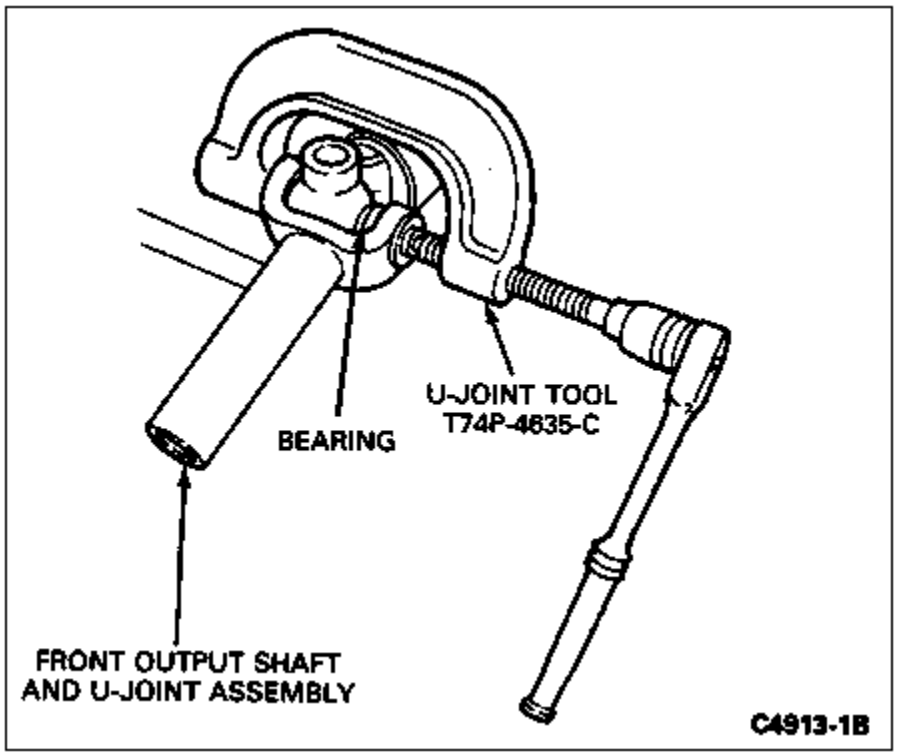
SPECIAL SERVICE TOOL (S) REQUIRED

Description	Tool Number
U-Joint Tool	T74P-4635-C

Disassembly

1. Place the axle shaft assembly in a vise, being careful not to damage it.
2. Remove the snap rings that retain the U-joint bearings in the axle companion flange in the axle shafts.
3. Position U-Joint Tool T74P-4635-C on the shaft and press the bearing out of the axle companion flange. If the bearing cannot be pressed all the way out of the axle companion flange, remove it with vise grip or channel lock pliers.
4. Reposition the tool to press on the journal cross in order to remove the bearing from the opposite side of the axle companion flange.
5. Remove the axle companion flange from the journal cross.
6. Remove the bearing and journal cross from the axle shaft in the same manner.

tomsn048@gmail.com

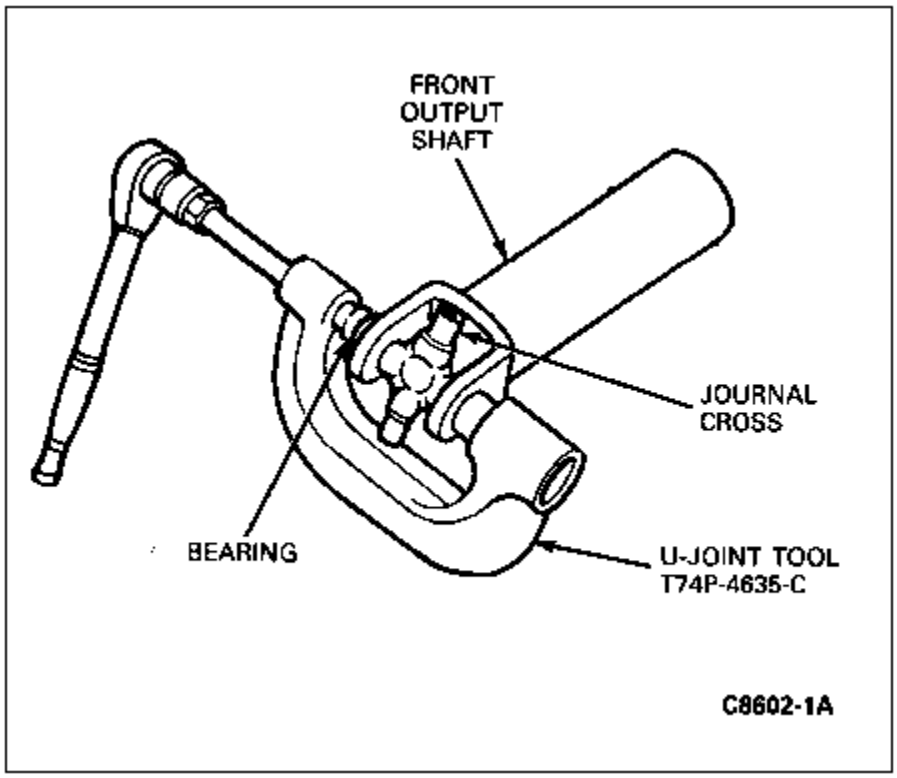


Assembly

1. Start a new bearing into the axle companion flange of the axle shaft.
2. Position the journal cross in the axle companion flange and press the bearing 6.35mm (1/4 inch) flush with the surface of the axle companion flange.
3. Remove the tool and install a new snap ring.
4. Start a new bearing into the opposite side of the axle companion flange.
5. Install the tool and press on the bearing until the opposite bearing is flush.
6. Remove the tool and install a new snap ring.
7. Position the flange on the journal cross and install two new bearings and snap rings.
8. **NOTE: Do not install the driveshaft if the U-joints show any signs of binding.**

   Check the joint for freedom of movement. If a bind has resulted from misalignment during the foregoing procedures, tap the ears of the driveshaft sharply to relieve the bind.

tomsn048@gmail.com



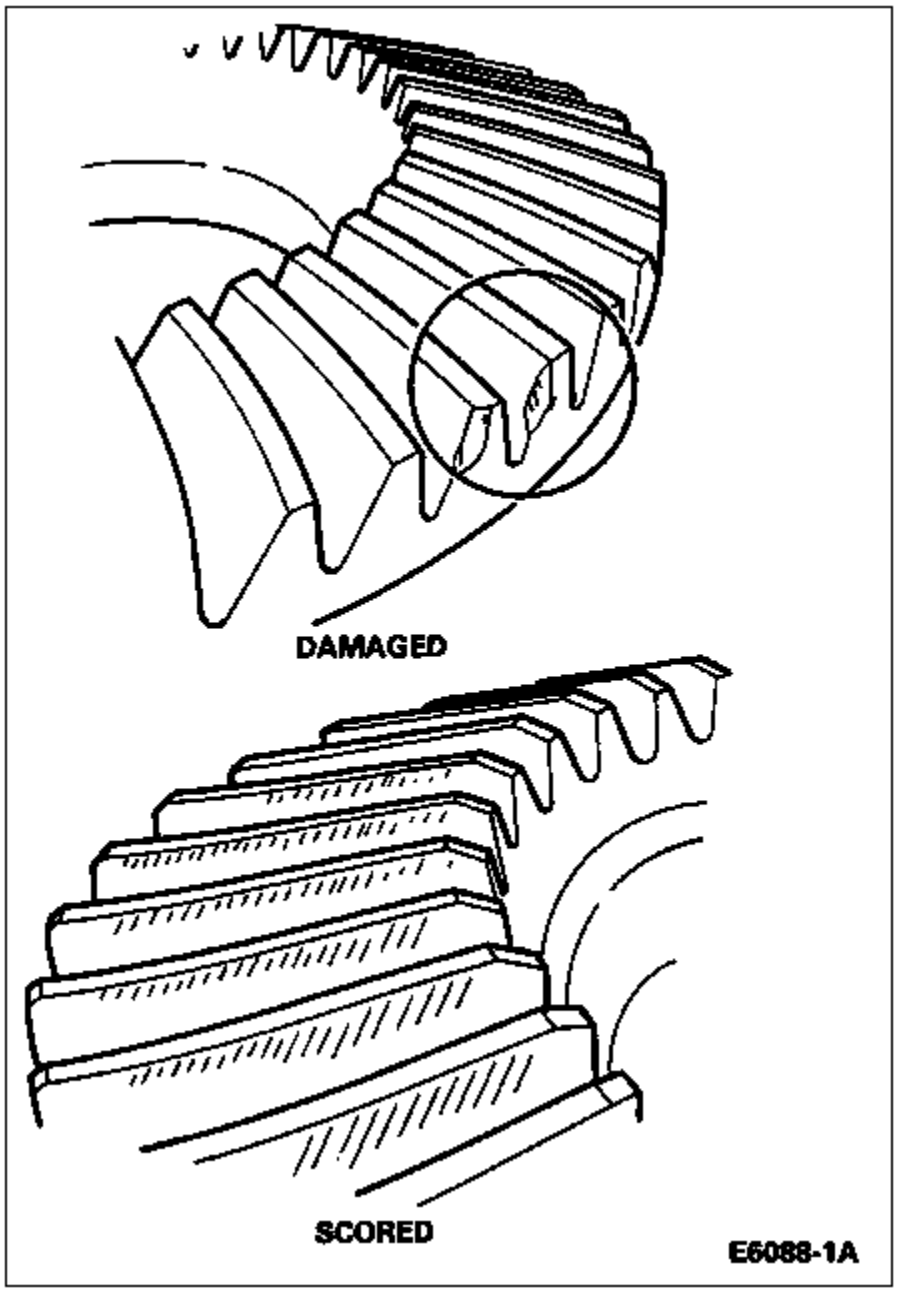
tomsn048@gmail.com

Inspection Before Disassembly of Carrier

The differential case assembly and drive pinion should be inspected prior to removal from the carrier casting. These inspections can determine the cause of the complaint and the resolution.

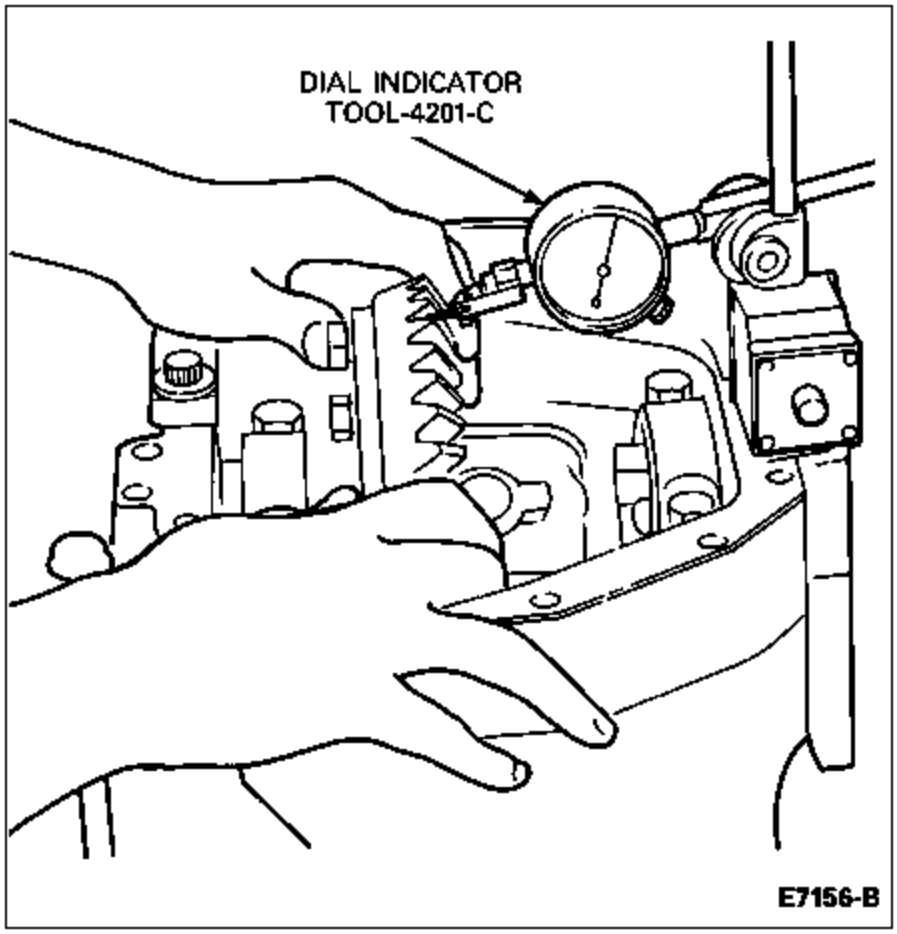
1. Wipe the lubricant from the internal working parts and visually inspect the parts for wear or damage.
2. Rotate the gears. Check any roughness which would indicate worn or damaged bearings or gears.
3. Check the ring gear teeth for signs of scoring, abnormal wear or nicks/chips.

tomsn048@gmail.com



4. Set up Dial Indicator with Bracketry TOOL-4201-C or equivalent and check ring gear backlash and ring gear backface runout. Refer to the Specification at the end of this section for allowable conditions.

tomsn048@gmail.com



tomsn048@gmail.com

Inspection After Disassembly of Carrier Housing

- Thoroughly clean all parts. Always use new solvent when cleaning bearings.
- Do not spin dry bearings with compressed air.
- Oil the bearings immediately to prevent rusting.
- Inspect the parts for any major damage.
- Clean the inside of the housing before rebuilding.
- When a scored or chipped gear set is replaced, the axle housing must be washed thoroughly.

Inspection procedures for individual parts are outlined below.

Gears

Examine the pinion and ring gear teeth for scoring, excessive wear, nicks and chipping. Worn, scored and damaged gears cannot be rebuilt to correct a noisy condition.

Bearing Cups

NOTE: If disassembly is required, it is recommended that new bearings be installed.

Check bearing cups for deep scores, galling, or spalling. If a 0.038mm (0.0015 inch) feeler gauge can be inserted between a cup and the bottom of its bore or any point around the cup, the cup must be reseated.

Cone and Roller Assemblies

When operated in the cups, bearing rollers must turn without roughness. Examine the roller ends for step wear. If inspection reveals either a damaged cup or a damaged cone and roller assembly, both parts should be replaced.

tomsn048@gmail.com

Axle, Front Drive Housed

A number of adjustments involve the front drive axle. For front wheel bearing adjustment, refer to Section 05-03A . For caster and camber alignment adjustment, refer to Section 04-00 .

To correctly assemble the ring and pinion and carrier assembly, the following procedures must be performed:

- Obtain correct pinion depth.
- Check pinion preload.
- Check total differential case travel from side to side.
- Determine correct differential preload and backlash shims.
- Check pinion and ring gear backlash.
- Confirm correct gear contact pattern using gear marking compound.

Adjustment of the differential bearings (4221) is accomplished by a selective shim between the differential bearing cup (4222) and carrier housing. The differential bearings are preloaded by the squeezing action of the carrier housing. A spreader must be used on the carrier to relieve the tension on the differential bearings and permit removal or installation of the differential.

Axle, Front Drive — Front Drive Axle Diagnosis

NOTE: The outboard CV joint internal components are not serviceable. If service is required the CV joint and shaft are replaced as an assembly.

For noise, harshness and vibration concerns, refer to the Diagnosis and Testing portion of Section 05-00 .

FRONT DRIVE AXLE DIAGNOSIS

Condition	Possible Source	Action
• Noise/Vibration in Turns (Clicking, Popping and Grinding)	• Cut or damaged CV joint boots resulting from inadequate or contaminated lube in CV joint.	• REFER to the Disassembly and Assembly portion of this section.
	• Loose CV joint boot clamps.	• REFER to the Disassembly and Assembly portion of this section.
	• Another component contacting halfshaft.	• REFER to the Disassembly and Assembly portion of this section.
	• Worn, damaged or improperly installed wheel bearing.	• REFER to the Removal and Installation portion of this section.
• Vibration at Highway Speed **NOTE: Halfshafts are not balanced and do not contribute to rotational vibration disturbances.**	• Out of balance front wheels or tires.	• REFER to Section 04-04 .
	• Out-of-round front tires.	• REFER to Section 04-04 .
	• Out of balance front or rear driveshaft.	• REFER to Section 05-01 .
• Shudder/Vibration During Acceleration	• Excessively worn or damaged CV joints.	• REFER to Disassembly and Assembly portion of this section.
	• Excessively high CV joint operating angles caused by improper ride height.	• CHECK ride height. VERIFY proper spring rate. CHECK items 1, 2 and 3 under Disassembly and Assembly, CV/CV Halfshaft .
• Halfshaft or CV Joint Pullout	• Differential mispositioned.	• CHECK differential mounts for proper location, damage or wear.

tomsn048@gmail.com

	• Frame rail or strut tower out of position or damaged. • Front suspension components worn or damaged.	• REFER to appropriate section in Group 02. • CHECK for worn bushings or bent components (front stabilizer bar, control arm, etc.). REFER to Section 04-01B .

tomsn048@gmail.com

Driveshaft, Front

Removal

1. Mark the driveshaft and axle companion flanges as well as the driveshaft boot and transfer case front output, so the driveshaft can be reinstalled in the same position.
2. Release Oetiker low-profile clamp on the driveshaft boot with the Boot Clamp Pliers D87P-1090-A or equivalent and free the boot from the transfer case (7A195).
3. Remove the axle snubber from beneath the pinion.
4. Remove the four bolts retaining the front driveshaft to the front axle companion flange.
5. Remove the nuts from the transmission mount studs in the front crossmember (5019).
6. Raise (jack) transfer case so the transmission mount studs are almost out of the front crossmember.
7. Slide the driveshaft front flange between the front axle and the starter motor (11001).
8. When the front flange has cleared, slide the boot and splined yoke out of the transfer case front output.
9. Remove the front driveshaft.

Installation

1. The transfer case should be raised on a jack so the transmission mount studs are almost out of the front crossmember.
2. Align the marks made at removal and slide the boot and splined yoke assembly into the transfer case front output.
3. Slide the driveshaft front flange between the front axle and the starter motor.
4. Lower the transfer case so the transmission studs are returned to their original positions.
5. Tighten the transmission mount nuts to specifications.
6. Align the companion flanges as marked during removal and install the attachment bolts and tighten to 30-40 Nm (22-30 lb-ft).
7. Position the axle snubber on the crossmember just below the axle pinion, install the fasteners and tighten to 23-33 Nm (17-24 lb-ft).
8. Install the Oetiker low-profile clamp with the Boot Clamp Pliers D87P-1090-A or equivalent.

tomsn048@gmail.com

tomsn048@gmail.com

Axle, Front Drive

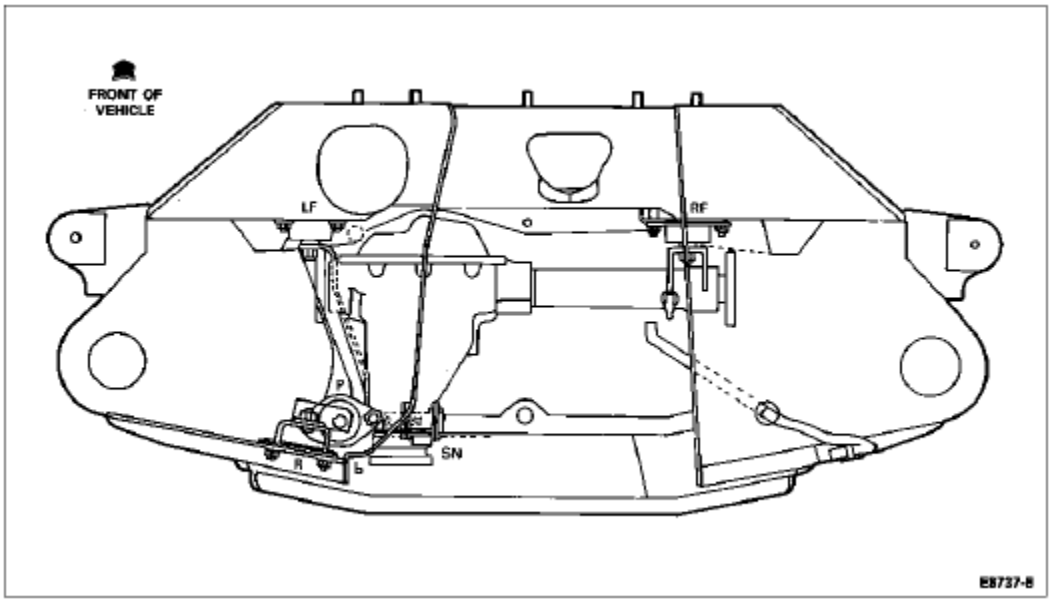
Removal

1. Raise the vehicle on a hoist or jack and install safety stands under the front lift points.
2. **NOTE: Mark the driveshaft and axle flanges so they can be reassembled in their original orientation.**

   Disconnect the front driveshaft from the front axle companion flange.
3. **NOTE: Only four of the six bolts hold the CV halfshaft to the axle shaft. The other two bolts retain the spacer.**

   Remove the bolts that connect the inboard halfshaft flange to the axle shaft (right and left). Wire the halfshafts to the body maintaining a level position.
4. Remove the vent hose from the vent fitting on the axle tube and cap the fitting to prevent any fluid leakage.
5. Remove snubber (SN) from the crossmember rear lateral support, located below the axle pinion.

Front Drive Axle



tomsn048@gmail.com

6. Make sure the front axle is supported by a hoist. Remove the locknuts that connect the axle mounting brackets to the front crossmember (5019) (four places).

7. Lower the hoist and remove the front axle.

8. If necessary, remove the bolts holding the mounting bracket to the axle housing. Remove the bracket.

Installation

1. If removed, attach the axle mounting bracket to the axle housing, using Threadlock and Sealer E0AZ-19554-AA or equivalent meeting Ford specification WSK-M2G351-A5 (Type II) on the two capbolts. Tighten to 95-108 Nm (70-80 lb-ft).

2. With the vehicle on jack stands, raise the axle into position in the vehicle.

3. **NOTE: When installing the axle with new mounting bushings, each nut must be tightened to full torque in one step to avoid scoring of the locking patch on the stud, before the nut is fully tightened.**

   Insert four axle mounting bushing studs through the axle mounting brackets. Install the locknuts using Threadlock and Sealer E0AZ-19554-AA or equivalent meeting Ford specification WSK-M2G351-A5 (Type II). Tighten to 88-115 Nm (65-85 lb-ft). Tighten down in the following order:

   a. Left front (LF)
   b. Right front (RF)
   c. Pinion (P)
   d. Rear (R)

4. Attach the vent hose to the vent fitting on the axle tube. Make sure the hose is not kinked.

5. Position and align the inboard halfshaft flange (right and left) with the axle shaft flange (align marks made during disassembly). Install the bolts and tighten to 30-40 Nm (22-30 lb-ft). Remove the wire that was supporting the halfshafts.

6. Position and align the front driveshaft flange to the front axle flange. Align marks made during removal. Install bolts and tighten to 30-40 Nm (22-30 lb-ft).

7. Position the axle snubber (SN) on the front crossmember just below the axle pinion. Install the fasteners and tighten to 23-33 Nm (17-24 lb-ft).

8. Remove the jack stands and lower the vehicle.

---

tomsn048@gmail.com

tomsn048@gmail.com

Hub and Bearing Assembly

Removal and Installation

1. **NOTE: The hub and bearing assembly is not serviceable. If the bearing requires replacement, replace as an assembly.**

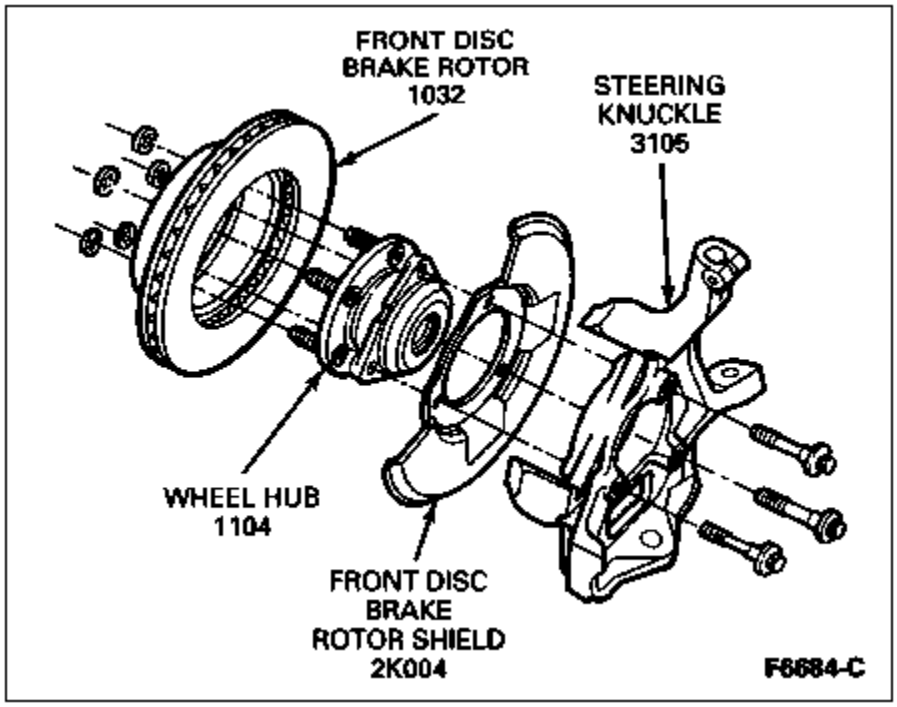
   Raise vehicle on a hoist and position suitable safety stands under vehicle. Remove wheel and tire assembly. Refer to Section 04-04 .

2. Remove disc brake caliper (2B120) and rotor. Refer to Section 06-03 .

3. Remove the three bolts retaining the hub assembly to the steering knuckle.

4. Remove the hub assembly.

For installation, follow removal procedure in reverse order.



tomsn048@gmail.com

tomsn048@gmail.com

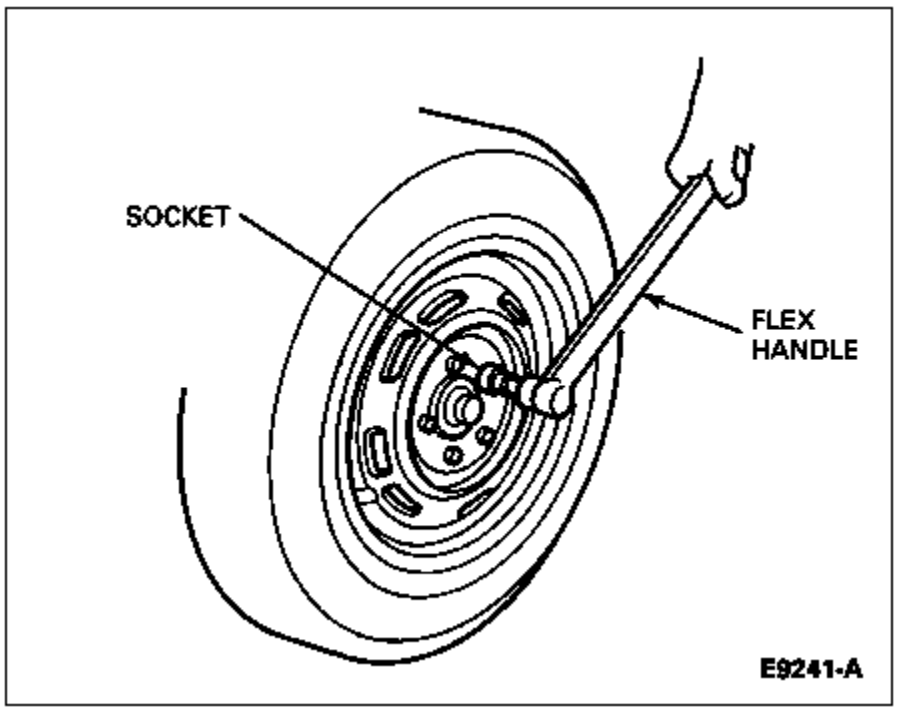
Halfshafts, Inboard U-Joint and Outboard CV Joint

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Front Hub Replacer	T81P-1104-A
Front Hub Remover/Replacer	T81P-1104-C
Metric Hub Remover Adapters	T83P-1104-BH
Front Hub Bearing Service Set	T86P-1104-A

Removal

1. Remove wheel cover/hub cover from wheel (1007) and tire and loosen lug nuts (1012).

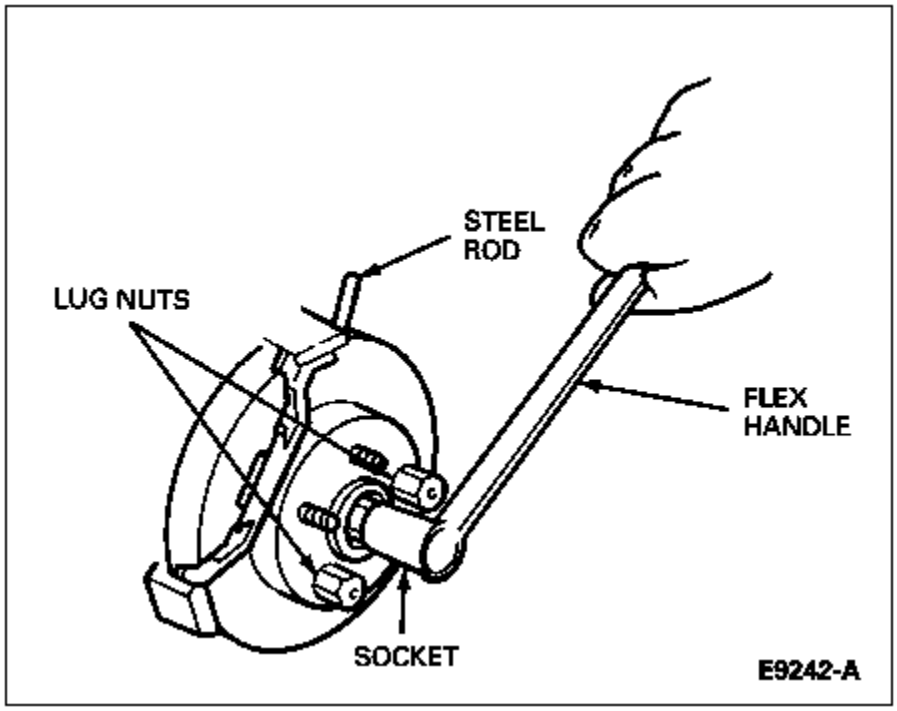


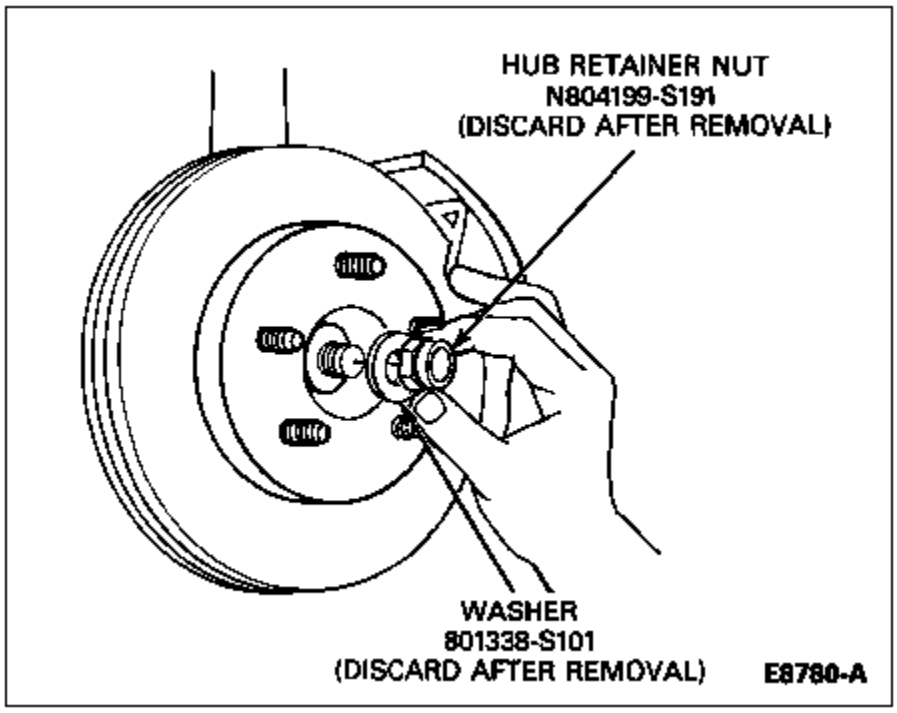
2. Raise the vehicle on a frame contact hoist.

3. **CAUTION: Discard the hub retainer nut. It is a torque prevailing design and cannot be reused.**

   Remove the wheel and tire, and the hub retainer nut and washer.

tomsn048@gmail.com





4. Mark the differential shaft flange in relation to the halfshaft so they may be installed in their original position.

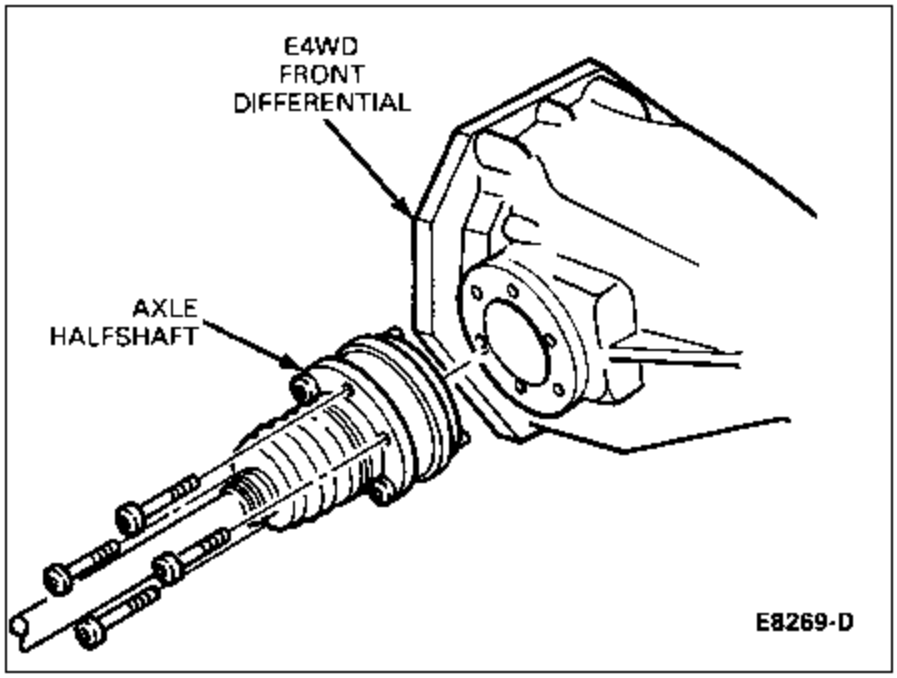
5. **NOTE: Only four of the six bolts hold the CV halfshaft to the axle shaft. The other two bolts retain the spacer.**

tomsn048@gmail.com

Remove the four bolts and disconnect the halfshaft inboard joint from the differential axle shaft flanges.

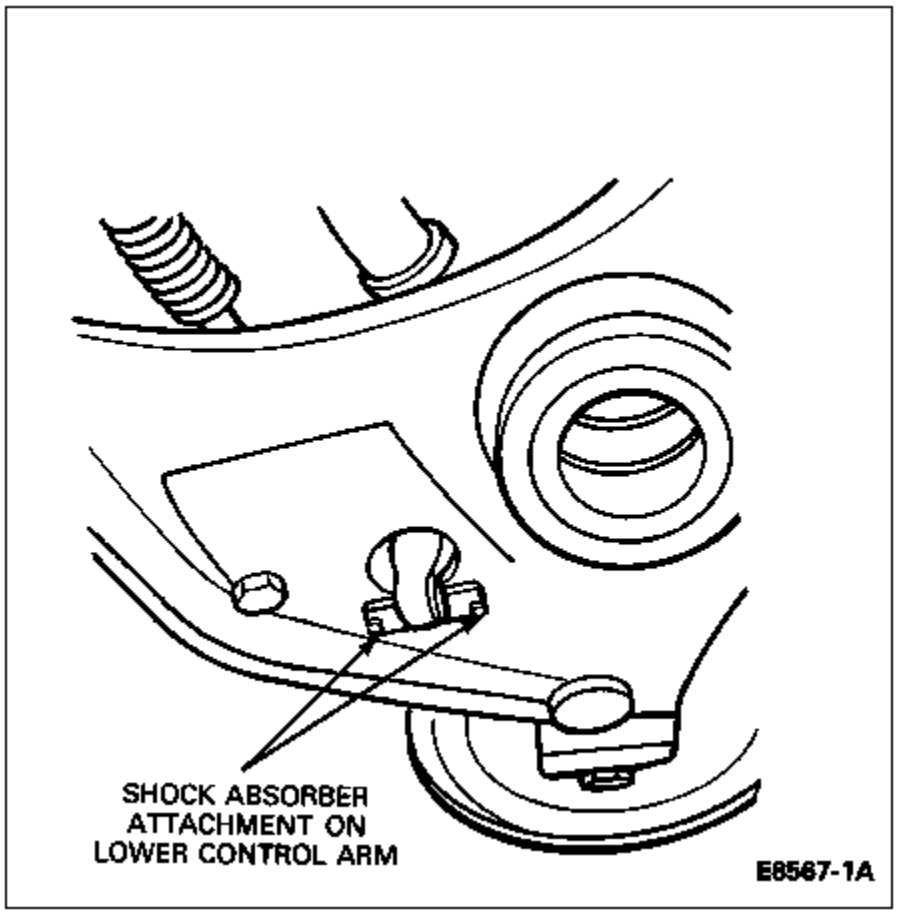
6. **CAUTION: Do not allow the shaft to hang unsupported. Damage to the outboard CV joint may result.**

   Support the end of the shaft by suspending it from a convenient underbody component with a length of wire.



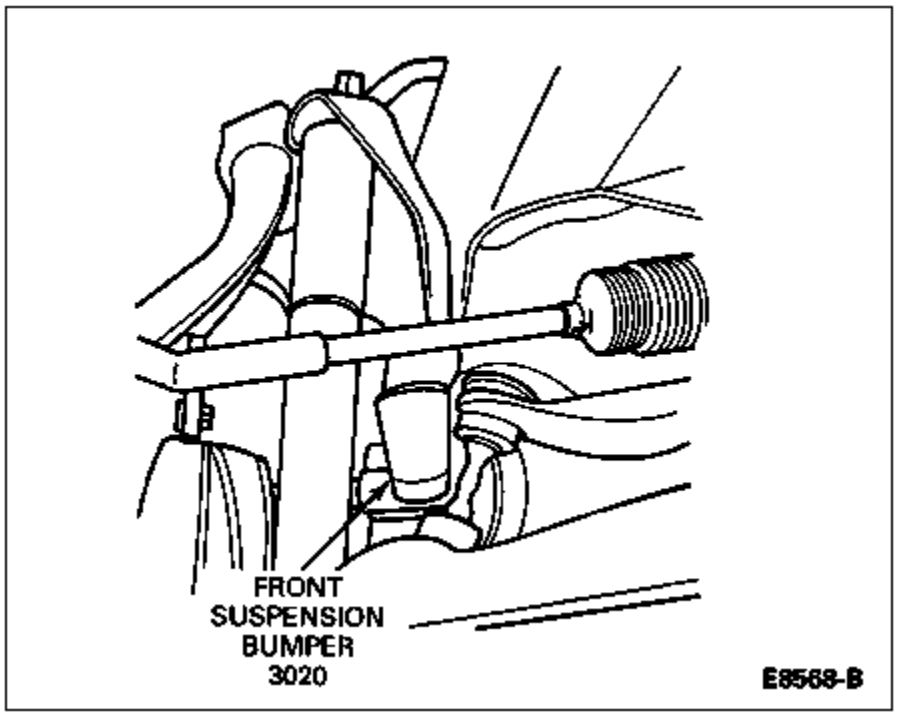
7. Loosen the shock absorber attachment on the lower control arm and move to the side.

tomsn048@gmail.com



8. Remove the front suspension bumper (3020).

tomsn048@gmail.com



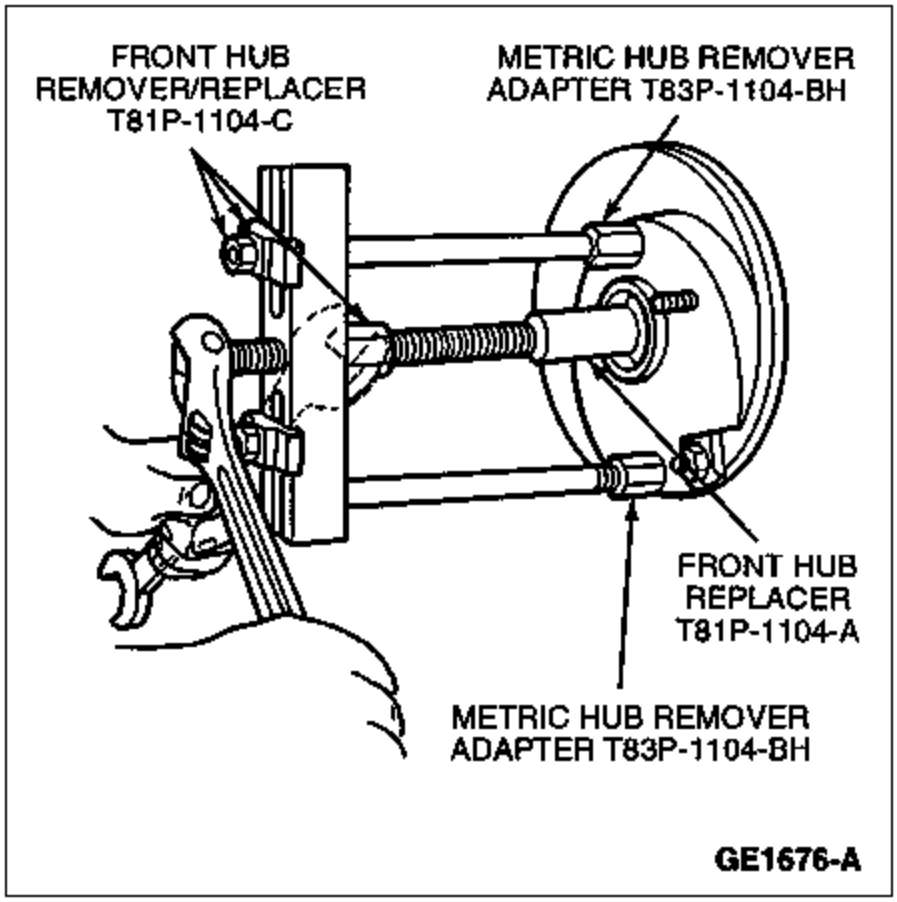
9. **CAUTION: Never use a hammer to separate the outboard CV joint stub shaft from the hub. Damage to the CV joint threads and internal components may result.**

   NOTE: Make sure adapters are fully threaded onto the hub studs and are positioned opposite the other adapter.

   Separate the outboard CV joint from the wheel hub (1104) using Front Hub Remover/Replacer T81P-1104-C with T81P-1104-A and Metric Hub Remover Adapters T83P-1104-BH and Front Hub Bearing Service Set T86P-1104-A.

10. Free the wheel hub, bearing and knuckle assembly from the halfshaft by pushing in the CV joint outer shaft until it is loose in the assembly.

tomsn048@gmail.com



11. **CAUTION: Once the halfshaft(s) have been removed, the vehicle must not be driven, or rolled with the vehicle weight supported by the hub bearing.**

    Remove halfshaft assembly from vehicle.

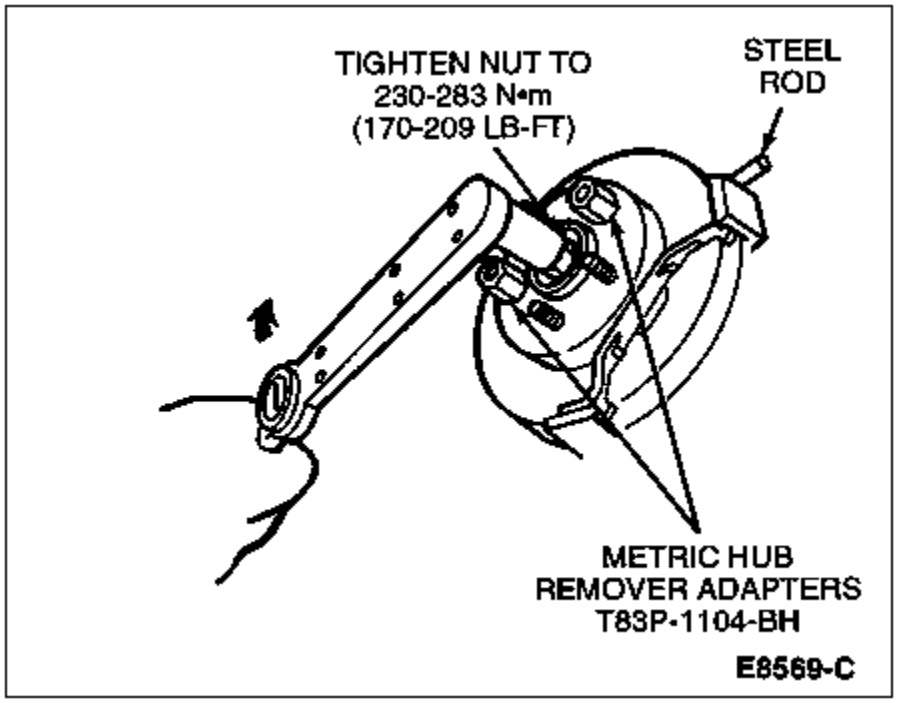
Installation

1. Carefully align splines of outboard CV joint stub shaft with splines in wheel hub and push the shaft into the hub as far as possible.
2. Temporarily fasten front disc brake rotor to hub with washers and two lug nuts.
3. Insert a steel rod into the rotor and rotate clockwise to contact the knuckle to prevent the rotor from turning during CV joint installation.
4. **CAUTION: A new hub retainer nut must be installed.**

   Install the hub nut washer and a new hub retainer nut. Manually thread the retainer onto the halfshaft as far as possible.
5. **CAUTION: Do not use power or impact tools to tighten the hub nut.**

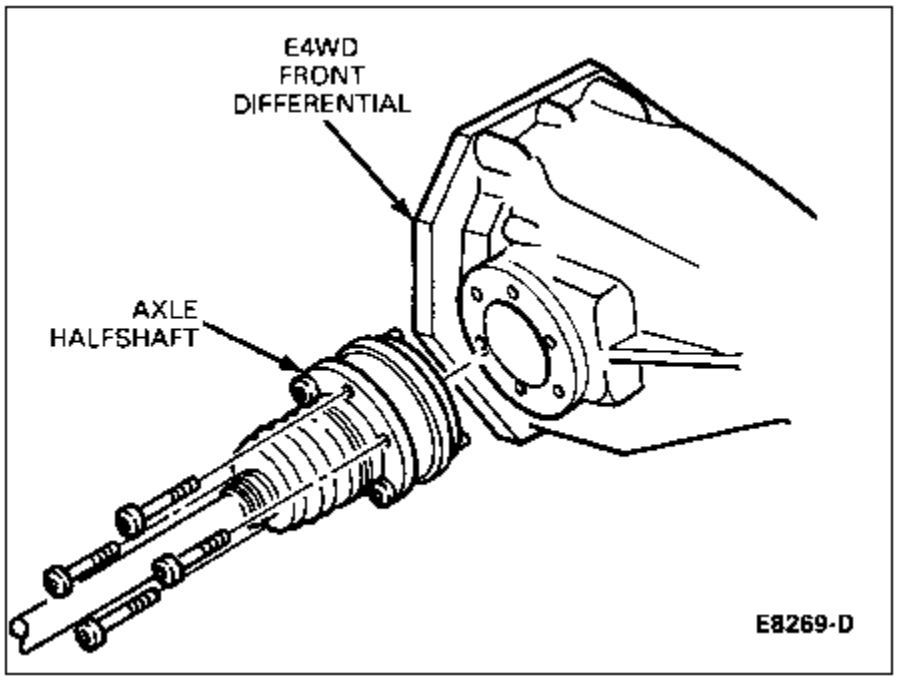
tomsn048@gmail.com

Tighten hub retainer nut to 230-283 Nm (170-209 lb-ft).



6. Install the inboard flange of the halfshaft to the differential output flange aligning index mark on the halfshaft with index mark on the differential output flange. This ensures original halfshaft position.

7. Install the flange bolts and tighten to 30-40 Nm (22-30 lb-ft).



tomsn048@gmail.com

8. Install wheel and tire and lower the vehicle.
9. Tighten lug nuts to 115-156 Nm (85-115 lb-ft).

---

tomsn048@gmail.com

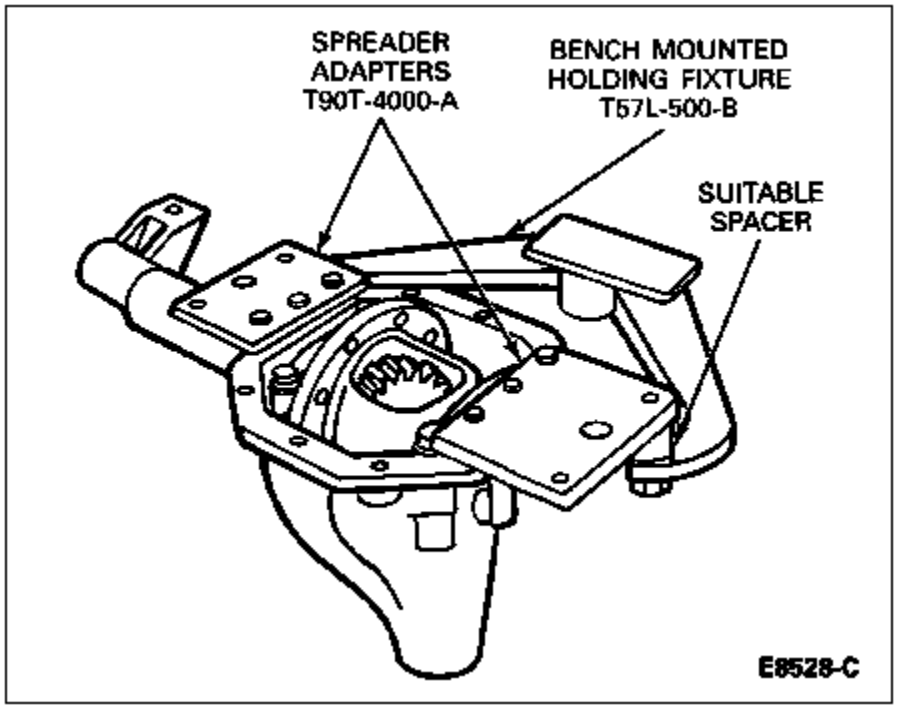
Axle Shafts, Carrier Oil Seal and Bearing

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Bench Mounted Holding Fixture	T57L-500-B
Impact Slide Hammer	T50T-100-A
Needle Bearing Replacer	T83T-1244-A
Driver Handle	T80T-4000-W
Axle Seal Replacer	T90T-3110-A
Spreader Adapter	T90T-4000-A

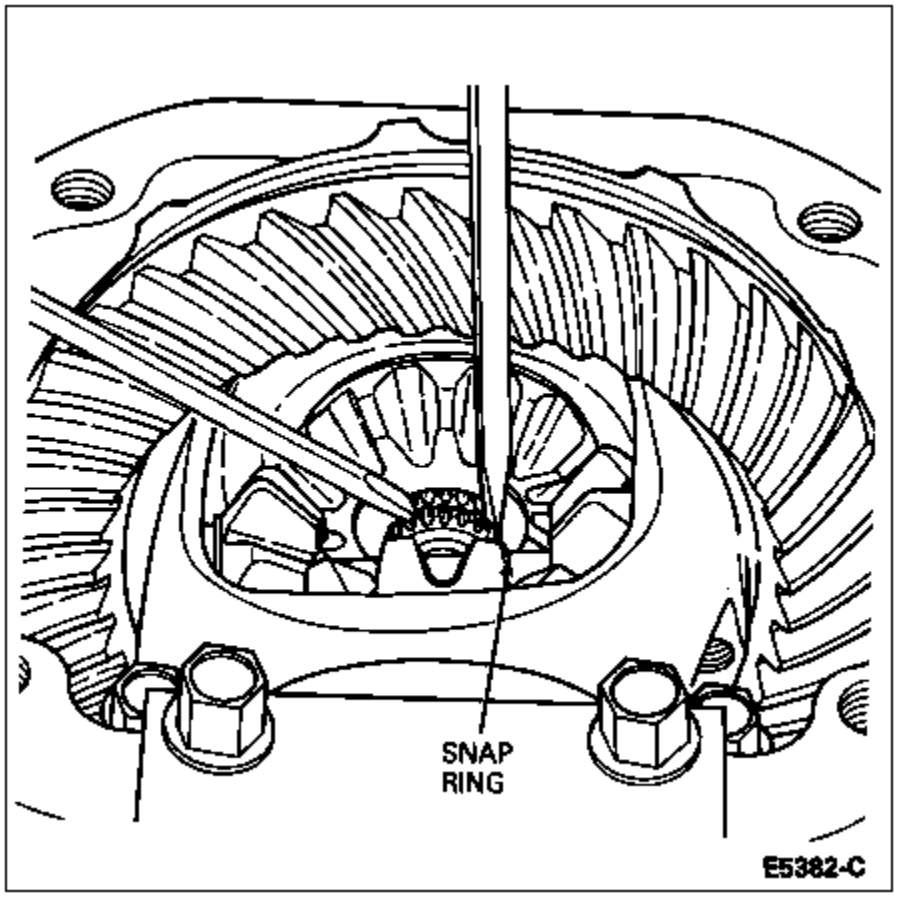
Removal

1. Remove the axle from the front sub-frame (5C145) and vehicle. Refer to the procedure in this section.
2. Remove cover plate and drain lubricant.
3. Mount the axle in Bench Mounted Holding Fixture T57L-500-B as shown.



tomsn048@gmail.com

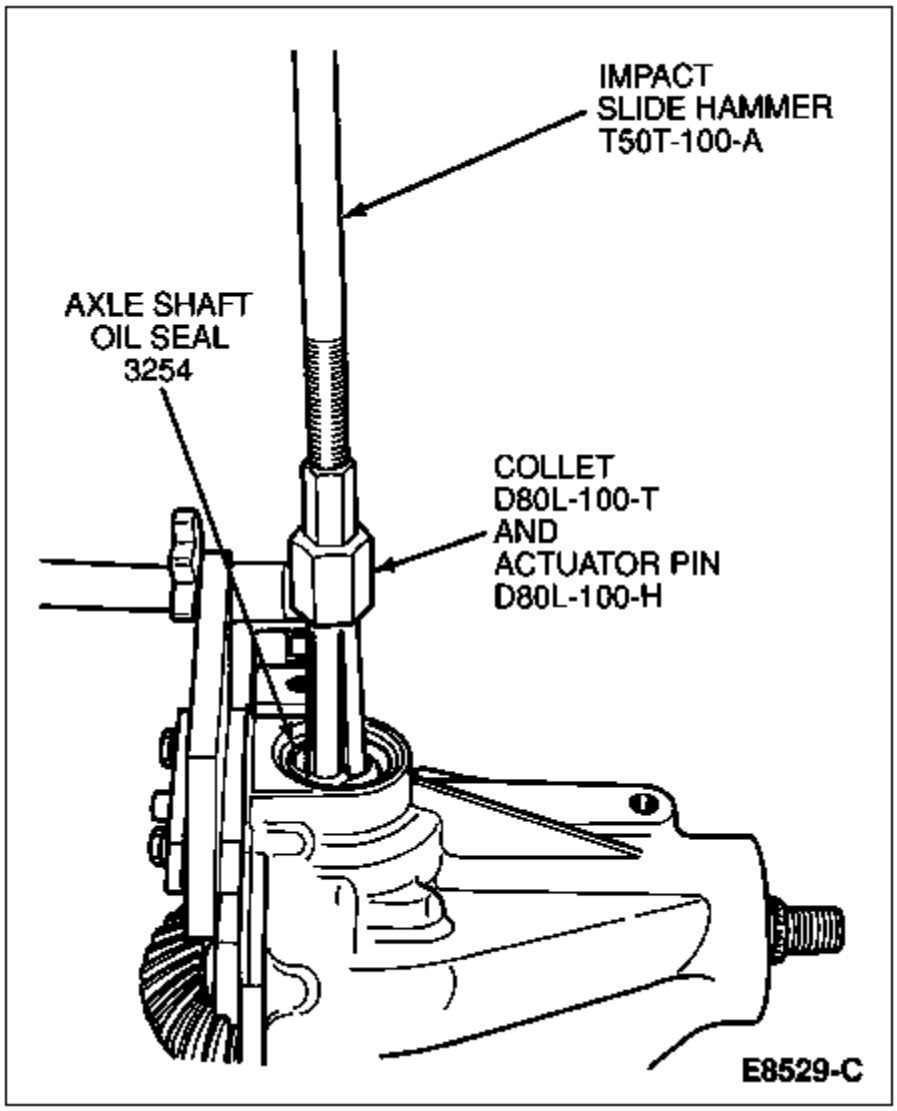
4. Rotate the shafts so the open side of the snap ring is exposed as shown. Remove snap rings from the shafts.



5. Remove shafts from the assembly.

6. Using Collet D80L-100-T, Actuator Pin D80L-100-H or equivalents and Impact Slide Hammer T50T-100-A remove the axle shaft oil seal (3254) and caged needle bearings as shown. Discard the seal and needle bearing (both sides).

tomsn048@gmail.com



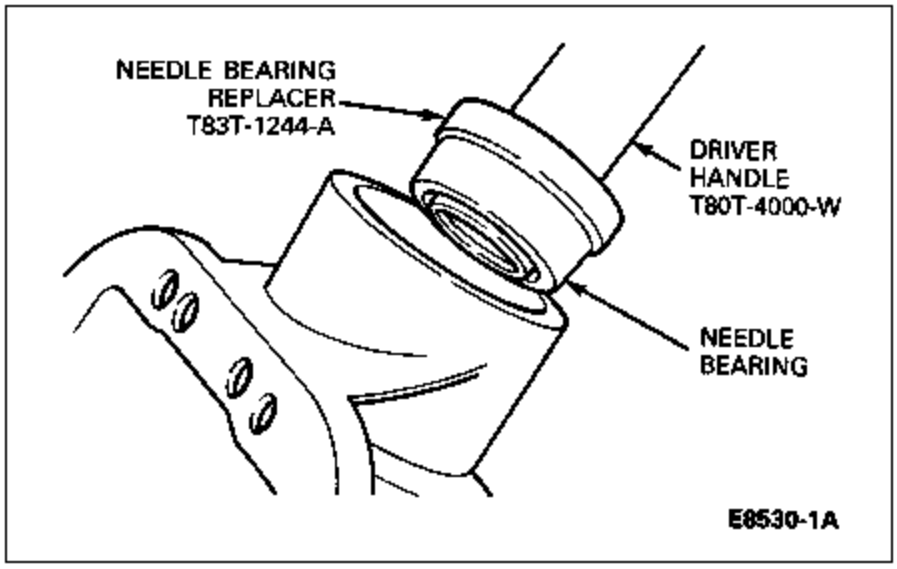
Installation

1. Make sure the bearing bore is free from nicks and burrs. Install a new caged needle bearing on Needle Bearing Replacer T83T-1244-A, with the manufacturer name and part number facing outward toward the tool.

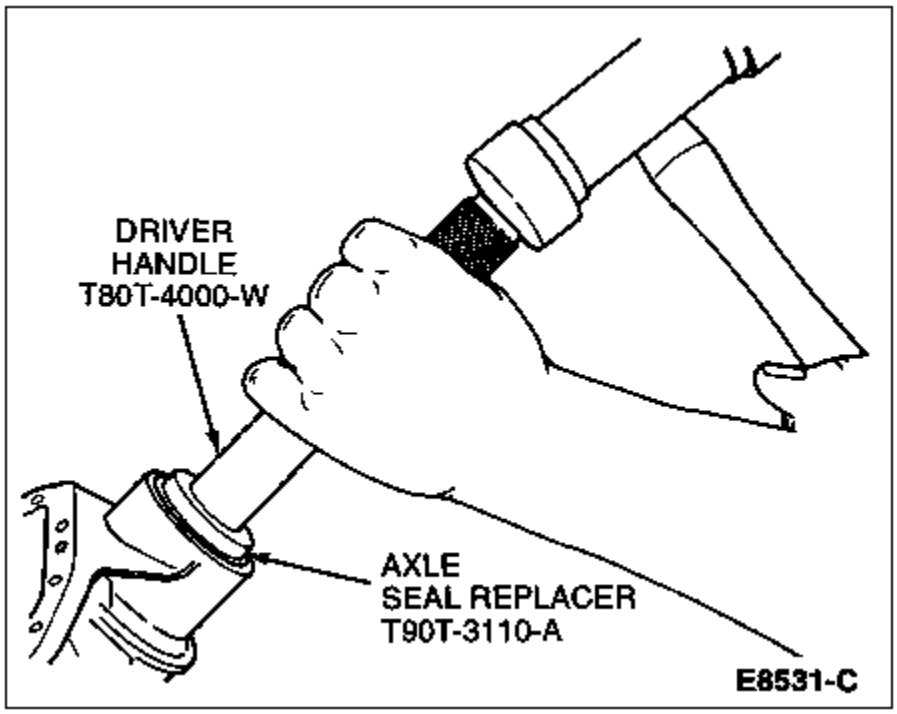
2. **NOTE: Tool controls the installation depth of seal and bearing.**

   Using Driver Handle T80T-4000-W drive the needle bearing until it is seated in the bore.

tomsn048@gmail.com



3. Coat the seal with Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B. Drive the axle shaft oil seal into the carrier using Axle Seal Replacer T90T-3110-A and Driver Handle T80T-4000-W.

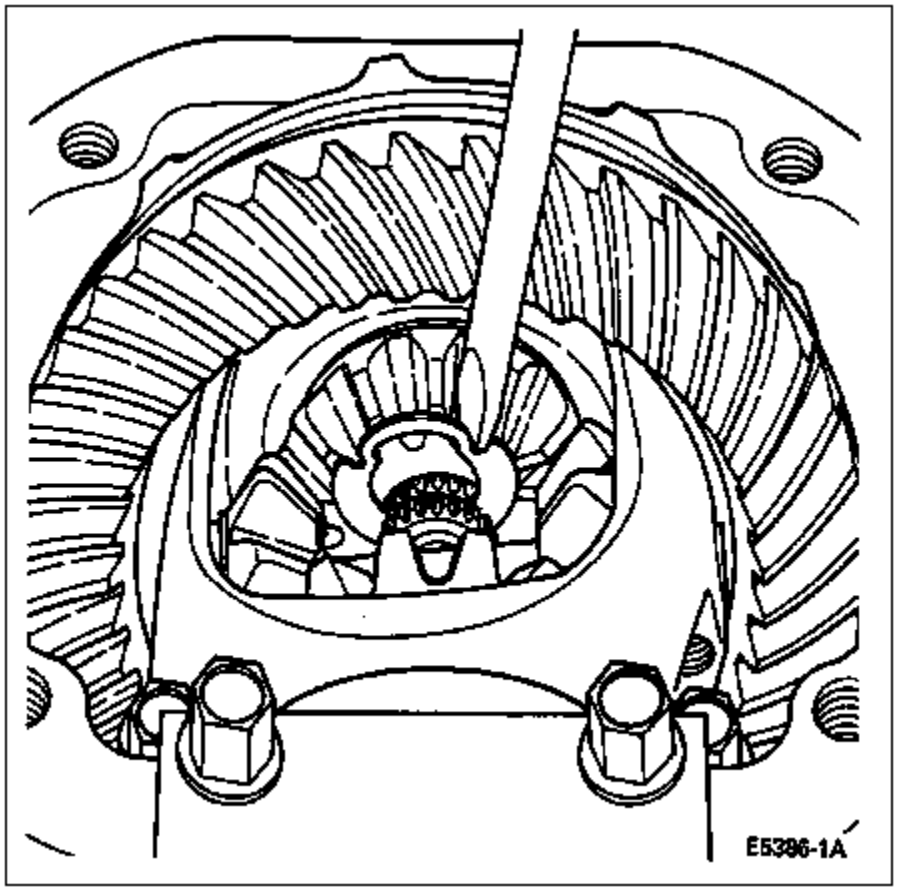


4. Install the axle shafts into the carrier so the groove in the shaft is visible in the differential case.

5. **NOTE: Do not tap on the center of the snap ring. This may damage the snap ring.**

   Install the snap ring in the groove in the shaft. Force the snap ring into position with a screwdriver as shown.

tomsn048@gmail.com



6. Remove the axle from the holding fixture.

7. **CAUTION: Apply only enough RTV to prevent leakage. Excess amounts of RTV may mix with axle lubricant which might cause damage to axle component.**

   NOTE: Allow one hour cure time before filling carrier with the proper amount of Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid, XT-2-QDX or -DDX or equivalent MERCON® fluid.

   Clean all traces of gasket RTV sealant from the surfaces of the carrier and cover and make sure the surfaces are free from dirt and oil. Apply a bead of RTV sealant D6AZ-19562-AA (clear) or -BA (black) or equivalent meeting Ford specification ESB-M4G92-A and ESE-M4G195-A, in a bead 3.18-6.35mm (1/8-1/4 inch) wide. The bead should be continuous and should not pass through or outside the holes.

8. **CAUTION: If any RTV enters cover screw holes, it may cause incorrect torque readings when installing the cover screws.**

   NOTE: The cover must be installed on the carrier within five minutes after applying the RTV sealant.

   Install the cover plate. Assemble cover bolts and tighten to 19-26 Nm (14-19 lb-ft).

tomsn048@gmail.com

9. Fill the carrier with the proper amount of Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid, XT-2-QDX or -DDX or equivalent MERCON® fluid.

10. Install the axle in the vehicle. Refer to the procedure in this section.

---

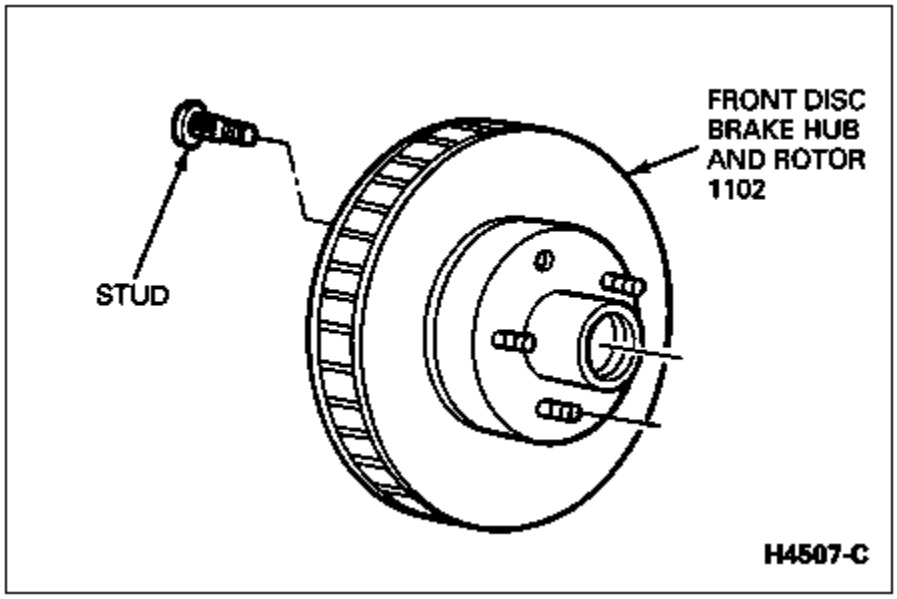
tomsn048@gmail.com

Wheel Hub Bolt

CAUTION: Service must be performed on any damaged components or the component that caused stud to require replacement.

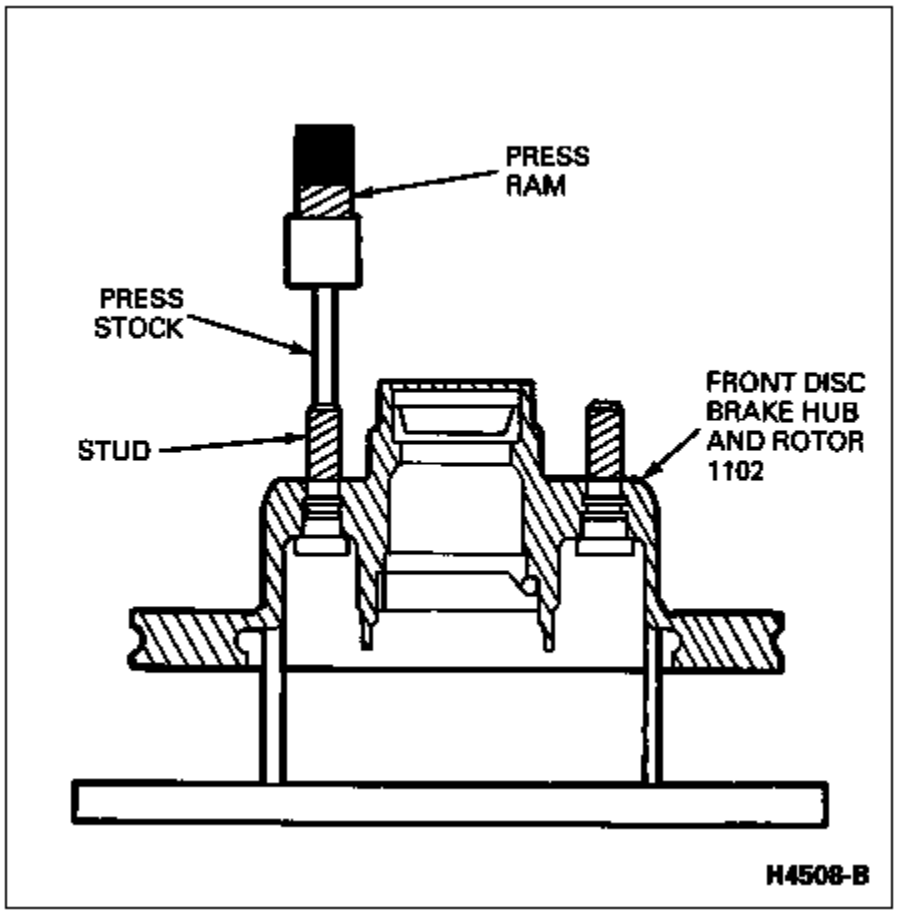
Removal

1. Raise the vehicle and install safety stands.
2. Remove the wheel and tire assembly as described in Section 04-04 .
3. Remove the front disc brake hub and rotor (1102) as described in Section 06-03 .



4. Position the front disc brake hub and rotor in a press so ram pressure is not directly exerted on the surface of front disc brake hub and rotor. With appropriate press stock, press the stud from the front disc brake hub and rotor. Discard the stud.

tomsn048@gmail.com

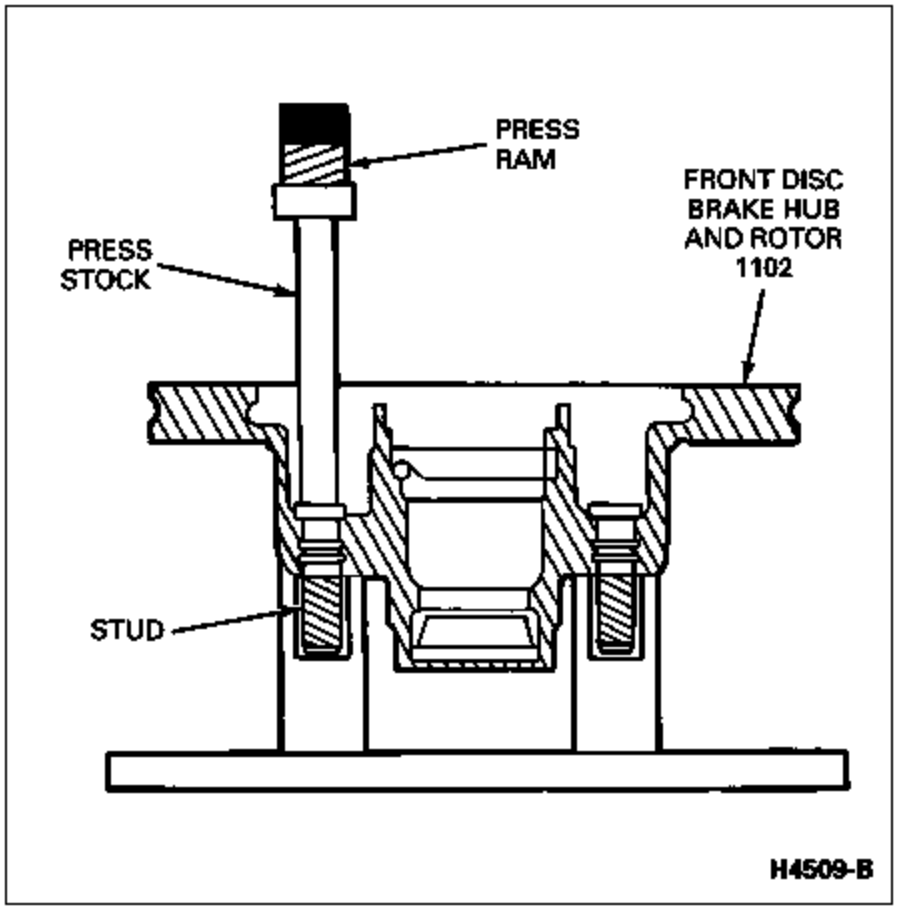


5. Inspect the stud for damaged threads. Discard if damaged.

Installation

1. Position a new stud in the hole. Align the serrations of the new stud with the serration marks from the old stud. With a hammer, lightly tap the stud until the serrations on the stud are started in the hole.
    - Make sure the stud is not installed in an "off-center" position in front disc brake hub and rotor.
2. Position the front disc brake hub and rotor in a press so the front disc brake hub and rotor is supported on the wheel mounting flange. Allow enough clearance for the stud to pass through the hole. Do not apply ram pressure directly on the rotor surface of front disc brake hub and rotor.
3. With appropriate press stock, press the stud flush against the inner surface of the hub and rotor.

tomsn048@gmail.com



4. Install the front disc brake hub and rotor as described in Section 06-03 .
5. Replace any damaged lug nuts (1012).
6. Install the wheel (1007) and tire as described in Section 04-04 .

tomsn048@gmail.com

tomsn048@gmail.com

Carrier Disassembly

SPECIAL SERVICE TOOL(S) REQUIRED

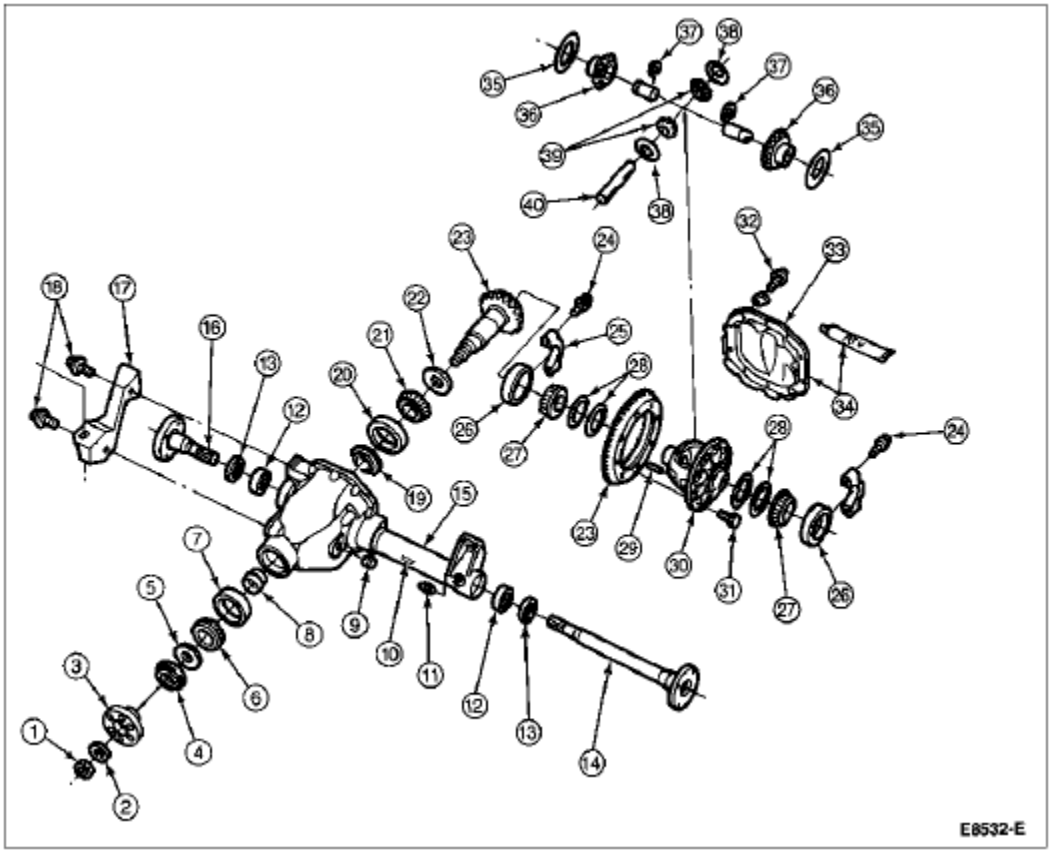
Description	Tool Number
Bench Mounted Holding Fixture	T57L-500-B
Spreader Adapters	T90T-4000-A
Companion Flange Holding Tool	T78P-4851-A
Impact Slide Hammer	T50T-100-A
Outer Pinion Bearing Cup Remover	T86T-4628-BH
Driver Handle	T80T-4000-W

1. Remove the axle from the front sub-frame (5C145) as described in Removal and Installation, Axle, Front-Drive in this section.

2. Remove the cover plate and drain lubricant.

Carrier Disassembly

tomsn048@gmail.com



Item	Part Number	Description
1	351126-S	Nut (Pinion)
2	356504-S	Washer (Pinion)
3	4851	Rear Axle Companion Flange
4	4676	Pinion Seal
5	—	Thrust Washer (Outer Pinion Bearings, Part of 3222)
6	4621	Front Pinion Bearing
7	4616	Front Drive Pinion Bearing Cup
8	3A222	Collapsible Spacer (Pinion Bearing Preload)
9	—	Fill Plug (Part of 3010)
10	—	Identification Tag (Part of 3010)
11	7034	Vent
12	3C123	Bearing
13	3254	Axle Shaft Oil Seal

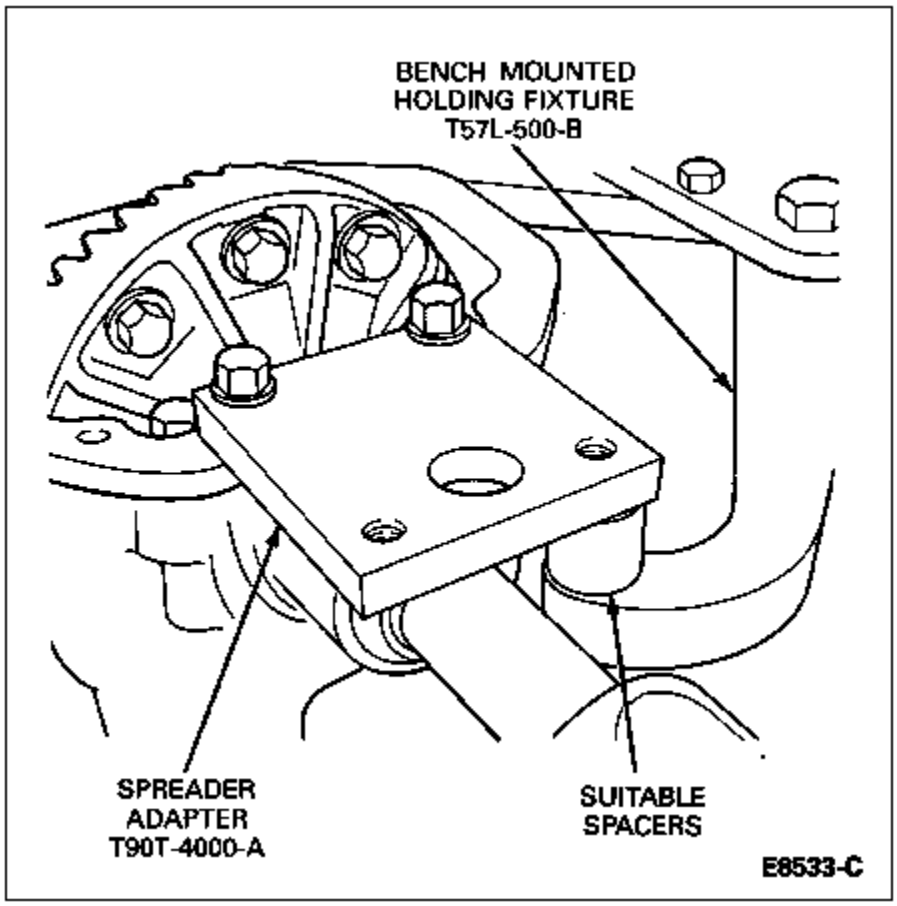
36	—	Side Gear (Part of 3215)
37	3167	Snap Ring (Axle Shaft Retention)
38	4230	Differential Pinion Thrust Washer
39	—	Differential Pinion Mate Gear (Part of 3215)
40	4211	Differential Pinion Shaft

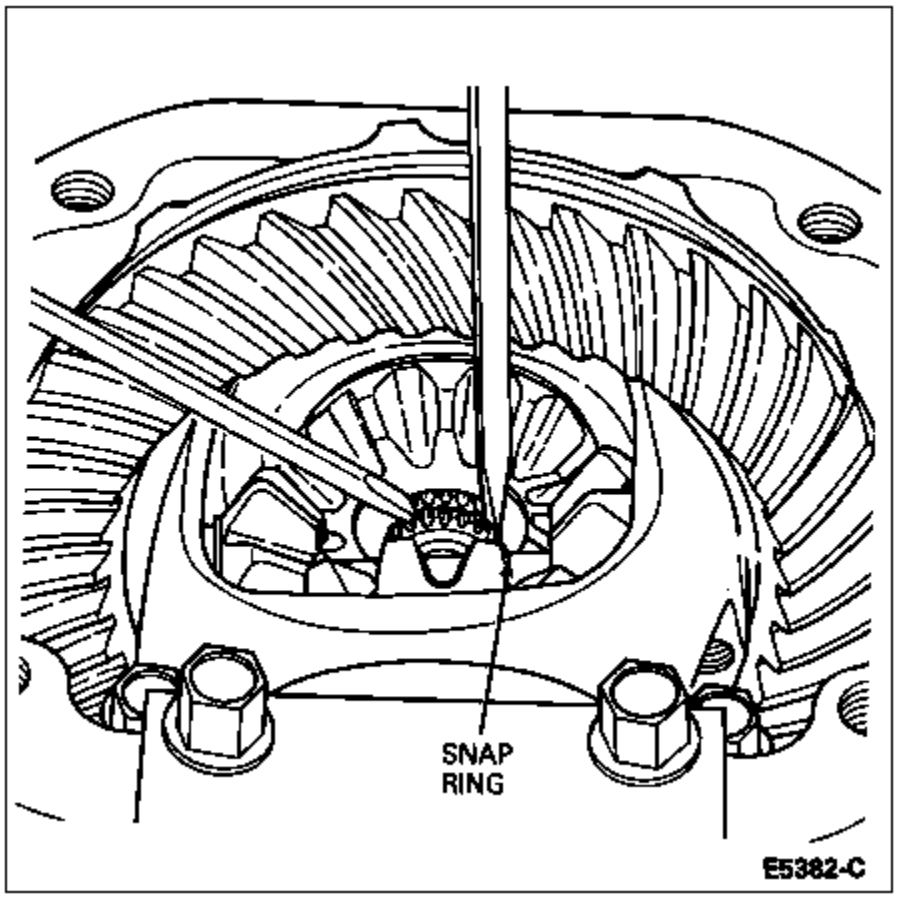
3. Mount the axle in Bench Mounted Holding Fixture T57L-500-B and Spreader Adapters T90T-4000-A and suitable spacers.

tomsn048@gmail.com



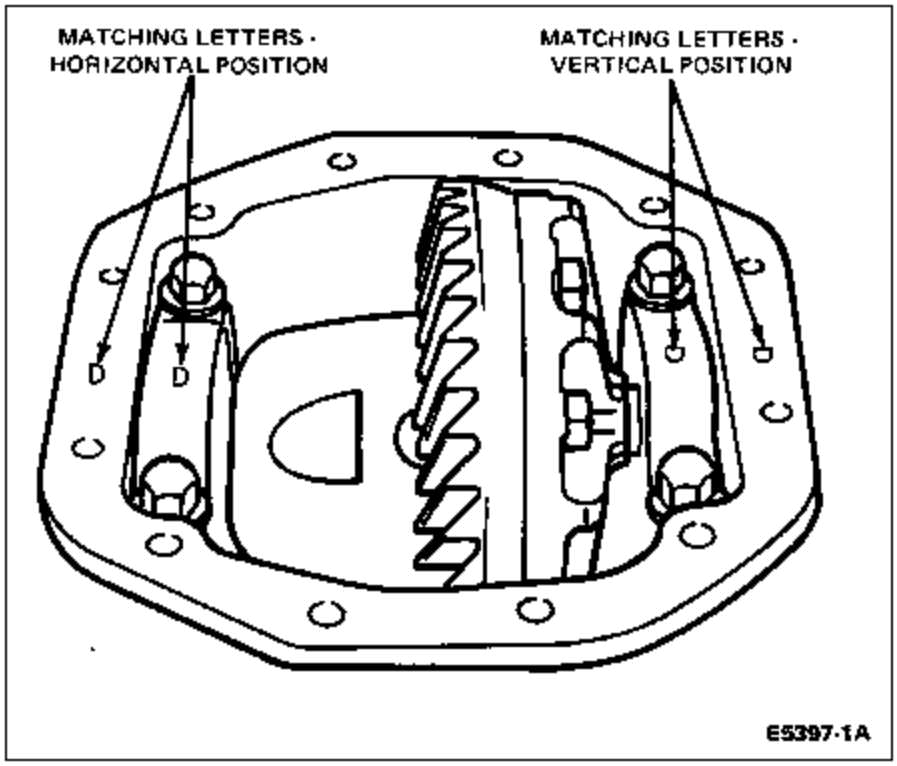
4. Remove old sealant and clean all gasket surfaces.
5. Rotate the shafts so the open side of the snap ring is exposed. Refer to Axle Shafts, Carrier Oil Seal and Bearing Removal in this section.
6. Remove snap rings from the shafts.
7. Remove shafts from the assembly.

tomsn048@gmail.com



8. Remove the bearing caps.

tomsn048@gmail.com



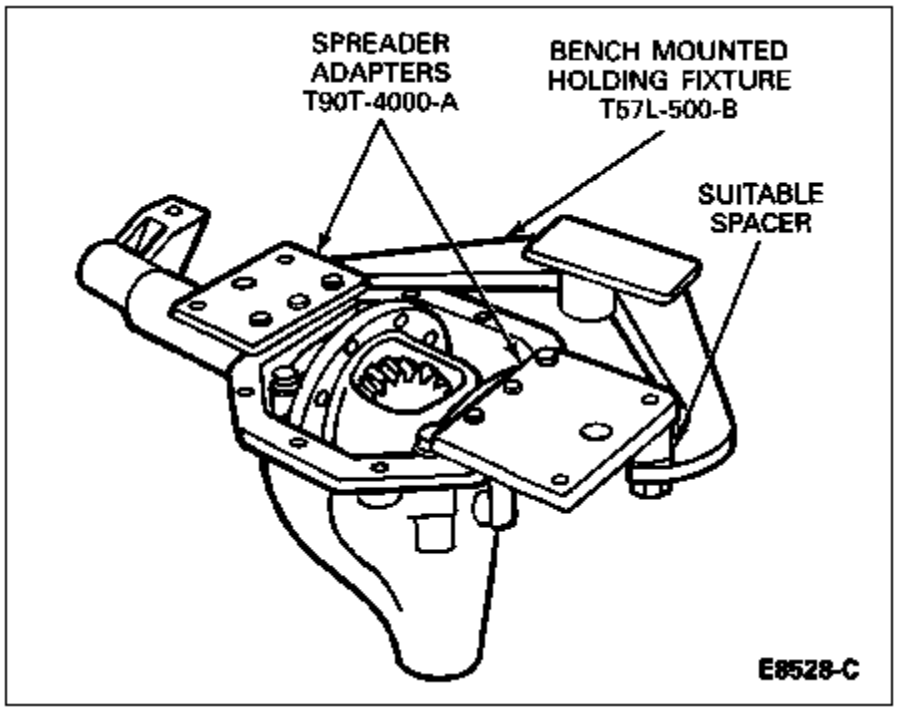
9. **CAUTION: Do not spread the carrier beyond .381mm (.015 inch).**

   CAUTION: Prybars may be necessary to remove the carrier from the case.

   NOTE: Numbers or letters stamped on cap and carrier must be matched and correctly repositioned upon assembly.

   Install Spreader Adapters T90T-4000-A, and spread carrier .381mm (.015 inch). Remove the differential case from the carrier.

tomsn048@gmail.com



10. Remove and tag differential bearing cups (4222) to indicate from which side of the carrier they were removed.

11. **NOTE: Before removing companion flange, mark flange yoke spline orientation to pinion gear spline to assure same position during reassembly.**

    Rotate holding fixture so pinion is facing up. Hold the rear axle companion flange with Companion Flange Holding Tool T78P-4851-A and remove the pinion nut and washer from the pinion shaft.

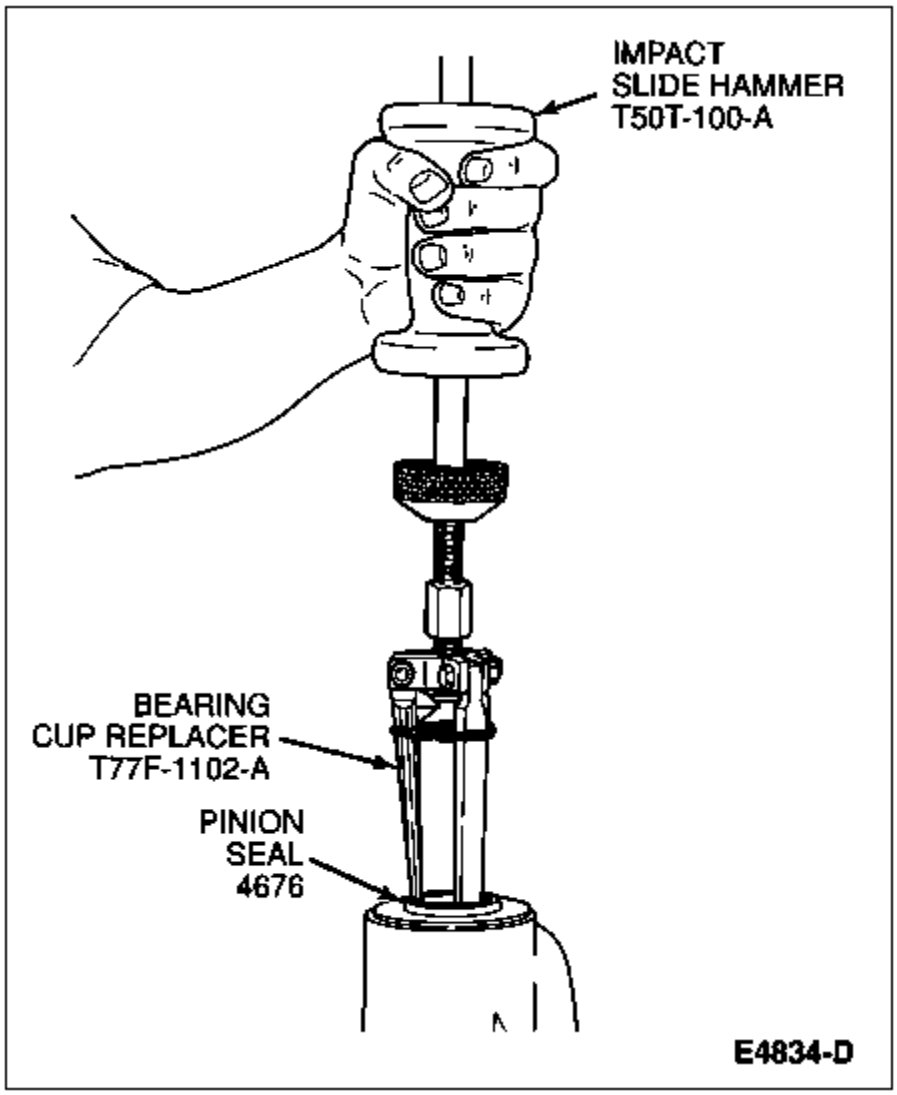
12. Remove the rear axle companion flange, using a 2-Jaw Puller D81L-1002-A or equivalent. If the flange shows any signs of wear in the area of seal contact, replace the flange.

13. **CAUTION: Pinion gear teeth have sharp edges. Use care to avoid cuts or injury.**

    Remove the drive pinion by tapping on the drive pinion shaft with a rawhide or plastic hammer. Catch the pinion to prevent damage to the pinion.

14. Remove the pinion seal from the carrier bore by using Bearing Cup Puller T77F-1102-A and Impact Slide Hammer T50T-100-A. Discard seal.

tomsn048@gmail.com



15. Remove the front bearing cone and roller, oil slinger and collapsible spacer and discard.

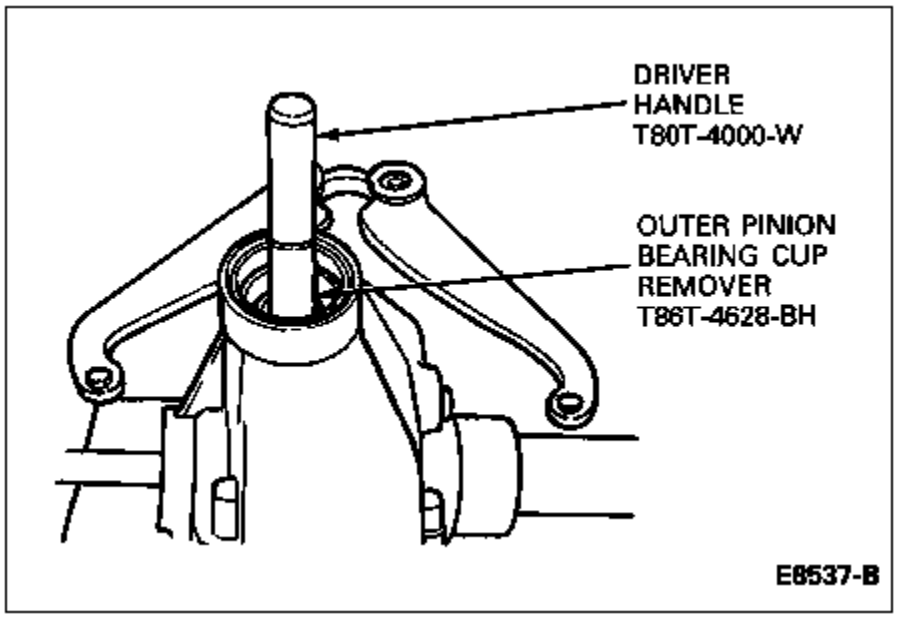
16. To remove the rear drive pinion bearing cup, pass Outer Pinion Bearing Cup Remover T86T-4628-BH and Driver Handle T80T-4000-W through the front drive pinion bearing cup and against the rear bearing cup. Drive out the rear bearing cup.

17. **NOTE: An oil baffle is located between the rear bearing cup and carrier bore. If the baffle is damaged during cup removal, replace with a new one.**

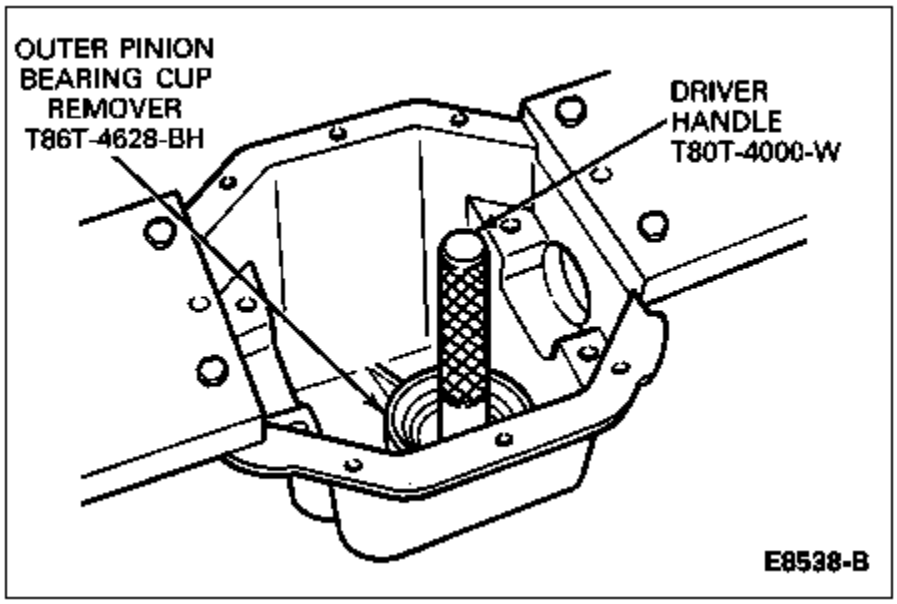
    NOTE: Baffles do not have selective thicknesses.

    Remove the oil baffle from the rear bearing cup bore.

tomsn048@gmail.com

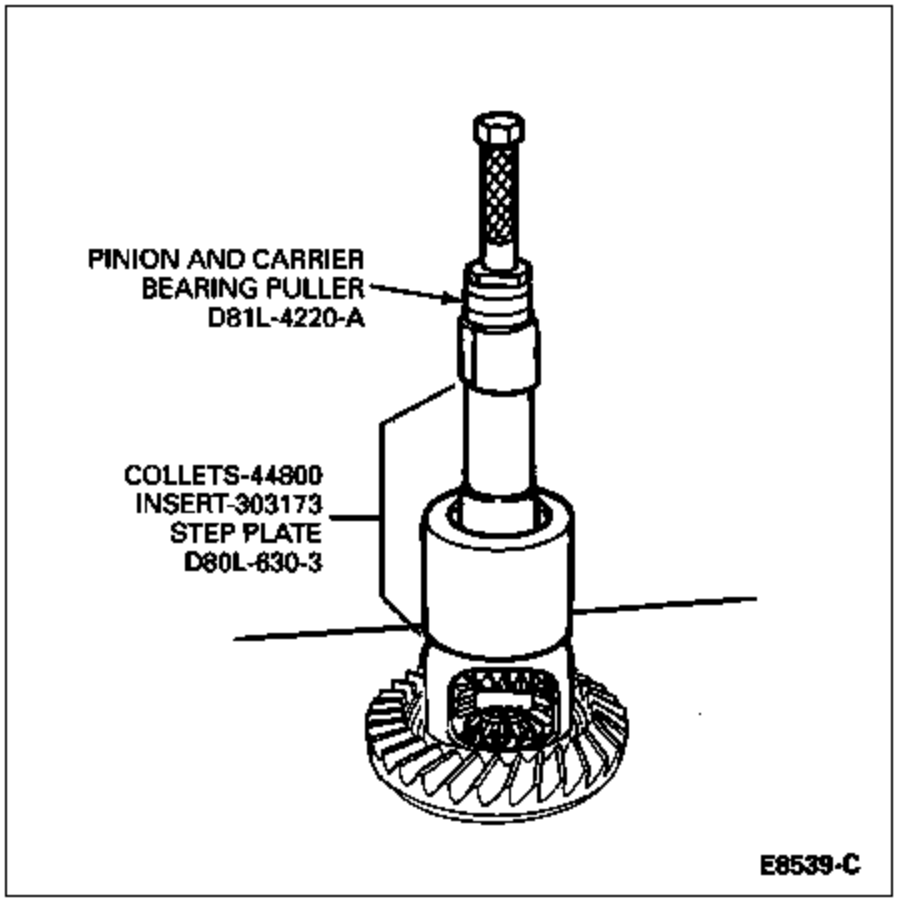


18. Turn the nose of the carrier down and remove the drive pinion bearing cup. Pass the Outer Pinion Bearing Cup Remover T86T-4628-BH and Driver Handle T80T-4000-W through the rear bearing bore and against the front bearing cup as shown. Drive the front pinion bearing cup out with a hammer.



19. Remove the differential case bearings and shims from the case. Place Step Plate D80L-630-3 or equivalent under bearing to protect the bearing. Install Pinion and Carrier Bearing Puller D81L-4220-A or equivalent and remove the bearing as shown. Turn the case over to remove the other bearing.

tomsn048@gmail.com



20. Wire the shims, bearing cup and cone together and identify from which side of the differential case they were removed. If any shims are damaged discard and replace at assembly.

21. Place a few shop towels over the vise to prevent the ring gear teeth from being nicked, after removal from the case.

22. Place the case in a vise. Remove the ring gear bolts and discard. Tap the ring gear with a rawhide hammer to free it from the case.

23. **NOTE: If side gears and pinion mate gears need to be replaced, refer to Disassembly and Assembly, Differential Case in this section.**

    NOTE: Whenever removing the ring gear bolts, discard the bolts and replace with new bolts upon assembly.

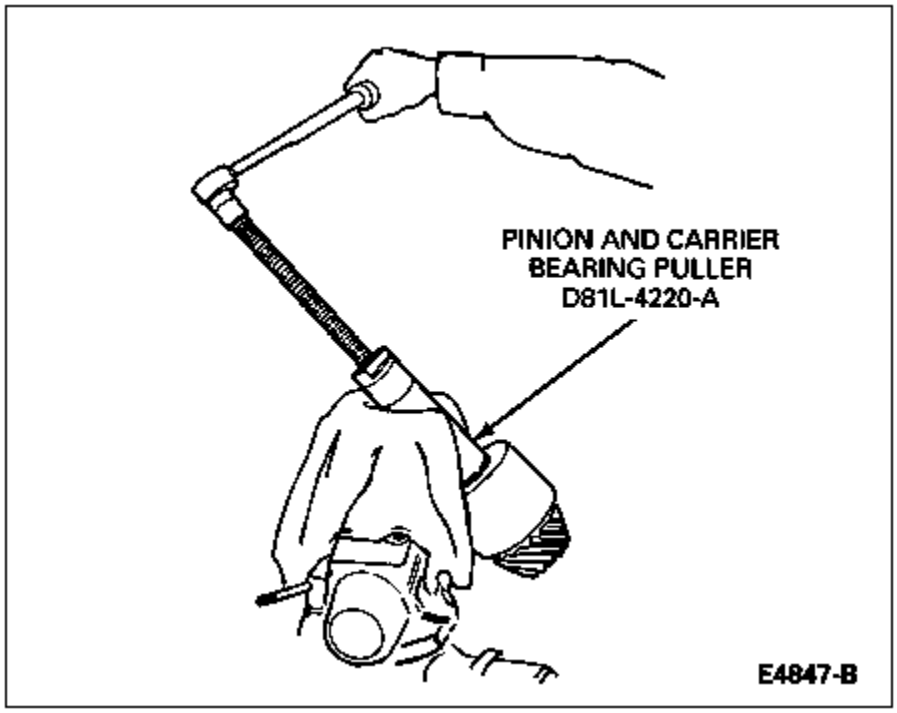
    Remove the case and ring gear from the vise.

24. **NOTE: For controlling drive pinion depth, an oil slinger with a selected thickness is located between the inner differential pinion bearing and drive pinion head. Be careful not to damage the oil slinger when removing the bearing. If the oil slinger is damaged, measure the thickness and replace with an oil slinger of equal thickness.**

    Remove the inner pinion bearing cone and oil slinger/pinion position shim from the drive pinion with Pinion and Carrier Bearing Puller D81L-4220-A or equivalent.

25. Inspect all parts for damage and replace as required.

tomsn048@gmail.com



tomsn048@gmail.com

Total Differential Case End Play

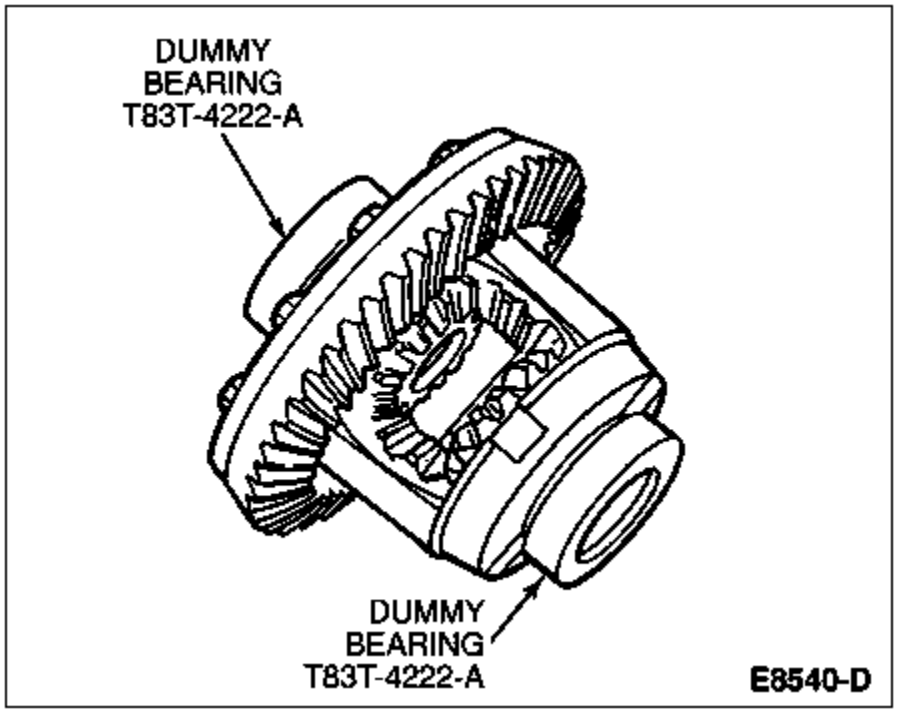
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Dummy Bearings	T83T-4222-A

1. Attach the ring gear to the differential case using new bolts. Tighten bolts alternately and evenly to 61-88 Nm (45-65 lb-ft).

2. **NOTE: Remove all burrs and nicks from hubs so master bearings rotate freely.**

   Clean the trunnion on the differential and install Dummy Bearings T83T-4222-A onto the differential case.



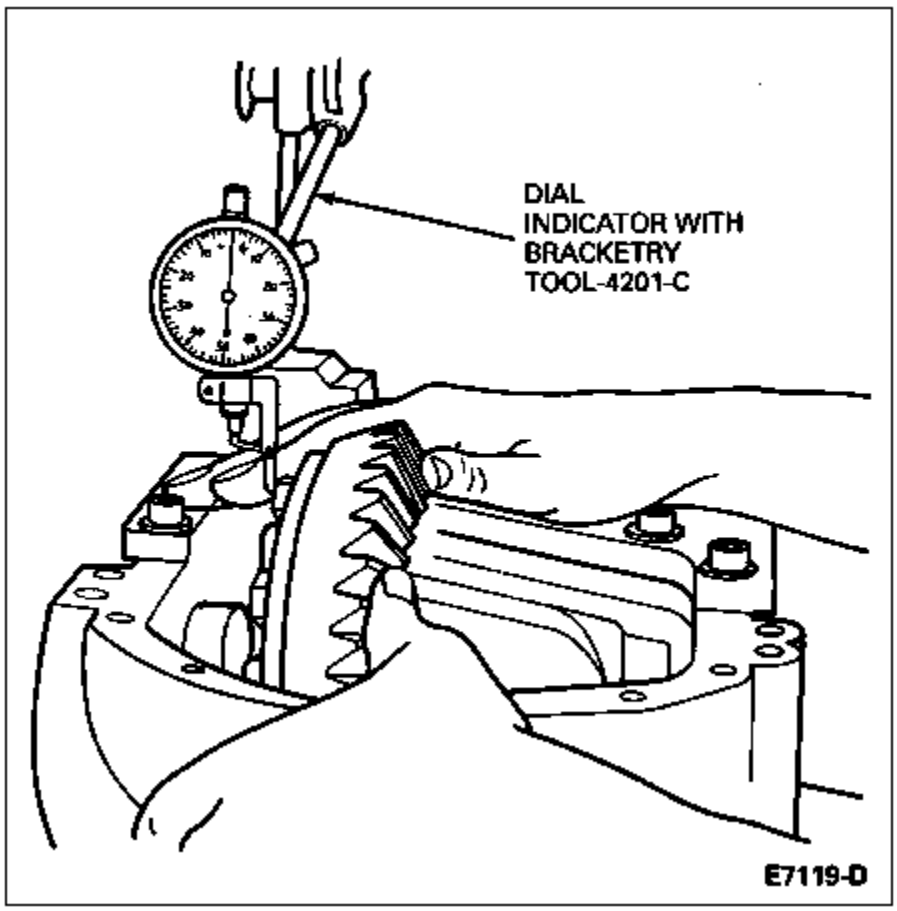
3. Place the differential case into carrier (without pinion). The differential case should move freely in the carrier.

4. Mount Dial Indicator with Bracketry TOOL-4201-C or equivalent against the differential case flange. Locate the tip of the indicator on the flat surface of one ring gear bolt.

5. **NOTE: Dial indicator should have a minimum travel capability of 5.08mm (0.200 inch).**

tomsn048@gmail.com

Force the differential case toward the dial indicator as far as possible and zero the dial indicator with force still applied.



6. Force the differential case away from the dial indicator as far as it will go. Repeat this procedure until the readings repeat.

7. Record the dial indicator reading. This reading indicates the amount of shims needed behind the differential side bearings to take up total clearance between the differential bearing (4221) and case. Enter this reading into the ring gear backlash and differential bearing preload worksheet as Measurement "A."

8. Remove the differential case from the carrier. Do not remove the dummy bearings at this time.

Worksheet for Calculating Ring Gear Backlash and Differential Bearing Preload Shims

Measure the width of the master differential bearings (T83T-4222-A) with a micrometer. If they measure 18-18.05mm (.710-.711 inch), follow the procedure and example that makes adjustment to the measurements obtained with the tools prior to making the final calculations for proper shim selection. This is shown in Example "A."

tomsn048@gmail.com

If the master bearings measure 18.11-18.16mm (.713-.715 inch), adjustments do not have to be made. Follow procedure and example as shown in example "B."

Example "A"

Steps:

1. Total amount of space measured without gearset assembled into carrier (Housing)
    - Measurement A **2.5mm (.098 inch)**
2. Total amount of space measured with gearset assembled into carrier (Housing)
    - Measurement B **1.24mm (.049 inch)**

Adjustments:

1. Measurement A less 20mm (.008 inch) = C **2.28mm (.090 inch)**
2. Measurement B less .10mm (.004 inch) = D **1.14mm (.045 inch)**
3. C - D = E **1.14mm (.045 inch)**

After measurements and calculations have been made, assemble the shim packs using the figures determined in D and E, and adjusting the pack as described.

Ring Gear Side:

D - .13mm (.005 inch) = **1.01mm (.040 inch)** Total shim pack thickness.

Opposite Side:

E + .25mm (.010 inch) = **1.4mm (.055 inch)** Total shim pack thickness.

Assemble shim packs onto differential case hubs, and assemble new differential bearing cones. Continue axle assembly. Refer to the procedure in this section.

Example "B"

Steps:

1. Total amount of space measured without gearset assembled into carrier (Housing)
    - Measurement A **2.28mm (.090 inch)**
2. Total amount of space measured with gearset assembled into carrier (Housing)
    - Measurement B **1.14mm (. 045 inch)**
3. Measurement A minus Measurement B =
    - Measurement C **1.14mm (.045 inch)**

tomsn048@gmail.com

After the measurements and calculations have been made, assemble the shim packs using the figures determined in A, B, & C, and adjusting the pack as described below.

Ring Gear Side:

B - .13mm (.005 inch) = **1.01mm (.040 inch)** Total shim pack thickness.

Opposite Side:

C + .25mm (.010 inch) = **1.4mm (.055 inch)** Total shim pack thickness.

Assemble shim packs onto differential case hubs, and assemble new differential bearing cones. Continue the axle assembly. Refer to the procedure in this section.

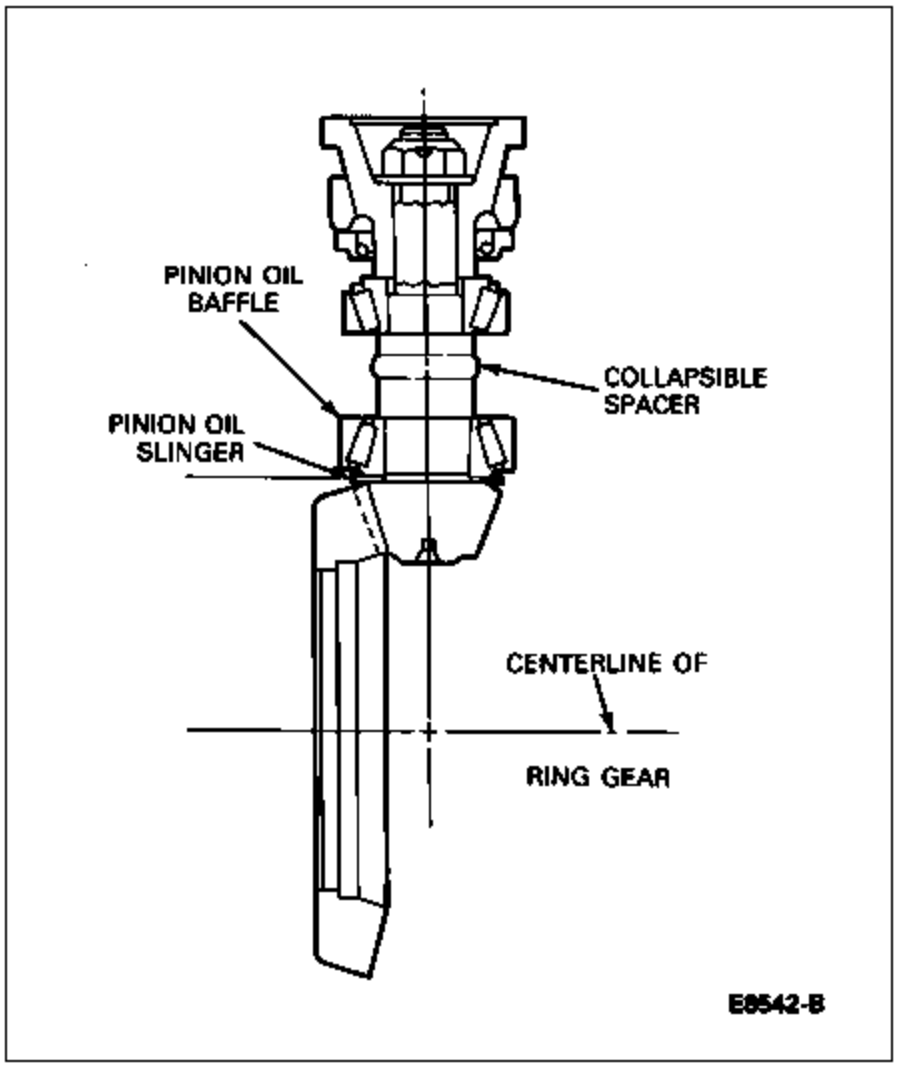
---

tomsn048@gmail.com

Drive Pinion Installation

Two separate adjustments affect contact between the ring gear and drive pinion: pinion depth and pinion and ring gear backlash.

Pinion depth is controlled by an oil slinger (with a selective thickness) located between drive pinion head and rear pinion bearing and an oil baffle located between the rear drive pinion bearing cup and carrier bore.

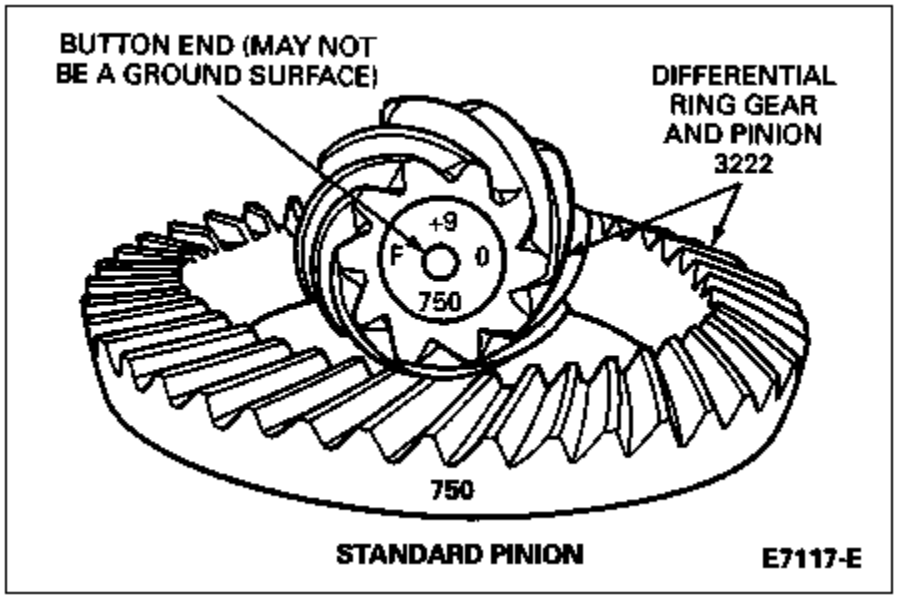


Pinion and ring gear backlash is controlled by preload shims located between the differential bearings (4221) and the differential case. This adjustment is described in Disassembly and Assembly, Differential Case to Carrier in this section.

In the pinion depth adjustment, the size of the selected thickness oil slinger and the oil baffle controls the pinion position. Increasing the oil slinger thickness moves the pinion toward the ring gear. Decreasing the oil slinger thickness moves the pinion away from the ring gear.

tomsn048@gmail.com

Ring gears and pinions are supplied in matched sets with standard or metric markings.



On the end of each drive pinion is marked a plus figure (+), a minus figure (-) or a zero (0). These figures best indicate the position for each gearset. The position is determined by the thickness of the baffle between the rear pinion bearing cup and carrier bearing bore and the thickness of the selective oil slinger between the pinion head and rear pinion bearing. Any pinion depth change is made by changing the thickness of the selective oil slinger. Refer to the charts.

If the original gearset is being reused, measure the original baffle and selective slinger. If either the baffle or selective slinger needs to be replaced, use a new one of the exact same thickness.

If a new gearset is used, notice the plus (+), minus (-), or zero (0) etching on both the original and the new drive pinion and adjust the thickness of the new selective oil slinger according to the charts.

For example, if the original pinion is etched +4 (m+ 10) and the new pinion is etched "0," then the new selective slinger is .10mm (0.004 inch) thicker than the original selective oil slinger. If the original pinion is etched "0" and the new pinion is etched + 3 (m+8), the new selective slinger should be 0.08mm (0.003 inch) thinner than the original slinger.

tomsn048@gmail.com

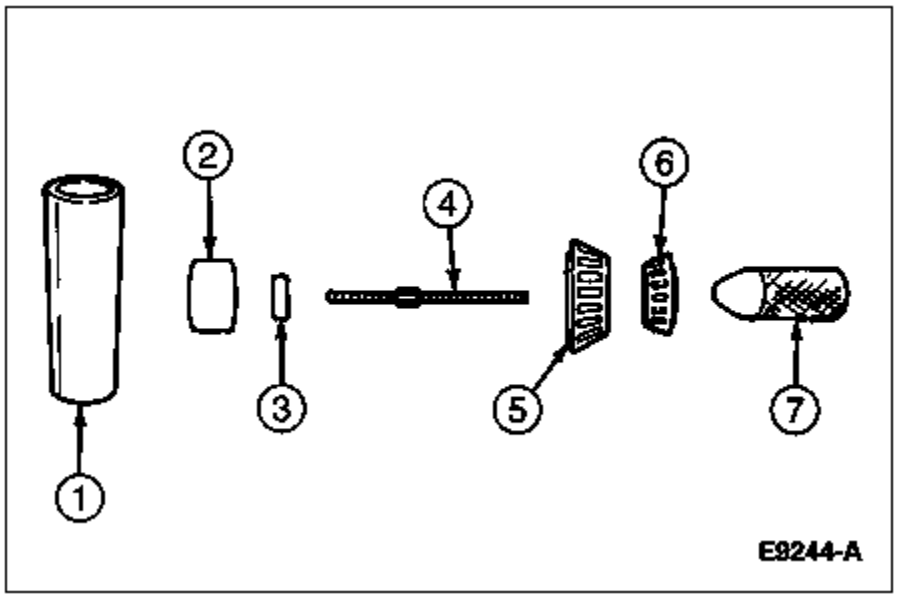
Depth Gauge Check

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Truck Pinion Depth Gauge — Dana Only	T80T-4020-A
Gauge Disc	T90T-4020-A
Pinion Bearing Cups Replacer, Inner and Outer	T71P-4616-A
Spacer	T75T-1176-A
Pinion Bearing Cone Replacer	T57L-4621-B
Axle Bearing/Seal Plate	T75L-1165-B

1. **NOTE: If any of the gauge surfaces become nicked, the high spots must be removed with a medium india oilstone to make sure there will be no erroneous readings.**

   Refer to the correct tools for the particular axles.



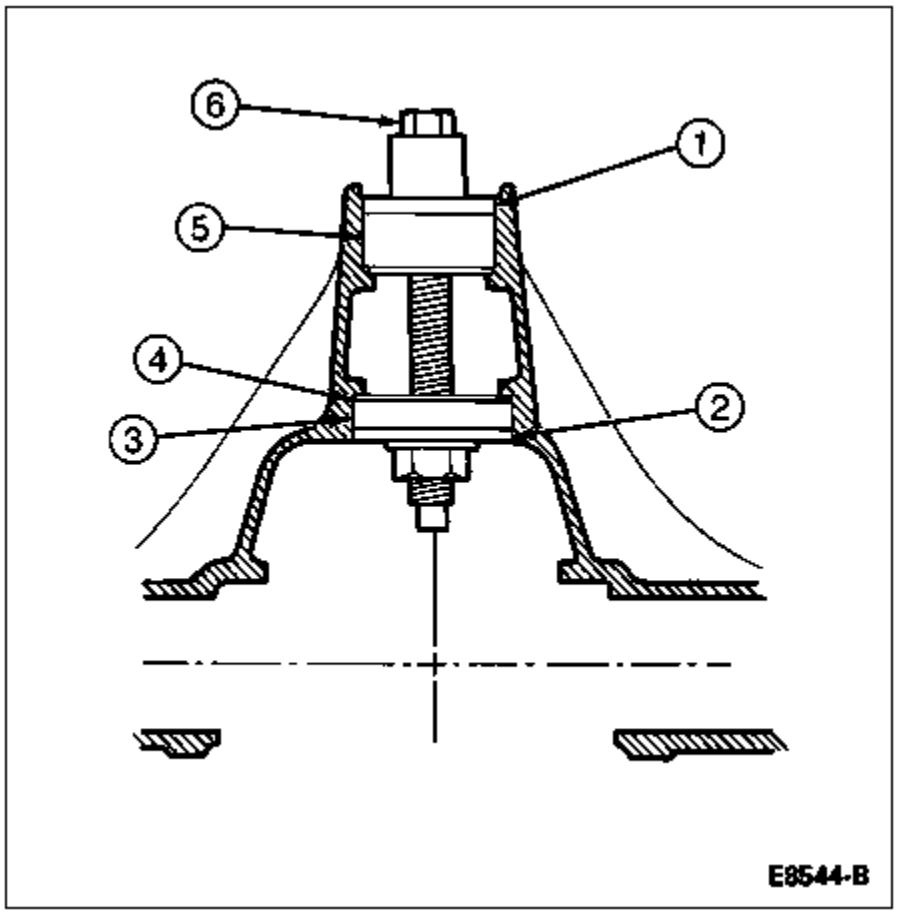
Item	Part Number	Description
1	T76P-4020-A7	Gauge Tube
2	T90T-4020-A	Gauge Disc
3	T76P-4020-A1	Aligning Adapter
4	T76P-4020-A9	Screw

tomsn048@gmail.com

5	4621	Front Pinion Bearing
6	4621	Rear Pinion Bearing
7	T76P-4020-A11	Handle

2. Install the oil baffle in the rear bearing cup bore in the carrier.

3. Install front and rear drive pinion bearing cup with forcing screw and Pinion Bearing Cups Replacer T71P-4616-A. Also use Spacer from T75T-1176-A.



Item	Part Number	Description
1	T71P-4616-A	Pinion Bearing Cups Replacer (Front)
2	T71P-4616-A	Pinion Bearing Cups Replacer (Rear)
3	4621	Rear Pinion Bearing
4	3B067	Oil Baffle
5	4621	Front Pinion Bearing
6	T75T-1176-A	Spacer

4. Place a new rear pinion bearing over the proper aligning adapter and insert into the pinion bearing

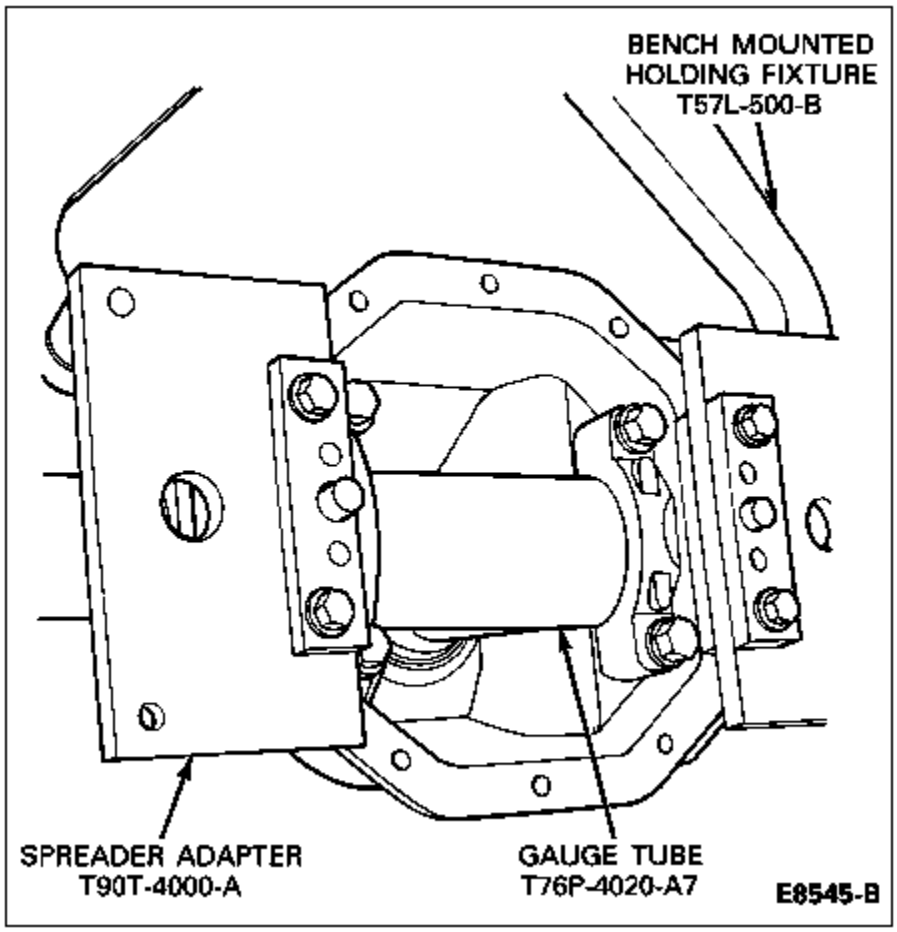
tomsn048@gmail.com

retainer.

5. **NOTE: The 3/8-inch square drive in the handle is to be used for obtaining the proper pinion bearing preload.**

   Place the front pinion bearing into the drive pinion bearing cup in the carrier and assemble the handle onto the screw and hand tighten.

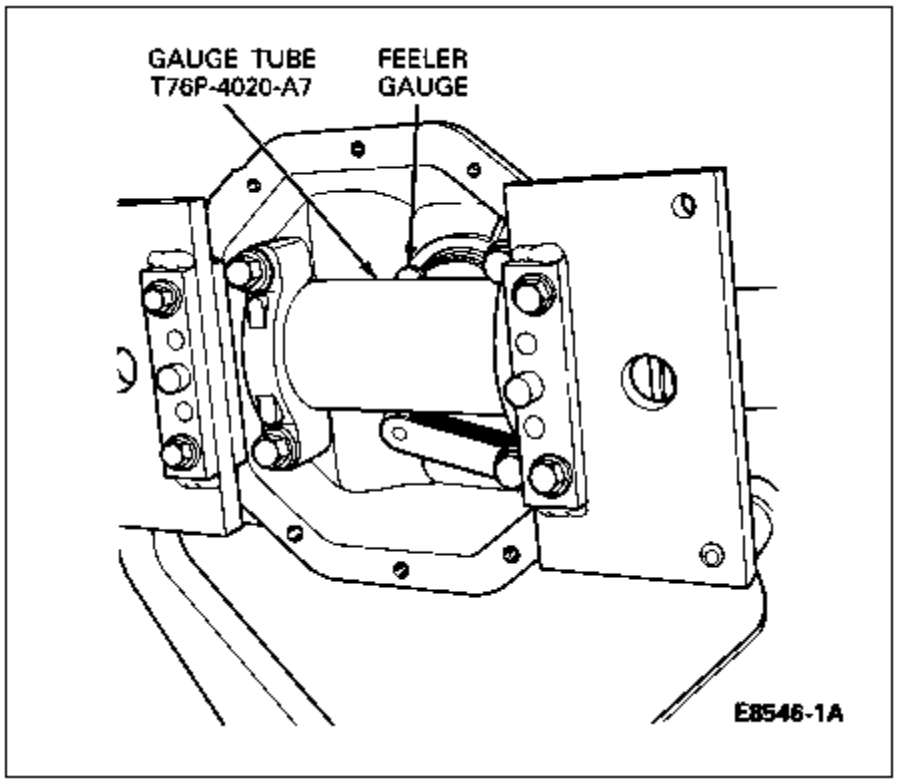
6. Center the proper gauge tube into the differential bearing bore. Install the bearing caps and tighten to proper specifications. To preload the bearing, tighten the handle to 2.3-4.5 Nm (20-40 lb-in).



7. **NOTE: The feeler gauge fit between the gauge tube and the gauge block should have a slight drag-type feeling.**

   Using a feeler gauge tool, select the thickest feeler shim that will enter between the gauge tube and the gauge block. Insert the feeler gauge directly along the gauge block to make sure a correct reading can be made.

tomsn048@gmail.com



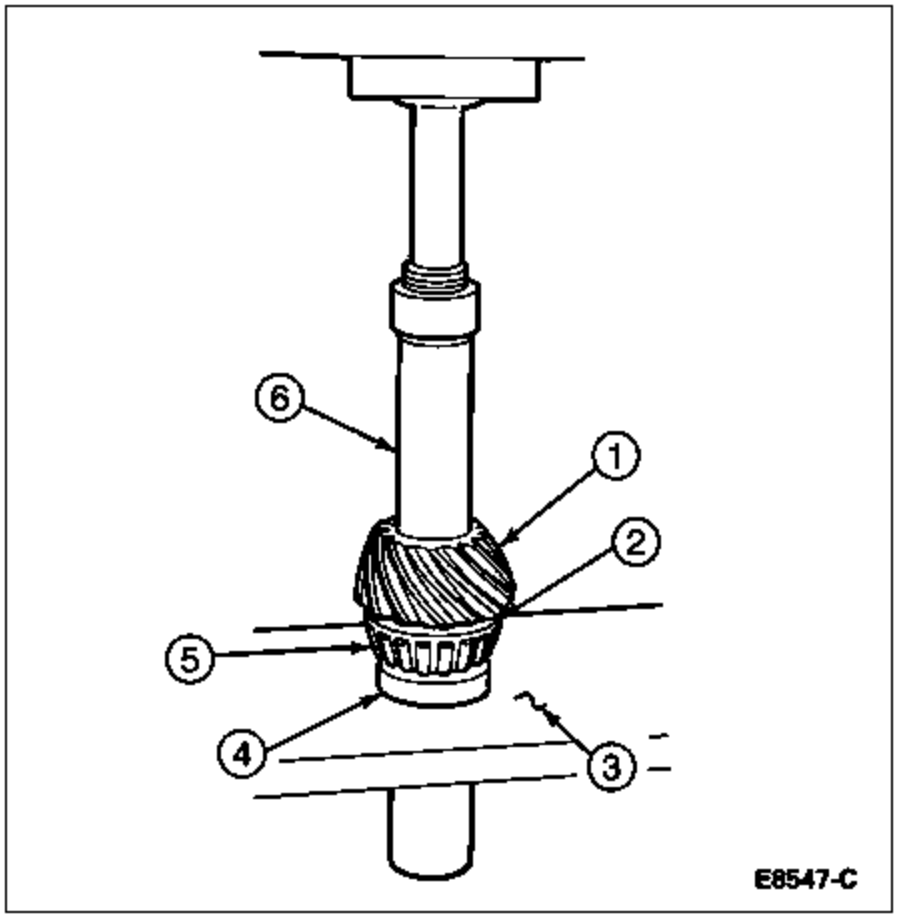
8. **NOTE: If the service pinion gear is marked with a plus (+) reading, this amount must be subtracted from the thickness dimension obtained. If the service pinion gear is marked with a minus (-) reading, this amount must be added to the thickness dimension obtained. In addition, you must use the same new rear pinion bearing that was used in the previous measuring steps.**

   After the correct feeler gauge feel is obtained, check the reading. This is the required oil slinger thickness, provided the service pinion gear has no markings.

9. After following these procedures, continue to build the remaining components with proper pinion and differential bearing preload torques and ring gear backlash.

10. Measure oil slinger with a micrometer to verify the slinger size. Place the oil slinger on the pinion and press on the bearing using Pinion Bearing Cone Replacer T57L-4621-B and Axle Bearing/Seal Plate T75L-1165-B.

tomsn048@gmail.com



Item	Part Number	Description
1	3222	Drive Pinion
2	3B067	Oil Slinger
3	T75L-1165-B	Axle Bearing/Seal Plate
4	T75L-4621-B	Pinion Bearing Cone Replacer
5	4621	Rear Bearing Cone and Roller
6	—	Press

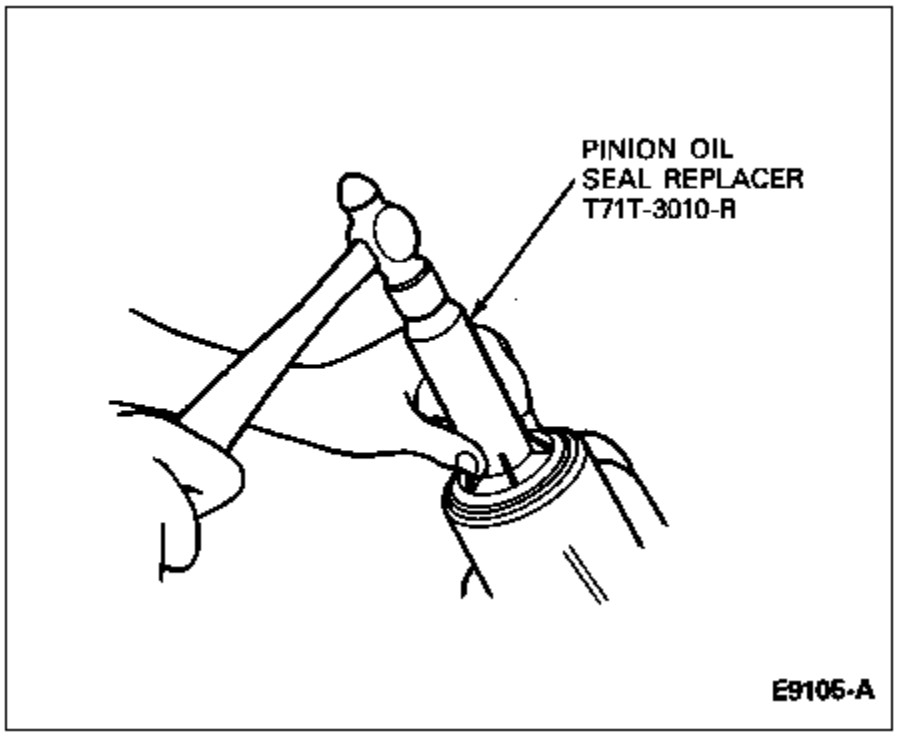
Drive Pinion Preload Check

1. **CAUTION: Never reuse a collapsible spacer. Upon removal, always discard the spacer and install new spacer for assembly.**

   Install a new collapsible spacer and front pinion bearing, and thrust washer into housing.

2. Coat the oil seal with Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX or -DDX or equivalent MERCON® fluid. Install the pinion seal with suitable oil seal replacer.

tomsn048@gmail.com



3. After installation, make sure the garter spring didn't pop out.
    - If the garter spring pops out, remove and replace the pinion seal.

Pinion Installation

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Companion Flange Replacer	T83T-4851-A

1. **NOTE: Before installing rear axle companion flange, align marks on flange spline and pinion gear spline to assure original position.**

   Install the rear axle companion flange with Companion Flange Replacer T83T-4851-A. Install washer and new nut and tighten nut to 190-373 Nm (140-275 lb-ft).

2. **CAUTION: Never tighten the pinion nut more than 373 Nm (275 lb-ft) or the collapsible spacer will be compressed too far.**

   Place an inch-pound torque wrench on the pinion nut. Check the pinion rotational torque. Rotational torque should be 1.7-4.0 Nm (15-35 lb-in). If the reading is less than 15 lb-in, tighten the pinion nut in small increments until a rotational torque of 1.7-4.0 Nm (15-35 lb-in) is reached.

3. If the reading is more than 1.7-4.0 Nm (15-35 lb-in), the collapsible spacer has been compressed too

tomsn048@gmail.com

far. The spacer must be removed and a new collapsible spacer installed.

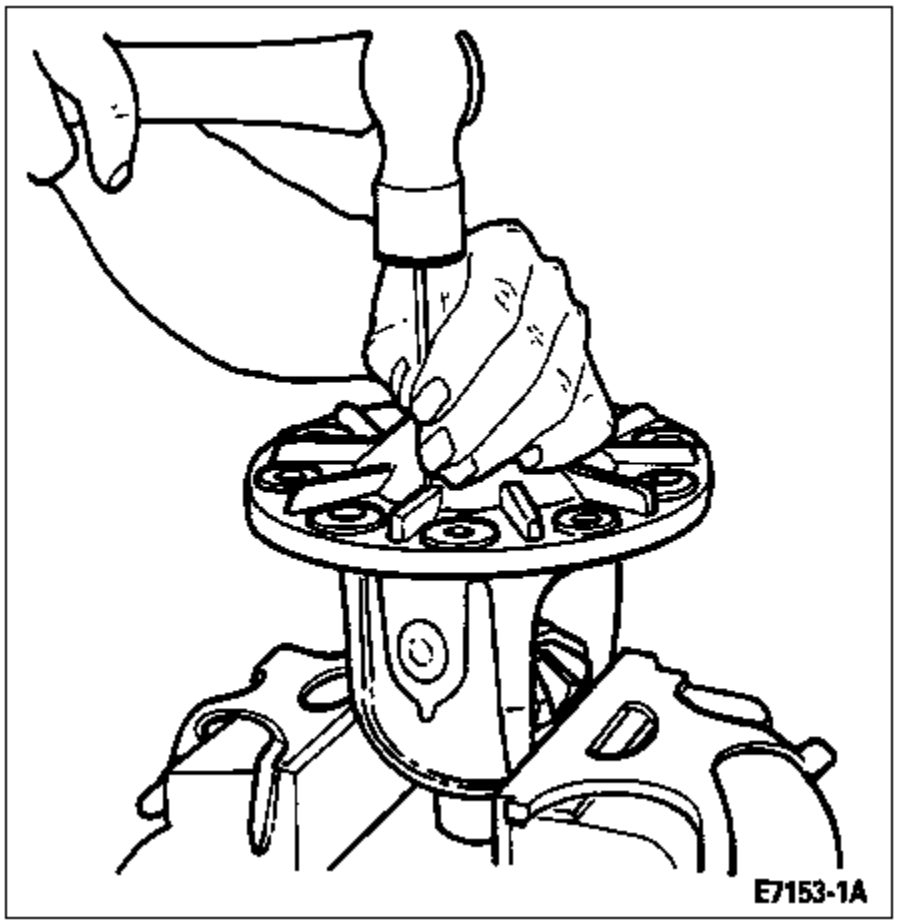
---

tomsn048@gmail.com

Differential Case

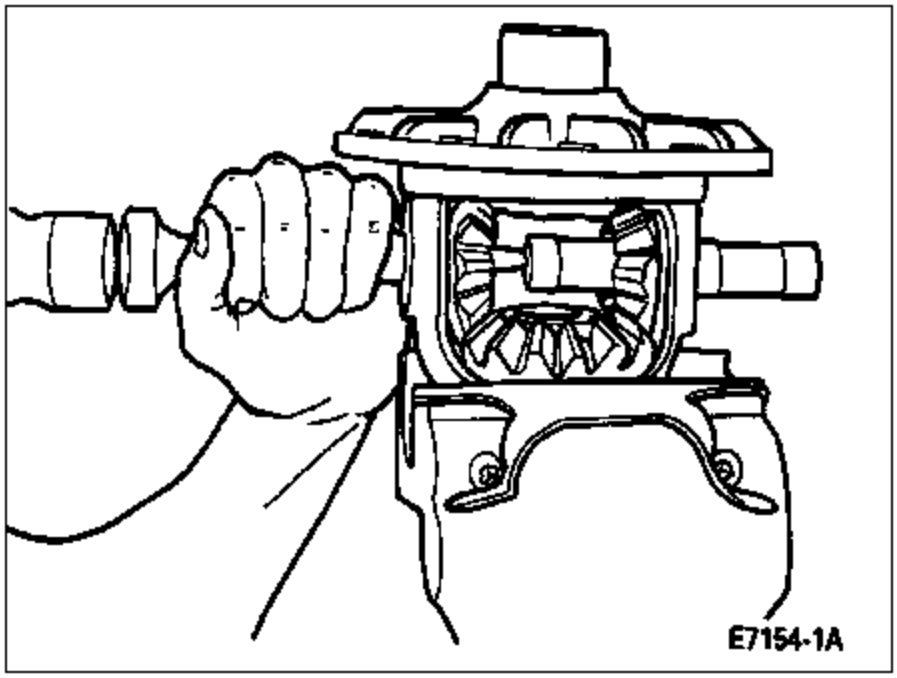
Disassembly

1. Place differential case in vise and drive out lock pin that retains the differential pinion shaft (4211) to case.



2. Remove shaft with a drift.

tomsn048@gmail.com

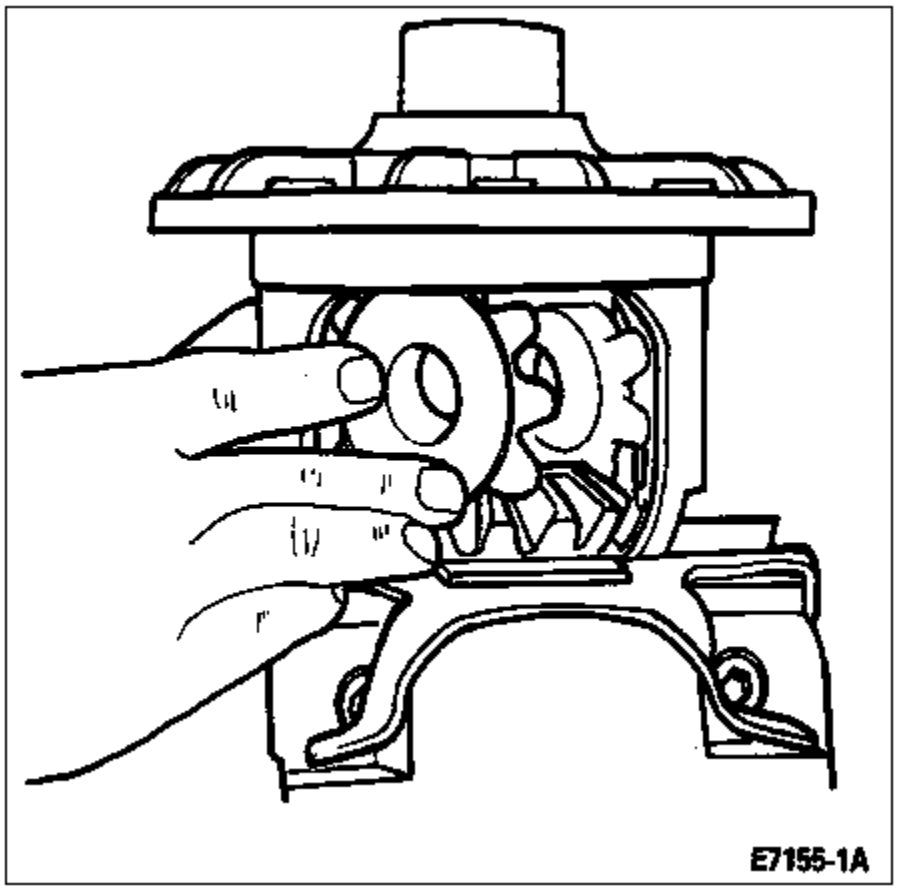


3. Rotate the pinion mate gears and side gears until the pinion mate gears turn to the windows of the case.

4. Remove pinion mate gears and differential pinion thrust washers (4230).

5. Lift side gears and thrust washers from case.

tomsn048@gmail.com



Assembly

1. Inspect case parts for signs of wear. If wear exists on all parts, replace the entire differential case. If one gear shows signs of wear, replace both pinion mate and side gears as a set.

2. Apply Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESW-M1C75-B to side gear thrust washers, hub and thrust face of side gears. Lubricate pinion mate gears and differential pinion thrust washer with Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B.

3. Hold side gears in place in case with one hand and install pinion mate gears and differential pinion thrust washers with the other hand.

4. Rotate the side gears and pinion mate gears until the holes in the differential pinion thrust washers and pinion mate gears line up exactly with the holes in the case.

5. Insert the differential pinion shaft in the case. Make sure the lock pin hole in the shaft lines up with the lock pin holes in the case.

6. Insert lock pin. Peen some metal of the case over the pin to lock it in place.

tomsn048@gmail.com

tomsn048@gmail.com

Differential Case Assembly to Carrier

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Differential Bearing Replacer	T83T-4221-A
Driver Handle	T80T-4000-W
Spreader Adapters	T90T-4000-A

Pinion and Ring Gear Backlash

1. **NOTE: The following measurements are to be made only after the pinion is installed.**

   Assemble ring gear to differential case. Use new bolts and tighten alternately and evenly to 61-88 Nm (45-65 lb-ft).

2. Position differential case into carrier. Master bearing should still be installed.

3. Mount dial indicator onto housing.

4. Force the differential case away from the drive pinion gear, until it is completely seated against the cross bore face of the carrier.

5. Position dial indicator so the indicator tip rests on a differential case bolt. Zero the dial indicator.

6. Force ring gear against pinion gear. Rock ring gear slightly to make sure gear teeth are in contact.

7. Force ring gear away from drive pinion gear, making sure the dial indicator returns to zero.

8. Repeat this procedure until the dial indicator reading is the same. Record this reading on the Worksheet for Calculating Ring Gear Backlash and Differential Bearing Preload as Measurement B.

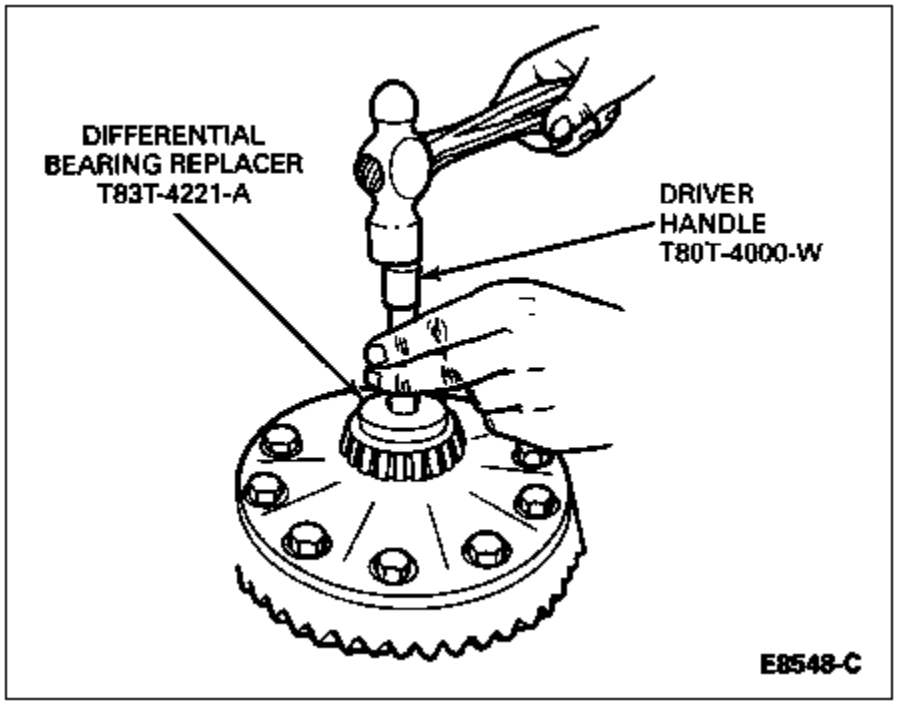
9. Remove the differential case from the carrier and remove the master bearings from the case.

10. Refer to the Worksheet and make the necessary calculations for proper shim selection.

11. As determined in Steps 5 through 7, place the required amount of shims in the ring gear hub of the differential case. For example, if the reading in Step 4 was 1.14mm (0.045 inch) minus 0.13mm (0.005 inch), place 1.02mm (0.040 inch) amount of shims on the hub of the ring gear side of the differential case.

12. Install the differential bearing (4221) on the hub of the ring gear side of the differential case. Drive the bearing onto the hub using Differential Bearing Replacer T83T-4221-A and Driver Handle T80T-4000-W.

tomsn048@gmail.com

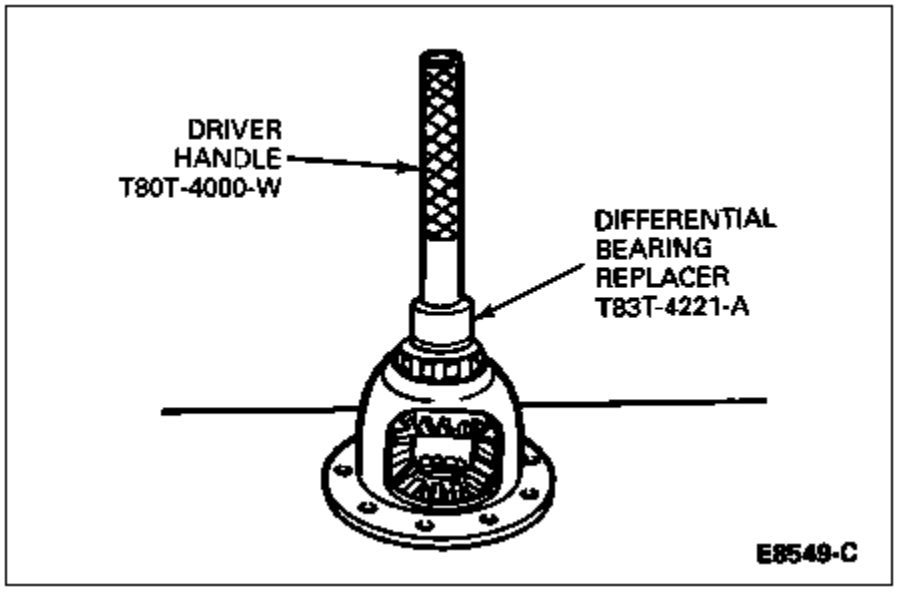


13. Place the required amount of shims on the hub of the drive pinion side of the differential case.

14. Install the differential bearing on the hub of the drive pinion side of the differential case.

    - Place Step Plate D80L-630-3 or equivalent on the ring gear side bearing to protect the bearing.

15. Drive the bearing onto the hub of the drive pinion side of the differential case using Differential Bearing Replacer T83T-4221-A and Driver Handle T80T-4000-W.



tomsn048@gmail.com

16. Install the differential bearing cups on the bearing cones.

17. **NOTE: Do not spread carrier beyond 0.381mm (.015 inch).**

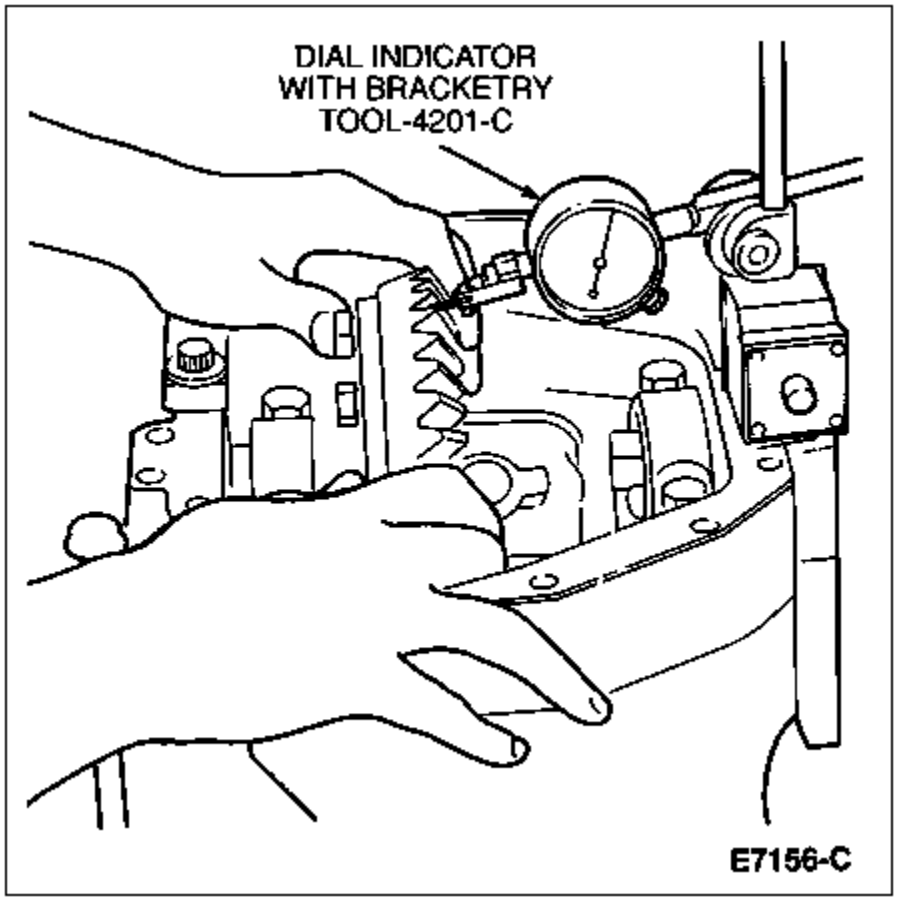
    NOTE: Be careful not to nick the teeth of the ring gear or pinion

    Spread the carrier 0.381mm (.015 inch) using Spreader Adapter T90T-4000-A and install the differential case in the carrier. If necessary, use a rawhide or plastic hammer to seat the differential case into the carrier housing cross bore.

18. Remove the spreader and dial indicator from the carrier housing.

19. Install bearing caps and bolts. Make sure the letters or numbers stamped on the caps correspond in both position and direction with the letters or numbers stamped into the carrier. Tighten bolts to 41-61 Nm (30-45 lb-ft).

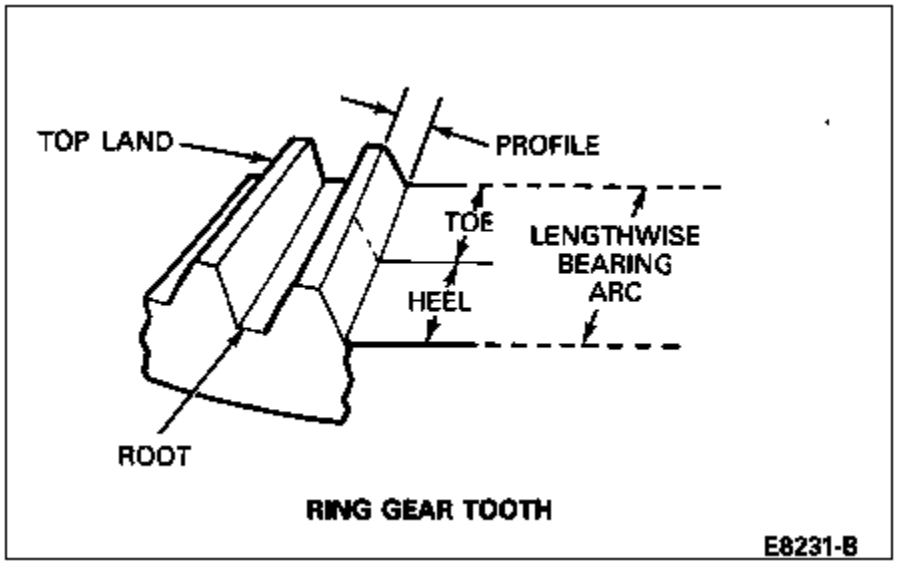
20. Install the dial indicator on the case as shown. Check ring gear and pinion backlash at three equally spaced points on the ring gear. Backlash should be to specification. If backlash is high, the ring gear must be moved closer to the pinion, by moving differential bearing shims to the ring gear side from the pinion side. If backlash is low, the ring gear must be moved away from the pinion by moving differential bearing shims from the ring gear side to the pinion side.



tomsn048@gmail.com

Ring Gear and Pinion Tooth Pattern Interpretation

NOTE: When making changes, note that two variables are involved. For example, if you have the backlash set correctly to specifications and you change the pinion position shim, you may have to readjust the backlash to the correct specification before checking the pattern. Refer to pattern interpretation.



The final pinion position will be verified by using the gear contact pattern method described as follows:

WARNING: GEAR TEETH MAY HAVE SHARP EDGES. WHEN HANDLING GEARS, USE CARE TO AVOID PERSONAL INJURY.

The toe of the gear tooth is the portion of the tooth surface at the end toward the center. The heel of the gear tooth is the portion of the tooth surface at the outer end. The top land of a gear tooth is the surface of the top of the tooth. Every gear has a characteristic pattern. The illustrations show typical patterns only, and explains how patterns shift as gear location is changed. When making pinion position changes, shims should be changed in the range of .05mm (.002 inch) to .10mm (.004 inch) until correct pattern has been obtained.

When a change in backlash is required, backlash shims should be changed in the range of 1-1/2 times the amount of backlash required to bring the gears into specification. For example, if the backlash needed to be changed by .10mm (.004 inch), the shim pack should be changed by .15mm (.006 inch) as a starting point. The actual amount of backlash change obtained will vary depending upon the ratio and gear size.

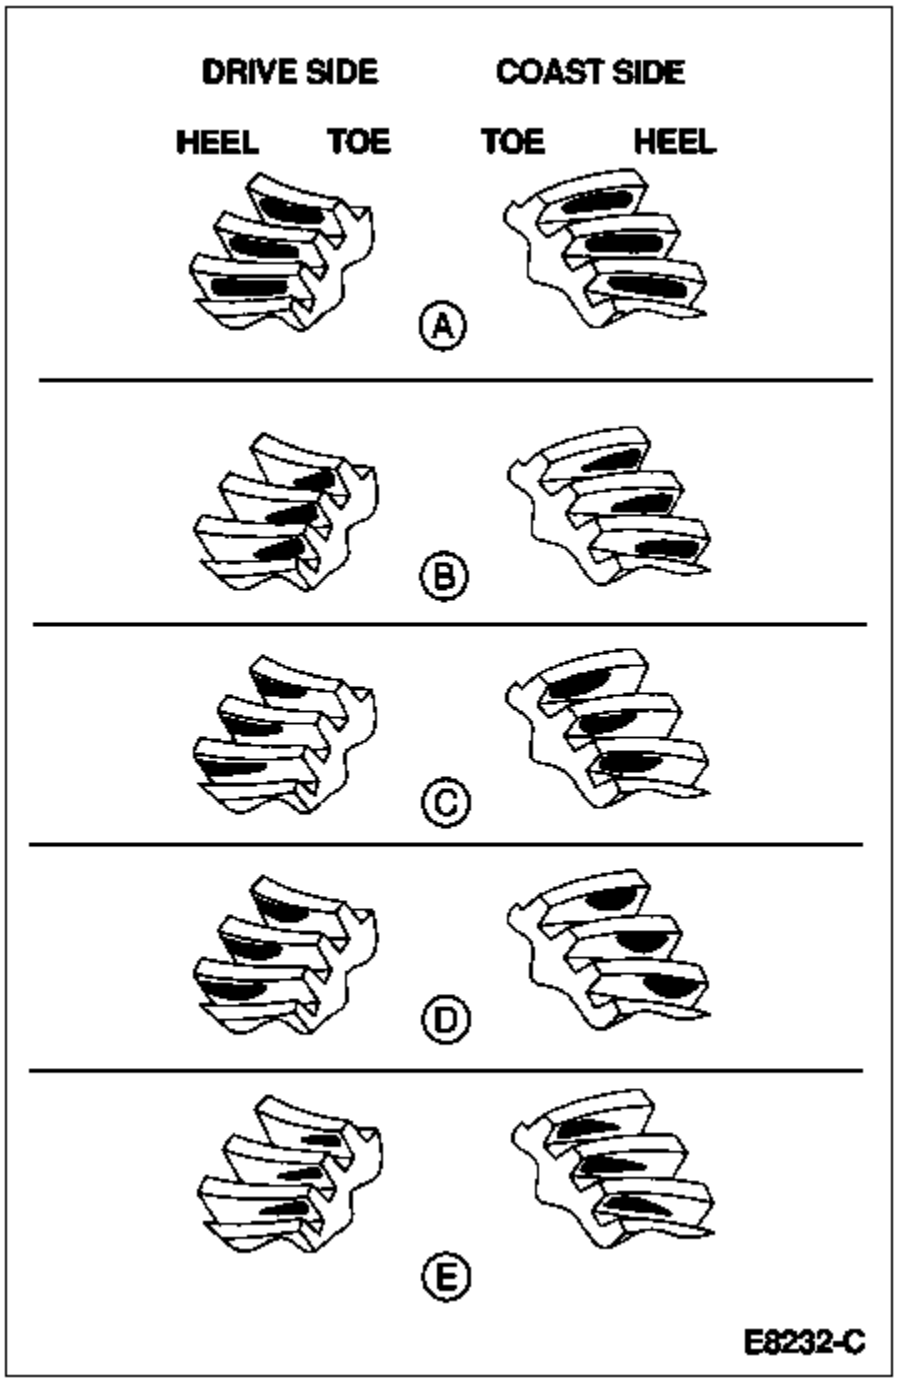
High backlash is corrected by moving the ring gear closer to the pinion. Low backlash is corrected by moving the ring gear away from the pinion. These corrections are made by switching shims from one side of the differential case to the other.

1. Paint ring gear teeth with a marking compound to both the drive and coast side.

2. Rotate ring gear one complete revolution in both directions while load is being applied with a large screwdriver or similar tool between the carrier casting and differential case flange.

tomsn048@gmail.com

Ring Gear Patterns



Item	Part Number	Description
A	—	Normal or Desirable Pattern
B	—	Backlash Correct. Thinner Pinion Position Shim Required

tomsn048@gmail.com

C	—	Backlash Correct. Thicker Pinion Position Shim Required
D	—	Pinion Position Shim Correct. Decrease Backlash
E	—	Pinion Position Shim Correct. Increase Backlash

Pattern Movements Summarized

1. The following summarizes how pinion and ring gear movements will obtain satisfactory roll patterns:

   a. Decreasing backlash moves the ring gear closer to the pinion.

      Drive pattern (convex side of gear) moves slightly lower and toward toe.

      Coast pattern (concave side of gear) moves lower and toward the toe.

   b. Increasing backlash moves the ring gear away from the pinion.

      Drive pattern moves slightly higher and toward the heel.

      Coast pattern moves higher and towards the heel.

   c. Thicker pinion position shim with the backlash constant moves the pinion closer to the ring gear.

      Drive pattern moves deeper on the tooth (flank contact) and slightly toward the toe.

      Coast pattern moves deeper on the tooth and toward the heel.

   d. Thinner pinion position shim with the backlash constant moves the pinion further from the ring gear.

      Drive pattern moves toward the top of the tooth (face contact) and toward the heel.

      Coast pattern moves toward the top of the tooth and slightly toward the toe.

Axle Shaft and Cover Assembly to Carrier

1. Assemble axle shafts into the carrier. Refer to Removal and Installation, Axle Shafts, Carrier Oil Seal and Bearing in this section.

2. **CAUTION: Apply only enough RTV to prevent leakage. Excess amounts of RTV may mix with axle lubricant which might cause damage to axle components.**

   CAUTION: If RTV enters cover bolt holes, it may cause erroneous torque readings when installing the cover bolts.

   Apply a continuous bead 3.18-6.35mm (1/8-1/4 inch) high and 3.18-6.35mm (1/8-1/4 inch) wide of RTV sealant D6AZ-19562-AA (clear) or -BA (black) or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A on the cover plate.

3. Install the cover plate and cover plate bolts and tighten to 19-26 Nm (14-19 lb-ft).

tomsn048@gmail.com

4. **NOTE: The cover must be installed on the carrier within five minutes after applying the RTV sealant.**

   NOTE: Allow one hour cure time before filling carrier with the proper amount of specified lubricant and vehicle operation.

   Fill the carrier with 1.04 liters (35 ounces) of Mercon® Multi-Purpose Automatic Transmission Fluid E6AZ-19582-B or equivalent meeting Ford specification ESR-M2C163-A2.

5. Install the axle assembly in the vehicle. Refer to Removal and Installation, Axle, Front Drive in this section.

---

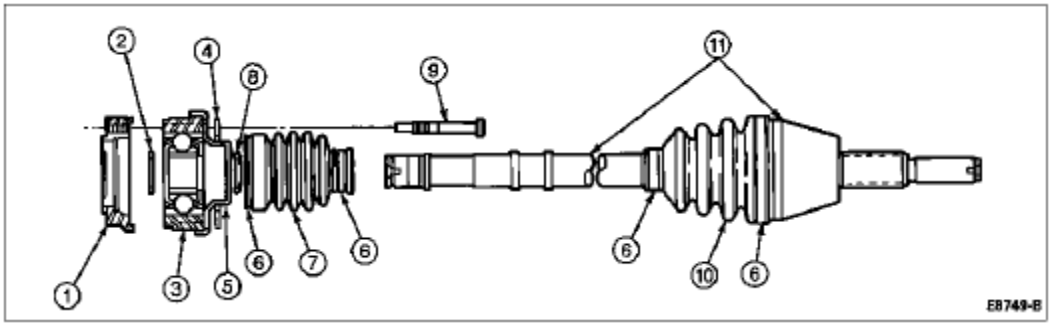
tomsn048@gmail.com

CV/CV Halfshaft

NOTE: The halfshaft can be serviced only to the following levels of detail:

- the inboard CV joint
- the inner boot alone
- the outboard CV joint and interconnecting shaft
- the outer boot and inner boot together

CV/CV Halfshaft

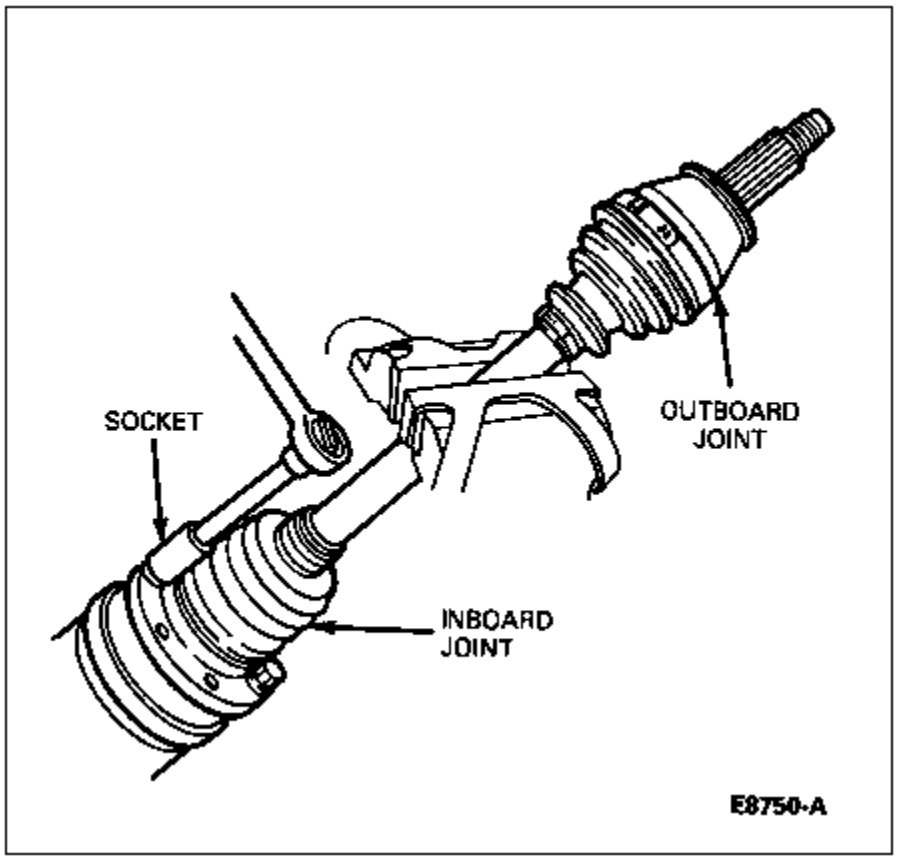


Item	Part Number	Description
1	3L387	Spacer and Grease Cap
2	—	Snap Ring (Part of 3L387)
3	3A466	Inboard CV Joint and Interconnecting Shaft
4	—	Bolt Plate (2) (Part of 3L387)
5	—	Boot Adapter (Part of 3A466)
6	—	Clamp (Part of 3A429)
7	3A429	Inboard Boot
8	—	Belleville Washer (Part of 3A429)
9	—	Assembly Bolt (Part of 3A466)
10	3A429	Outboard Boot
11	3A406	Outboard CV Joint

tomsn048@gmail.com

Disassembly

1. Remove halfshaft from vehicle. Refer to the procedure in this section.
2. Clamp halfshaft in a vise with the inboard joint lower than the outboard joint. Do not allow vise jaws to contact the boots or clamps.



3. Cut the inner boot clamps with side cutters and peel away the clamps from the boot.
4. Pull the larger boot end off the joint to provide increased access to the assembly bolts.
5. Remove the inboard CV joint assembly bolts (2) and separate the spacer and grease cap from the joint assembly retaining the bolt plates (2) for reassembly.
6. Remove the snap ring retaining the interconnecting shaft end into the CV joint cage and discard.
7. Remove the joint assembly from the shaft.
8. Remove the Belleville washer from the shaft and discard.
9. Remove the inner boot from the shaft and discard.
10. Cut the outer boot clamps with side cutters and peel away the clamps from the boot.
11. **NOTE: The outboard CV joint is non-serviceable beyond this point.**

tomsn048@gmail.com

Remove the outboard joint and shaft from the vise and pull the outer boot off the shaft and discard.

12. Clean all parts in a suitable parts cleaning solvent.

13. Inspect CV joints for excessive wear, pitting, rust and broken parts. If inspection determines that a CV joint is unusable, the entire inboard CV joint or the complete outboard CV joint and interconnecting shaft must be replaced.

Assembly

1. Slide new outer boot over shaft.

2. Fill CV joint area around the balls with 80 grams (2.8 oz.) of Constant Velocity Joint Grease E2FZ-19590-B or equivalent meeting Ford specification ESP-M1C187-A.

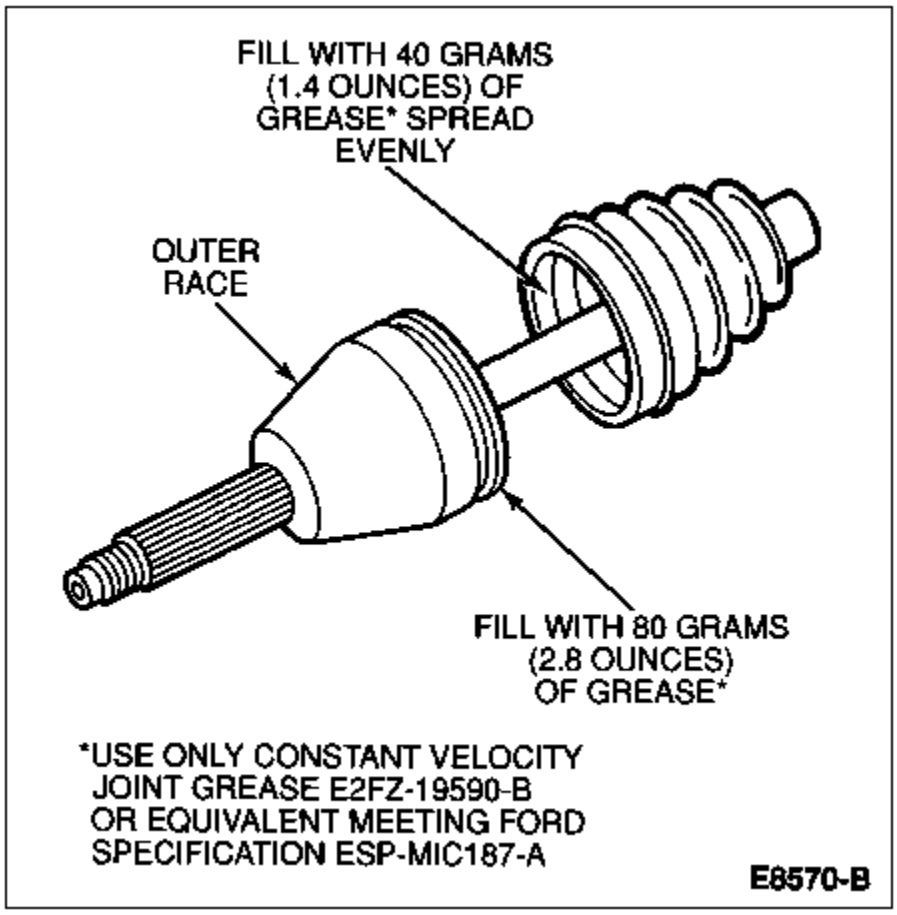
3. Spread 40 grams (1.4 oz.) of grease evenly inside large boot for a total combined fill of 120 grams (4.2 oz.).

4. Assemble outer boot onto outboard CV joint and interconnecting shaft, making sure boot is seated in the boot grooves on the joint's outer race and on the shaft.

5. **CAUTION: Do not overtighten clamps. This may damage clamp or boot.**

   Tighten clamps using crimping pliers.

tomsn048@gmail.com



6. Slide new inner boot over shaft.
7. Slide Belleville washer onto shaft end. Check for proper orientation.
8. Assemble inboard CV joint onto interconnecting shaft spline until resting on Belleville washer.
9. Install snap ring.
10. **CAUTION: Do not overtighten. It may damage clamp or boot.**

    Spread evenly 40 grams (1.4 oz.) of grease inside inner boot. Slip boot into place, making sure boot is seated in the boot grooves on the joint's boot adapter and on the shaft. Tighten the clamps using crimping pliers.
11. **NOTE: Be sure not to contaminate bolt holes with grease.**

    Fill the spacer and grease cap with remaining 40 grams (1.4 oz.) of Constant Velocity Joint Grease E2FZ-19590-B or equivalent meeting Ford specification ESP-M1C187-A.
12. Fit spacer to CV joint end pilot and install assembly bolts. Tighten bolts to 26-34 Nm (19-25 lb-ft).
13. Work inboard joint a few times by plunging to spread grease evenly within joint.
14. Install complete halfshaft into the vehicle. Refer to the procedure in this section.

tomsn048@gmail.com

tomsn048@gmail.com

CV Joint Boot

1. **NOTE: While inspecting the boots, watch for indentations (dimples) in the boot convolutions. If an indentation is observed, it must be removed. Refer to CV Joint Boot Indentation removal procedure.**

   Inspect boots for evidence of cracks, holes or splits.

2. Inspect underbody for any indication of grease splatter in vicinity of CV joint boots which is an indication of boot or clamp damage.

3. Make sure wheel hub retainer nut is the correct prevailing torque type.

4. The neoprene rubber boot will sweat during operation, causing a light film of grease to show on the outside of the boot. This condition is normal.

tomsn048@gmail.com

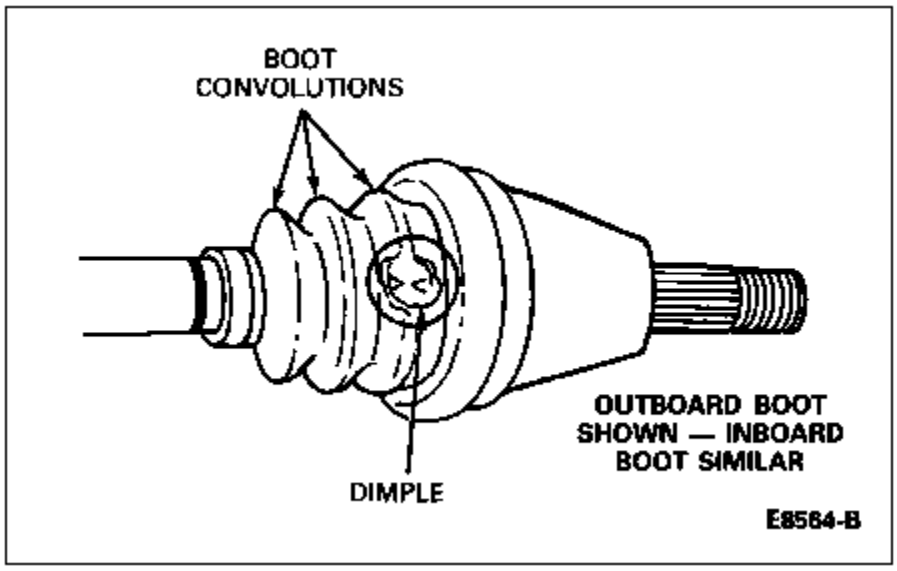
CV Joint Boot Indentation

Removal

Indentations or dimples in the CV joint boots may occur due to improper handling during storage or service of the halfshafts. If, during inspection, a boot is observed to be dimpled, perform the following procedure.

1. **CAUTION: Extreme care should be taken not to allow CV joint boots to come in forceful contact with foreign objects that may cause the external boot convolutions to become indented.**

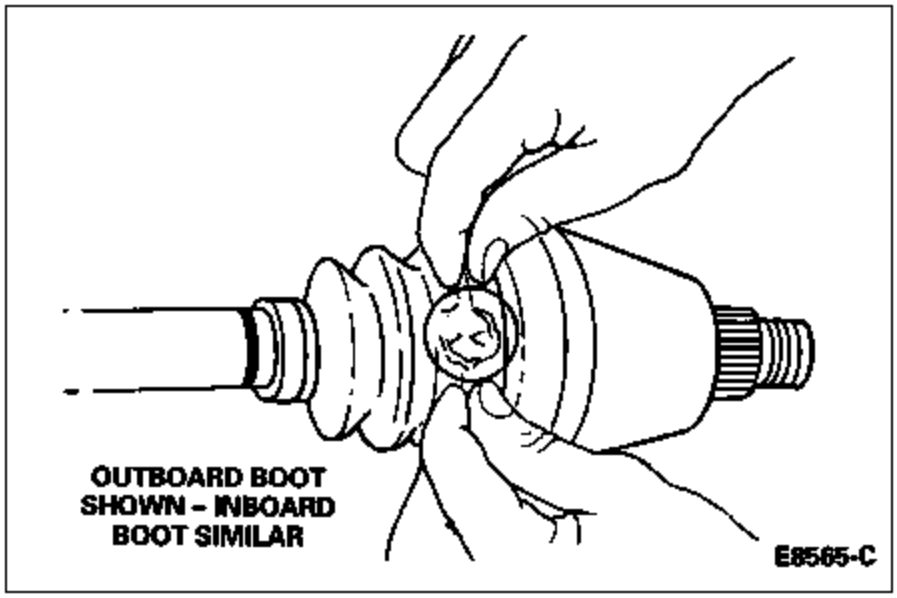
   Inspect the boot(s) for any sign of grease leakage in the dimple which would indicate a cut. Replace the boot if a cut exists or if there is evidence of other damage.



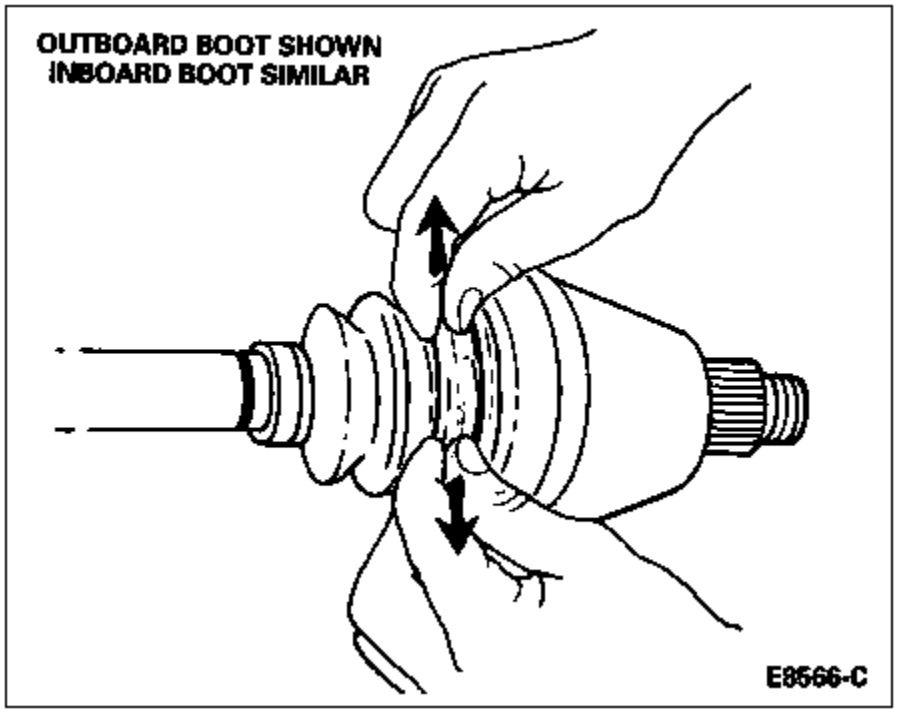
2. If the boot is in good condition, the dimple can be removed as follows:

   a. Grasp the dimpled convolution on either side of the dimple using the forefinger and thumb of each hand.

tomsn048@gmail.com



b. While grasping boot, pull the convolution by moving hands in opposite directions. The dimple should pop out. If the dimple does not invert or if it dimples again, one clamp should be removed and the internal and external air pressure equalized.



tomsn048@gmail.com

tomsn048@gmail.com

SPECIFICATIONS

Lubricant Capacities — Halfshaft Assemblies

Vehicle	Joint Location	Specification	Total Fill	
			Grams	Ounces
Aerostar E-4WD	Inboard	ESP-M1C187-A Ford Part No. E2FZ-19590-A	80	2.8

Inspection and Verification

When it comes to today's electrically controlled RABS/4WABS, the diagnosis of many concerns requires following the diagnostic procedures exactly as they are outlined in the service manual. But there is more to it than that. You have to take the information given you by the customer, and combine it with your understanding of brake systems in general. This knowledge and information will help you make the most efficient use of the diagnostic procedures in this manual.

Getting Started

Brake system diagnosis starts with the customer's concern. It is best to get this information directly from the customer, not just from a service write-up. Customers usually do their best to describe what they have been experiencing and what their concerns are. But it is often necessary to ask questions and probe further in order to get a complete picture of the problem.

Customers may report that the brake pedal (2455) went to the floor, when it actually only dropped part way. Remember, customers get used to how their vehicle's brakes are performing. If the system suddenly behaves differently, they may become alarmed. Under these circumstances, what they report may not be as clearly stated as it could be. Your job is to listen carefully and ask probing questions about anything that doesn't fit your experience and understanding of brake system functioning.

Verify the Complaint

Once you are satisfied that you understand the customer's concerns, take the vehicle on the road yourself. Many brake concerns involve a wide variety of noises and pulsations that can only be experienced while operating the vehicle. Make sure the vehicle's tires are inflated properly. Make your brake application evaluation on level, dry, hard, smooth pavement that is free from oil, grease or loose dirt.

Back in the Shop

The next step in servicing a brake complaint is a thorough inspection of the system.

Brake Master Cylinder

Look for leaks. Clean the unit and remove the brake master cylinder filler cap. Check the fluid level. Check the condition of the gasket.

Hydraulic Leaks

On vehicles with power brakes, with the engine (6007) running, apply 667 N (150 lbs.) force to the brake pedal and hold for ten seconds. If brake pedal height cannot be maintained for 10 seconds or the brake warning light comes on, service is required.

Occasional brake squeal can be caused by environmental conditions such as cold ambient temperatures, heat, rain, snow, salt, mud, hot ambient temperatures or high humidity. This occasional squeal is not a functional problem and does not indicate any loss in brake effectiveness.

Visually examine front and rear tires and wheel assemblies for damage such as uneven wear, tread washouts, or sidewall damage. Make sure the tires are of the same size, type and, where possible, same manufacturer. Any tire or wheel (1007) that is damaged should be replaced. Refer to Section 04-04 .

Wheels and tires must be cleared of any foreign matter, and tire pressures adjusted to the correct

specification as detailed in Section 04-04 .

If tires exhibit uneven wear or feathering, the cause must be corrected. Check steering and suspension components for damage/wear and, if necessary, check and adjust steering alignment. Refer to Section 04-00 .

Road Test

A road test should be performed to compare actual vehicle braking performance with the performance standards expected by the driver. The ability of the test driver to make valid comparisons and detect performance deficiencies will depend on experience.

The driver should have a thorough knowledge of brake system operation and accepted general performance guidelines, in order to make good comparisons and detect performance problems.

An experienced brake technician will always establish a route that will be used for all brake diagnosis road tests. The road selected will be reasonably smooth and level. Gravel or bumpy roads are not suitable because the surface does not allow the tires to grip the road equally. Crowned roads should be avoided because of the large amount of weight shifted to the low set of wheels on this type of road. Once the route is established and consistently used, the road surface variable can be eliminated from the test results.

A key factor in evaluating brake concerns is the deceleration rate. During braking, all of us are sensitive to whether or not the vehicle is slowing at the rate we have come to expect. This varies from vehicle to vehicle and with changes in operating conditions. It is evident how well the brakes on a particular vehicle are working after just a few applications.

Stopping Distance Method

For this test, you need to mark out or find a driving lane that is 3.7m (12 ft.) wide. You also need to place two markers along this lane, 7.5m (25 ft.) apart. At a speed of 32 km/h (20 mph), drive down the center of the lane and apply the service brakes when you reach the first marker. Observe whether the vehicle comes to a smooth stop before the second marker. Also note whether it pulled to the right or left and whether it went beyond the 3.7m (12 ft.) width. For trucks under 4500 kg (10,000 lbs.) a commonly accepted standard is a smooth stop within 7.5m (25 ft.), while staying within the lane.

Before a road test, get a complete description of the customer concerns or suspected condition. From the description, experience will allow possible causes to be matched with symptoms. Certain components will be tagged as possible suspects while others will be eliminated by the evidence. More importantly, the customer's description can reveal unsafe conditions which should be checked or corrected before the road test. The description will also help form the basic approach to the road test by narrowing the problem to specific components, vehicle speed or conditions.

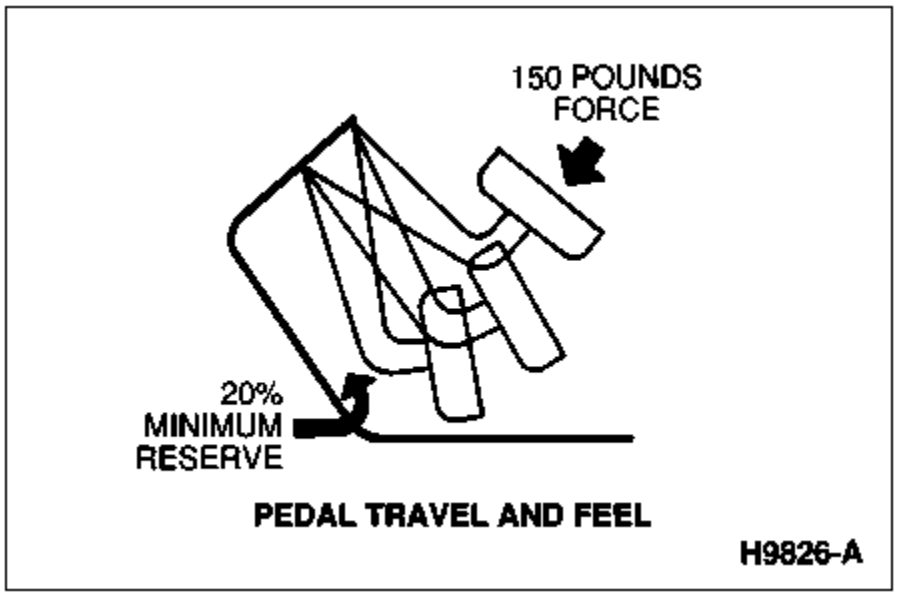
The road test should begin with a general brake performance check. With the customer's description as a guide, the brake system should be tested at different vehicle speeds using both light and heavy brake pedal pressure. On vehicles with rear drum brakes, to determine if the problem is in the front or rear braking system, the service brake pedal is used first, then the parking brake. If the condition (i.e., pull, vibration, pulsation) occurs only with the parking brake, the problem is in the rear system. If the condition occurs when the service brake pedal is pressed, the problem is in the front system. Vehicles with rear disc brakes require further testing to determine problem location.

Locking the brakes and sliding the tires should be avoided. Locked brakes and sliding tires do not indicate brake efficiency: A heavily braked and turning wheel will stop the vehicle in less distance than locked brakes. If the problem becomes evident during this check, it should be determined if it fits the description given before the road test. If the problem is not evident, an attempt should be made to duplicate the condition using the information from the description.

If a concern exists, the brake system symptom chart in this section should be used, in order to isolate it to a specific subsystem and condition description. From this description, a list of possible causes can be used to further narrow the cause to a specific component or condition.

Pedal Reserve

To check brake pedal reserve with the engine running, apply 667 N (150 lbs.) force and observe the extent of brake pedal travel. There should be at least 20% reserve travel distance available.



Hydraulic Parts

Check hydraulic hoses and tubes for leaks, cracks, chafing, and distortions. The fasteners that hold these components in place should also be checked.

Wheel Cylinder — Drum Brakes

NOTE: Don't pry under or otherwise disturb the dust boot. This may destroy a very important seal. If there is leakage, it will find its way around the dust boot.

With the brake drum (1126) removed, check for loose or worn parts. Check the rear wheel cylinder (2261) for leakage around the dust boot.

Disc Brake Caliper

Check for proper installation, leakage, caliper slide lubrication and excessive wear along caliper supports.

Dual Circuit Warning Light

Functions:

- Apply the parking brake.
- Check that the light comes on when you start the engine.
- Release the parking brake. Check that the brake warning light goes off.

Detecting Causes of Brake Problems

ABS brake systems, with their electronically-controlled components, provide a greater degree of braking control than ever before. The fault codes generated by the built-in diagnostics make solving many concerns a simple matter. However, it isn't always possible to immediately nail the culprit when something isn't working properly. Eliminate the obvious first, and gradually close in on the real concern.

Start with the clues found during basic inspection. Correct the obvious problems and see how that affects the performance of the system. Save the potentially difficult possibilities for last. Many times, the concern will be corrected before you have to get into more challenging areas.

The most difficult concerns are often intermittent. Make sure the problem is really an intermittent brake issue and not an intermittent operating condition. Get as much information as possible.

Talk to the primary driver. Find out how often it actually happens, what time of day, what the load is, what the road conditions are and what the weather is like. Listen carefully. There may be important clues in the answers.

Isolating ABS

WARNING: DO NOT DISABLE THE FRONT BRAKES. IF YOU DO, STOPPING DISTANCES MAY BE EXTREMELY LONG, ESPECIALLY IN VEHICLES THAT ARE UNLOADED.

Many concerns that seem at first to be ABS related are actually problems with the base brake system. On the rear anti-lock systems (RABS) pull the brake fluid level sensor connector and fasten it safely out of the way. This will effectively disable the RABS, but leave the normal power assisted brake system functioning normally.

Road test the vehicle. With RABS disabled, you will get a good feel for the functioning of the base brake system and any concerns. Fix these concerns before testing the ABS itself.

This procedure will demonstrate the vehicle's deceleration before lockup. This will help evaluate the vehicle's braking performance after correcting all concerns. Use one of the deceleration tests referred to earlier for accurate measure of the deceleration rate.

With the RABS disconnected, test for brake imbalance. Apply pressure quickly to detect one wheel locking up before the other. With RABS functioning, this judgment can't be made.

Reactivate the RABS to check for the pedal pulsation. Remember that the RABS shuts off below approximately 8 km/h (5 mph), which can result in lockup at the conclusion of a stop. Operate vehicle safely to reach speed when testing.

Premature RABS Activation

One concern that may be a challenge to isolate is premature RABS activation. The first step is to thoroughly check out the base brake system. If the base brake system checks out and there is still premature RABS activation, there are several areas to take a close look at:

- **A weak sensor signal:** Look for a bad wheel speed sensor, chips on the pole piece or an air gap that's too high.
- **A wiring problem:** Look for chafed wires that might be causing a faulty electrical circuit.
- **A rear axle problem:** Rear axle malfunctions account for many premature RABS activation

problems. Look for rear axle speed sensor ring damage and for play in the differential that allows the rear axle speed sensor ring to move away from the wheel speed sensor.

The "Rolling Skid"

NOTE: Some initial, momentary wheel lockup is permissible during this test.

ABS are designed to sense the RAPID deceleration rate of a wheel. This is what warns of possible lockup. Some tires have high peak traction which tends to fall off rapidly. When a tire has this characteristic, the ABS can easily perform as designed. When increasing the braking force, the tires rapidly decelerate, and at the appropriate point, the ABS kicks in at the wheel or axle that needs reduced pressure. Brake pedal pulsations can be felt, and on 4WABS the pump motor can be heard.

Tires with a tendency to develop peak traction which then falls off more slowly may slip some as they decelerate (sometimes referred to as a "rolling skid"). This was a typical characteristic of bias belted tires. This condition may cause the ABS system not to activate, because the wheel isn't fully locking up. There may, however, be considerable squealing and smoking of the tires, and sometimes even skid marks. This is a concern the customer may report.

Have the customer take you for a drive to demonstrate. Observe how the driver activates the brakes. Before beginning the test, adjust the outside rearview mirrors so you can observe the rear wheels.

Have the owner apply the brakes normally during a hard stop. Ford recommends speeds of no more than 24 km/h (15 mph) for this test. If you feel the ABS activate, rolling skid isn't the problem.

If the ABS doesn't activate, have the driver increase the pressure until they squeal and smoke. Hold in this position. Observe rearview mirrors for evidence of smoke. It is also helpful to have an assistant standing nearby who can watch the wheels from a better angle during the test.

Check to see if the wheels continue to rotate for the duration of the stop.

Finally, see if increasing the pressure even more will cause the ABS to activate. If it does, the vehicle is experiencing the slow drop-off from peak traction discussed above.

This last step, applying extra pressure, is very important to the diagnosis. Many drivers back off on the brakes when they hear the squeal because they think, and understandably so, that a wheel or wheels are locking up. Correcting this problem may mean explaining that the system is functioning fine and the wheels are not locking up.

RABS and 4-Wheel Drive

When diagnosing RABS concerns on a 4-wheel drive vehicle, remember that the front and rear drivetrains are mechanically locked together in 4-wheel drive. If the front wheels turn, the rear wheels turn. If the front wheels lock up, the rear wheels lock up. The RABS can't prevent lockup in the rear when the front brakes are applied hard enough to cause lockup on low-traction surfaces.

For more information on the rear anti-lock brake system (RABS), refer to Section 06-09A . For more information on the four wheel anti-lock brake system (4WABS), refer to Section 06-09B .

The Vehicle That Keeps Coming Back

If you get a vehicle that has been brought in for brake service frequently, take a close look at the service history. How long did that vehicle go before its first brake service? What has happened since? If components have been replaced, are they the correct parts? Recurring problems can be the result of some mistake made earlier in the service history.

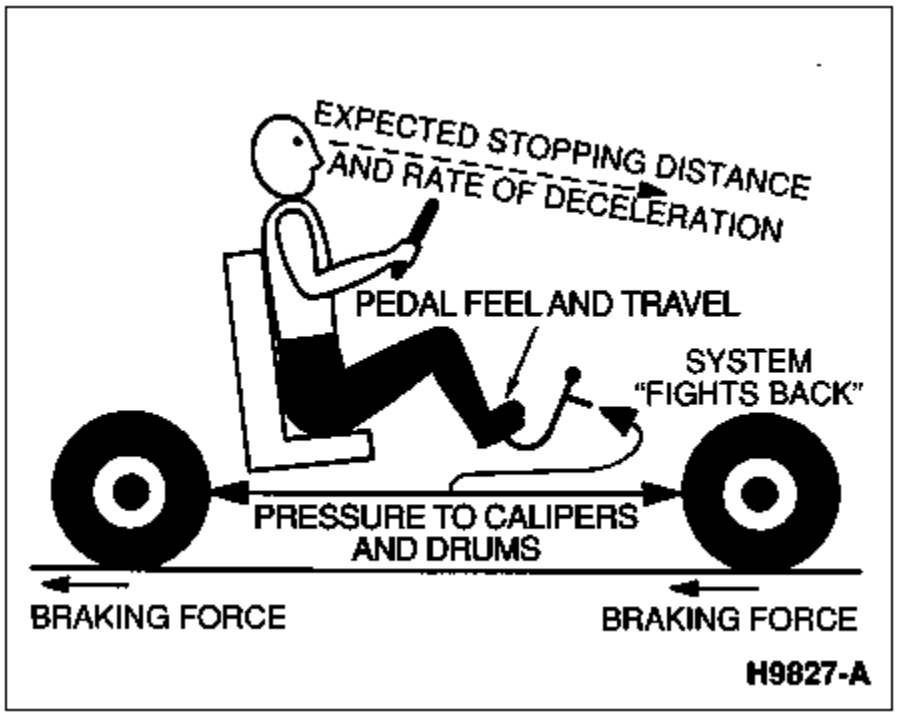
Brake Pedal Feel and Stopping Distance

A combination of things indicates whether brakes are working properly: The feel of the brake pedal, how rapidly the vehicle slows down and distance travelled before stopping. If the brakes are working properly and we experience the expected feel and results, we are confident. If the brakes feel different and/or the vehicle doesn't slow or stop as expected, we feel uneasy. . .even panicked. This panic will be heightened in emergency stopping situations.

Customers often report brake problems in terms of brake pedal feel. "My brakes feel spongy" or "The brake pedal went to the floor" or "The brakes feel hard and I have to apply much more force than usual" are all possible customer complaints. These complaints are often accompanied by reports that the vehicle "Just didn't stop the way it should." These simple complaints may indicate problems that are much more complex to diagnose and correct.

What makes understanding brake feel and stopping distance a challenge is that different brake systems have a different feel and a different braking response. Feel is the result of several factors:

Stopping Perceptions



Design

Brake feel will vary from vehicle to vehicle, even of the same design depending on how the vehicle is equipped.

Operation

How the vehicle is used may also change the feel of the brakes. Factors such as loading, trailer towing and operating on steep grades or gravel roads can all affect the feel of the brakes.

Pedal Force and Travel

The amount of force applied, combined with the amount of brake pedal travel will affect the feel and stopping response. Some drivers are stronger than others and can force the brake pedal down further.

Spring or Give in the System

This is a very important concept. A braking system isn't rigid. Every part has some give. For example, the disc brake calipers (2B120) flex a little as force is applied, flexible hoses swell a little under pressure, and shoe return springs are extended. The combination of these and other points where the system gives a little results in a "springiness" that "fights back" against the hydraulic pressure. This "fighting back" is felt through the brake pedal. As parts of the system become worn or corroded, this "fighting back" feel may change.

Symptom Chart — Brake System Service

BRAKE SYSTEM SERVICE

Condition	Possible Source	Action
• Brakes Not Working, Excessive Pedal Travel, Brake Pedal Feels Spongy When Fully Applied	• Low fluid level.	• ADD fluid, BLEED system, CHECK for leaks, and BLEED system.
	• Worn or damaged four wheel ABS hydraulic control unit (Ranger only).	• REFER to Section 06-09B , Symptom Chart.
	• Worn or damaged RABS valve accumulator or outlet (dump) valve	• REFER to Section 06-09A , Symptom Chart.
	• Rear brakes out of adjustment.	• ADJUST rear brakes. REFER to Section 06-02 .
	• Front wheel bearing out of adjustment.	• ADJUST front wheel bearings. REFER to Section 04-01A for all 4x2 vehicles, Section 05-03A for Ranger and Section 04-01C for Aerostar 4x4.
	• Brake master cylinder or booster dash unit mounting loose.	• TIGHTEN nuts and bolts to specification.
	• Disc brake caliper attachment loose.	• REPLACE or TIGHTEN as required.
	• Worn or damaged brake shoe adjusting lever cables .	• REMOVE drum and CHECK lining for proper adjustment. REPLACE brake shoe adjusting lever cables. REFER to Section 06-02 .
	• Glazed, worn, scored or damaged brake linings.	• REPLACE rear brake shoes and linings. REFER to Section 06-02 .
	• Drums out of round or rotors with excessive runout.	• REFINISH, or REPLACE if wear exceeds limits. REFER to Section 06-03 , Section 06-02 .
	• Front brake hose improperly positioned.	• CHECK front brake

		hose for misposition near heat source. REPOSITION as required.
	• Air in system.	• BLEED system. REFER to Section 06-06.
	• Reservoir cap vent hole clogged.	• SERVICE or REPLACE brake master cylinder filler cap as required.
• Excessive Pedal Travel or Brake Pedal Goes to Floor Consistently	• Hydraulic system.	• PERFORM master cylinder diagnosis test. REFER to Pinpoint Test R and Pinpoint Test T. REPAIR as required.
	• Brake drums worn, bad wear pattern, or cracked.	• REPAIR or REPLACE as required. REFER to Section 06-02.
	• Loose or improper attachment of brake pedal, pedal support booster and brake master cylinder.	• REPAIR or REPLACE as required. REFER to Section 06-07.
	• External leak.	• REPAIR as required.
	• Air in system.	• BLEED system. REFER to Section 06-06.
• Excessive Pedal Effort to Fully Apply Brakes	• Overloaded vehicle.	• LIGHTEN load and ADVISE owner of correct load limits of vehicle.
	• Insufficient vacuum to power brake booster.	• REPLACE damaged or leaking vacuum booster hoses.
	• Restricted air filter on power brake booster.	• CLEAN or REPLACE filter.
	• Booster and brake pedal linkage binding caused by worn bushings or corrosion.	• REPLACE worn bushings or CLEAN and LUBRICANT linkage.
	• Worn or damaged power brake booster.	• REPLACE power brake booster. REFER to Section 06-07.
	• Brake lining worn, glazed, contaminated or improper type.	• REPLACE brake lining in axle sets.
	• Rear brake shoe and lining improperly installed.	• REPOSITION brake shoes properly and ELIMINATE any binding. REFER to Section 06-02.

	• Seized caliper pistons in rear wheel cylinders or disc brake calipers. • Restricted brake lines or hoses.	• REPAIR or REPLACE as required. • REPAIR or REPLACE as required.
• Brakes Drag, Slow or Incomplete Release	• Parking brake control or parking brake rear cable and conduits binding. • Rear brake components binding. • Damaged front wheel bearing. • Worn or damaged brake master cylinder. • Caliper slides binding. • Brakes out of adjustment. • Restriction in hydraulic system. • Binding/seized rear wheel cylinders or caliper pistons.	• REPAIR, LUBRICATE, or REPLACE parts as required. REFER to Section 06-05 . • REPAIR, LUBRICATE, or REPLACE parts as required. • CHECK bearings for adjustment, wear, damage. ADJUST bearings. • PERFORM master cylinder diagnosis test. REFER to Pinpoint Test R and Pinpoint Test T . REPAIR as required. • REPLACE slide pins, CLEAN grooves, LUBRICATE slides. • ADJUST rear brakes. REFER to Section 06-02 . • REPAIR or REPLACE as required. REFER to Section 06-06 . • REPAIR or REPLACE as required. REFER to Section 06-03 , or Section 06-02 .
• Empty Reservoir	• Damaged brake master cylinder reservoir. • Leaking mounting grommets. • Leaking components (lines, hoses, disc brake calipers, rear wheel cylinder, etc.).	• REPLACE brake master cylinder reservoir. REFER to Section 06-06 . • REPLACE grommets and brake master cylinder reservoir. • REPAIR as required. BLEED system as required.
• Noise at Wheels When Brakes Are Applied — Snap or Clicks	• Cracked welds at brake shoe web.	• REPLACE rear brake shoe and lining in axle sets.

	• Brake shoes binding at backing plate ledges.	• CLEAN and LUBRICATE ledges.
	• Machining marks on brake drums.	• REFINISH, or REPLACE brake drums. REFER to Section 06-02 .
	• Backing plate ledges worn.	• REPLACE brake backing plate and LUBRICATE ledges. REFER to Section 06-02 .
	• Loose or missing disc brake pad anti-rattle clips.	• REPLACE. REFER to Section 06-03 .
	• Improper rotor finish after turning.	• REFINISH or REPLACE disc brake rotors. REFER to Section 06-03 .
	• Improper positioning, wear or damage of disc brake caliper.	• INSPECT, REPAIR or REPLACE. REFER to Section 06-03 .
• Noise at Wheels When Brakes Are Applied — Scrape or Grind	• Worn brake linings, loose rivets or foreign material scraping brake components.	• REPLACE rear brake shoes and linings. REFINISH or REPLACE brake drums or disc brake rotors if excessively scored. REFER to Section 06-03 , Section 06-02 .
	• Brake shoe interference with back of brake drum, shield-to-rotor clearance or binding at backing plate guide ledges.	• INSPECT. REPLACE as necessary. LUBRICATE. REFER to Section 06-02 , Section 06-03 .
	• Other brake system components. Warped or bent brake backing plate causing interference with brake drum.Cracked brake drums or disc brake rotors.Loose brake shoe hold-down springs.	• INSPECT and REPAIR as necessary. REFER to Section 06-02 , Section 06-03 .
	• Tires rubbing against chassis, body, or loose brake shoe hold-down springs.	• INSPECT. REPAIR as necessary. REFER to Section 04-04 .
• Noise at Wheels When Brakes Are Applied — Squeaks, Squeals or Chatter	• Worn or scored brake drums and lining or disc brake rotors.	• INSPECT, REPAIR or REPLACE as required. REFER to Section 06-03 , or Section 06-02 .
	• Burrs or rust on disc brake caliper that would obstruct seating of shoe to disc brake caliper.	• CLEAN or DEBURR disc brake caliper.

	• Dirty, greased or glazed linings. • Improper lining parts or loose rear brake adjustment. • Other brake system components.Loose lining rivets.Weak, damaged or incorrect brake shoe retracting springs.Loose or damaged shoe retaining pins, brake shoe retracting springs and clips.Grooved backing plate ledges.	• CLEAN or REPLACE. • INSPECT for correct usage. If necessary REPLACE with correct type in axle sets. REFER to Section 06-02 , Section 06-03 . • INSPECT, REPAIR or REPLACE as required. REFER to Section 06-02 .
• Noise at Wheels, Brakes Not Applied — Squeak or Squeal	• Wheel covers improperly attached. • Loose wheel attaching lug nuts. • Worn, dry or improperly adjusted wheel bearings. • Glazed linings — adjustment too tight. • Other brake system components.Stretched brake shoe retracting springs.Bent or warped brake backing plate causing interference with brake drum.Improper positioning of disc brake pad in disc brake caliper.Excessive runout of front disc brake rotor.	• SEAT covers with a rubber mallet. REPAIR flanges or REPLACE cover. • TIGHTEN to proper torque. REPLACE wheel if stud holes are damaged. • REPLACE worn or damaged wheel bearings. LUBRICATE and ADJUST. • REMOVE glaze from linings. ADJUST brakes properly. • INSPECT, REPAIR or REPLACE as required. REFER to Section 06-02 , or Section 06-03 as required.
• Noise at Wheels, Brakes Not Applied — Growling, Click or Rattle	• Stones or foreign material trapped inside wheelcovers. • Loose wheel lug nuts. • Damaged, worn, or improperly adjusted wheel bearings.	• REMOVE stones, etc. • TIGHTEN to correct torque. REPLACE wheel if stud holes are elongated. REFER to Section 04-04 . • ADJUST or REPLACE as

		required.
• Noise at Wheels, Brakes Not Applied — Squeaks, Squeals or Chatter	• Loose or missing anti-rattle clips, or caliper pins.	• INSPECT, REPAIR or REPLACE as required. REFER to Section 06-03 .
	• Drum brake linings/shoes loose or extra parts.	• INSPECT, REMOVE or REPAIR. REFER to Section 06-02 .
	• Worn, damaged or dry wheel bearings.	• INSPECT, LUBRICATE or REPLACE. ADJUST bearings properly.
• Grinding Noise	• Improperly lubricated wheel bearings.	• SERVICE as required. REFER to Section 04-01A for 4x2 and Section 05-03A for Ranger, and Section 04-01C for Aerostar 4x4.
• Excessive Brake Lining Wear	• Improperly adjusted wheel bearings.	• ADJUST or REPLACE as required. REFER to Section 04-01A for 4x2 and Section 05-03A for Ranger.
	• Binding caliper sliders.	• SERVICE as required.
• Brake Roughness, Vibration or Pulsation	• Improperly adjusted wheel bearings.	• ADJUST or REPLACE as required. REFER to Section 04-01A for 4x2, Section 05-03A for Ranger and Section 04-01C for Aerostar 4x4.
	• Excessive rotor runout, or thickness variation.	• SERVICE or REPLACE as required.
• Groan, Roughness or Chatter at Wheel (Brakes Applied)	• Loose wheel lug nuts.	• TIGHTEN to correct torque. REPLACE wheel if stud holes are elongated. REFER to Section 04-04 .
	• Worn, damaged, dry or improperly adjusted wheel bearings.	• INSPECT, LUBRICATE or REPLACE.
	• Loose or worn front suspension components.	• INSPECT, REPAIR or REPLACE as required. REFER to

		Section 04-00 .
	• Brake drum cracked or out of round.	• REPLACE drum if required. REFER to Section 06-02 .
	• Disc brake caliper loose, or missing parts — also loose or bent dust shield.	• REPAIR or REPLACE as required. REFER to Section 06-03 .
	• Excessive wear or lateral runout of disc brake rotor.	• REPLACE rotor. REFER to Section 06-03 .
	• Worn tires.	• REPLACE tires. REFER to Section 04-04 .
• Brakes Pull to One Side	• Unequal air pressure in tires.	• INFLATE tires to correct pressure.
	• Grease or fluid on linings. Glazed linings.	• CLEAN, SAND or REPLACE linings. CLEAN disc brake rotors.
	• Loose or missing disc brake caliper pin.	• REPLACE missing pin. REFER to Section 06-03 .
	• Improper size or type of lining on one wheel.	• REPLACE with correct brake linings in sets.
	• Improper size wheel cylinder on one wheel.	• REPLACE with correct wheel cylinder. REFER to Section 06-02 .
	• Stuck or seized pistons in wheel cylinders or seized calipers.	• REPAIR or REPLACE as required. REFER to Section 06-03 , or Section 06-02 .
	• Restricted brake lines or hoses.	• REPAIR or REPLACE as required.
	• Other brake components.Improper adjustment of drum brakes.Improper positioning of disc brake shoe and lining in the caliper.Fit of caliper to knuckle.Improperly adjusted, damaged or worn wheel bearings.Distorted drum brake shoes.Worn brake linings or scored rotor.Missing, broken or stretched retracting or retaining springs and clips.	• INSPECT, ADJUST, REPAIR or REPLACE as required. REFER to Section 06-02 or Section 06-03 .
	• Suspension or steering.	• REPAIR as required.
• Brakes Grab or Lock When Applied	• Tires worn or incorrect pressure.	• INFLATE tires to correct pressure. REPLACE tires with worn tread. REFER to Section 04-04 .

	• Grease or fluid on linings — damaged linings.	• REPLACE lining in sets. CLEAN rotors.
	• Improper size or type of linings.	• REPLACE with correct brake linings in sets.
	• Over-reaction of brake booster.	• REPLACE brake booster if required. REFER to Section 06-07 .
	• Lining sensitivity to moisture.	• DRY linings by applying brakes while moving.
	• Other brake system components.Loose or missing pins for caliper attachment.Worn, damaged or dry wheel bearings.	• INSPECT, REPAIR, REPLACE or LUBRICATE if required. REFER to Section 06-03 , or Section 06-02 .
	• ABS HCU: defective outlet (dump) valve Ranger 4x4.	• REFER to Section 06-09B .
	• RABS Valve: defective outlet (dump) valve.	• REFER to Section 06-09A .
• Brake Warning Light On	• Low brake fluid level.	• ADD fluid, CHECK for leaks, and BLEED system as required.
	• Parking brake applied or not returning completely.	• RELEASE parking brake.
	• Shorted light circuit.	• CORRECT short in brake warning light circuit.
	• Damaged fluid level switch or float assembly.	• REPLACE plastic brake master cylinder reservoir.
	• Differential pressure switch shuttled (Aerostar only) due to leakage in hydraulic circuit or damaged differential switch.	• REPAIR leakage in hydraulic circuit or REPLACE combination valve.
	• Anti-lock light does self check.	• REFER to Diagnostic Charts in Section 06-09A or Section 06-09B .
• Vibration When Brakes Are Applied.	• Loose lug nuts.	• TIGHTEN lugnuts to specification. REPLACE rim if stud holes are elongated. REFER to Section 04-04 .
	• Cracked disc brake rotors.	• REPLACE front disc brake rotor. REFER to Section 06-03 .

	• Front disc brake rotors/brake drums out of round or improper machining.	• MACHINE disc brake rotors or brake drums or REPLACE as required.
	• Worn or improperly adjusted wheel bearings.	• ADJUST or REPLACE wheel bearings as required.
	• Loose or worn front suspension components.	• TIGHTEN loose components to specifications. REPLACE worn or damaged components.
	• Excessive radial or lateral runout on wheel and tire.	• ADJUST or REPLACE tire or wheel to ELIMINATE excessive runout on tire or wheel as required. REFER to Section 04-04 .

Pinpoint Tests

DIAGNOSTIC PINPOINT TEST INDEX

Description	Test
Brakes Pull or Drift	Test A
Brake Warning Indicator Always On	Test B
Vibration When Brakes Are Applied	Test C
Pedal Goes Down Fast	Test D
Pedal Goes Down Slowly	Test E
Pedal Is Low or Feels Spongy	Test F
Brake Lockup During Light Brake Pedal Force	Test G
Excessive and/or Erratic Pedal Travel	Test H
Brakes Drag	Test J
Brakes Shudder	Test K
Brake Pedal Excessive Effort, Booster System OK	Test L
Brake Noise	Test M
Slow or Incomplete Brake Pedal Return	Test N
Vibration, Pedal Pumping, Low Pedal or Brake Chatter	Test P
Hydraulic Leak Test	Test Q
Brake Master Cylinder Bypass Condition Check	Test R
Excessive Pedal Effort	Test S
Brake Fluid Loss, Brake Master Cylinder Internal Test OK	Test T

PINPOINT TEST A: BRAKES PULL OR DRIFT

A1 INSPECT TIRE PRESSURE

- Measure air pressure in all four tires.

Is tire pressure within specifications?

Yes	No
GO to **A2** .	ADJUST tire pressure.

A2 CHECK CALIPER AND REAR WHEEL CYLINDERS

- Check the front disc brake caliper pistons, pins or rear wheel cylinders for binding, leakage or sticking.

Do the front disc brake caliper pistons, pins or rear wheel cylinders bind or stick?

Yes	No
REPAIR or REPLACE components as necessary.	GO to **A3** .

A3 INSPECT FRONT DISC BRAKE ROTORS AND BRAKE DRUMS

- Inspect the disc brake rotors and/or brake drums for excessive runout or damage.

Does excessive runout or damage exist?

Yes	No
REPAIR or REPLACE disc brake rotor or brake drum as necessary.	GO to **A4** .

A4 INSPECT WHEEL BEARINGS

- Inspect front and rear wheel bearings for excessive end play or improper preload.

Does excessive end play or improper wheel bearing preload exist?

Yes	No
ADJUST wheel bearing preload or REPLACE wheel bearings.	INSPECT for and REPAIR hydraulic leaks. RETEST system.

PINPOINT TEST B: BRAKE WARNING INDICATOR ALWAYS ON

B1 CHECK PARKING BRAKE SWITCH

- With parking brake fully released, disconnect the parking brake switch C202 (Ranger) or C309 (Aerostar).

Did brake warning indicator light go out?

Yes	No
REPLACE the parking brake switch. RETEST.	GO to **B2** .

B2 ISOLATE CIRCUITS, 531 (DG/R), 977 (P/W), AND 162 (LG/R)

- With brake master cylinder reservoir fluid level OK, disconnect the brake master cylinder fluid level switch C137 (Ranger) or C165 (Aerostar).

Does the brake warning indicator light go out?

Yes	No
GO to **B3** .	SERVICE ground short in Circuit 531 (DG/Y), 977 (P/W), or 162 (LG/R).

B3 TEST BRAKE FLUID LEVEL INDICATOR SWITCH

- Test for continuity between fluid level switch C137 (Ranger) or C165 (Aerostar), circuit 512 (T/LG) and ground .

Is there 10,000 ohms or more?

Yes	No
REPLACE the brake master cylinder reservoir.	SERVICE short to ground in Circuit 512 (T/LG).

PINPOINT TEST C: VIBRATION WHEN BRAKES ARE APPLIED

C1 ISOLATE VIBRATION/SHUDDER

- Determine if vibration/shudder is induced by the rear brakes by using the parking brake to slow the vehicle from approximately 80 to 56 km/h (50 to 35 mph). To use the parking brake:
- Hold the release handle out, or press release button in, while applying the parking brake.

Is vibration/shudder present?

Yes	No
CHECK the rear brakes. GO to **C2** for disc brakes. GO to **C3** for drum brakes.	CHECK the front brakes. GO to **C2** .

C2 RESURFACE DISC BRAKES

- Resurface front disc brake rotors and road test vehicle.

Is shudder/vibration present?

Yes	No
GO to **C4** .	Brake system repaired.

C3 REFINISH BRAKE DRUMS

- Refinish brake drums and road test vehicle.

Is shudder/vibration present?

Yes	No
GO to **C5** .	Brake system repaired.

C4 REPLACE DISC BRAKE PADS

- Replace disc brake pads and road test vehicle.

Is shudder/vibration present?

Yes	No
REPLACE front disc brake rotors.	Brake system repaired.

C5 REPLACE BRAKE SHOES AND LININGS

- Replace rear brake shoes and linings and road test vehicle.

Is shudder/vibration present?

Yes	No
DETERMINE which brake drum is at fault and REPLACE.	Brake system repaired.

PINPOINT TEST D: PEDAL GOES DOWN FAST

D1 ROAD TEST

- Road test vehicle only if condition cannot be verified in shop.
- Statically depress brake pedal.

Does brake pedal operate properly?

Yes	No
Vehicle OK.	GO to **D2** .

D2 CHECK BRAKE FLUID LEVEL

- Check brake fluid level.

Is fluid level within specifications?

Yes	No
GO to **D3** .	CHECK reservoir sealing points. ADD fluid and BLEED system. REPEAT Test **D1** .

D3 PRESSURIZE SYSTEM

- Pump brake pedal rapidly (five times).

Does brake pedal maintain height throughout test?

Yes	No
CHECK rear brake adjustment and ADJUST if necessary. If condition still exists, BLEED system. REPEAT Test **D1** .	GO to **D4** .

D4 INSPECT FOR BRAKE SYSTEM LEAKS

- Perform Hydraulic Leak Test — Pinpoint Test Q in this section.

Does system leak?

Yes	No
SERVICE as necessary. ADD fluid and BLEED system. REPEAT Test **D1** .	GO to **D5** .

D5 BRAKE MASTER CYLINDER BYPASS TEST

- Perform Brake Master Cylinder Bypass Condition Check — Pinpoint Test R in this section.

Is test OK?

Yes	No
System OK.	REPLACE damaged parts. ADD fluid and BLEED system. REPEAT Test **D1** .

PINPOINT TEST E: PEDAL GOES DOWN SLOWLY

E1 ROAD TEST

- Check if condition occurs during actual stopping application by depressing the brake pedal while the vehicle is moving.

Does condition occur when vehicle is moving?

Yes	No
GO to **E2** .	Condition occurs only when vehicle is stationary. Normal condition. No action required.

E2 RECHECK BRAKE SYSTEM LEAKS

- Perform Hydraulic Leak Test — Pinpoint Test Q in this section.

Does system leak?

Yes	No
SERVICE as necessary, ADD fluid and BLEED system. REPEAT Test **E1** .	GO to **E3** .

E3 MASTER CYLINDER BYPASS TEST

- Perform Brake Master Cylinder Bypass Condition Check — Pinpoint Test R in this section.

Is test OK?

Yes	No
System OK.	REPLACE damaged parts, ADD fluid and BLEED system. REPEAT Test **E1** .

PINPOINT TEST F: PEDAL IS LOW OR FEELS SPONGY

F1 BRAKE PEDAL CHECK

- Statically apply brake pedal.
- Road test vehicle only if condition cannot be verified in shop.

Does brake pedal operate properly?

Yes	No
Vehicle OK.	GO to **F2** .

F2 BRAKE PEDAL RESERVE CHECK

- Key ON, engine running at idle with transmission in PARK or NEUTRAL.
- Depress brake pedal lightly three or four times.
- Wait 15 seconds to allow the vacuum to replenish.
- Push down on brake pedal until it stops moving downward or an increased resistance to the brake pedal travel occurs.

  NOTE: This increased resistance may feel like the pedal has bottomed out.

- Hold the brake pedal in the applied position while increasing the engine speed to 2000 rpm.
- Release the accelerator pedal.

Does the brake pedal move downward as engine speed returns to normal?

Yes	No
GO to **F3** .	CHECK vacuum to power brake booster. REFER to Section 06-07 .

F3 BRAKE FLUID LEVEL CHECK

- Check brake fluid level.

Is brake fluid level within specifications?

Yes	No
GO to **F4** .	CHECK brake master cylinder reservoir sealing points. ADD fluid and BLEED system.

F4 FILLER CAP VENT CHECK

- Check if brake master cylinder filler cap vent holes are clogged or dirty.

Are holes clogged or dirty?

Yes	No
CLEAN as necessary. REPEAT Test **F1** .	GO to **F5** .

F5 BLEED BRAKE SYSTEM

- Bleed brake system. Refer to Section 06-06 .

Has the condition been corrected?

Yes	No

Vehicle OK.	GO to **F6** .

F6 FRONT WHEEL BEARING ADJUSTMENT

- Check front wheel bearings for proper adjustment.

Are bearings properly adjusted?

Yes	No
CHECK rear brake adjustment and ADJUST if necessary. REPEAT Test **F1** .	ADJUST front wheel bearings. REPEAT Test **F1** .

PINPOINT TEST G: BRAKE LOCKUP DURING LIGHT BRAKE PEDAL FORCE

G1 TIRE CHECK

- Check tires for uneven wear and correct pressure.

Is there a wear or pressure concern?

Yes	No
CORRECT tire concern. REFER to Section 04-04 .	GO to **G2** .

G2 BRAKE SHOE AND LINING CHECK

- Inspect brake shoe and linings for contamination, correct installation, damage, correct size and type.

Is there a brake shoe and lining concern?

Yes	No
REPAIR or REPLACE brake shoe and lining. REFER to Section 06-02 , Section 06-03 .	GO to **G3** .

G3 PARKING BRAKE CHECK

- Inspect parking brake components for damage or seized condition.

Is there a parking brake concern?

Yes	No

CORRECT parking brake concern. REFER to Section 06-05 .	GO to **G4** .

G4 WHEEL BEARING CHECK

- Raise vehicle enough to relieve weight on tires.
- Pull alternately on front and rear of each tire to check for loose or damaged wheel bearings.

Is there a wheel bearing concern?

Yes	No
CORRECT the wheel bearing concern. REFER to the appropriate section in Group 04 or Section 05.	GO to **G5** .

G5 POWER BRAKE BOOSTER PUSH ROD CHECK

- Support the brake master cylinder and remove the brake master cylinder mounting nuts.
- Position the brake master cylinder out of the way.
- With a shop-fabricated gauge, check the power brake booster push rod adjustment.
- The exposed end of the power brake booster push rod should be within 24.89-25.27mm (0.980-0.995 in.) of the brake master cylinder mounting surface on the power brake booster.

Does the power brake booster push rod require adjustment?

Yes	No
ADJUST as necessary. REFER to Section 06-07 .	GO to **G6** .

G6 ABS CHECK

- Perform the appropriate diagnostic tests in Section 06-09A or Section 06-09B to check for defective dump valve.

Is there an anti-lock brake system concern?

Yes	No
REPAIR or REPLACE the worn or damaged anti-lock brake system component. REFER to Section 06-09A or Section 06-09B .	To CHECK for possible missed symptoms, GO to **G1** .

PINPOINT TEST H: EXCESSIVE AND/OR ERRATIC PEDAL TRAVEL

H1 ROUGH ROAD TEST

- Road test vehicle under rough road conditions.
- Apply brakes slowly.

Are brakes good?

Yes	No
Vehicle OK.	GO to **H2** .

H2 WHEEL BEARING CHECK

- Check for loose front wheel bearings.

Are front wheel bearings loose?

Yes	No
REPLACE front wheel bearing if damaged. TIGHTEN front wheel bearing assembly to specification. REPEAT **H1** .	CHECK front disc brake rotor for thickness variances. REFER to Section 06-03 .

PINPOINT TEST J: BRAKES DRAG

J1 BRAKE FUNCTION TEST

- Road test vehicle and apply brakes.

Are brakes functional?

Yes	No
Vehicle OK.	CHECK power brake vacuum booster push rod. REPEAT **J1** .

PINPOINT TEST K: BRAKE SHUDDER

K1 ROAD TEST

- With standard wheels and tires installed, road test the vehicle and verify the condition.

Do the front brakes chirp, shudder or vibrate?

Yes	No
If shudder or vibration occurs, GO to **K2** .	A front brake chirp is normal condition. No repair required.

K2 APPLY PARKING BRAKE

- Lightly apply the parking brake while road testing the vehicle.

Does the vehicle shudder or vibrate when braking?

Yes	No
CHECK the rear brakes. GO to **K4** .	CHECK the front brakes. GO to **K3** .

K3 RESURFACE DISC BRAKES

- Resurface front disc brake rotors and road test vehicle.

Does the condition persist?

Yes	No
REPLACE front disc brake rotors.	Brakes check OK.

K4 REFINISH DRUM BRAKES

- Refinish brake drums and road test vehicle.

Does the condition persist?

Yes	No
REPLACE brake drums. REPEAT **K1** .	Brakes check OK.

PINPOINT TEST L: EXCESSIVE BRAKE PEDAL EFFORT, BOOSTER SYSTEM OK

L1 BRAKE PEDAL LINKAGE TEST

- Detach booster push rod from brake pedal pin and depress brake pedal fully.

Has condition been corrected?

Yes	No
CHECK power brake booster vacuum	SERVICE or REPLACE brake pedal linkage.

availability. REFER to Section 06-07 .	VERIFY system OK.

PINPOINT TEST M: BRAKE NOISE

M1 CHECK PEDAL NOISE

- Run engine at fast idle for 10 seconds or longer. Apply brake pedal and listen for noise. Compare results with known good system.

Was a noise present?

Yes	No
GO to **M2** .	Vehicle OK.

M2 PUSH ROD ADJUSTMENT

- Check and adjust power brake booster push rod. Refer to Section 06-07 .

Is push rod OK?

Yes	No
BLEED brake system.	REPLACE power brake booster. REPEAT Step **M1** .

PINPOINT TEST N: SLOW OR INCOMPLETE BRAKE PEDAL RETURN

N1 CHECK BRAKE PEDAL RETURN

- Run engine at fast idle while making several brake applications. Pull brake pedal rearward with approximately 44.5N (10 lbs.) force. Release the brake pedal and measure the distance to the toe board. Make a hard brake application. Release the brake pedal and measure the brake pedal to toe board distance. The brake pedal should return to its original position.

Did brake pedal return to original position?

Yes	No
Vehicle OK.	GO to **N2** .

N2 CHECK BRAKE PEDAL BINDING

- Check brake pedal to be sure it is operating freely.

Is the brake pedal operating freely?

Yes	No
REPLACE power brake booster.	CORRECT any sticking or binding. REPEAT N2.

PINPOINT TEST P: VIBRATION, PEDAL PUMPING, LOW PEDAL, BRAKE CHATTER

P1 ISOLATION TEST

- Perform road tests and static tests to isolate trouble to the front, rear or parking brake system.

Has the condition been isolated?

Yes	No
REPAIR, REPLACE or ADJUST components of system as necessary. REFER to the appropriate section in Group 06.	REPEAT P1.

PINPOINT TEST Q: HYDRAULIC LEAK TEST

Q1 CHECK FOR LEAKS

- Apply the brakes and check for leaks.

Are any leaks found?

Yes	No
REPLACE leaking parts as required.	GO to Q2.

Q2 REAR BRAKE LEAK CHECK

- Inspect all rear wheel cylinders or rear disc brake calipers for leaks.

Do rear wheel cylinders or rear disc brake calipers check OK?

Yes	No
GO to Q3.	REPLACE or REBUILD rear wheel cylinders or rear disc brake calipers as required.

Q3 FRONT BRAKE LEAK CHECK

- Inspect front disc brake calipers for leaks.

Do front disc brake calipers check OK?

Yes	No
GO to **Q4** .	REPLACE or REBUILD front disc brake calipers as required. RETEST.

Q4 MASTER CYLINDER LEAK CHECK

- Disconnect the brake master cylinder connector tubes from the brake master cylinder.
- Plug the output ports using the appropriate size flared tube type plugs.
- Push down hard on the brake pedal.

Does the brake pedal slowly move downward?

Yes	No
REPLACE or REBUILD the brake master cylinder as required.	Hydraulic system checks OK.

PINPOINT TEST R: BRAKE MASTER CYLINDER BYPASS CONDITION CHECK

R1 FLUID LEVEL CHECK

- Check the fluid level in the brake master cylinder reservoir.

Is the reservoir low or empty?

Yes	No
FILL the brake master cylinder reservoir to the correct level. GO to **R2** .	GO to **R2** .

R2 FLUID LEVEL CHECK, BRAKES APPLIED

- Apply brakes very slowly several times while observing the brake fluid level in the brake master cylinder reservoir.

  NOTE: Brake master cylinder bypass typically occurs when the brakes are applied very slowly and line pressures are low. A "hard" application can flare the internal lip seals out and result in a passing test where the concern may in fact be valid.

Does the level remain the same?

Yes	No
GO to **R3** .	Brake master cylinder checks OK.

R3 WHEEL TURNING TORQUE CHECK, FRONT WHEELS

- Place transmission in NEUTRAL.
- Raise front wheels off of ground.
- Apply 445 N (100 lbs.) evenly over a period of 30 seconds to the brakes and hold for approximately 15 seconds.
- While holding brakes, exert 101 N (75 lbs.) force to front wheels.

Does either wheel rotate?

Yes	No
SERVICE brake master cylinder as required.	Front chamber of brake master cylinder checks OK. GO to **R4** .

R4 WHEEL TURNING TORQUE CHECK, REAR WHEELS

- Place transmission in NEUTRAL.
- Raise rear wheels off of ground.
- Apply 445 N (100 lbs.) evenly over a period of 30 seconds to the brakes and hold for approximately 15 seconds.
- While holding brakes, exert 101 N (75 lbs.) force to rear wheels.

Does either wheel rotate?

Yes	No
SERVICE brake master cylinder as required.	Rear chamber of brake master cylinder checks OK.

PINPOINT TEST S: EXCESSIVE PEDAL EFFORT, VACUUM BOOST SYSTEM

S1 VACUUM CHECK

- Disconnect vacuum booster hose from booster.
- Connect Rotunda Vacuum/Pressure Tester 059-00008 or equivalent to the vacuum hose with a T-fitting.
- Key on, engine running. Allow engine to reach normal operating temperature.
- Record the vacuum reading.

Is the vacuum reading at least 51-64 kPa (15-19 in-Hg)?

Yes	No
GO to S2 .	LOCATE and REPAIR source of low vacuum.

S2 SYSTEM INSPECTION

- Key OFF.
- Reconnect the vacuum line.
- Inspect power brake booster check valve, rubber grommet and all vacuum plumbing for cracks, holes, bad connections or missing clamps.
- Push down on brake pedal and hold.
- Key ON, engine running.

Does the brake pedal move downward when the engine is started?

Yes	No
Vacuum system is OK.	GO to S3 .

S3 COMPONENT ISOLATION CHECK

- Key OFF.
- Reconnect the vacuum gauge to the same point as in Step S1, but leave the rest of the system connected.
- Key ON, engine running at idle until vacuum reaches 51-64 kPa (15-19 in-Hg).
- Key OFF.
- Observe vacuum gauge for 1 minute.

Does vacuum pressure drop more than 3.4 kPa (1 in-Hg)?

Yes	No
DISCONNECT each component one at a time and REPEAT the test procedures in Step S3 until the leaking component is found. PLUG the disconnected vacuum line while performing the test procedures. REPAIR or REPLACE as required.	GO to S4 .

S4 BOOSTER LEAK CHECK

- Key ON.
- Run engine until vacuum reaches 51-64 kPa (15-19 in-Hg).
- Key OFF.
- Push down on the brake pedal and hold for a few seconds and release.

Does the vacuum drop to 0 kPa (0 in-Hg)?

Yes	No

REPLACE or REBUILD power brake booster as required.	System checks OK. REMOVE vacuum gauge and RECONNECT all vacuum lines.

PINPOINT TEST T: BRAKE FLUID LOSS, BRAKE MASTER CYLINDER INTERNAL TEST OK

T1 FLUID LEVEL CHECK

- Check fluid level in brake master cylinder reservoir.

Is fluid level in brake master cylinder reservoir full?

Yes	No
GO to **T2** .	Low or empty brake master cylinder reservoir with no brake warning indicator. REPLACE brake master cylinder reservoir.

T2 FLUID LEVEL CONDITION

- Apply and release brake pedal one full stroke. Observe reservoir fluid level as brake pedal is released.

Does fluid level change?

Yes	No
External leak outside of the brake master cylinder. REPAIR leak.	GO to **T3** .

T3 MASTER CYLINDER CONDITION

- Wipe off exterior of brake master cylinder, brake master cylinder filler cap and gasket with clean cloth.
- Road test vehicle and pump brakes.
- Check if brake master cylinder exterior is dry or wet.
- Check for fluid from bore end of power brake booster at dash.

Is brake master cylinder dry?

Yes	No
GO to **T4** .	External leak in brake master cylinder. REPAIR brake master cylinder.

T4 BRAKE PEDAL CONDITION CHECK

- Apply pressure to brake pedal one full stroke and release, repeat 3 more cycles.

Does brake pedal go down 3.175mm (0.125 inch) each time?

Yes	No
CHECK entire brake system for major leak. REPAIR as required.	Brake master cylinder OK.

Component Tests

WARNING: USE OF ANY OTHER THAN THE APPROVED DOT 3 BRAKE FLUID WILL CAUSE PERMANENT DAMAGE TO BRAKE COMPONENTS AND WILL RENDER THE BRAKES INOPERATIVE.

NOTE: Always check the fluid level in the brake master cylinder reservoir (2K478) before performing the test procedures.

If the fluid level is not at the MAX line on the brake master cylinder reservoir, add High Performance DOT 3 Brake Fluid C6AZ-19542-AB or DOT 3 equivalent fluid meeting Ford specification ESA-M6C25-A, DOT 3.

If a brake is locked and the vehicle must be moved, open a bleeder screw at the locked wheel (1007) to let out enough fluid to relieve the pressure. Close the bleeder screw. This bleeding operation may release the brakes but will not correct the cause of trouble. If this does not relieve the locked wheel condition, service the locked components before proceeding.

Brake Booster Functional Test

Inspect all hoses and connections. All unused vacuum connectors should be capped. Hoses and their connections should be properly secured and in good condition with no holes or collapsed areas.

Brake Booster Operation Check

1. Check hydraulic brake system for leaks or insufficient fluid.
2. With transmission (7003) in NEUTRAL, stop engine (6007) and apply parking brake control (2780). Apply brake pedal (2455) several times to exhaust all vacuum in the system.
3. Apply brake pedal and hold it in the applied position. Start engine. If vacuum system is operating, brake pedal will tend to move downward under constant foot pressure. If no motion is felt, the power brake booster system is not functioning.

Brake Booster

1. Remove vacuum booster hose from power brake booster and check valve connection. Manifold vacuum should be available at the check valve end of the vacuum booster hose with engine at idle speed and transmission in NEUTRAL. If manifold vacuum is available to the power brake booster, connect vacuum booster hose to power brake booster and repeat Steps 2 and 3 of the brake booster functional test. If no downward movement of brake pedal is felt, replace power brake booster.
2. Operate engine a minimum of 10 seconds at fast idle. Stop engine, and let vehicle stand for 10 minutes. Then, apply brake pedal with approximately 89 N (20 lbs.) of force. Brake pedal feel should be the same as that noted with engine operating. If brake pedal feels hard (no power assist), replace check valve and retest. If brake pedal feels spongy, bleed hydraulic system to remove air. Refer to Section 06-06 for Hydraulic System Bleeding.

Check Valve

The function of the power brake booster check valve is to allow manifold vacuum to enter the power brake booster and prevent the escape of vacuum in case manifold vacuum is lost during sustained full throttle operation.

To test the functioning of the power brake booster check valve:

- Start and run the engine for at least 10 seconds.
- Operate the brake pedal to check for power assist.
- Disconnect the vacuum booster hose from the power brake booster.
- There should be enough vacuum retained in the power brake booster for at least one more power-assisted brake operation.

Vacuum System Test

To test the vacuum system, refer to Pinpoint Test S in this section.

Brake Master Cylinder

Normal Conditions

The following conditions are considered normal and are not indications that the brake master cylinder (2140) is in need of service.

Condition 1: During normal operation of the brake master cylinder, the fluid level in the brake master cylinder reservoir will rise during brake application and fall during release. The net fluid level, i.e., after brake application and release, will remain unchanged.

Condition 2: A trace of brake fluid will exist on the power brake booster shell below the brake master cylinder mounting flange. This results from the normal lubricating action of the brake master cylinder bore and seal.

Condition 3: Brake fluid level will decrease with disc brake pad wear.

Abnormal Conditions

Changes in brake pedal feel or travel are indicators that something could be wrong in the brake system. Refer to the Symptom Chart for abnormal condition diagnosis.

Bypass Condition Test

For the bypass condition test, refer to Pinpoint Test R in this section.

Non-Pressure Leaks

The only part of the brake system that could have a brake fluid loss that did not appear when the system is under pressure is the brake master cylinder reservoir area. Brake fluid loss could be caused by a missing or poorly fitted brake master cylinder filler cap, from a punctured or otherwise damaged brake master cylinder reservoir, by a missing or damaged brake master cylinder filler cap gasket, or at the sealing grommets between the brake master cylinder and the brake master cylinder reservoir.

The brake master cylinder reservoir grommets are not separately serviceable and must be replaced with a new brake master cylinder reservoir.

NOTE: The wet appearance of the outer cover of rubber brake hoses is called "sweating." This is a normal condition for neoprene rayon braid hose. The "sweating" condition is not evidence of a brake fluid leak and will not result in a loss of pressure in the system.

Replace a flexible brake hose if it shows signs of softening, cracking or other damage.

When installing a new brake hose, position the hose to avoid contact with other vehicle parts.

Compensator Port Check

The purpose of the compensator ports in the brake master cylinder is to supply any additional brake fluid required by the system due to brake pad wear and to allow brake fluid returning from the brake lines to the brake master cylinder to enter the brake master cylinder reservoir.

The returning brake fluid will cause a slight turbulence in the brake master cylinder reservoir. If turbulence is seen in the brake master cylinder reservoir upon release of the brake pedal, this is normal and shows that the compensating ports are not plugged.

Brake Combination Valve, Aerostar

If there is a brake system concern such as premature rear brake lockup, that cannot be attributed to the rear anti-lock brake system (RABS), the cause may be a malfunctioning brake combination valve.

Check the brake combination valve by substituting the suspected bad valve with a known good one. If the condition persists, recheck the RABS. Refer to Section 06-09A .

Brakes, Disc

Front

1. **NOTE: For service, install a new disc brake caliper bracket bolt (Ranger only) or reuse the old bolt with thread locking compound such as Ford Threadlock and Sealer E0AZ-19554-AA or equivalent meeting Ford specification WSK-M2G315-A5 (Type II). Tighten to 100-130 Nm (74-96 lb-ft).**

   Inspect the disc brake caliper (2B120) and mounting for loose or damaged parts.

2. Check the front brake hose (2078) and front disc brake caliper fitting for leaks or damage.

3. Check the disc brake caliper closely for wet areas that might indicate a leaking seal.

4. Measure front disc brake rotor thickness, parallelism and runout carefully. Refer to Section 06-03 .

5. Resurface, recondition or replace the front disc brake hub and rotor (1102). A visual inspection will not determine the required service unless the damage is obvious.

6. Check for brake fluid contamination when inspecting the brake shoes and linings (2001). This may indicate a leaking piston seal assembly. If a seal is leaking, the disc brake caliper must be disassembled and inspected. Refer to Section 06-03 .

7. Check for even wear from side to side. If the set of brake shoes and linings on one side of the vehicle is excessively worn, the caliper piston may be seized in the bore on the opposite side of the vehicle. If a seized caliper piston is suspected, the disc brake caliper must be disassembled and inspected. Refer to Section 06-03 .

Brakes, Drum

In order to properly inspect the rear brakes, the brake drum (1126) must be removed. Refer to Section 06-02 . Check for the following conditions during a drum brake diagnosis:

1. Inspect the brake shoe and lining material for:

   - wear beyond service limits,
   - uneven wear,
   - cracks,
   - scoring,
   - gouges,
   - contamination from grease or brake fluid.

2. Inspect the rear wheel cylinder (2261) for signs of leakage.

3. **NOTE: A good spring will make a dull thud when dropped on a concrete floor. A heat-damaged spring that has lost tension will make a distinctive ringing sound when dropped on a concrete floor.**

   Check the brake shoe adjusting screw springs and brake shoe retracting springs (2296) for signs of:

   - heat damage,
   - bends or damage to coils or shank,
   - loss of tension.

4. Check the brake backing plate shoe support pads for signs of scoring. The support pads must be smooth and have a light coating of lithium grease.

5. Inspect the brake drum for scratches, scoring, bell mouth and out-of-round conditions.

6. Refer to Section 06-02 for additional service and repair procedures.

Brake Thickness

FRONT DISC

Description	4x2	4x4
Lining Thickness Inboard and Outboard	9.9mm (0.39 In.)	9.9mm (0.39 In.)

REAR DISC

Description	mm	Inch
Lining Minimum Thickness	3.12	1/8

REAR DRUM

Truck Series	Ranger Reg. and SuperCab Under 4580 GVWR	Ranger Reg. SuperCab over 4580 GVWR	All Aerostar
Lining Thickness Primary	4.8mm (.19 In.)	4.8mm (.189 In.)	4.8mm (.189 In.)
Lining Thickness Secondary	7.1mm (.28 In.)	6.2mm (.245 In.)	6.2mm (.245 In.)
Lining Length Primary	154.9mm (6.10 In.)	214.9mm (8.46 In.)	214.9mm (8.46 In.)
Lining Length Secondary	223.5mm (8.80 In.)	243.8mm (9.6 In.)	243.6mm (9.59 In.)

Hydraulic System

1. **NOTE: If dirt is found in any part of the hydraulic system, flush the entire system with clean isopropyl alcohol.**

   Clean brake parts in clean isopropyl alcohol or use the Rotunda Brake Parts Washer 065-00016 or equivalent.

2. Inspect all parts for wear or damage.

3. Check the wheel cylinder or caliper bore for rust, scores, or other damage.

4. Be sure the bleeder screw passage is clean and open.

5. Replace all parts that are worn or damaged.

Brake Master Cylinder

Clean all brake master cylinder parts in clean isopropyl alcohol, or use the Rotunda Brake Parts Washer 065-00016 or equivalent and inspect the parts for wear or damage. Replace them if required. When a master cylinder repair kit is used, follow the instructions in the kit and install all of the parts provided.

The following conditions are considered normal and are not indications that the brake master cylinder reservoir (2K478) is in need of service:

- Low brake fluid level detected without signs of leakage. This condition is caused by displacement of brake fluid from the brake master cylinder reservoir into the front disc brake calipers (2B120) to compensate for normal brake wear. Add brake fluid as needed.
- A momentary or slight squirt of brake fluid from the brake master cylinder reservoir upon application of the brake pedal (2455). This condition is caused by brake fluid displacement through the brake master cylinder reservoir compensating port as the brake master cylinder pistons move forward in the bore when the brakes are applied.
- Slight turbulence in the brake fluid when the brake pedal is released. Turbulence occurs as brake fluid returns to the brake master cylinder (2140) after releasing the brakes.
- A trace of brake fluid found on the outside of the power brake booster (2005) below the brake master cylinder mounting flange. This condition results from the lubricating action of the master cylinder wiping seal.

Make sure all ports and vents in the brake master cylinder are open and free of foreign matter.

Brake Tubing

Clean new brake tubing with isopropyl alcohol. Inspect for cracks, kinks or other damage. Replace as necessary.

Brake Booster

Inspect the power brake booster for damage, misalignment, or loose mounting nuts. Make sure the vacuum supply hose connection is secure. A trace of brake fluid below the brake master cylinder mounting is normal and is caused by the wiping action of the brake master cylinder piston seals.

Parking Brake

- Inspect the parking brake control (2780) and look for loose mounting bolts, damaged or missing parts.
- Operate the parking brake and check for binding or seized components.
- Raise and support the vehicle and remove any debris that may interfere with parking brake operation.
- Check the condition of the parking brake cables. Look for abrasion or cables rubbing on body or frame parts. Repair, replace or reroute as necessary.
- Remove the brake drums (1126) and have an assistant operate the parking brake just enough to observe operation. Look for damaged or missing parts.
- Lubricate parking brake parts with Disc Brake Caliper Slide Grease D7AZ-19590-A or equivalent meeting Ford specification ESA-M1C172-A.

Brake Pedal

On dual brake master cylinder (2140) with power brake booster-equipped vehicles, the brake systems are designed to permit a full stroke of the brake master cylinder when the brake pedal (2455) is fully depressed. A brake pedal clearance adjustment is not required.

If brake pedal travel seems restricted, check for obstructions.

Free Play

To release the brakes, fluid must flow back to the brake master cylinder (2140) through a return port when brake pedal pressure is released. To be sure the brake master cylinder piston moves back far enough to expose the return port, free play is built into the brake pedal linkage on power brake booster systems. This prevents the caliper piston or wheel cylinder piston from becoming trapped in a partially released position. If a problem is suspected, the push rod and brake pedal (2455) should be checked to make sure they are not binding. Pedal free play is not always perceptible in dash-mounted booster systems, because the operating clearance for the brake master cylinder piston is adjusted at the booster push rod, rather than the brake pedal linkage. Refer to Section 06-07 for instructions on dash-mounted booster push rod adjustment.

Brakes, Rear, Drum

WARNING: BRAKE FLUID CONTAINS POLYGLYCOL ETHERS AND POLYGLYCOLS. AVOID CONTACT WITH EYES. WASH HANDS THOROUGHLY AFTER HANDLING. IF BRAKE FLUID CONTACTS EYES, FLUSH WITH RUNNING WATER FOR 15 MINUTES. GET MEDICAL ATTENTION IF IRRITATION PERSISTS. IF TAKEN INTERNALLY, DRINK WATER AND INDUCE VOMITING. GET MEDICAL ATTENTION IMMEDIATELY.

Rear brake shoes and linings (2200) are adjusted automatically by sharply applying brake while alternately driving the vehicle forward and reverse. Brake adjustment occurs during reverse stops only. Manual brake adjustment is required when the brake shoes are replaced, or if the brake shoe adjusting lever cables (2A178) have malfunctioned. Refer to Section 06-02 .

Keep the brake master cylinder reservoir (2K478) filled with High Performance DOT 3 Brake Fluid C6AZ-19542-AB or DOT 3 equivalent fluid meeting Ford specification ESA-M6C25-A, DOT 3. **Never use brake fluid that has been drained from the system.**

Hydraulic Brake Fluid Color

NOTE: Brake fluid contaminated with a hydrocarbon/mineral based fluid (power steering or transmission fluid) can be detected by an obvious swelling of the brake master cylinder filler cap gasket. If the swollen gasket condition is present, all brake system rubber parts must be replaced. All brake tubes must be thoroughly flushed with High Performance DOT 3 Brake Fluid C6AZ-19542-AB or DOT 3 equivalent fluid meeting Ford specification ESA-M6C25-A DOT 3 before the vehicle goes back into service.

Hydraulic brake fluid color must conform with the requirements of Federal Motor Vehicle Safety Standard 116. Under this standard, brake fluids are visually different from other automotive fluids such as transmission, power steering and engine oil.

The color of the brake fluid in a normal brake system in service can vary from its original color for many reasons. Sometimes a brake master cylinder (2140) may show significantly different shades of color of brake fluid in the brake master cylinder reservoir (2K478). Some of the reasons for the apparent difference in color in a system are listed below.

- Brake fluid discoloration can occur due to heat and/or aging.
- Brake fluid discoloration can exist when different brands/shades of brake fluid are used in topping off during normal service.
- Brake fluid discoloration can occur through the dissolving of color dye used on brake master cylinder internal springs in manufacturer's assembly procedure.

Brake Fluid Level Check

WARNING: BRAKE FLUID CONTAINS POLYGLYCOL ETHERS AND POLYGLYCOLS. AVOID CONTACT WITH EYES. WASH HANDS THOROUGHLY AFTER HANDLING. IF BRAKE FLUID CONTACTS EYES, FLUSH EYES WITH RUNNING WATER FOR FIFTEEN MINUTES. GET MEDICAL ATTENTION IF IRRITATION PERSISTS. IF TAKEN INTERNALLY, DRINK WATER AND INDUCE VOMITING. GET MEDICAL ATTENTION IMMEDIATELY.

Check the brake fluid level in the brake master cylinder reservoir (2K478) on the brake master cylinder (2140). The brake fluid level should be at or near the MAX mark. If the brake fluid level is low, inspect the brake system and add brake fluid as directed in the following procedure.

Brake System Service

1. **WARNING: USE OF A BRAKE FLUID THAT DOES NOT MEET DOT 3 SPECIFICATION, COULD DAMAGE THE HYDRAULIC BRAKE SYSTEM AND CAUSE BRAKE FAILURE.**

   Clean and remove the brake master cylinder filler cap from the brake master cylinder reservoir.

2. Fill the brake master cylinder reservoir to the MAX line with High Performance DOT 3 Brake Fluid C6AZ-19542-AB or DOT 3 equivalent fluid meeting Ford specification ESA-M6C25-A, DOT 3.

3. Install the brake master cylinder filler cap on the brake master cylinder reservoir.

Brake Rotor, Disc

Each time the brakes are serviced, the disc brake rotor should be checked for scoring, runout, parallelism and thickness.

Disc brake rotor scoring and runout may be checked on most brakes with the disc brake rotor either on or off.

Disc brake rotor specifications are listed in the Specifications at the end of this section.

Runout

Disc brake rotor lateral runout is the side-to-side movement or wobble of the disc brake rotor as it rotates. Excessive runout may cause vibration, brake pedal pumping, low brake pedal (2455) or brake chatter. Use the following procedure to check disc brake rotor runout.

1. Tighten the wheel hub retainer to eliminate all end play from the wheel bearing. Be sure the disc brake rotor can be turned.

2. Attach Dial Indicator with Bracketry TOOL-4201-C or equivalent to some part of the vehicle suspension so the stylus of the indicator touches the surface of the disc brake rotor approximately 25.4mm (one inch) from outer edge of the disc brake rotor.

3. Adjust the dial indicator to mid travel. Zero the scale on the dial indicator. Slowly turn the disc brake rotor one complete turn and note the high and low readings on the dial. The total between the high

and low reading must not exceed the specified runout limit.

4. **CAUTION: Be sure to adjust the wheel hub retainer to specifications after the runout check.**

   Refinish or replace the disc brake rotor as required.

Parallelism

Parallelism is the variations in the thickness of the disc brake rotor. If the two rubbing surfaces of the disc brake rotor are not parallel, the disc brake rotor may cause excessive brake pedal travel, a pulsating brake pedal, or noise.

Two methods can be used to check if the two faces of a disc brake rotor are parallel. A micrometer can be used to measure the disc brake rotor thickness at 12 points approximately 30 degrees apart and 25.4mm (1 inch) from the outer edge of the disc brake rotor.

The other method is to measure the disc brake rotor on a precision lathe designed for machining disc brake rotors. Attach two dial indicators, one on each side of the disc brake rotor, so that the stylus on each indicator contacts the rubbing surface, directly opposite each other, approximately 25.4mm (1 inch) from the outer edge of the disc brake rotor.

Zero both indicators and rotate the disc brake rotor while watching both dials. If the total readings of both indicators exceed the specified limit for parallelism, the disc brake rotor must be refinished or replaced.

Refinishing

Use a disc brake lathe to refinish the disc brake rotor. (Follow manufacturer's instructions.)

Replace the disc brake rotor when the overall thickness is at or below the specified minimum thickness shown on the disc brake rotor. Refer to Specifications at the end of this section for minimum (discard) disc brake rotor thickness, maximum brake surface lateral runout, thickness variation, and surface finish.

Service Limits

WARNING: NEVER INSTALL A DISC BRAKE ROTOR THAT HAS BEEN TURNED TO MINIMUM WEAR OR DISCARD THICKNESS.

Measure the thickness of the disc brake rotor to determine if it is within Specifications listed at the end of this section. Disc brake rotor minimum (discard) thickness is stamped on the disc brake rotor. Disc brake rotors have a minimum thickness dimension (minimum wear thickness or discard thickness). This is not the refinishing dimension.

Brake Drum

Maximum Diameter

Brake drum maximum diameter is molded into the rim of the brake drum (1126). The brake drum may be machined enough to correct scoring but only up to the MAX. DIA. dimension. If, after machining, the brake drum inside braking surface diameter exceeds the specification, it must be discarded.

Lugnut Torque Requirement

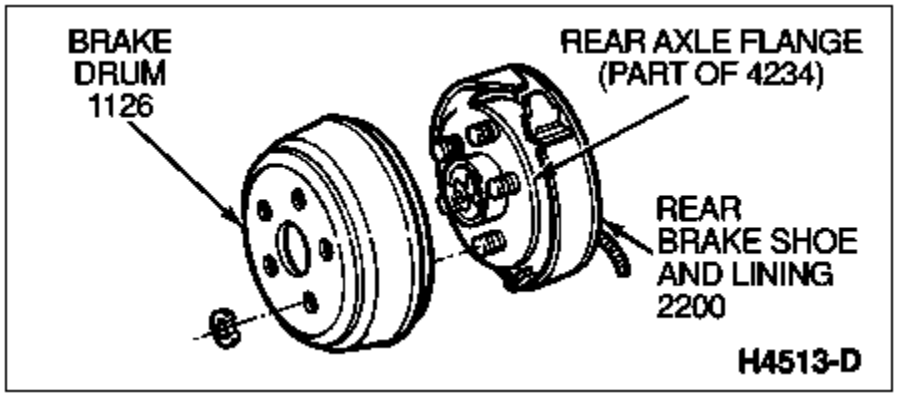
NOTE: Torque specification is for nut and bolt threads free of dirt and rust. Do NOT use oil or grease on threads. Use only Ford recommended replacement fasteners.

Tighten lugnuts to 135 Nm (100 lb-ft).

tomsn048@gmail.com

Brake Drum

WARNING: DO NOT INHALE DUST FROM BRAKES OR ASSOCIATED COMPONENTS. INHALATION OF DUST CAN BE INJURIOUS TO YOUR HEALTH. COMPRESSED AIR OR BRUSHES MUST NOT BE USED TO CLEAN BRAKES, BRAKE DRUMS (1126) AND ASSOCIATED COMPONENTS. A VACUUM CLEANER, SUCH AS ROTUNDA BRAKE/CLUTCH/SERVICE VACUUM 091-R0001 OR EQUIVALENT, EQUIPPED FOR THIS PURPOSE SHOULD BE CAREFULLY USED TO REMOVE ANY DUST. ADHERENT DUST SHOULD BE REMOVED WITH A DAMP RAG. ANY DUST SHOULD BE CONTAINED IN A SEALED AND LABELED BAG FOR DISPOSAL. WEAR AN APPROVED HIGH EFFICIENCY CARTRIDGE OR AIR LINE RESPIRATOR AND USE EXTRA CAUTION TO AVOID BREATHING THIS DUST. ALWAYS USE NON-ASBESTOS REPLACEMENT PARTS.



Removal

1. Raise and support the vehicle so the wheel (1007) is clear of the floor.
2. **CAUTION: Use of a drum puller or a torch is not recommended. Drum distortion may result.**

   Remove the hub cap, if equipped, and wheel.
3. Remove the retaining nut and remove the brake drum.
4. **CAUTION: Loosen the adjusting screw only if the brake drum cannot be removed. Do not burr, chip or damage the notches in the adjusting screw assembly or the self adjusting mechanism will not function properly.**

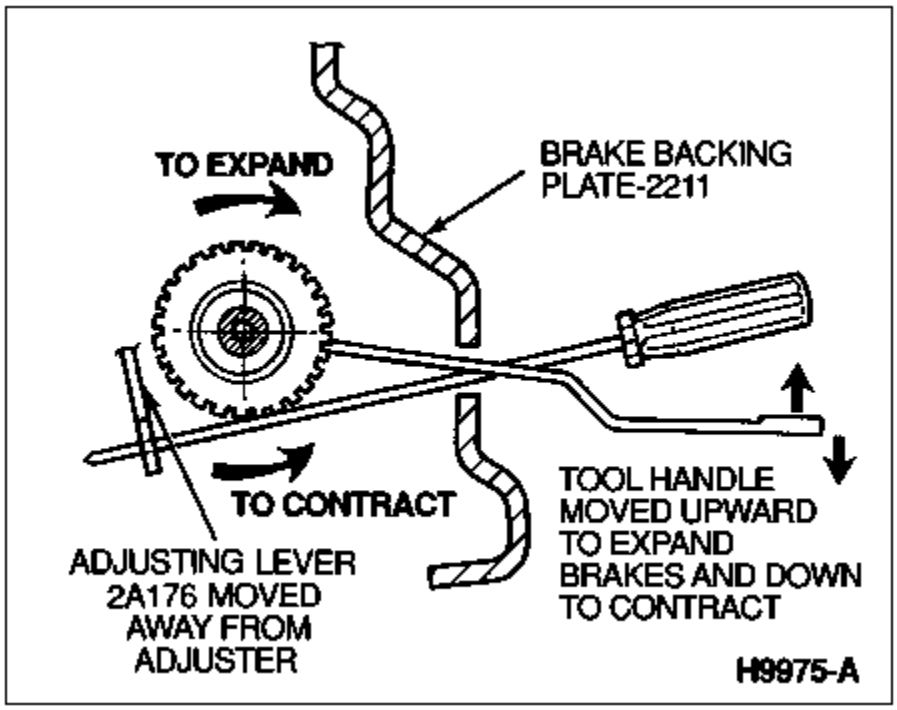
   If the brake drum is rusted to the axle shaft pilot, use coarse sandpaper or file to remove the rust buildup, then work the brake drum off.

   - If the brake drum will not come off, insert a narrow screwdriver through the brake adjusting hole in the brake backing plate (2211), and disengage the adjusting lever from the brake adjusting screw assembly. While holding the adjusting lever away from the brake adjusting

tomsn048@gmail.com

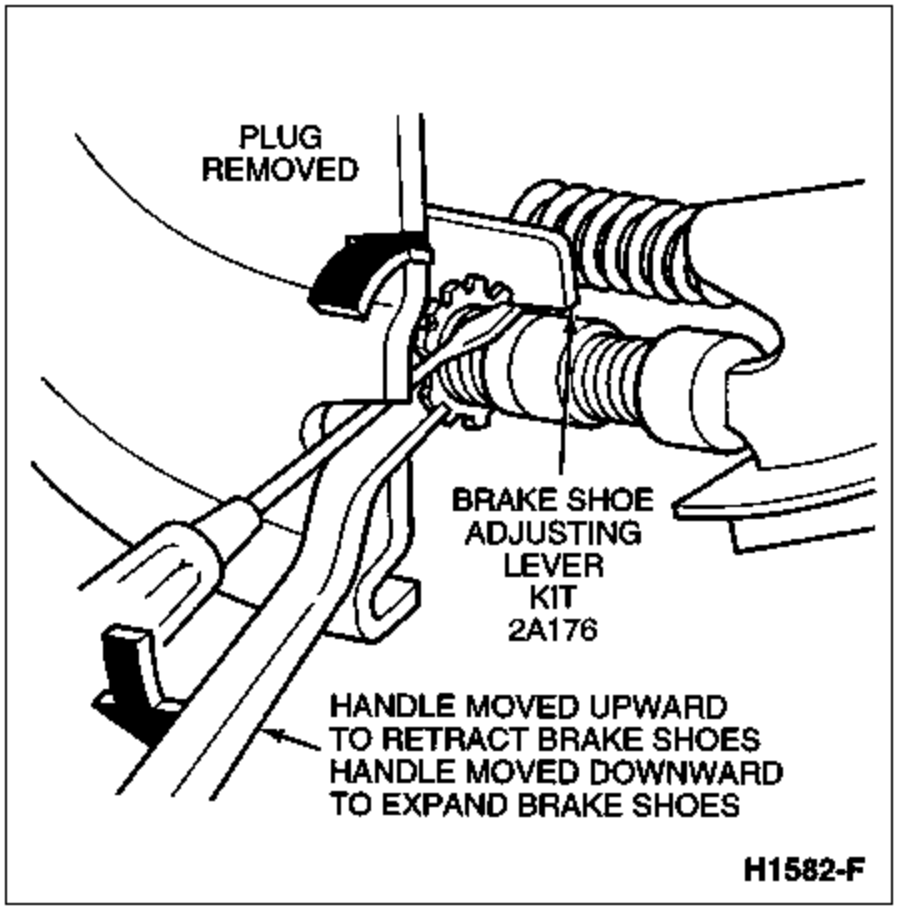
screw assembly, loosen the brake adjusting screw assembly with Brake Adjustment Tool D81L-1103-C or equivalent.

Ranger



Aerostar

tomsn048@gmail.com



Installation

1. If a new brake drum is to be installed, remove the protective coating from the new brake drum with carburetor degreaser or equivalent.

2. Adjust the rear brake shoe and lining (2200) as described in this section using Brake Adjustment Gauge D81L-1103A or equivalent. Brake drum turning may be performed as long as the maximum inside diameter is not exceeded. The maximum inside diameter is cast into the drum face.

3. Install the brake drum.

4. Install the wheel on the wheel hub bolts against the brake drum, and tighten the lug nuts (1012) to 135 Nm (100 lb-ft).

tomsn048@gmail.com

tomsn048@gmail.com

Brake Shoes and Lining

SPECIAL SERVICE TOOL(S) REQUIRED

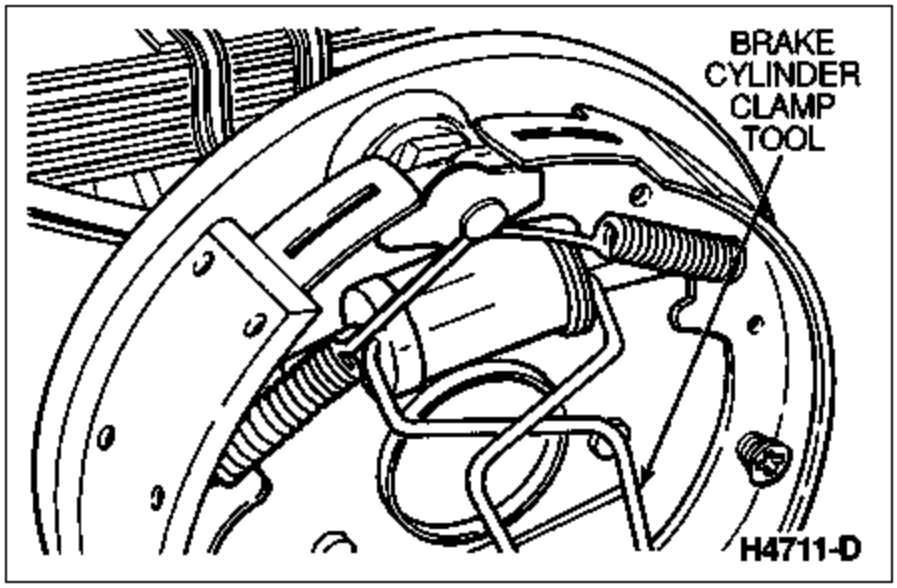
Description	Tool Number
Hold-Down Spring Tool	T73T-2300-A

CAUTION: To ensure correct assembly, note the position of each part removed.

Removal

1. Remove the wheel (1007) and brake drum (1126).
2. **NOTE: If the boots are not removed, brake fluid leakage past the cups may go undetected because the boots may seal the fluid in the rear wheel cylinder. If leaks are found, the rear wheel cylinder must be repaired or replaced.**

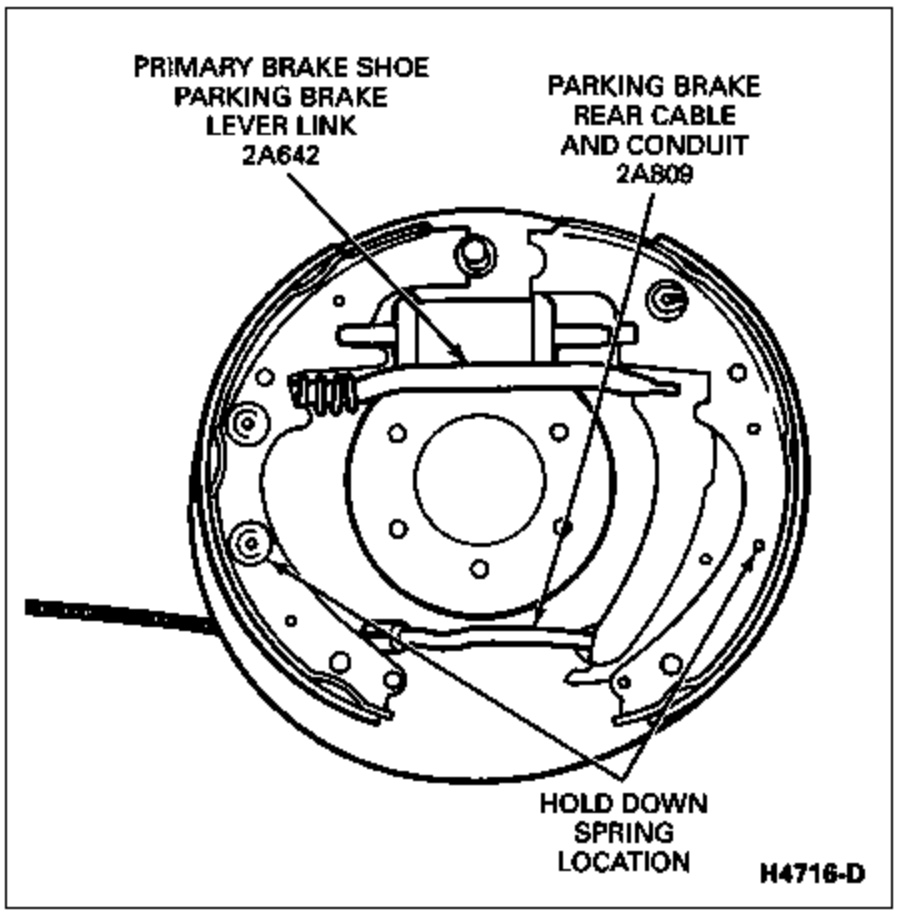
   Inspect rear wheel cylinder for signs of leaks or presence of rust by removing the boots and inspecting interior surfaces. Water leaking into the rear wheel cylinder past the boots will cause rust to form and may cause the rear wheel cylinder to seize.
3. If no leaks are found, install brake cylinder clamp over the ends of the rear wheel cylinder as shown.



4. Remove the brake shoe retracting springs.

tomsn048@gmail.com

5. Remove the brake shoe adjusting lever cable from the anchor pin, cable guide and adjusting lever.
6. Remove the cable guide from the secondary brake shoe and lining web.
7. Remove the adjusting lever and adjusting lever return spring.
8. Remove the brake shoe adjusting screw spring.
9. Using Hold-Down Spring Tool T73T-2300-A, remove the brake shoe hold-down spring and pin from each rear brake shoe and lining (2200).
10. Remove the brake shoe adjuster assembly.
11. Remove the primary brake shoe parking brake lever link and parking brake link spring.



12. Remove the parking brake rear cable and conduit (2A635) from the parking brake lever.
13. Remove the rear brake shoe and lining from the vehicle.
14. Remove the parking brake lever from the secondary rear brake shoe and lining.

21	2200	Rear Brake Shoe and Lining (Primary)
22	2A178	Brake Shoe Adjusting Lever Cable
23	2211	Brake Backing Plate

Installation

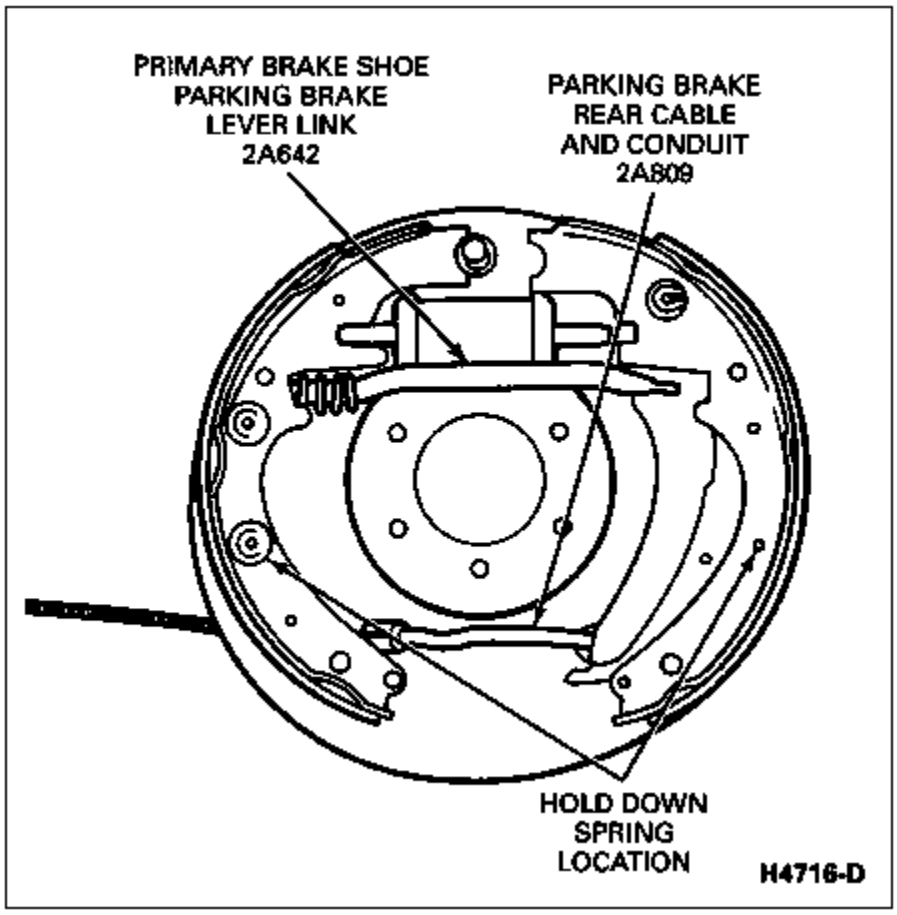
1. Clean the ledge pads on the brake backing plate.

2. Apply a light coating of Disc Brake Caliper Slide Grease D7AZ-19590-A or equivalent meeting Ford specification ESA-M1C172-A at the points where the brake shoes touch the brake backing plate.

3. Before installing the rear brake shoes and linings, assemble the parking brake lever on the secondary shoe and, on ten-inch brakes, secure with the spring washer and parking brake lever pin retainer.

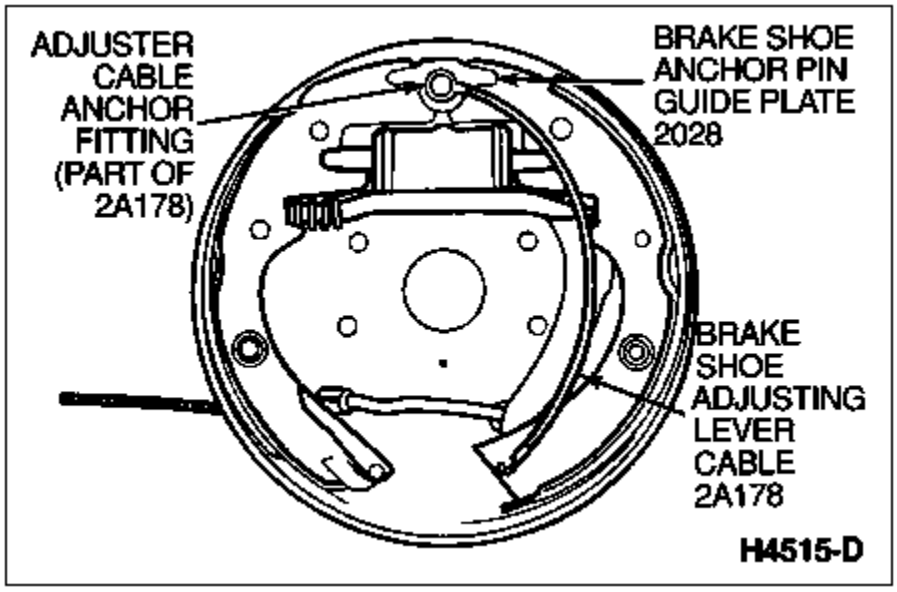
4. Position the rear brake shoe and lining on the brake backing plate (2211), and install the brake shoe hold-down spring pins, brake shoe hold-down springs, and brake shoe hold-down spring cups using Hold-Down Spring Tool T73T-2300-A. Install the primary brake shoe parking brake lever link, parking brake link spring, and washer. Connect the parking brake rear cable and conduit to the parking brake lever.

tomsn048@gmail.com



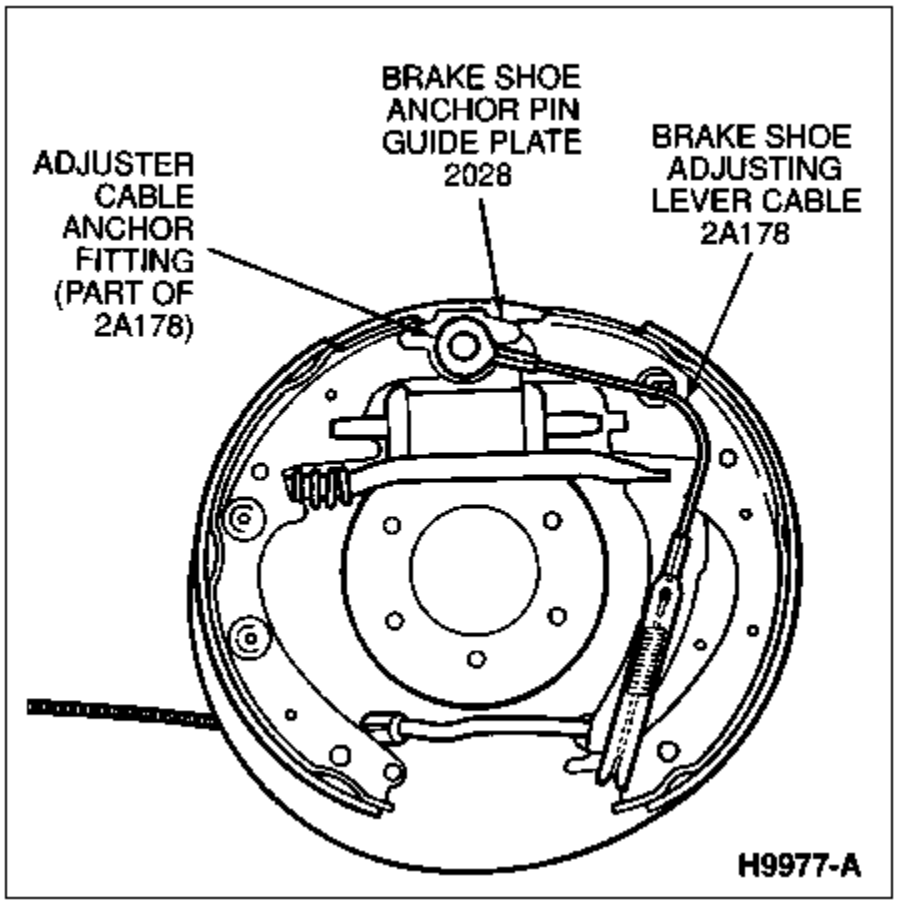
5. Install the brake shoe anchor pin guide plate. Place the brake shoe adjusting lever cable anchor over the anchor pin with the crimped side away from the brake backing plate.

Aerostar



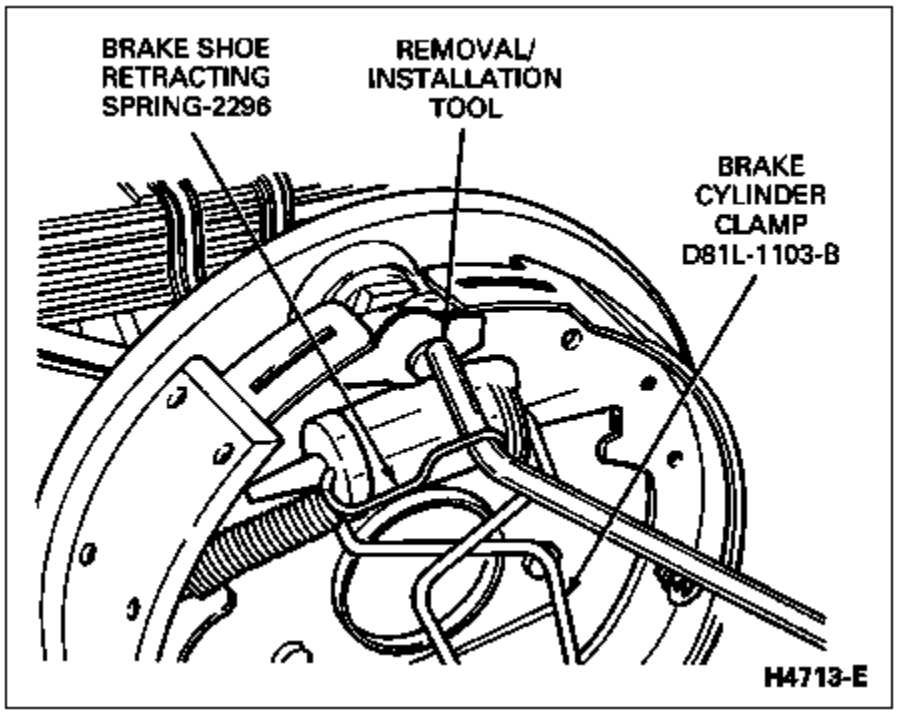
tomsn048@gmail.com

Ranger



6. Install the primary shoe-to-anchor (short) spring using a brake spring removal/installation tool.

tomsn048@gmail.com



7. **NOTE: Make sure the brake shoe adjusting lever cable is positioned in the groove, and not between the cable guide and the shoe web.**

   Install the cable guide on the secondary shoe web with the flanged holes fitted into the hole in the secondary shoe web. Thread the brake shoe adjusting lever cable around the cable guide groove.

8. **NOTE: Make sure the cable end is not cocked or binding on the anchor pin when installed. All parts should be flat on the anchor pin.**

   Install the secondary shoe-to-anchor (long) spring.

9. Remove the wheel cylinder clamp.

10. **CAUTION: Install the brake adjuster screw in the same location from which it was removed. Interchanging the brake adjuster screws from one side of the vehicle to the other will cause the rear brake shoe and lining to retract rather than expand each time the automatic adjusting mechanism is operated.**

    NOTE: For Aerostar, to prevent incorrect installation, the socket end of each brake shoe adjusting screw is stamped with R or L to indicate their installation on the right or left side of the vehicle. The brake shoe adjusting screw nuts can be distinguished by the number of lines machined around the body of the nut. Two lines indicate a right-hand nut; one line indicates a left-hand nut. Another way to identify adjusters is to check thread pitch. The right side adjuster has right-hand threads while the left side adjuster has left-hand threads. The adjuster will also increase in length when the adjusting lever is operated if properly installed.

    Apply Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B to the threads of the brake adjuster screw, the thrust washer and the brake shoe adjusting screw stud or socket. Turn the adjusting screw into the brake shoe adjusting screw nut to the end of the threads and then loosen it one-half turn. Refer to illustrations.

1	2A176	Adjusting Lever
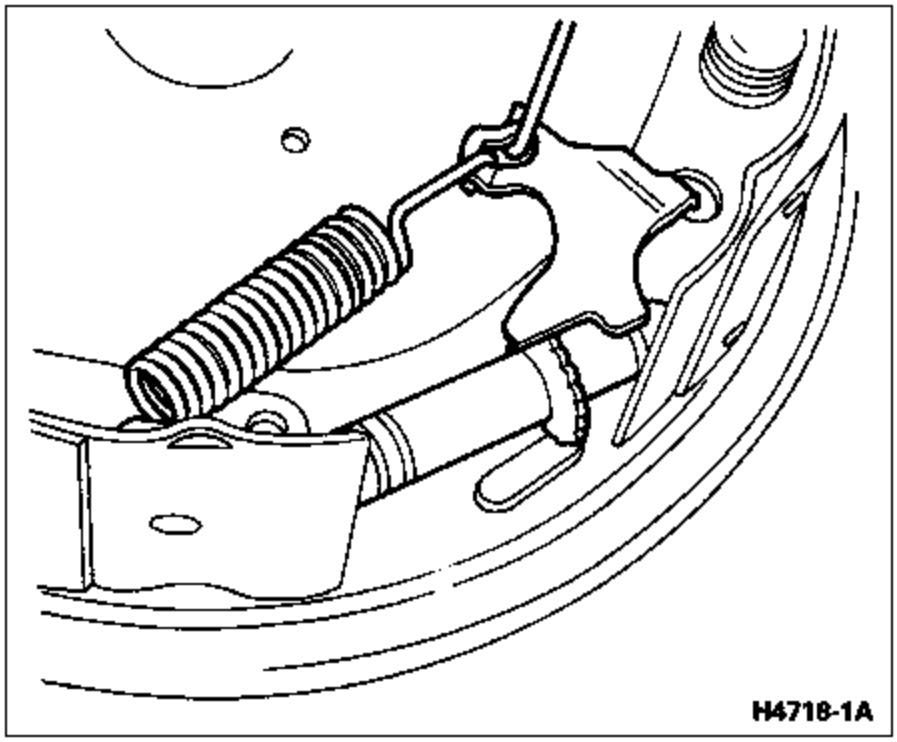
2	2048	Brake Shoe Adjusting Screw Stud
3	372583-S	Thrust Washer
4	—	Adjustment Notches (Part of 2047)
5	2047	Brake Adjuster Screw Nut
6	2041	Brake Shoe Adjusting Screw
A	—	Left-Hand Identifier Ring
B	—	"L" at Base of Socket

11. Assemble the adjuster and install the assembly between the shoe ends. Refer to illustrations.

Aerostar

tomsn048@gmail.com

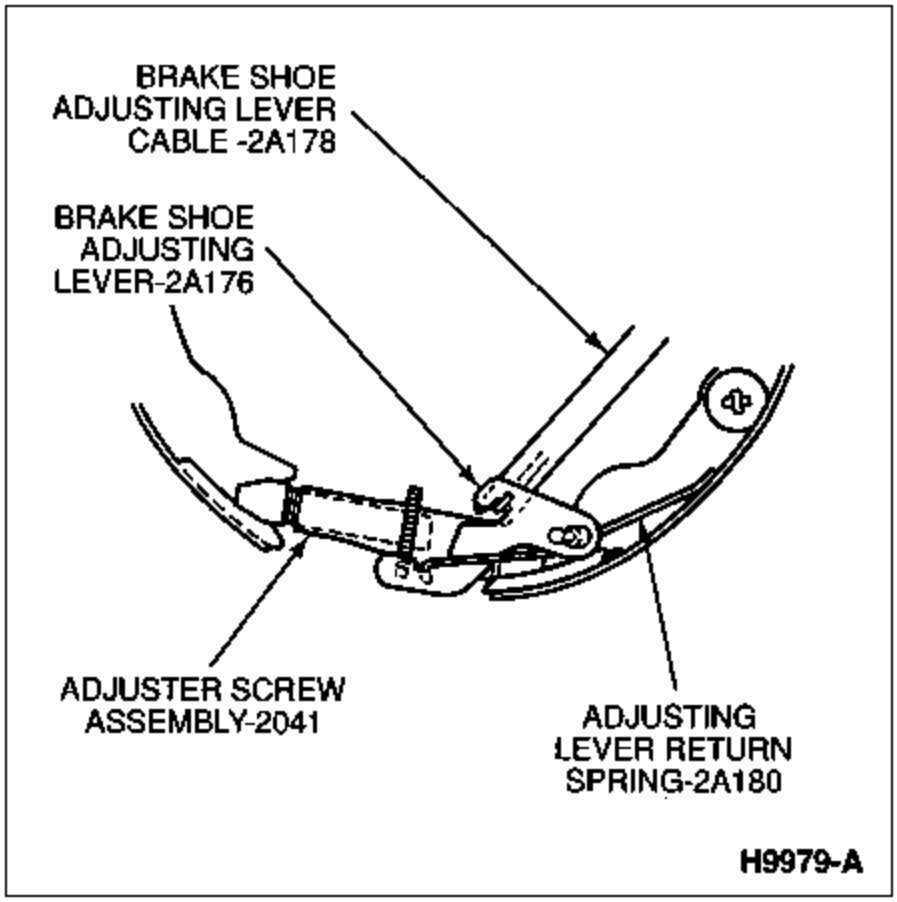


12. On the Aerostar, hook the cable hook into the hole in the brake shoe adjusting lever from the outboard plate side. The brake shoe adjusting levers are also stamped with an R or L to indicate their installation on the right- or left-hand brake assembly.

13. On the Ranger, after installation, the brake shoe adjusting lever should engage the brake adjuster screw nut just below the centerline. Hook the brake shoe adjusting lever cable into the notch in the brake shoe adjusting lever from the inboard side and install the brake shoe adjusting lever and adjusting lever return spring on the pin on the web of the secondary rear brake shoe and lining

Ranger

tomsn048@gmail.com



14. On the Aerostar, install the hooked end of the brake shoe adjusting screw spring in the large hole in the primary shoe web. Connect the loop end of the brake shoe adjusting screw spring to the adjuster lever hole.

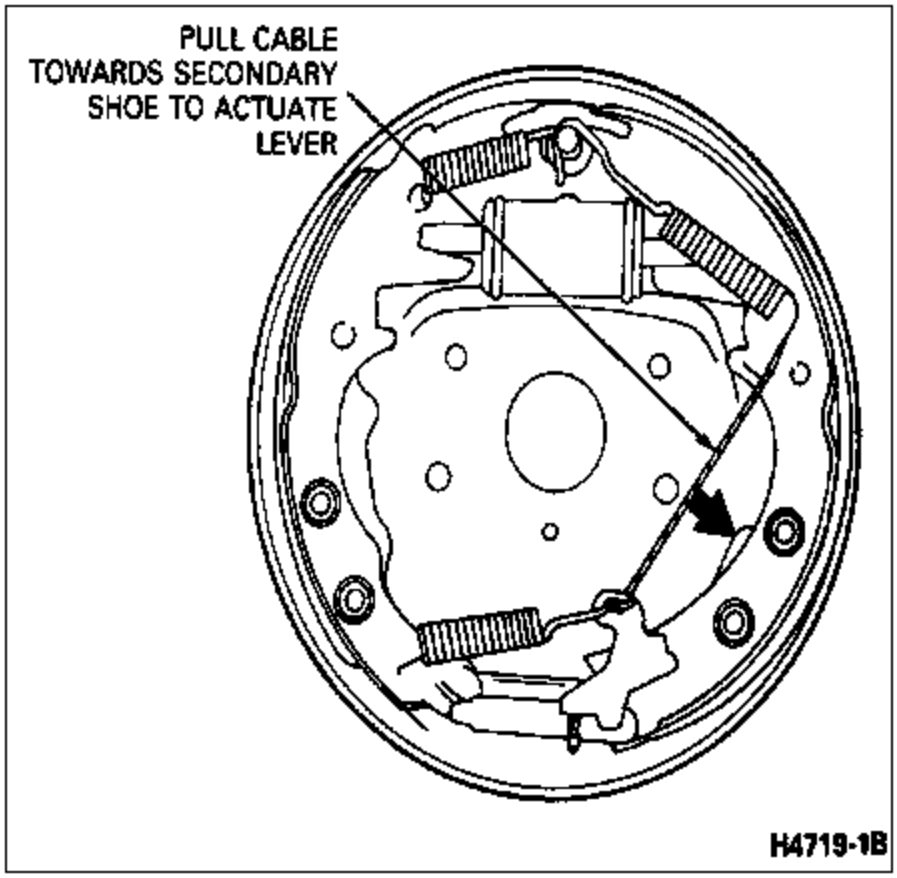
15. On the Ranger, install the brake shoe adjusting screw spring in the rear brake shoe and lining.

16. On the Aerostar, pull the brake shoe adjusting lever, brake shoe adjusting lever cable and brake shoe adjusting screw spring down toward the rear to engage the pivot hook in the large hole in the secondary shoe web.

17. On the Aerostar, check the action of the adjuster by pulling brake shoe adjusting lever cable toward secondary shoe, activating brake shoe adjusting lever. Brake shoe adjusting lever should snap in above the next tooth of adjuster. Release brake shoe adjusting lever cable to return brake shoe adjusting lever to original position and the adjuster should turn one notch.

Aerostar

tomsn048@gmail.com



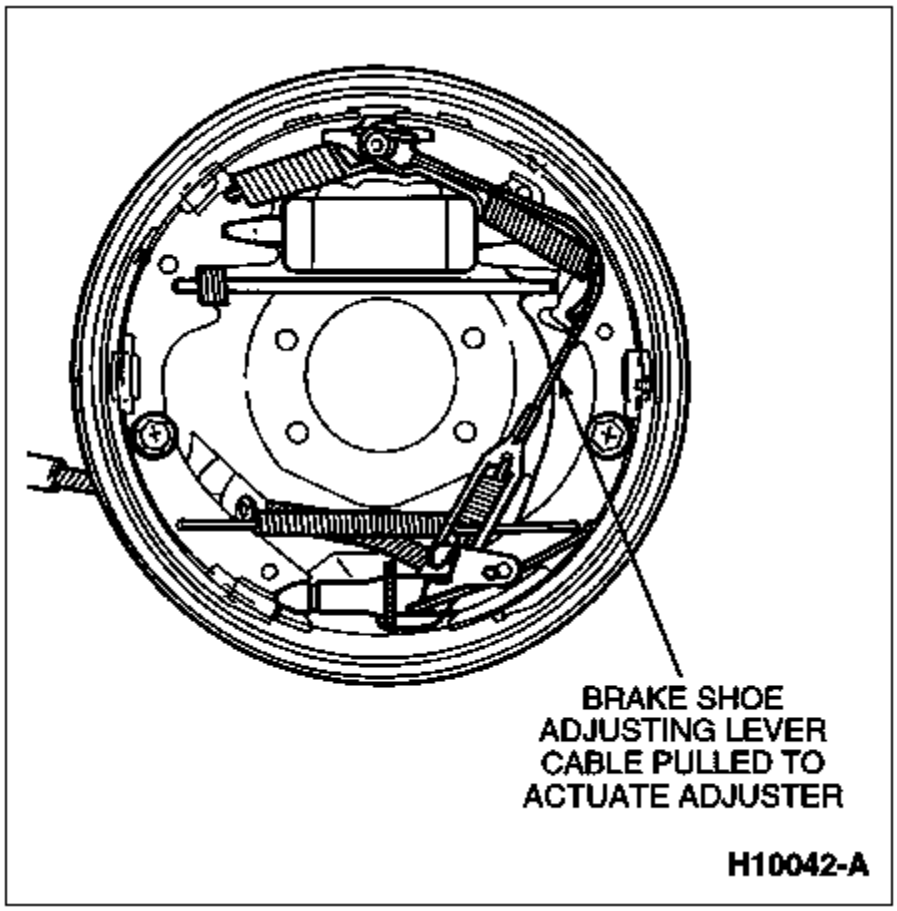
If pulling the brake shoe adjusting lever cable does not produce the action described, or if brake shoe adjusting lever kit action is sluggish instead of positive and sharp, check the position of the brake shoe adjusting lever on the adjusting screw toothed wheel. The brake shoe adjusting lever should contact the adjusting wheel one tooth above the centerline of the brake adjuster screw. If the contact point is below this centerline, the brake shoe adjusting lever will not lock on the teeth in the adjusting screw wheel, and the brake adjuster screw will not be turned as the brake shoe adjusting lever is actuated by the brake shoe adjusting lever cable. Refer to Diagnosis and Testing in Section 06-00 for adjuster diagnosis.

18. Check the action of the Ranger adjuster mechanism:

    - Pull the brake shoe adjusting lever cable toward the secondary rear brake shoe and lining.
    - The brake shoe adjusting lever should turn the adjuster screw nut one tooth.
    - Release the brake shoe adjusting lever cable and the brake shoe adjusting lever should drop below the next tooth on the adjuster screw nut.
    - If the action is not sharp and definite, check for binding or lack of lubrication.

Adjuster Test, Ranger

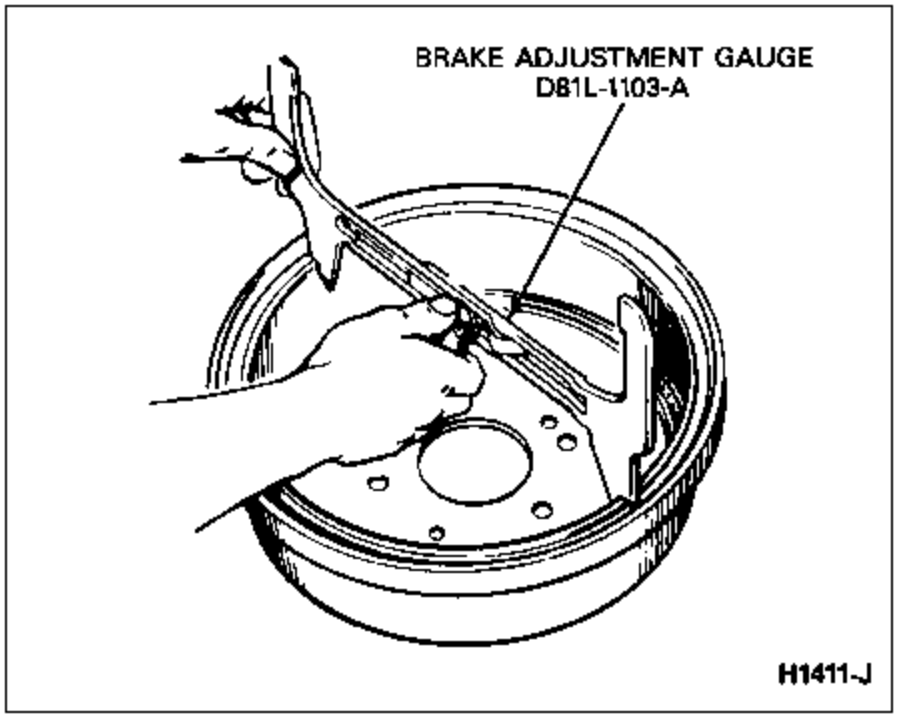
tomsn048@gmail.com



19. Using Brake Adjustment Gauge D81L-1103-A or equivalent, measure the inside diameter of the brake drum.

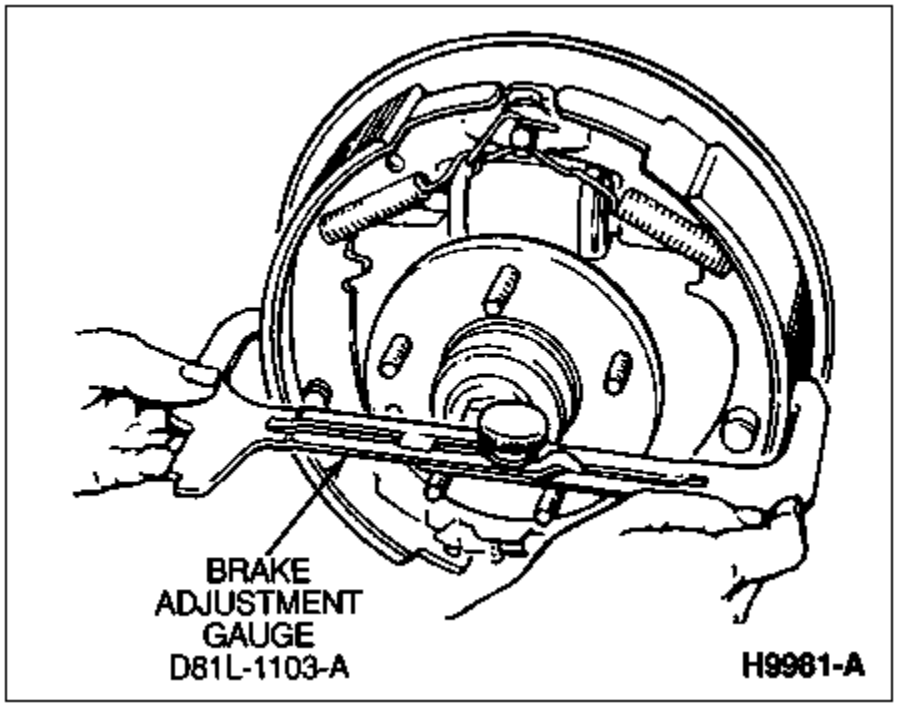
Measuring Brake Drum

tomsn048@gmail.com



20. Using the brake adjuster screw, adjust the rear brake shoe and lining to the brake drum inside diameter.

Measuring Rear Brake Shoe and Lining



21. Install the brake drum.

tomsn048@gmail.com

22. Install the wheel and tire assembly. Tighten the lug nuts (1012) to 135 Nm (100 lb-ft).

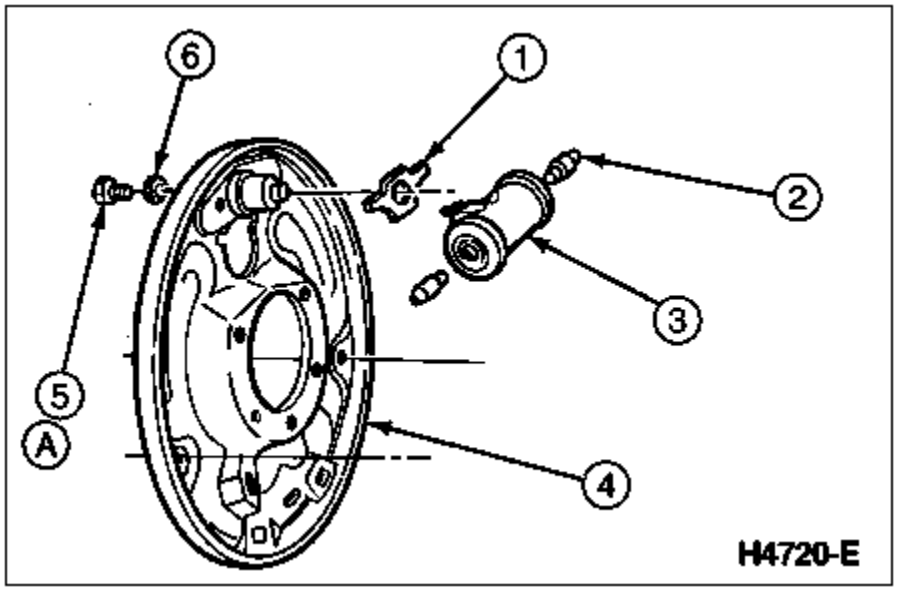
---

tomsn048@gmail.com

Wheel Cylinder

Removal

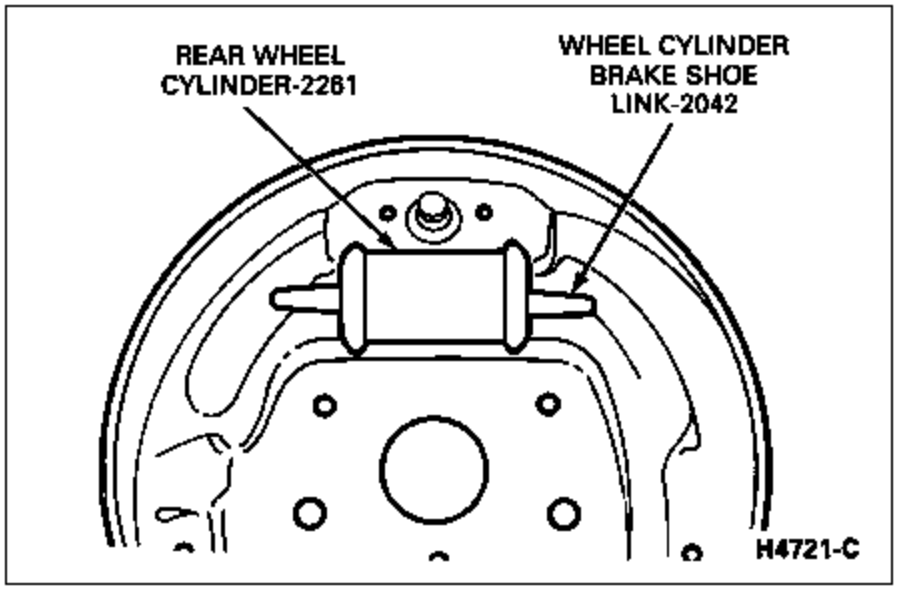
1. Raise and support vehicle. Remove wheel (1007).



Item	Part Number	Description
1	2028	Brake Shoe Anchor Pin Guide Plate
2	2042	Wheel Cylinder Brake Shoe Link
3	2261	Rear Wheel Cylinder
4	2211	Brake Backing Plate
5	20310-S	Bolt, Wheel Cylinder-to-Backing Plate
6	34941-S	Washer
A	—	Tighten to 12-18 Nm (106-159 Lb-In)

2. Remove the brake drum (1126), and rear brake shoes and linings (2201) as described in this section.

tomsn048@gmail.com



3. Disconnect the brake line from the rear wheel cylinder. Connect a length of hose to the line and submerge end of hose in a can containing a small amount of brake fluid to prevent air from entering the system.

4. Remove the rear wheel cylinder retaining bolts and lockwashers, and then remove the rear wheel cylinder from the brake backing plate.

Installation

1. Apply Silicone Rubber D6AZ-19562-AA or -BA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A to wheel cylinder mounting area to seal backing plate mounting area.

2. Place the rear wheel cylinder on the brake backing plate and install the retaining bolts and lockwashers. Tighten the wheel cylinder-to-backing plate bolts to 12-18 Nm (106-159 lb-in).

3. Connect the brake line to the rear wheel cylinder.

4. Install the rear brake shoe and lining (2200) as described in this section. Install the brake drum and adjust the brakes as described in this section.

5. Install the wheel and tire assembly.

6. Bleed the system as described in Section 06-06 . Check brake operation before moving the vehicle.

---

tomsn048@gmail.com

tomsn048@gmail.com

Brake Backing Plate

Removal

1. Raise and support the vehicle.
2. Remove the rear brake shoe and lining (2200) and the rear wheel cylinder. Refer to the procedures in this section.
3. Disconnect parking brake rear cable and conduit (2A635) from brake backing plate by squeezing locking fingers together using a 9/16-inch flare nut wrench and pulling parking brake rear cable and conduit through brake backing plate.

19	2A642	Primary Brake Shoe Parking Brake Lever Link
20	2296	Brake Shoe Retracting Spring (Short)

4. Remove the axle shaft (4234). Refer to Section 05-02A or Section 05-02B . Use care not to damage the oil seal.

5. Remove the nuts retaining the brake backing plate to the rear axle housing and remove the brake backing plate and the rear wheel gasket from the rear axle housing.

Installation

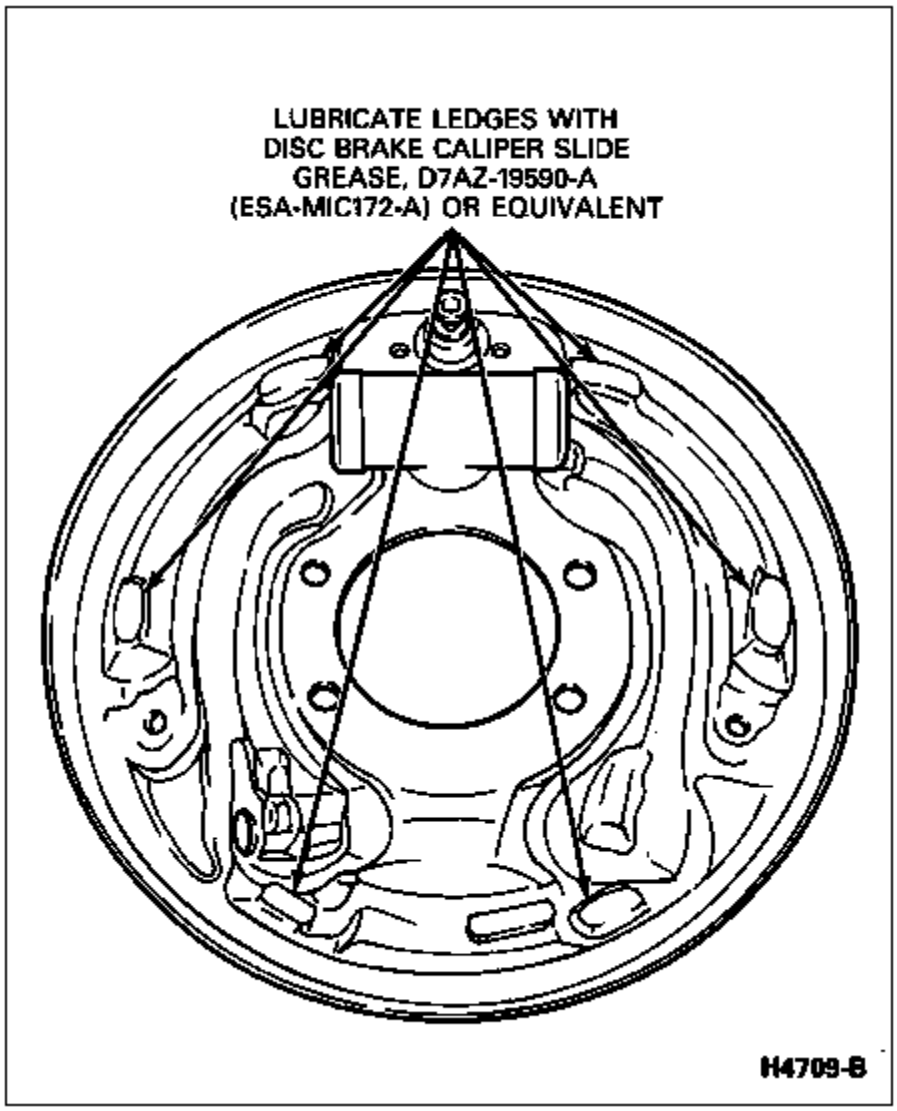
1. Apply Silicone Rubber D6AZ-19562-AA or -BA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A to braking plate mounting hole to seal axle shaft flange mounting area.

2. Position the brake backing plate and rear wheel gasket on the rear axle housing.

3. Install the backing plate retaining nuts. Alternately and evenly tighten the nuts to 34-47 Nm (25-35 lb-ft).

4. Apply a light coating of Disc Brake Caliper Slide Grease D7AZ-19590-A or equivalent meeting Ford specification ESA-M1C172-A to the ledge pads at the points where the rear brake shoe and lining contact the brake backing plate.

tomsn048@gmail.com



5. Feed the parking brake rear cable and conduit through its hole in the brake backing plate and engage locking fingers.

6. Install the axle shaft. Refer to Section 05-02A or Section 05-02B as required in the Powertrain, Drivetrain Service Manual. Use care not to damage the oil seal.

7. Install the rear wheel cylinder and rear brake shoe and lining and adjust using Brake Adjustment Tool D81L-1103-C or equivalent. Connect the parking brake rear cable and conduit to the parking brake lever.

8. Install the rear brake shoe and lining. Refer to the procedure in this section.

9. Connect the brake line to the rear wheel cylinder. Tighten the brake line fitting to 15-20 Nm (11-14 lb-ft).

10. Install the brake drum (1126) and wheel and tire assembly. Tighten the lugnuts to 135 Nm (100 lb-ft).

11. Bleed air from the system as described in Section 06-06 .

tomsn048@gmail.com

tomsn048@gmail.com

Wheel Cylinder

Rear wheel cylinders should be rebuilt in full axle sets only. If one side of the vehicle is done, the other side should also be rebuilt.

Rear wheel cylinders should not be disassembled unless they are leaking. Carefully pull lower edges of wheel cylinder boots away from rear wheel cylinder, and note whether interior is wet with brake fluid. Excessive brake fluid at this point indicates leakage past piston cups and a need for rear wheel cylinder overhaul.

NOTE: A slight amount of brake fluid is nearly always present and acts as a lubricant for the wheel cylinder piston. It is not necessary to remove the rear wheel cylinder from the backing plate to disassemble, inspect, hone, and overhaul the rear wheel cylinder. Removal is necessary only if the rear wheel cylinder is damaged or scored beyond service.

Disassembly

1. Remove the rear brake shoe and lining (2200). Refer to the procedure in this section.
2. On ten-inch brakes, remove the wheel cylinder brake shoe links.
3. Disengage rear wheel cylinder boots from retaining grooves in rear wheel cylinder casting. Remove each wheel cylinder boot and wheel cylinder piston from rear wheel cylinder as an assembly.
4. Remove rear wheel cylinder piston cups and wheel cylinder piston cup spring from wheel cylinder bore.
5. Discard all rubber parts.
6. Remove wheel cylinder bleeder screw from rear wheel cylinder.
7. Wash all parts in clean, denatured alcohol.
8. Inspect pistons for scratches, scoring, or other visible damage. Replace if necessary. Always replace rubber parts.
9. Inspect the rear wheel cylinder bore for score marks or rust. If either condition is present, the rear wheel cylinder bore must be honed. **However, the rear wheel cylinder should not be honed more than 0.08mm (0.003 inch) beyond its original diameter.**
10. Wash rear wheel cylinder with clean, denatured alcohol after honing, dry it with compressed air.
11. Inspect the bleeder hole to ensure it is free of obstructions.

Assembly

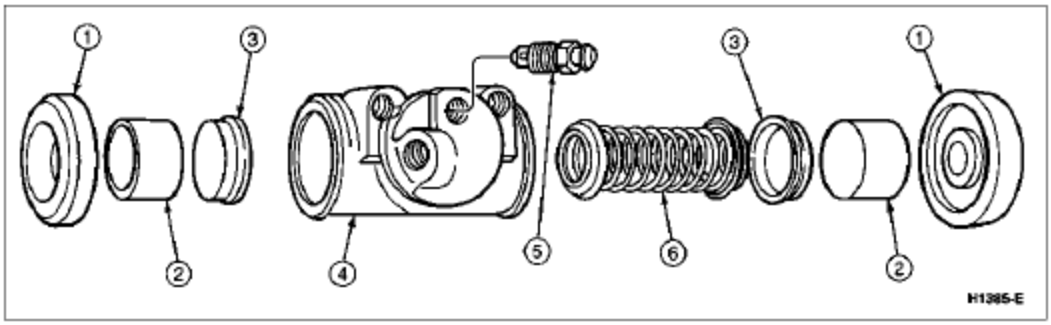
Use all parts in the wheel cylinder service kit.

1. Apply a light coating of High Performance DOT 3 Brake Fluid C6AZ-19542-AA or equivalent DOT 3 fluid meeting Ford specification ESA-M6C25-A, DOT 3 to all internal parts.

tomsn048@gmail.com

2. Thread bleeder screw into rear wheel cylinder. Tighten to 7-9 Nm (61-79 lb-in).
3. Insert the wheel cylinder piston cup spring, wheel cylinder piston cups and wheel cylinder pistons into their respective positions in the wheel cylinder bore. Place a wheel cylinder boot over each end of the wheel cylinder.
4. Install the bleeder screw.
5. Install the wheel cylinder brake shoe links, if required.
6. Install rear brake shoe and lining. Refer to the procedure in this section.
7. Install brake drum (1126) and wheel (1007).
8. Bleed brake system. Refer to Section 06-06 .

Brake Wheel Cylinder, Disassembled



Item	Part Number	Description
1	—	Wheel Cylinder Boot (Part of 2261)
2	2196	Wheel Cylinder Piston
3	2201	Wheel Cylinder Piston Cup
4	2261	Rear Wheel Cylinder

tomsn048@gmail.com

Cleaning

WARNING: BRAKES CONTAIN ASBESTOS FIBERS. AVOID BREATHING DUST. BREATHING ASBESTOS DUST MAY CAUSE ASBESTOSIS AND CANCER.

BREATHING ASBESTOS DUST IS HAZARDOUS TO YOUR HEALTH.

DUST AND DIRT PRESENT ON WHEEL BRAKE AND CLUTCH ASSEMBLIES MAY CONTAIN ASBESTOS FIBERS THAT ARE HAZARDOUS TO HEALTH WHEN MADE AIRBORNE BY CLEANING WITH COMPRESSED AIR OR BY DRY BRUSHING.

WHEEL BRAKE ASSEMBLIES AND CLUTCH FACINGS SHOULD BE CLEANED USING A VACUUM CLEANER RECOMMENDED FOR USE WITH ASBESTOS FIBERS SUCH AS ROTUNDA BRAKE/CLUTCH/SERVICE VACUUM 091-R0001 OR EQUIVALENT. DUST AND DIRT FROM VACUUM SHOULD BE DISPOSED OF IN SUCH A MANNER THAT PREVENTS DUST EXPOSURE, SUCH AS SEALED BAGS. THE BAG MUST BE LABELED AS PER OSHA INSTRUCTIONS AND THE TRASH HAULER NOTIFIED AS TO THE BAG'S CONTENTS.

IF A VACUUM SUITABLE FOR ASBESTOS IS NOT AVAILABLE, CLEANING SHOULD BE DONE WET. IF DUST GENERATION IS STILL POSSIBLE, TECHNICIANS SHOULD WEAR GOVERNMENT-APPROVED TOXIC DUST PURIFYING RESPIRATORS.

GRINDING OR SANDING ON BRAKE LININGS, PADS, ROTORS, DRUMS OR CLUTCH FACINGS SHOULD BE DONE ONLY WHILE USING PROPERLY EXHAUST-VENTILATED EQUIPMENT.

OSHA REQUIRES AREAS WHERE ASBESTOS DUST GENERATION IS POSSIBLE TO BE ISOLATED AND POSTED WITH WARNING SIGNS. ONLY TECHNICIANS CONCERNED WITH PERFORMING BRAKE OR CLUTCH SERVICE SHOULD BE PRESENT IN THE AREA.

CAUTION: Do not use denatured alcohol for flushing the system or cleaning assemblies where alcohol could be trapped and cause eventual failure of rubber components in the system.

1. Denatured alcohol is acceptable for cleaning parts, provided the parts are completely air-dried and coated with brake fluid before installation.

2. To remove brake fluid contamination, clean all parts with denatured alcohol. Do not attempt to clean contaminated lining. Contaminated brake lining must be replaced.

tomsn048@gmail.com

tomsn048@gmail.com

Inspection

Use Rotunda Brake/Clutch/Service Vacuum 091-R0001 or equivalent to remove all dust from backing plates and interior of brake drums (1126).

Wheel Cylinders

1. Rear wheel cylinders should not be disassembled unless they are leaking. Pull back each rear wheel cylinder dust boot and inspect for leakage.

2. Excessive brake fluid at this point indicates leakage past the piston cups and a need for rear wheel cylinder (2261) overhaul. A slight amount of fluid is nearly always present and acts as a lubricant for the pistons. If evidence of leakage is noted, the rear wheel cylinder should be disassembled, inspected and overhauled.

3. Inspect the rear wheel cylinder bore for scratches and pitting. If the rear wheel cylinder is pitted or has deep scratches, the rear wheel cylinder must be replaced.

Brake Drums

1. A brake drum should be visually inspected and measured with Rotunda Brake Drum Micrometer 104-00046 or equivalent. Before making an inspection or measurement, remove grease, brake fluid, or other contaminants from the brake drum using denatured alcohol.

2. Best shop practice requires measuring every brake drum with a brake drum micrometer regardless of visual inspection. The brake drum micrometer is set to the drum diameter and measures the amount and type of wear. Measure the diameter at various points 45-degrees apart around the brake shoe and lining contact area, and at the bottom of the deepest groove to determine if the brake drum requires replacement.

Brake Lining

1. Inspect rear brake shoes and linings (2200) for excessive lining wear or shoe damage. If lining is damaged or worn within 0.79mm (1/32 inch) of the rivet heads on riveted linings, it must be replaced. Replace any rear brake shoe and lining that has been contaminated with oil, grease or brake fluid. Replace rear brake shoe and lining in axle sets only. Never replace just one rear brake shoe and lining of a brake assembly. Replace both primary and secondary shoes. Prior to replacement of lining, brake drum diameter should be checked to determine that brake drum diameter is within specification. If braking surface diameter exceeds specification, the brake drum must be replaced.

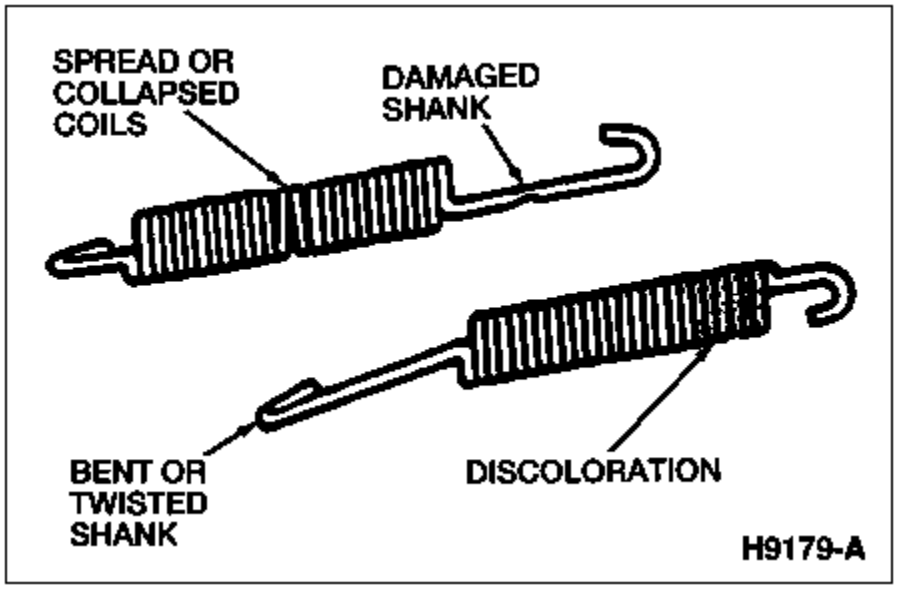
2. Check condition of rear brake shoes and linings, retracting spring, hold-down springs, and brake drum for signs of overheating. If rear brake shoe and lining metal parts have a slight blue coloring, indicating overheating, retracting and hold-down springs should be replaced. Overheated springs lose their tension and could allow new rear brake shoe and lining to drag and wear prematurely, if not replaced.

Springs

Check springs for:

tomsn048@gmail.com

- Spread or collapsed coils
- Twisted, bent or damaged shanks
- Discoloration — This is a sign of brake overheating. Overheated springs lose some of their tension and should be replaced.



Brake Backing Plate

1. Inspect the brake backing plate for correct mounting and securely tightened mounting nuts.

2. Inspect the brake shoe and lining contact pads (where the rear brake shoe and lining rest).

    - Deep grooves in the brake shoe and lining contact pads could restrict brake shoe and lining movement.
    - If grooves exist, hand sand the brake shoe and lining contact pads.
    - If the grooves are still present after hand sanding, the rear brake backing plate must be replaced. Any attempt to remove the grooves by grinding may result in improper brake shoe and lining-to-brake drum contact.

3. Inspect all other brake parts and replace any that are worn or damaged.

---

tomsn048@gmail.com

tomsn048@gmail.com

Brake Drum

Refinishing

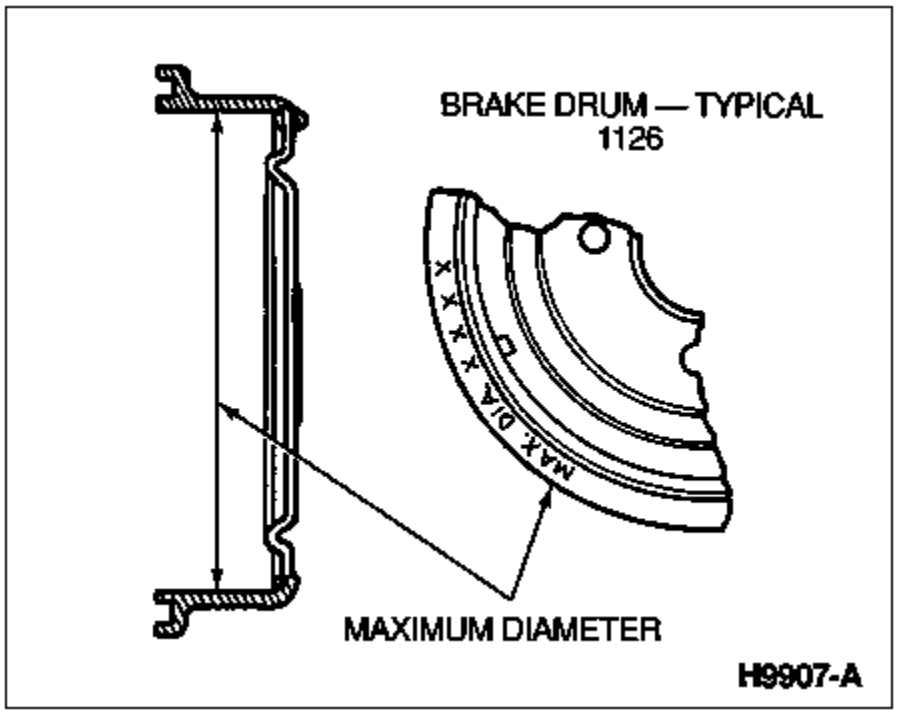
Minor scores on brake drums (1126) can be removed with sandpaper. Do not refinish brake drums to remove score marks. A drum surface which is highly polished can cause brake lockup or noise. This polished condition should be removed with sandpaper. A brake drum that is out of round sufficient to cause vehicle vibration or roughness when braking should be refinished. Remove only enough stock to true-up the brake drum. When brake drum maximum inside diameter shown on the brake drum is exceeded either through wear or refinishing, the brake drum must be replaced.

Check inside diameter of brake drum with Brake Adjustment Gauge D81L-1103-A or Rotunda Brake Drum Micrometer 104-00046 or equivalent.

After a brake drum is refinished, wipe refinished surface with a cloth soaked in clean, denatured alcohol.

Maximum Diameter

Brake drum maximum diameter is cast into the rim of the brake drum. The brake drum may be machined enough to correct scoring but only up to the MAX. DIA. dimension. If, after machining, the brake drum inside braking surface diameter exceeds the specification, it must be discarded.



tomsn048@gmail.com

tomsn048@gmail.com

Brake Shoe and Lining

Drums Removed

WARNING: DO NOT INHALE DUST FROM BRAKES OR ASSOCIATED COMPONENTS. INHALATION OF DUST CAN BE INJURIOUS TO YOUR HEALTH. COMPRESSED AIR OR BRUSHES MUST NOT BE USED TO CLEAN BRAKES, BRAKE DRUMS AND ASSOCIATED COMPONENTS. A VACUUM CLEANER SUCH AS ROTUNDA BRAKE/CLUTCH/SERVICE VACUUM 091-R0001 OR EQUIVALENT EQUIPPED FOR THIS PURPOSE SHOULD BE CAREFULLY USED TO REMOVE ANY DUST. ADHERENT DUST SHOULD BE REMOVED WITH A DAMP RAG. ANY DUST SHOULD BE CONTAINED IN A SEALED AND LABELED BAG FOR DISPOSAL. WEAR AN APPROVED HIGH EFFICIENCY CARTRIDGE OR AIR LINE RESPIRATOR AND USE EXTRA CAUTION TO AVOID BREATHING THIS DUST. ALWAYS USE NON-ASBESTOS REPLACEMENT PARTS.

The rear brakes are automatically adjusted while driving the vehicle in reverse and sharply applying the brakes, and then driving forward. It may be necessary to do this several times to obtain the proper rear brake adjustment. Manual brake adjustment is required only after the brake shoes have been replaced, or if brake shoe adjusting lever has malfunctioned and has been repaired or replaced. Perform the manual adjustment with the brake drums (1126) removed, using Brake Adjustment Gauge D81L-1103-A or equivalent and the procedure described below.

When adjusting the rear brake shoes, check the parking brake rear cable and conduit (2A635) for proper operation. Make sure the equalizer operates freely. For parking brake service, refer to Section 06-05 .

1. Raise vehicle on hoist. Position suitable safety stands under vehicle. Remove wheel (1007). Remove brake drum as described in this section.

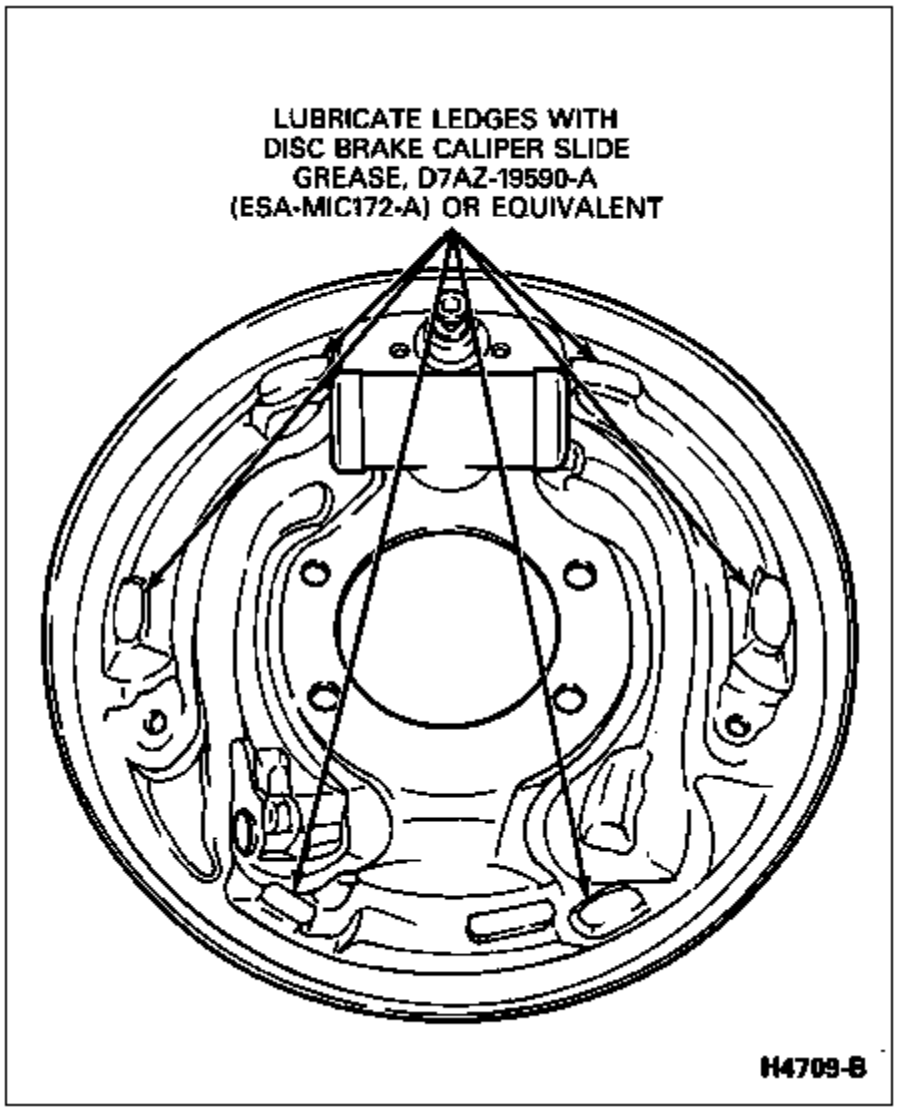
2. Use Rotunda Brake/Clutch/Service Vacuum 091-R0001 or equivalent to remove any dust present on the brake assembly.

3. Carefully remove the brake shoe hold-down spring. Using sandpaper, clean the shoe-to-backing plate contact points while holding the shoe away from the brake backing plate.

4. Check brake backing plate for damage. If any damage is found, it must be replaced. Refer to procedure in this section. If no damage is found, apply a small amount of Disc Brake Caliper Slide Grease D7AZ-19590-A or equivalent meeting Ford specification ESA-M1C172-A to the points where the shoes touch the brake backing plate. Be careful not to get the lubricant on the linings.

    - The following illustration is simplified to show contact point location.

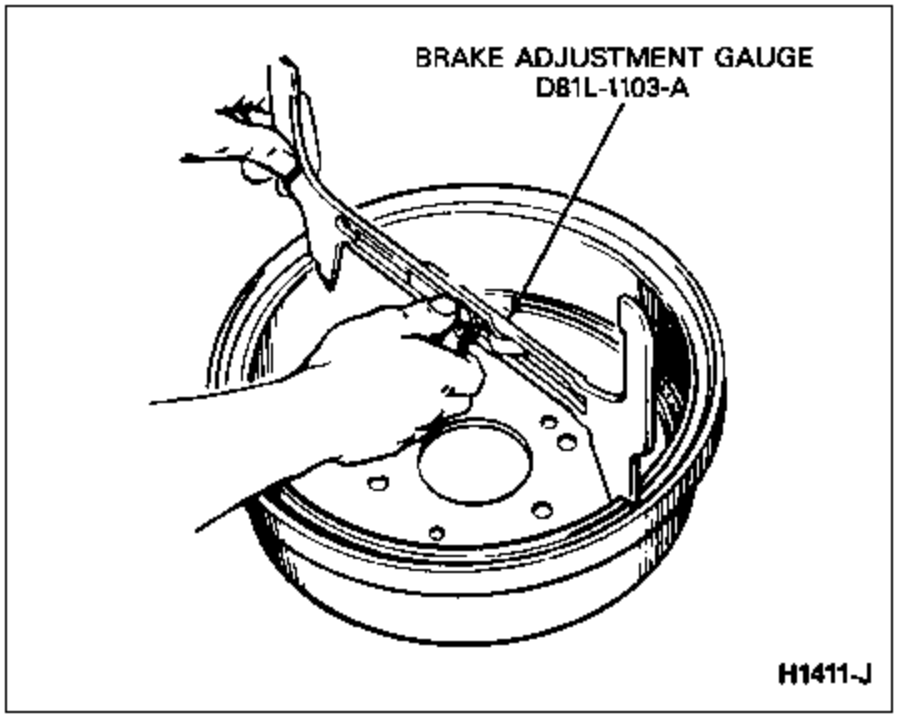
tomsn048@gmail.com



5. Reinstall brake shoe hold-down spring.

6. Set the Brake Adjustment Gauge D81L-1103-A or equivalent to the inside diameter of the drum braking surface.

tomsn048@gmail.com



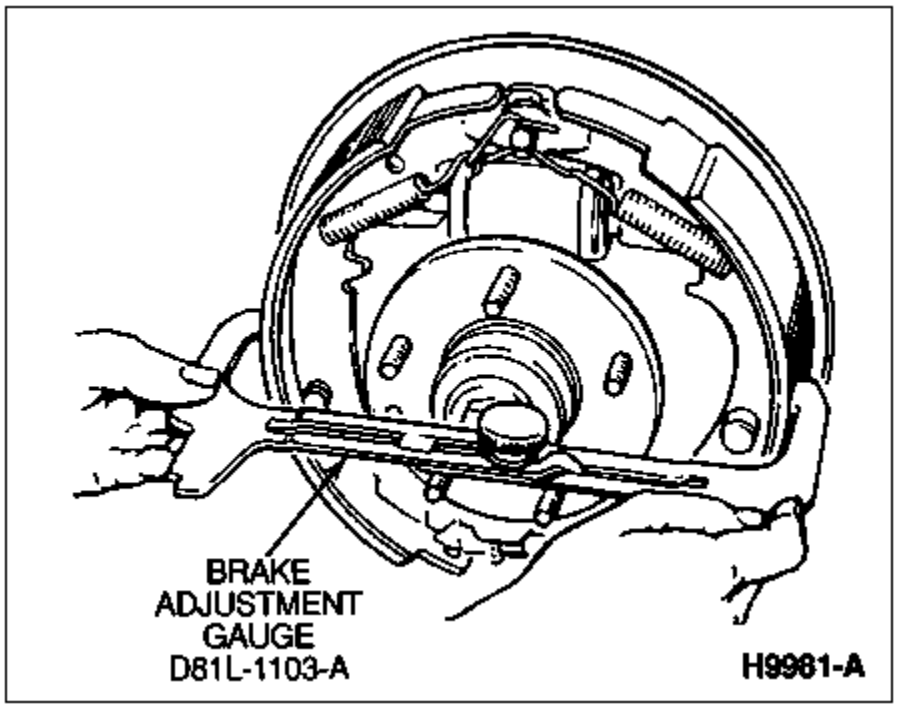
7. Reverse the tool as shown and adjust the rear brake shoe and lining (2200) until they match the gauge setting. The gauge contact points on the rear brake shoe and lining must be parallel to the vehicle with the center line through the center of the axle.

8. Hold the brake shoe adjusting lever out of engagement while rotating the notched part of the adjuster screw assembly, to prevent burring the notches. Make sure the adjuster rotates freely.

9. If necessary, remove the adjuster for disassembly and cleaning, then lubricate the adjusting screw threads and pilot end with a thin, uniform coating of Disc Brake Caliper Slide Grease D7AZ-19590-A or equivalent meeting Ford specification ESA-M1C172-A.

Checking Adjustment, Typical

tomsn048@gmail.com



10. Install the brake drums.

11. Install the wheel on the brake drum and tighten the lug nuts (1012) to 135 Nm (100 lb-ft). Remove the safety stands and lower the vehicle.

12. After adjusting the brake shoes, check brake operation before moving the vehicle.

13. Complete the adjustment by sharply applying the brakes several times while driving the vehicle alternately in forward and reverse.

Drums Installed

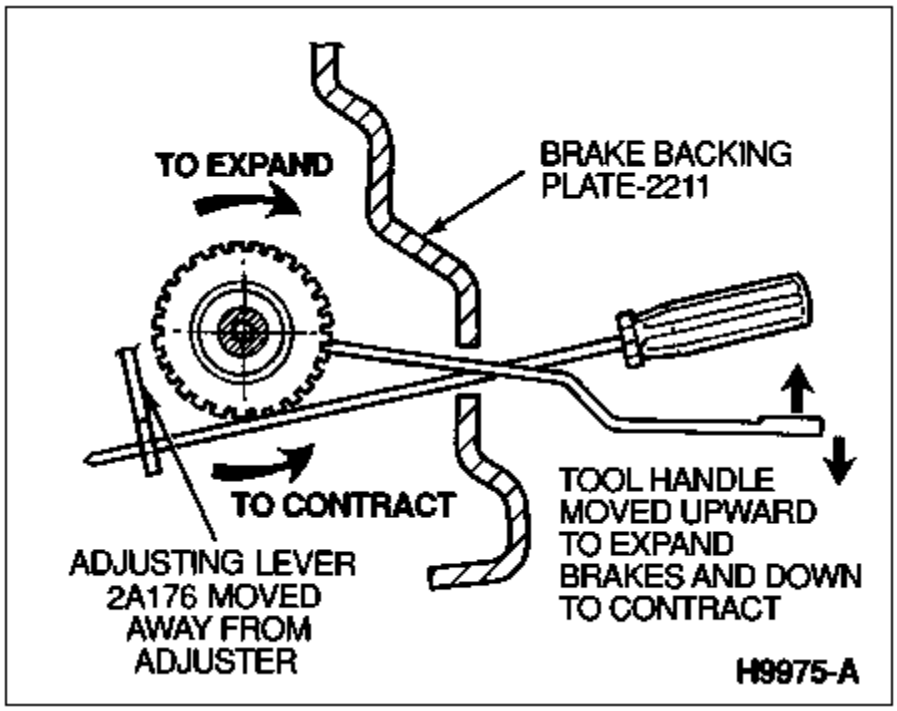
Adjust the single anchor brake by turning the adjusting screw located between the lower ends of the shoes.

1. Place transmission (7003) in neutral. Raise the vehicle until the tires clear the floor. Install safety stands.

2. Remove the cover from the adjusting hole at the bottom of the brake backing plate, and turn the brake shoe adjuster assembly using Brake Adjustment Tool D81L-1103-C or equivalent inside the hole to expand the brake shoes until they lock the brake drum. Refer to illustration.

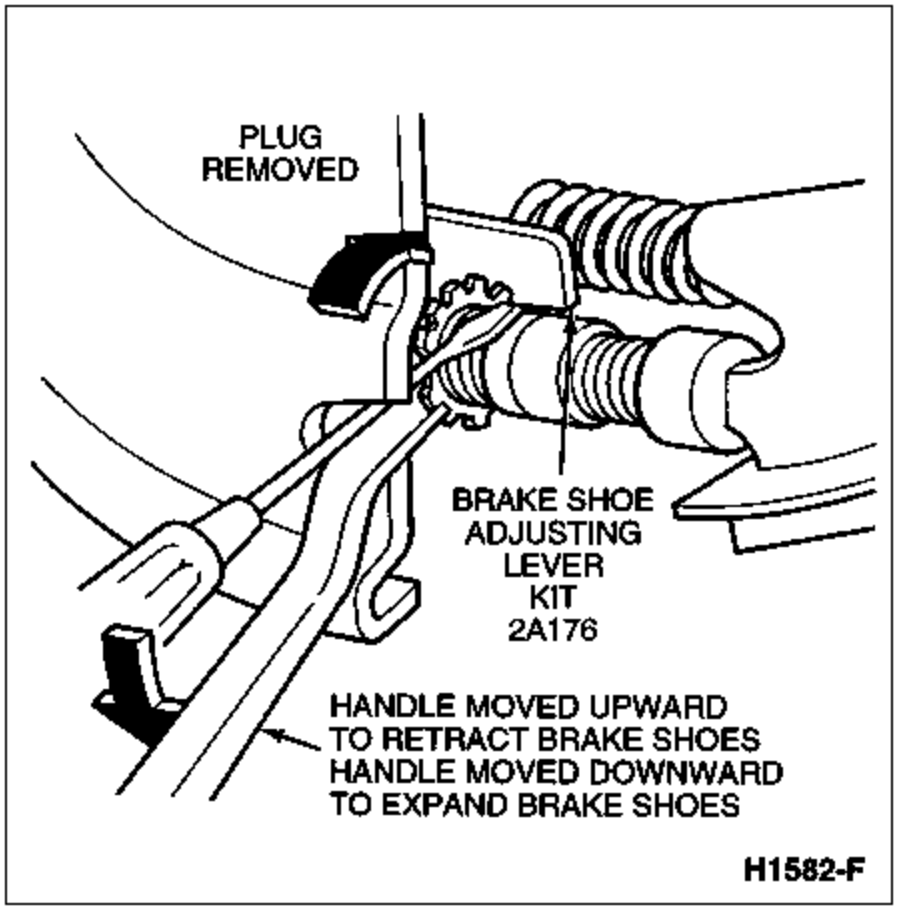
Ranger

tomsn048@gmail.com



Aerostar

tomsn048@gmail.com



3. When the rear brake shoes and linings are against the brake drum, loosen the brake shoe adjusting screw nut 10 to 12 notches so that the brake drum rotates freely without drag.

4. If the brake drum does not rotate freely, remove the wheel and brake drum, and vacuum out any dust and dirt from the linings using Rotunda Brake/Clutch/Service Vacuum 091-R0001 or equivalent.

5. Using sandpaper, remove any rust from the points where the shoes touch the brake backing plate.

6. Check brake backing plate for damage. If none is found, apply a light coating of Disc Brake Caliper Slide Grease D7AZ-19590-A or equivalent meeting Ford specification ESA-M1C172-A . Do not get the lubricant on the rear brake shoe and lining.

7. Install the wheel and brake drum and adjust the rear brake shoe and lining.

8. Install the adjusting hole cover in the brake backing plate.

9. Check and adjust the other rear brake assembly.

10. Apply the brakes. If the pedal travels more than halfway to the floor, there is too much clearance between the brake shoes and the brake drums. Repeat Steps 2 and 3 of this procedure.

11. **WARNING: PERFORM THE ROAD TEST ONLY WHEN THE BRAKES WILL APPLY AND THE VEHICLE CAN BE SAFELY STOPPED.**

    When the rear brake shoes and linings have been properly adjusted, lower the vehicle and road test

tomsn048@gmail.com

to check brake operation.

tomsn048@gmail.com

tomsn048@gmail.com

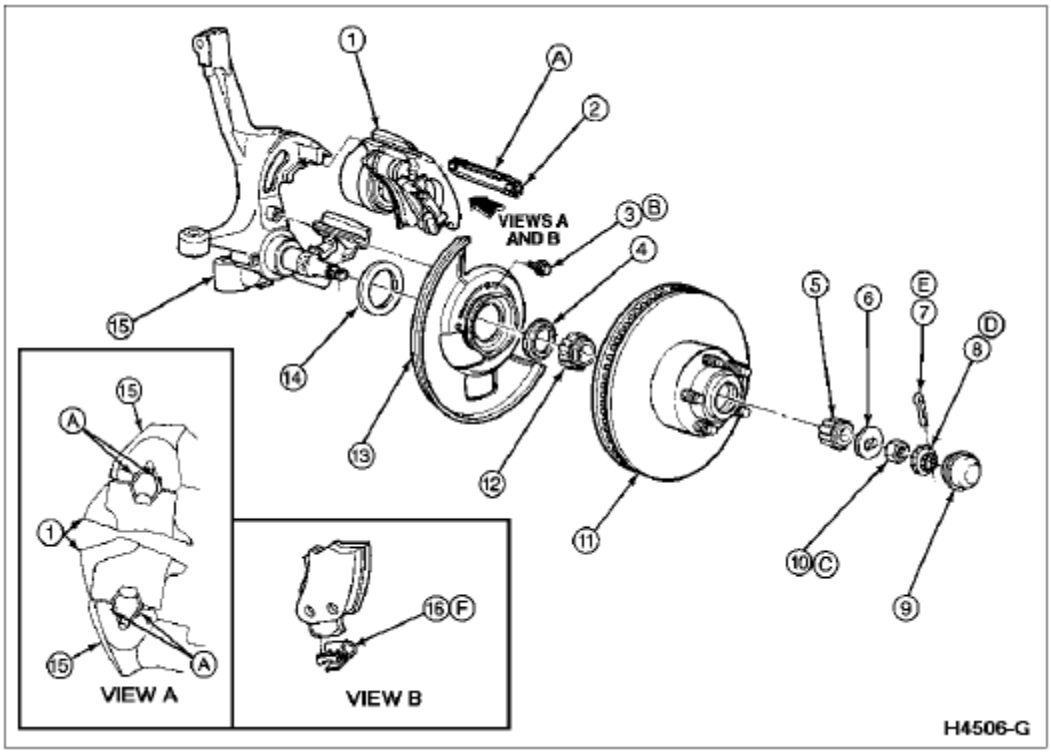
Service Precautions

When servicing the front disc brakes, observe the following precautions:

- Always replace brake shoes and linings (2001) in full axle sets. Never replace brake shoe and lining on just one side of the vehicle.
- Before compressing caliper pistons into the caliper bore, remove and discard enough brake fluid from the brake master cylinder reservoir (2K478) to allow for piston displacement.
- Never allow the weight of the disc brake caliper (2B120) to hang from the front brake hose (2078).
- After servicing the brakes, always test brakes before attempting to move the vehicle.
- When installing disc brake caliper, the caliper pin must be installed so the retention tabs are in contact with the spindle surface to make sure pin is fully inserted (four places). Caliper pin may be installed from the inboard or outboard side with the pins oriented in grooves.

Spindle, Wheel and Caliper Assembly, Aerostar 4x2



Item	Part Number	Description

tomsn048@gmail.com

Caliper and Lining, Aerostar

NOTE: If the disc brake calipers (2B120) are to be removed for service other than to replace the brake shoe and lining (2001), fluid removal from the reservoir brake master cylinder reservoir (2K478) may not be required. Go to Step 2.

CAUTION: System contamination may result if anything other than a CLEAN device is used to remove fluid from reservoir brake master cylinder reservoir.

NOTE: Removing some fluid will prevent fluid from overflowing from the brake master cylinder reservoir when the caliper piston is pressed into the bore.

Removal

1. Use a clean siphon or suction hose to remove a portion of the fluid from the brake master cylinder reservoir. Discard the removed fluid.

2. Raise the vehicle and install safety stands. Remove a front wheel and tire assembly.

3. **CAUTION: Do not position C-clamp on the outboard anti-rattle spring. Also, do not compress the caliper piston further than is required to disengage torque buttons from disc brake caliper. Replace the brake shoe and lining if the outboard anti-rattle spring is bent or damaged. Do not pry with screwdriver or other tool to gain clearance.**

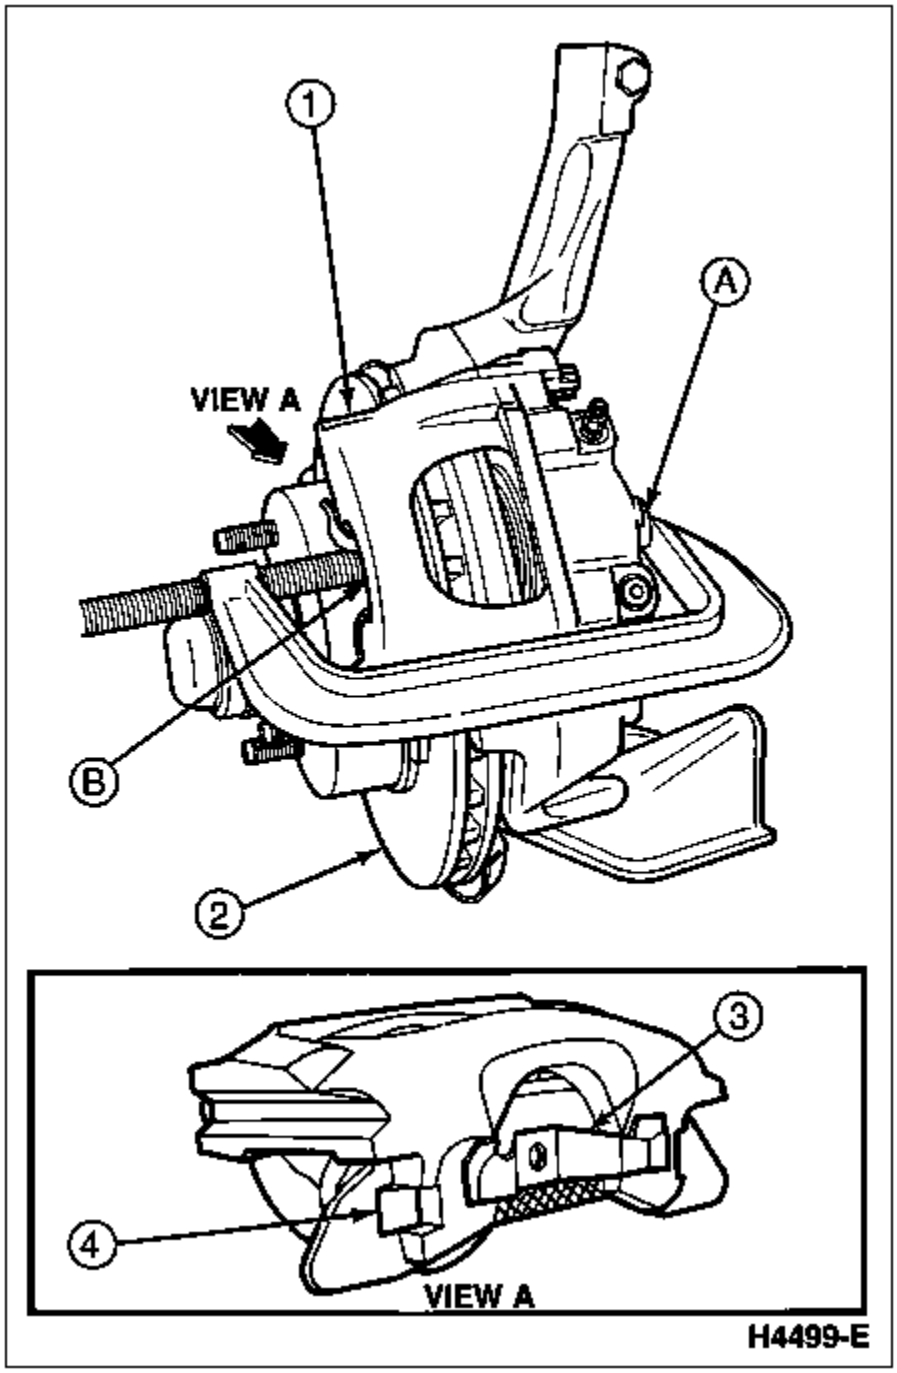
   CAUTION: Do not attempt to "bottom" the caliper piston in the bore at this time. Use an old, worn out brake shoe or block of wood and the C-clamp to bottom the caliper piston once the disc brake caliper is removed from the front disc brake hub and rotor (1102), and the brake shoe and lining are removed from the disc brake caliper.

   Use an eight-inch C-clamp to move the caliper piston back into its bore as follows:

   - Place the frame of the C-clamp against the disc brake caliper, and the screw end of the C-clamp against the outer shoe BELOW THE SPRING CLIP.
   - Tighten the clamp until the torque buttons just clear the disc brake caliper (about 3mm [1/8 inch]). Remove the C-clamp.

   Aerostar

tomsn048@gmail.com



Item	Part Number	Description
1	2B120	Disc Brake Caliper
2	1102	Front Disc Brake Hub and Rotor
3	—	Outboard Anti-Rattle Spring (Part of 2001)
4	—	Torque Button (Part of 2001)
A	—	C-Clamp Frame Against Front Disc Brake Caliper
B	—	C-Clamp Screw Against Outboard Brake Shoe and

tomsn048@gmail.com

		Lining (Not on Anti-Rattle Spring)

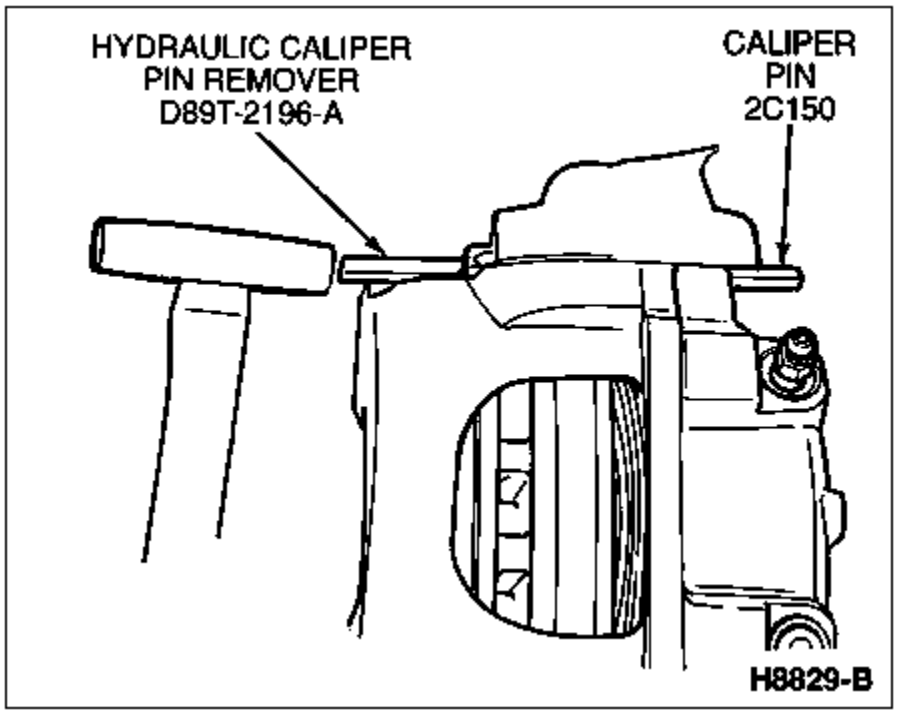
4. Clean excess dirt from area around pin tabs.

5. Using Hydraulic Caliper Pin Remover D89T-2196-A or equivalent and a light hammer, drive the caliper pin from the disc brake caliper as follows:

   - Position the notched end of the tool against the caliper pin (retention tab half), at a 45-degree angle from the pin retention tabs.

   - Tap the tool with the hammer to compress the retention tabs.
   - As the retention tabs are compressed, move the tool to gain a straight approach to the caliper pin, and continue tapping to drive the caliper pin through the caliper/spindle groove.

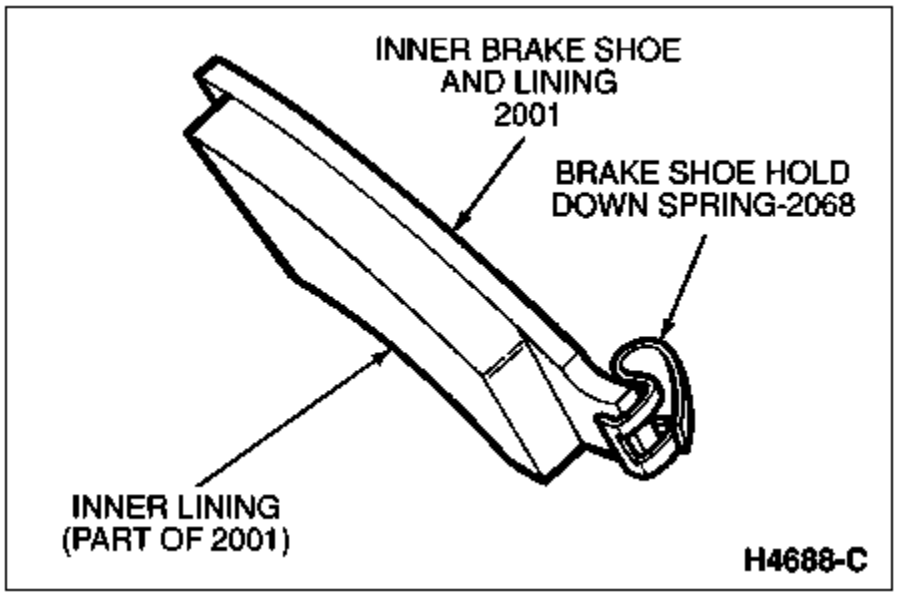
tomsn048@gmail.com



6. **CAUTION: DO NOT let the disc brake caliper hang with its weight on the front brake hose (2078).**

   Remove the disc brake caliper from the rotor. If the disc brake caliper is to be serviced, disconnect the front brake hose from the disc brake caliper. If not, support the disc brake caliper with wire.

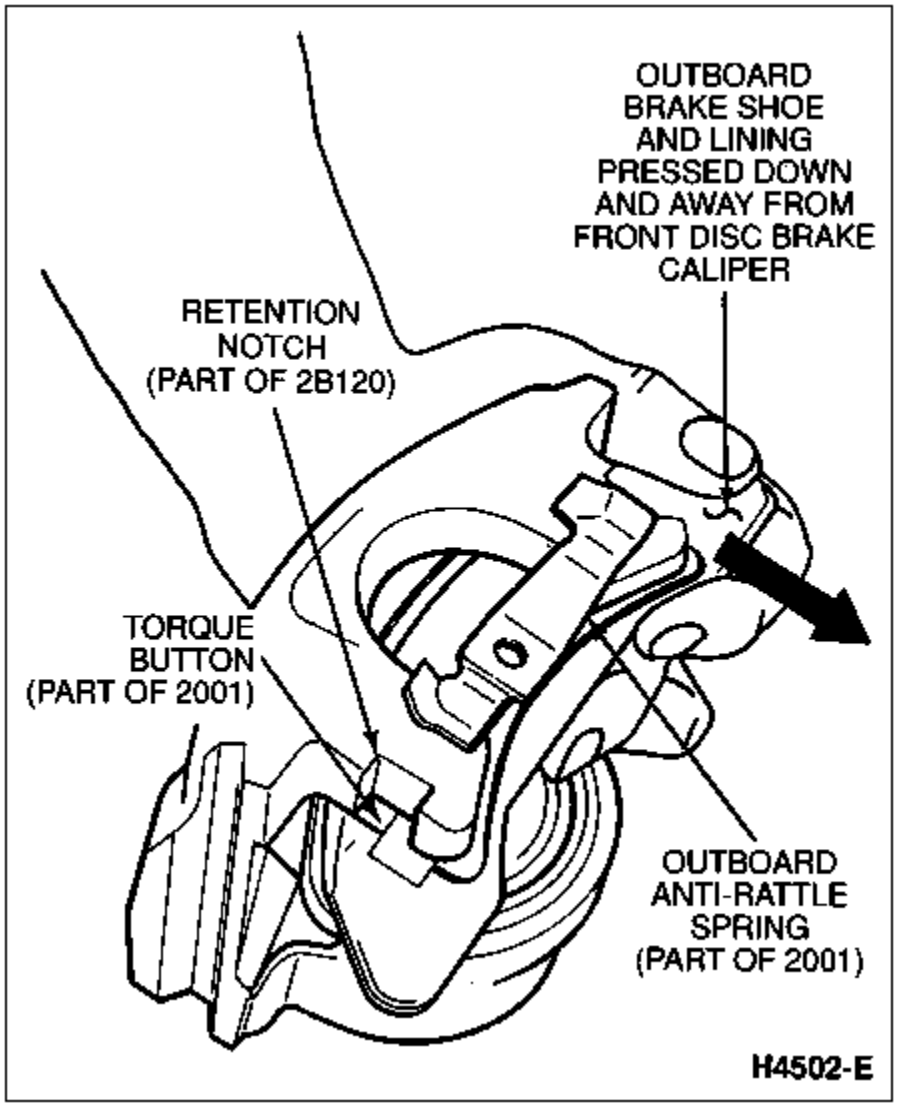
7. Compress the brake shoe hold-down spring (2068) and remove the inner brake shoe and lining from the disc brake caliper.



8. To remove the outer brake shoe and lining from the disc brake caliper, press each ear of the outboard

tomsn048@gmail.com

brake shoe and lining away from the disc brake caliper, slide the torque buttons out of the retention notches and slide the brake shoe and lining off.



Installation

1. **CAUTION: Never attempt to bottom out the caliper piston with the outer brake shoe and lining installed.**

   The caliper must be bottomed out when installing new brake shoes and linings. Be sure that enough fluid has been removed from reservoir brake master cylinder reservoir (see Step 1 of Removal) to prevent fluid overflow. Bottom out the caliper piston with an eight-inch C-clamp using a worn-out inner shoe or a block of wood to push against the caliper piston.

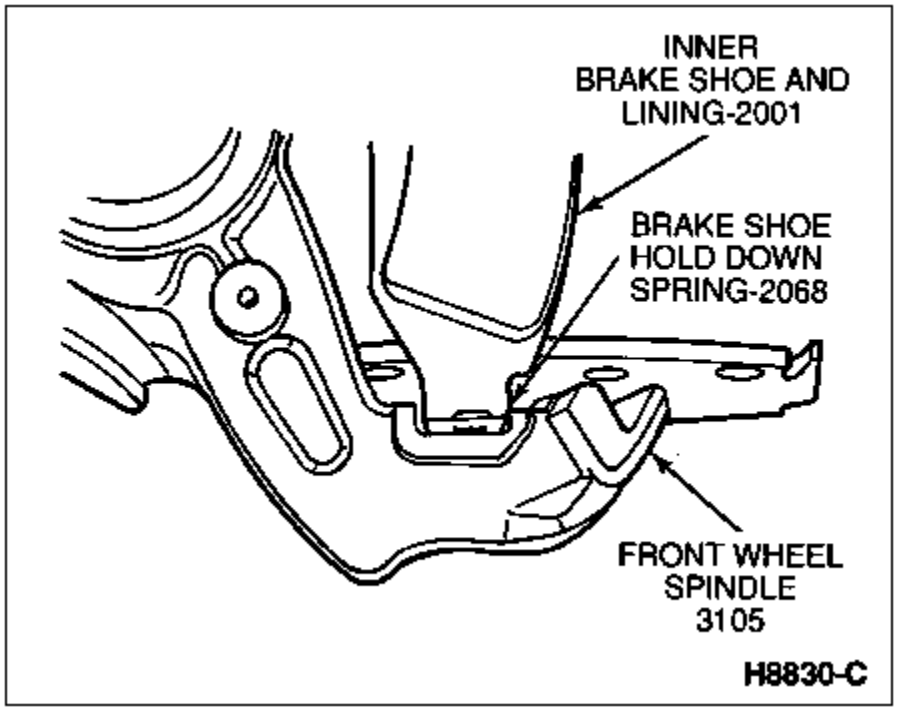
2. Place a new brake shoe hold-down spring on the lower end of the inner brake shoe and lining. Be sure the tabs are positioned properly (spring loop away from the pad material) and the brake shoe

tomsn048@gmail.com

hold-down spring is fully seated.

3. Position the inner brake shoe and lining and brake shoe hold-down spring in the lower shoe abutment of the front wheel spindle (3105) with the brake shoe hold-down spring tab against the shoe abutment and the loop of the spring away from the front disc brake hub and rotor.

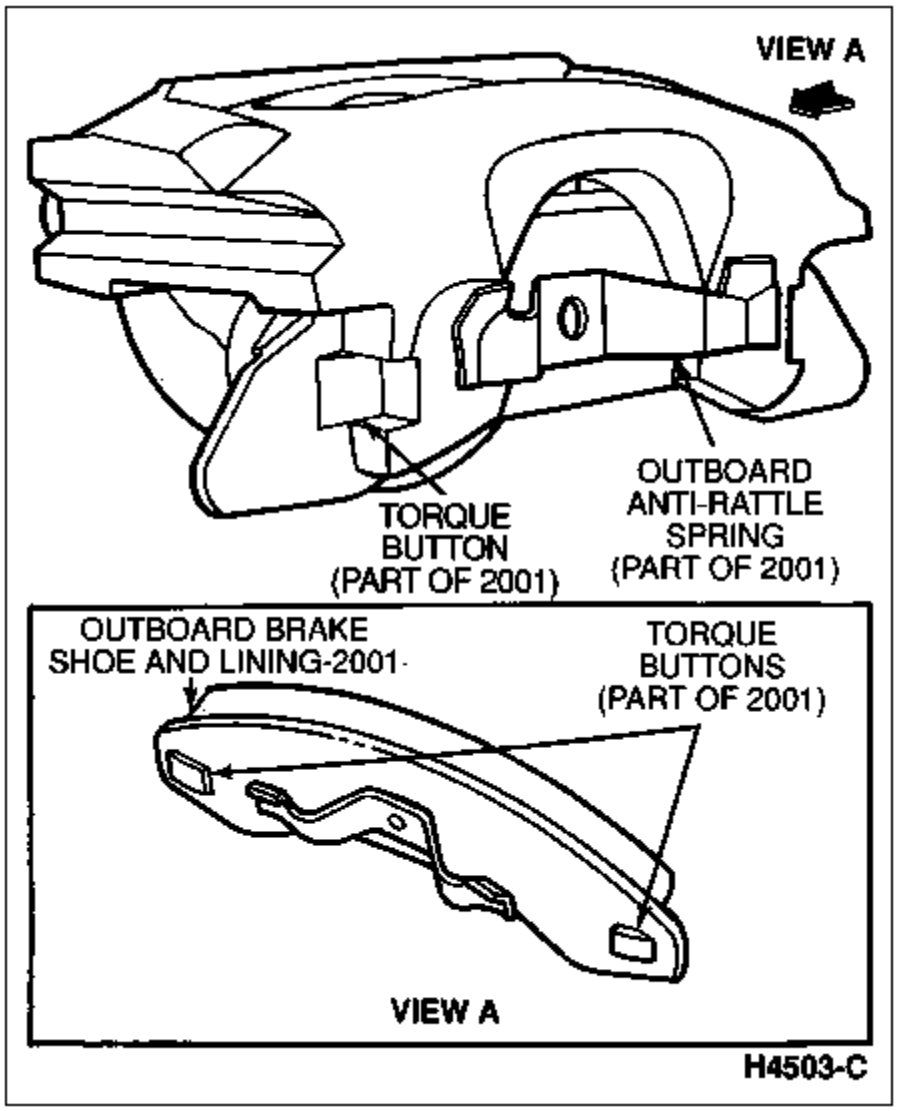
4. Compress the brake shoe hold-down spring and slide the upper end of the brake shoe and lining into position in the front wheel spindle.



5. **WARNING: OUTER SHOE TORQUE BUTTONS MUST BE SOLIDLY SEATED IN CALIPER HOLES OR TEMPORARY LOSS OF BRAKES MAY OCCUR.**

   Install the outer brake shoe and lining in the disc brake caliper, making sure the torque buttons on the shoe are seated solidly in the matching holes in the disc brake caliper.

tomsn048@gmail.com



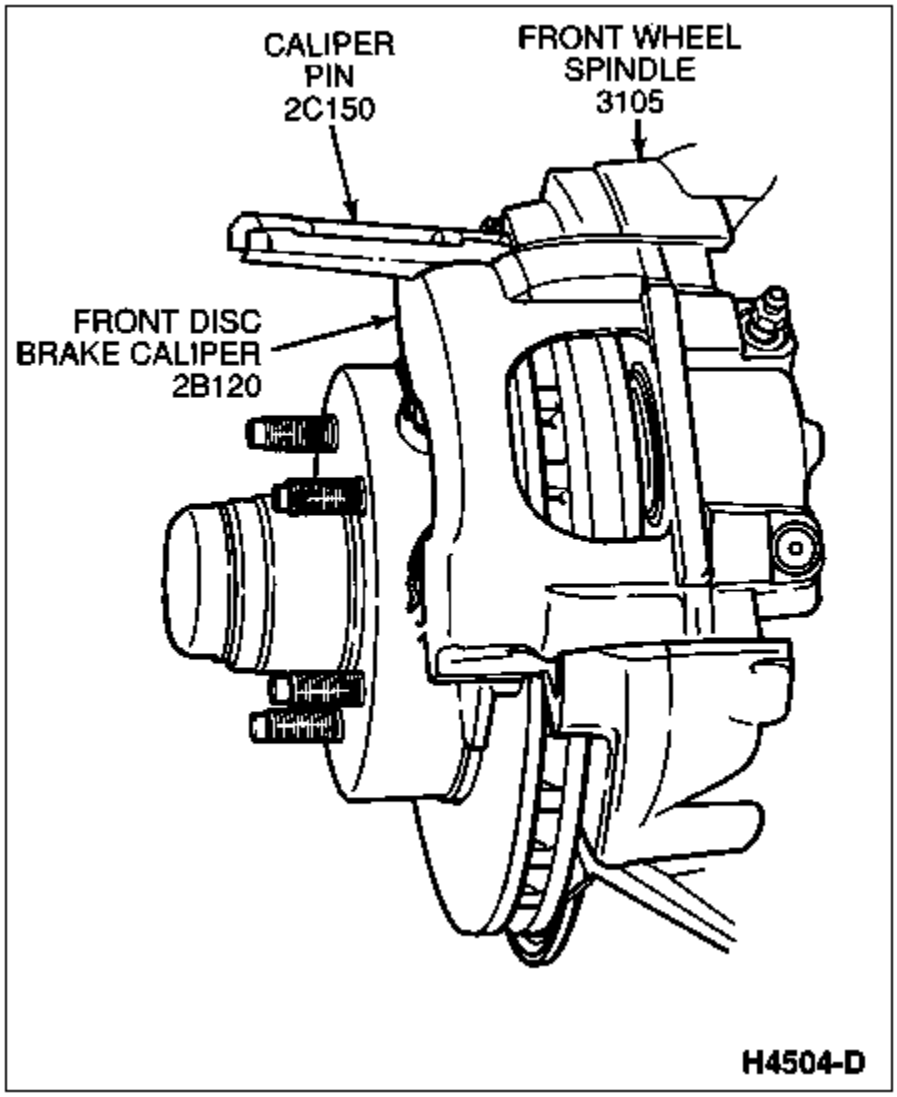
6. **CAUTION: Be sure to install the caliper pins so the retention tabs will be in contact with the front wheel spindle, not the disc brake caliper. When the upper pin is properly positioned, the retention tabs will be at the top, against the front wheel spindle. When the lower caliper pin is properly positioned, the retention tabs will be at the bottom, also in contact with the front wheel spindle.**

   Lubricate the caliper grooves with Disc Brake Caliper Slide Grease D7AZ-19590-A or equivalent lubricant meeting Ford specification ESA-M1C172-A. Position the disc brake caliper on the front wheel spindle.

7. **CAUTION: During the installation procedure, do not allow the tabs of the caliper pin to be tapped too far into the front wheel spindle groove. If this happens, it will be necessary to tap the other end of the caliper pin until the tabs snap into place. The tabs on each end of the caliper pin must be free to catch on the front wheel spindle face.**

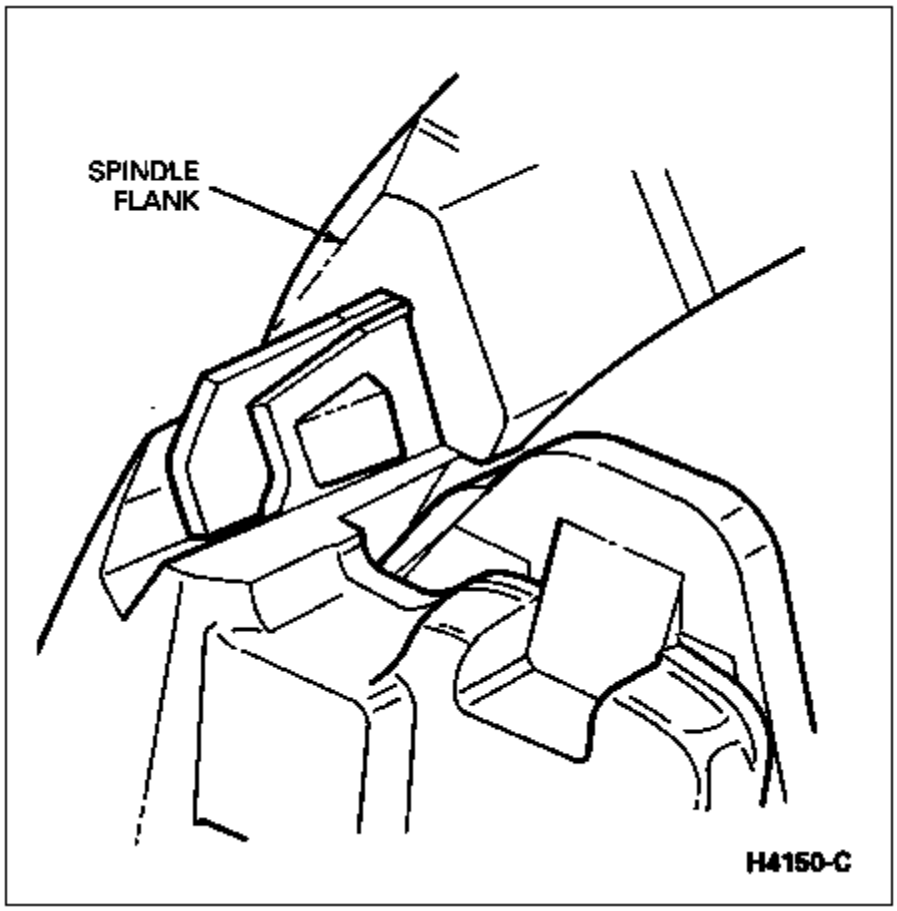
   From the outboard side, position the caliper pin between the disc brake caliper and the front wheel spindle grooves. The caliper pin must be positioned so the tabs will be installed against the front wheel spindle outer face.

tomsn048@gmail.com



8. Tap the caliper pin on the outboard end with a hammer. Continue tapping the caliper pin inward until the retention tabs on the sides of the caliper pin contact the front wheel spindle face. Repeat procedure for the lower caliper pin.

tomsn048@gmail.com



9. If removed, install the front brake hose to the disc brake caliper.
10. If the front brake hose was removed, bleed the brakes as described in Section 06-06 .
11. Install the wheel and tire assembly. Tighten lug nuts to 115-155 Nm (85-115 lb-ft).
12. Lower the vehicle, check the brake fluid level and fill as necessary. Check brakes for proper operation then recheck brake fluid level in brake master cylinder reservoir. Fill as necessary.

tomsn048@gmail.com

tomsn048@gmail.com

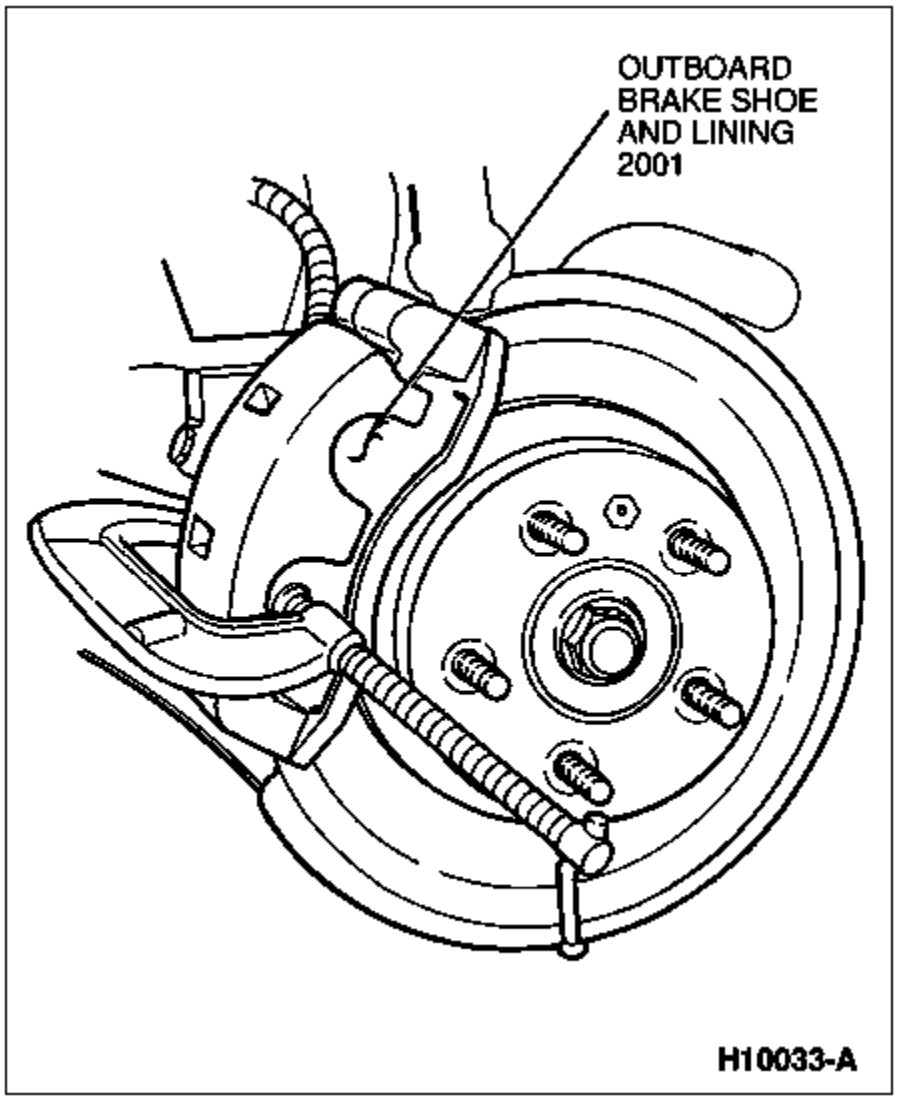
Caliper, Lining and Front Disc Brake Caliper Anchor Plate, Ranger

NOTE: Refer to the Spindle, Wheel and Caliper Assembly illustration in this section.

Removal

1. Remove and discard sufficient brake fluid from the brake master cylinder reservoir (2K478) to allow for caliper piston displacement.
2. Raise and support the vehicle.
3. Remove the tire and wheel assembly.
4. Using a C-clamp:
    - Position the frame of the C-clamp on the inboard side of the disc brake caliper (2B120). Do not place the clamp frame over the front brake hose.
    - Position the C-clamp screw on the outboard brake shoe and lining.
    - Compress the C-clamp only enough to give removal clearance for the disc brake caliper.

tomsn048@gmail.com



5. Remove the front brake hose flow bolt.
6. Disconnect and plug the front brake hose (2078). Discard the copper washers.
7. **CAUTION: Use care to retain as much of the original caliper slide pin grease as possible.**

   From the inboard side of the disc brake caliper, remove the two caliper slide pins.
8. Slide the disc brake caliper off the front disc brake hub and rotor (1102).
9. Slide the brake shoe and lining out of the front disc brake caliper anchor plate.
10. Remove the two caliper anchor plate bolts.
11. Remove the front disc brake caliper anchor plate from the front wheel hub and spindle (3K206).

tomsn048@gmail.com

Installation

1. Position the front disc brake caliper anchor plate on the front wheel hub and spindle.
2. Install the two caliper anchor plate bolts. Tighten the bolts to 98-132 Nm (73-97 lb-ft).
3. Position the brake shoe and lining in the front disc brake caliper anchor plate.
4. Slide the disc brake caliper over the brake shoe and lining.
5. Install the caliper slide pins. Tighten to 30-36 Nm (23-26 lb-ft).
6. Using new copper washers, install the flow bolt through the front brake hose fitting and into the disc brake caliper. Tighten the flow bolt to 30-40 Nm (22-29 lb-ft).
7. Install the tire and wheel assembly.
8. Lower the vehicle.
9. Refill the brake master cylinder reservoir with clean Ford High Performance DOT 3 Brake Fluid C6AZ-19542-AA or equivalent DOT 3 fluid meeting Ford specification ESA-M6C25-A.
10. Bleed the brake system. Refer to Section 06-06 .
11. Test the brakes before moving the vehicle.

---

tomsn048@gmail.com

Rotor, Ranger

NOTE: Refer to the Spindle, Wheel and Caliper illustration in this section.

Removal

1. Remove and discard sufficient brake fluid from the brake master cylinder reservoir (2K478) to allow for caliper piston displacement.
2. Raise and support the vehicle.
3. Remove the tire and wheel assembly.
4. Using a C-clamp:
   - Position the frame of the C-clamp on the inboard side of the disc brake caliper. Do not place the clamp frame over the front brake hose.
   - Position the C-clamp screw on the outboard brake shoe and lining.
   - Tighten the C-clamp only enough to give removal clearance for the disc brake caliper.
5. Remove the two front disc brake caliper anchor plate bolts.
6. **CAUTION: Do not allow the weight of the disc brake caliper (2B120) to hang from the front brake hose (2078).**

   Slide the caliper and anchor bracket assembly off the front disc brake hub and rotor (1102). Using a wire, support the disc brake caliper from a convenient underbody component.

NOTE: Steps 7 through 10 apply to 4x2 vehicles. For 4x4 vehicles, go to Step 11.

7. Remove the hub grease cap (1131), cotter pin, nut retainer, hub spindle nut and the front wheel outer bearing retainer washer (1195).
8. Carefully pull outward and push back the front disc brake hub and rotor to expose the front wheel bearing (1216).
9. Remove the front wheel bearing and protect it from contamination.
10. Remove the front disc brake hub and rotor, inner bearing cone and roller (1201) and the grease seal as an assembly from the front wheel spindle (3105).
11. On 4x4 vehicles, remove the front disc brake hub and rotor from the front hub.
12. If necessary, remove the grease seal and the inner bearing cone and roller from the front disc brake hub and rotor. Discard the grease seal.

tomsn048@gmail.com

Installation

1. Inspect the front disc brake hub and rotor for cracks or other damage. Replace as necessary.
2. If necessary, install the inner bearing cone and roller and a new grease seal in the front disc brake hub and rotor.
3. Position the front disc brake hub and rotor on the front hub (4x4 vehicles) or the front wheel spindle (4x2 vehicles).
4. Install the front wheel bearing.
5. Install the front wheel outer bearing retainer washer.
6. Install the hub spindle nut. Tighten the hub spindle nut to 23-34 Nm (17-25 lb-ft) while rotating the front disc brake hub and rotor, back off 120-180 degrees and retighten to 2.0-2.3 Nm (18-20 lb-in).
7. Without changing the position of the hub spindle nut, install the nut retainer, cotter pin and hub grease cap.
8. Install the disc brake caliper and front disc brake caliper anchor plate assembly. Refer to the procedure in this section.
9. Install the tire and wheel assembly. Tighten the lug nuts to 115-155 Nm (85-115 lb-ft).
10. Lower the vehicle. Test the brakes.

tomsn048@gmail.com

Rotor, Aerostar

Refer to the Exploded Views at the beginning of the Removal and Installation procedures in this section.

Removal

1. Raise the front of the vehicle and install safety stands.
2. Remove the wheel and tire assembly.
3. Remove the disc brake caliper (2B120) from the front disc brake hub and rotor (1102) and support it out of the way with wire. Refer to Caliper and Lining removal procedure in this section.
4. On 4x2 vehicles, remove the hub grease cap (1131), cotter pin, retainer, hub spindle nut, washer, and outer front wheel bearing (1216), and remove the front disc brake hub and rotor , the inner bearing cone and roller (1201) and the grease seal as an assembly from the front wheel spindle (3105).

    - On 4x4 vehicles, refer to Section 04-01B for procedures.
    - On Aerostar E-4WD vehicles, refer to Section 04-01C for hub removal procedures.

Installation

1. If a new front disc brake hub and rotor will be installed, remove the protective coating or any dirt or grease deposits with degreaser.
2. If a new front disc brake hub and rotor is being installed, pack the new inner bearing cone and roller with Premium Long-Life Grease XG-1-C or -K or equivalent lubricant meeting Ford specification ESA-M1C75-B.
3. If a new front disc brake hub and rotor are being installed, install the bearing cone and roller as described here.
4. Install the front disc brake hub and rotor on the front wheel spindle.
5. On 4x2 vehicles, install the bearing cone and roller, washer, and nut. Adjust bearing end play and install the cotter pin and dust cap as described in Section 04-01A . On 4x4 vehicles, refer to Section 04-01B .
6. Install the disc brake caliper as described in this section.
7. Install the wheel and tire assembly. Tighten lug nuts to 115-155 Nm (85-115 lb-ft).
8. Lower the vehicle. Check the brakes for proper operation.

tomsn048@gmail.com

tomsn048@gmail.com

Rotor Shield

NOTE: Refer to the applicable front brake Exploded Views at the beginning of Removal and Installation.

Removal

1. Remove the front disc brake hub and rotor (1102). Refer to the procedure in this section.
2. Remove the three bolts and the front disc brake rotor shield (2K004) from the front wheel spindle (3105).

Installation

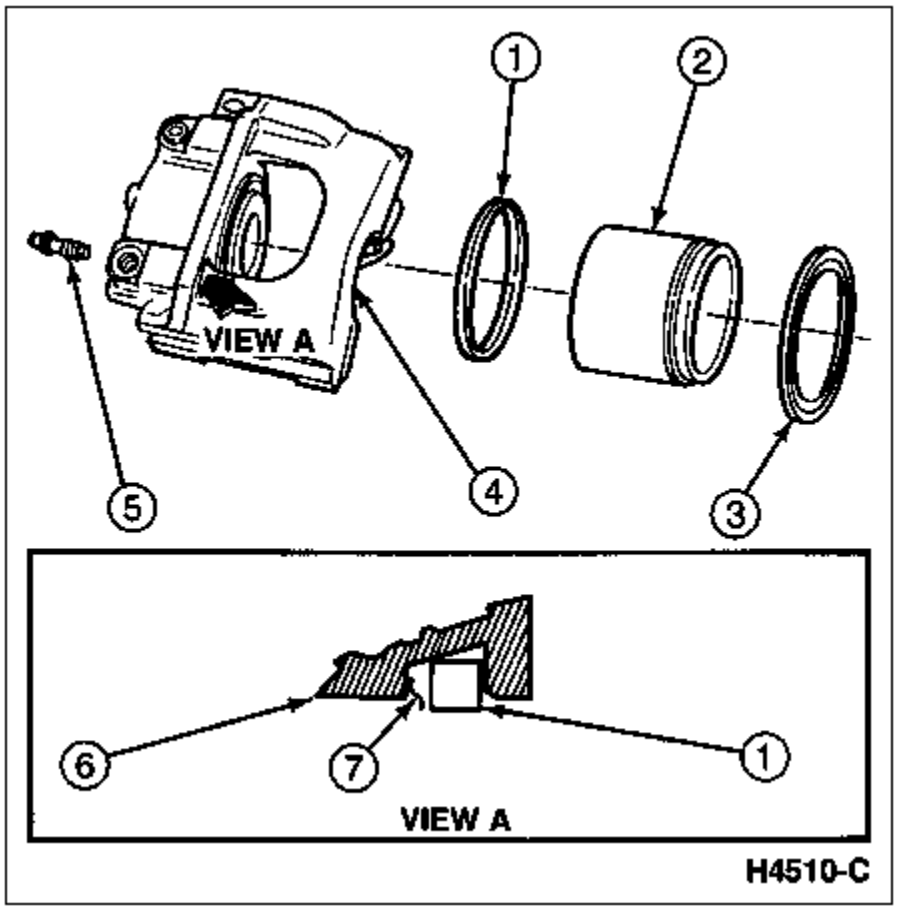
To install, reverse the removal procedure. Tighten the front disc brake rotor shield bolts to 11-13 Nm (97-115 lb-in).

tomsn048@gmail.com

Caliper, Aerostar

Disassembly

1. Remove the disc brake caliper (2B120) from the vehicle as outlined in Caliper and Lining Removal in this section. Place a block of wood over the caliper piston (2196) before applying air pressure to prevent damage to the caliper piston.



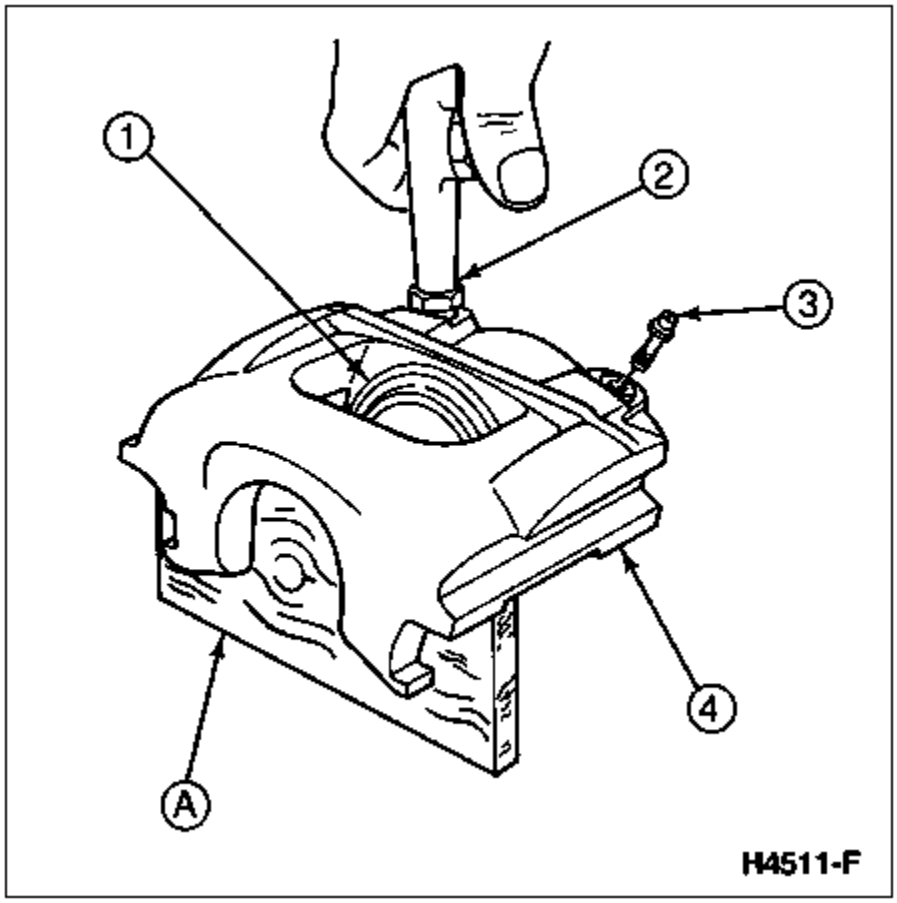
Item	Part Number	Description
1	2B115	Piston Seal
2	2196	Caliper Piston
3	2207	Dust Boot
4	2B120	Disc Brake Caliper
5	2208	Bleeder Screw
6	—	Caliper Bore (Part of 2B120)

tomsn048@gmail.com

7	—	Seal Groove (Part of 2B120)

2. **NOTE: Use care because the caliper piston can develop considerable force from pressure buildup.**

   Apply air pressure to the fluid port in the disc brake caliper with Rubber-Tipped Air Gun D93L-7000-A or equivalent to remove the caliper piston. If the caliper piston is seized and cannot be forced from the disc brake caliper, tap lightly around the caliper piston while applying air pressure.



Item	Part Number	Description
1	2196	Caliper Piston
2	D93L-7000-A	Air Gun
3	2208	Bleeder Screw
4	2B120	Disc Brake Caliper, Front
A	—	Wood Block (To Prevent Piston Damage)

3. Remove the dust boot from the disc brake caliper.

4. **CAUTION: To prevent damage to the seal groove, do not use a metal tool to remove the**

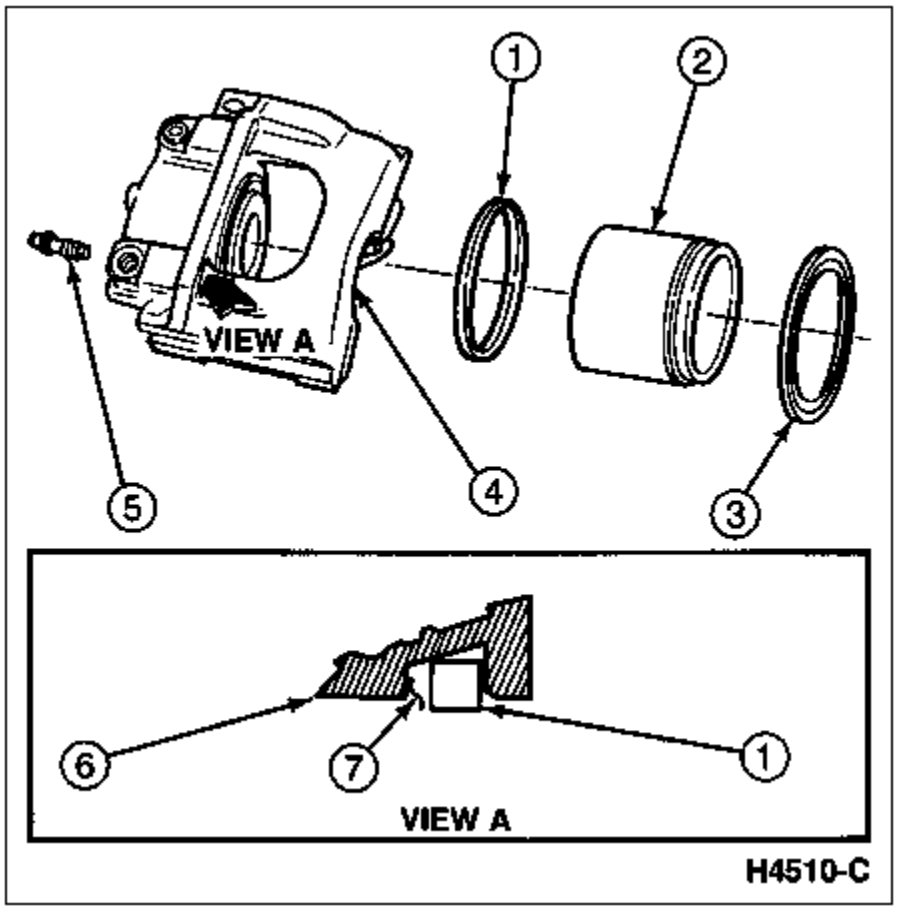
tomsn048@gmail.com

piston seal.

Remove the rubber piston seal from the caliper piston and discard it.

Assembly

1. Apply a film of clean brake fluid to the new caliper piston seal, and install it in the caliper bore. Be sure the seal does not become twisted but is firmly seated in the groove.
2. Coat the caliper piston with brake fluid. Spread the dust boot over the caliper piston seating the dust boot in the caliper piston groove.
3. Install the caliper piston into the caliper bore.
4. The dust boot flange should set squarely in the outer groove of the caliper bore when the wheel cylinder piston is completely installed.



Item	Part Number	Description
1	2B115	Piston Seal
2	2196	Caliper Piston
3	2207	Dust Boot

tomsn048@gmail.com

4	2B120	Disc Brake Caliper
5	2208	Bleeder Screw
6	—	Caliper Bore (Part of 2B120)
7	—	Seal Groove (Part of 2B120)

5. Install the disc brake caliper as outlined in this section.

tomsn048@gmail.com

Caliper, Ranger

Disassembly

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Piston Dust Seal Replacer	T92P-2588-AH
Driver Handle	T80T-4000-W

1. Remove the disc brake caliper (2B120) from the vehicle. Refer to the procedure in this section.

2. **CAUTION: Use care to retain as much of the original caliper slide pin grease as possible.**

   Remove the caliper slide pins and caliper slide pin dust boots from the front disc brake caliper anchor plate.

3. **NOTE: Because there are two caliper pistons, it is desired to have both pistons nearly expelled before the seal is broken. Therefore, the dimensions of the wood block used to assist removal are important. A block 38 x 38 x 150mm (1.5 x 1.5 x 6 inches) is recommended.**

   Place a wood block in the disc brake caliper jaws to avoid damage to the disc brake caliper pistons when they are forced out of the disc brake caliper bores.

4. **WARNING: TO AVOID DAMAGE OR INJURY, USE ONLY ENOUGH AIR PRESSURE TO EXPEL THE PISTON. DO NOT ATTEMPT TO CATCH THE CALIPER PISTON AS IT IS FORCED OUT OF THE DISC BRAKE CALPIER.**

   Using a rubber nosed air nozzle at the brake fluid inlet port, apply low pressure air to force the disc brake caliper pistons out of the disc brake caliper bores.

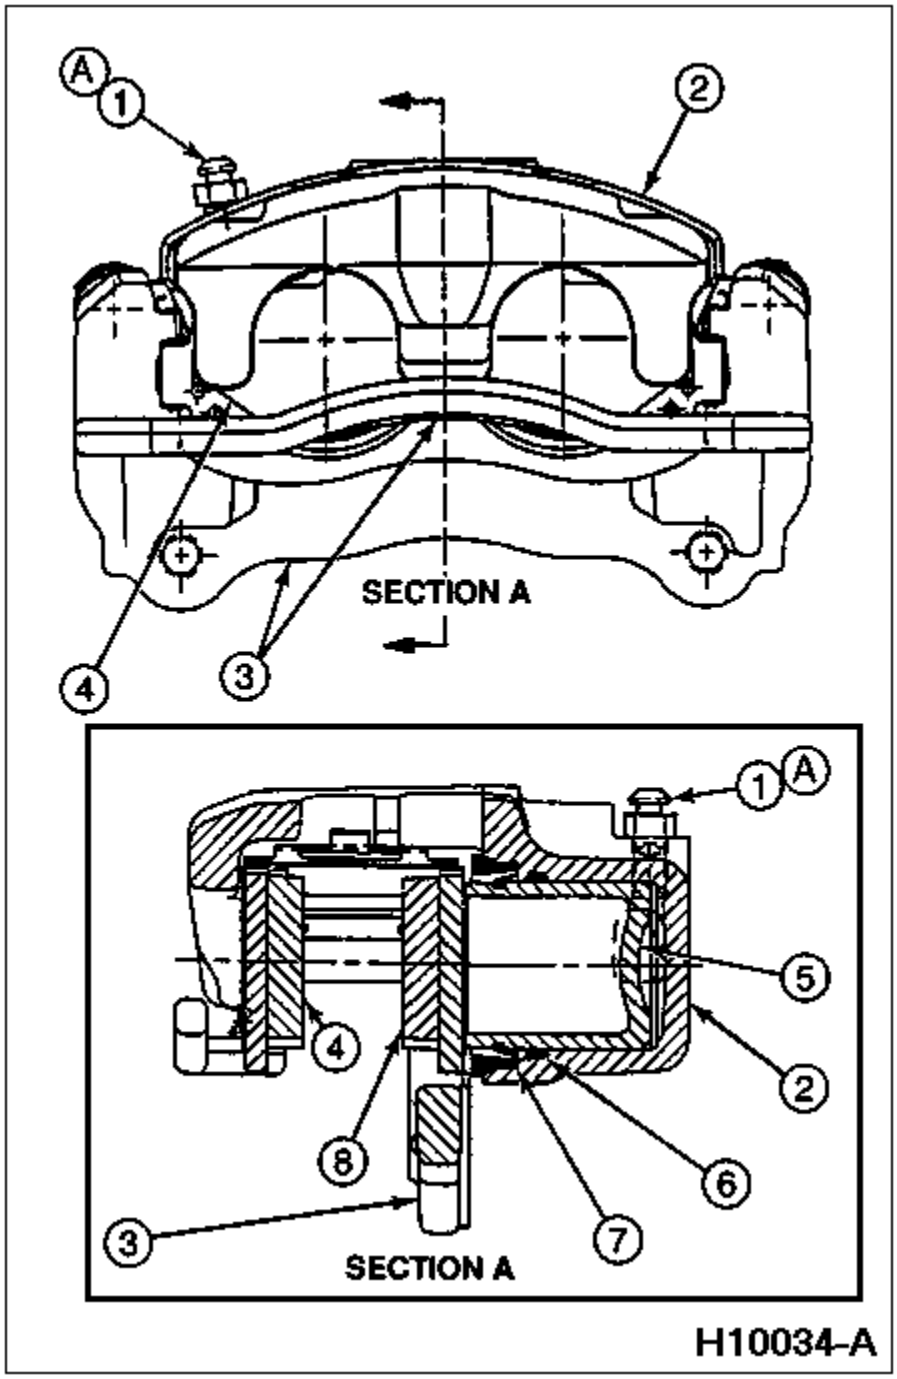
5. To encourage the removal of a reluctant caliper piston, tap gently around it. If a caliper piston cannot be removed from the disc brake caliper, replace the disc brake caliper.

6. Using a suitable tool, pry the caliper piston dust boots out of the disc brake caliper bores. Discard the caliper piston dust boots.

7. **CAUTION: To avoid damage to the bores or seal seats, use only a non-metallic tool to remove the piston seals.**

   Remove and discard the disc brake caliper piston seals from the caliper bores.

tomsn048@gmail.com



Item	Part Number	Description
1	2208	Bleeder Screw
2	2B120	Disc Brake Caliper Housing
3	2B292	Front Disc Brake Caliper Anchor Plate
4	2001	Brake Shoe and Lining, Outboard
5	2196	Caliper Piston
6	2B115	Piston Seal

tomsn048@gmail.com

7	2207	Dust Boot
8	2001	Brake Shoe and Lining, Inboard
A	—	Tighten to 11-17 Nm (97-150 Lb-In)

Assembly

1. Clean and inspect the disc brake caliper bores for scoring, rust, pitting or other damage. Do not hone a worn or damaged caliper bore. A new disc brake caliper must be used.

2. Clean and inspect the caliper pistons for cracks or other damage. Do not attempt to repair a worn or damaged caliper piston. A new one must be installed.

3. Clean and inspect the caliper pin bolt bushings. Replace if worn or damaged.

4. **CAUTION: Do not use anything but clean brake fluid to lubricate the caliper pistons, seals and caliper bores. Use of any other lubricant may cause premature failure of brake components.**

   Lubricate the caliper bores, new piston seals and the caliper pistons with clean Ford High Performance DOT 3 Brake Fluid C6AZ-19542-AA or equivalent DOT 3 fluid meeting Ford specification ESA-M6C25-A.

5. Install the new piston seals into the caliper bore seal grooves. Make sure the seals are not twisted and are fully seated.

6. Install the caliper pistons into the caliper bores past the piston seals. Use a rocking, twisting motion and use care not to distort the piston seals.

7. After the caliper pistons are past the piston seals, press the caliper pistons about 2/3 into the caliper bores.

8. **CAUTION: Effective operation of the disc brake caliper is directly affected by the condition of the caliper piston dust boots. Use care not to dislodge or damage them.**

   Install the new dust boots on the caliper pistons.

9. Using Piston Dust Seal Replacer T92P-2588-AH and Driver Handle T80T-4000-W seat the dust boots into the caliper bores. Make sure the dust boots are fully seated into the caliper piston grooves and caliper bore grooves. After installation, the dust boots should not extend beyond the face of the caliper piston.

10. After installing the dust boots, press the caliper pistons to the bottom of the caliper bores.

11. **CAUTION: For Ranger and Explorer disc brakes, the caliper slide pins are covered by a flexible boot and are intended to be lubed for life. At time of publication, there was no approved material or procedure for re-lubing the caliper slide pins. For routine service such as brake pad replacement, the slide pins, grease and boots should be reused as are, if not damaged. If damaged, new pins (with new boots and grease included) must be installed.**

tomsn048@gmail.com

CAUTION: Do not use petroleum or mineral based service greases (such as Ford Disc Brake Caliper Slide Grease D7AZ-19590-A or equivalent meeting Ford specification ESA-M1C172-A) for this application. Such greases will cause rapid deterioration of the slide pin boots. Service life of the disc brakes could be reduced as a result.

Install the caliper slide pin dust boots into the disc brake caliper anchor plate. Make sure the boots are fully seated in the grooves.

12. Install the caliper slide pins into the caliper slide pin boots. Make sure the caliper slide pin boots are seated in the grooves in the caliper slide pins.

13. Expel the air from the caliper slide pin boots and make sure the caliper slide pins are fully coated with lubricant.

14. Install the disc brake caliper on the front disc brake caliper anchor plate. Refer to the procedure in this section.

---

tomsn048@gmail.com

Rotor Service

Rotor Minimum Thickness

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Disc Rotor Surface Gauge and Ball	T71P-1102-A

WARNING: FRONT DISC BRAKE HUB AND ROTOR MINIMUM THICKNESS MUST NOT BE LESS THAN SHOWN IN THE SPECIFICATIONS PORTION OF THIS SECTION, NOR LESS THAN THE NUMBER CAST ON THE INSIDE OF THE FRONT DISC BRAKE HUB AND ROTOR AFTER REFINISHING.

NOTE: The 53.975mm (2.125-inch) gauge ball that is part of T71P-1102-A is used for Aerostar 4x2 and E-4WD rotor measurement. A 70mm (2.756-inch) gauge ball used in conjunction with the micrometer gauge bar is required to make this measurement on Ranger 4x4 front rotors. Tool number for 70mm (2.756-inch) gauge ball not available at time of printing.

NOTE: Maximum allowable stock removal of the rotor braking surface is determined by the use of Disc Rotor Surface Gauge and Ball T71P-1102-A as follows:

1. Remove the inner grease seal and the inner bearing cone and roller (1201) from the front disc brake hub and rotor (1102). Wipe the inner and outer bearing cups clean.

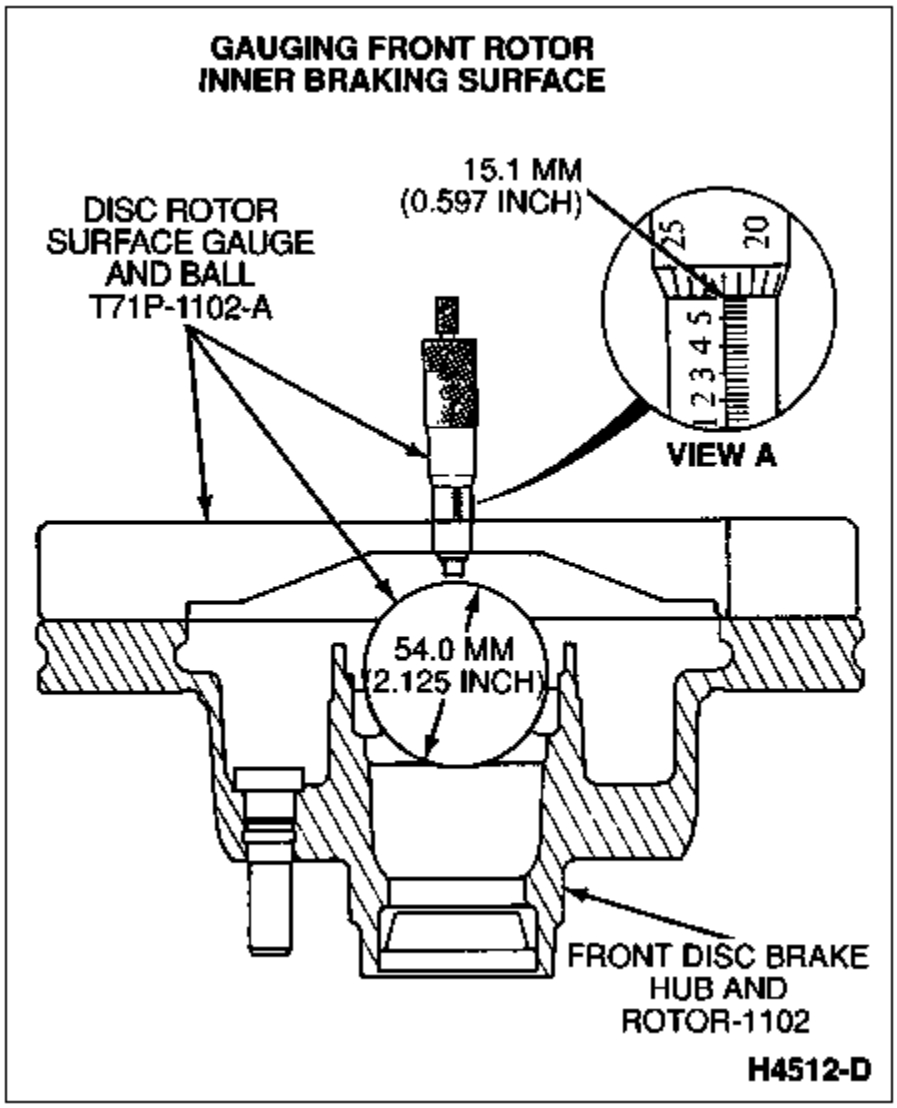
2. Carefully place the gauge ball in the inner bearing cup **(do not drop)** .

3. Set the micrometer to the baseline setting dimension. Refer to the Specifications portion of this section.

4. **NOTE: If the micrometer must be retracted from the baseline setting to allow the legs to set on the rotor surface, the front disc brake hub and rotor has had more than allowable stock removed and the front disc brake hub and rotor must be replaced.**

   Position the micrometer gauge bar on the rotor inner braking surface with the micrometer centered over the ball. To measure the distance between the micrometer baseline setting and the ball, turn the micrometer down to touch the top of the ball, and calculate the difference between the reading and the baseline setting. This distance is equal to the maximum allowable stock removal from the inside braking surface only. If the micrometer end at the baseline setting touches the ball, no additional stock removal is allowed.

tomsn048@gmail.com



5. **CAUTION: If the rotor thickness is less than the minimum, the front disc brake hub and rotor must be replaced, regardless of the gauge bar and ball measurement. Rotor minimum thickness is also shown on each rotor.**

   Check the front disc brake hub and rotor for the maximum amount of stock that can be removed from the rotor thickness. Measure actual rotor thickness with micrometer and subtract minimum allowable thickness (cast in individual rotor). Total material removal (combination of both sides) must not exceed this amount.

6. Never use a lathe that cuts only one face of the front disc brake hub and rotor at a time; it must be a simultaneous straddle cut.

7. Set the cutting tool to just contact the high spots on the front disc brake hub and rotor, then adjust the cutting tool to the minimum depth required to clean up the rotor face.

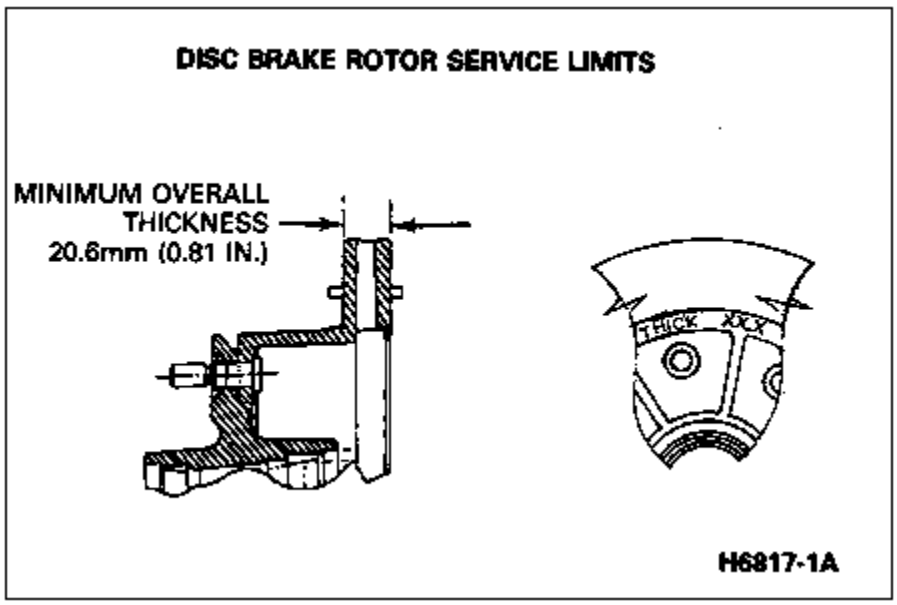
Do not exceed the allowable stock removal for the inner braking surface or total rotor thickness. Before installing the front disc brake hub and rotor on the front wheel spindle (3105), clean all chips from the front disc brake hub and rotor and flush new grease through the bearing with a bearing packing tool. A new inner grease seal must be coated with wheel bearing grease and installed in the front disc brake hub and rotor.

tomsn048@gmail.com

The front disc brake hub and rotor must be installed on the same side of the vehicle from which it was removed. Measure the thickness of the brake shoe and lining (2001). If the lining thickness at any point on the assembly is less than 1.5mm (1/16 inch) above the backing plate or if the lining shows evidence of brake fluid or oil contamination, replace both sets of brake shoes and linings.

Removal of dust and dirt from brake assemblies should be done by using the Rotunda Brake Clutch Service Vacuum model 164-R3600 or Rotunda Brake Parts Washer model 065-00016 or an equivalent.

WARNING: BRAKE ASSEMBLY DUST AND DIRT SHOULD NOT BE REMOVED BY EITHER BLOWING OFF WITH AN AIR GUN OR VACUUMING WITH A STANDARD INDUSTRIAL VACUUM CLEANER BECAUSE A HEALTH HAZARD FROM BREATHING IN ASBESTOS DUST MAY DEVELOP. ALSO, ANY MACHINING DONE ON BRAKE LININGS OR PADS SHOULD BE DONE USING PROPERLY EXHAUST VENTILATED EQUIPMENT.



Rotor Machining

Lathe turn the rotor in order to perform the following:

- Remove rotor scoring, scratching too deep to repair by hand sanding. Deep scoring/scratching usually occurs after brake use with linings fully worn to the rivets. Stock removal must not reduce rotor thickness to below the specified minimum thickness.
- Correct a shudder/vibration/pulsation condition if due to rotor distortion. Check the wheel bearing adjustment and correct as required and verify if the condition is corrected. If there is any buildup of foreign material on the linings or rotor surfaces, the condition may not be due to rotor distortion. Hand sand the surfaces and determine if the condition is corrected before resorting to lathe turning. Check the lateral runouts of the brake surfaces. Lathe turn the rotor if hand sanding of any foreign matter on friction surfaces does not correct the condition, or if measured runout exceeds .254mm (0.010 inch) total indicator reading.

tomsn048@gmail.com

Runout Check

To check rotor runout, first eliminate the wheel bearing end play by tightening the adjusting nut to specifications. Then check to be sure the front disc brake hub and rotor can still be rotated.

- Clamp a dial indicator to the spindle knuckle assembly so the stylus contacts the front disc brake hub and rotor approximately 25.4mm (1 inch) from the outer edge. Rotate the rotor one turn (360 degrees) and take an indicator reading. If the reading exceeds 0.08mm (0.003 inch) total lateral runout, replace or resurface the front disc brake hub and rotor.

The following requirements must be met when resurfacing front disc brake hub and rotors.

- Use a disc brake lathe to resurface the front disc brake hub and rotors. Follow the manufacturer's instructions.
- The minimum overall thickness specification shown on each rotor allows for a 0.762mm (0.030 inch) machining cut plus 0.762mm (0.030 inch) additional wear. If rotor thickness falls below the minimum, it must be replaced.
- After lathe turning, the finished brake surfaces of the rotor should be flat and parallel within 0.05mm (0.002 in.); lateral runout should not exceed 0.076mm (0.003 inch) total indicator reading.
- To adjust wheel bearings after runout check or resurfacing, refer to the appropriate section in Group 04.
- Measure the thickness of the brake linings. If the lining thickness at any point on the assembly is less than 1.5mm (1/16 inch) above the backing plate or if the lining shows evidence of brake fluid or oil contamination, replace all four brake shoes and linings.
- Thickness on each face must be uniform.

---

tomsn048@gmail.com

Caliper

Clean all metal parts with isopropyl alcohol. Clean out and dry the grooves and passageways with compressed air. Make sure caliper bore and component parts are thoroughly clean.

Wipe off the disc brake caliper (2B120) and inspect for cracks or other damage. While disassembled, inspect the caliper bore and caliper piston for pitting, rust or other damage. Inspect the seal groove for nicks or other damage caused by using a metal tool to remove the piston seal. Replace as necessary. Do not attempt to hone a damaged caliper bore.

tomsn048@gmail.com

Brake Shoe and Lining

Remove any dirt or debris on or around the brake shoe and lining (2001). Inspect the brake shoe and lining for brake fluid, grease, oil or other contaminants. Do not put contaminated brake shoe and lining into service. Do not attempt to remove any contaminant that has soaked into the lining material. Inspect the brake shoe and lining pad material for minimum thickness. Do not put brake shoes and linings into service that have lining thickness less than 1.5mm (1/16 inch).

tomsn048@gmail.com

Rotor

Inspect the front disc brake hub and rotor (1102) for grease, oil or other contamination. Clean with an approved solvent that will not leave any residue. Inspect the front disc brake hub and rotor for cracks, heat discoloration or other damage. Replace as necessary. Inspect for minimum thickness. Refer to rotor service procedures and specifications in this section.

tomsn048@gmail.com

tomsn048@gmail.com

Inspection and Verification

Check operation of the parking brake with vehicle on a hoist and parking brake fully released. If there is any slack in the cables or if the rear brakes drag when the wheels are turned, adjust as required. Check for any cable damage and replace as necessary.

tomsn048@gmail.com

Symptom Chart — Parking Brake System

PARKING BRAKE SYSTEM

Condition	Possible Source	Action
• Squeals or Groans	• Glazed linings.	• REMOVE glaze from linings using sandpaper or emery cloth.
	• Misaligning of parts.	• CORRECT misalignment with correct installation. REFER to Section 06-02 .
	• Dirt in brake drum.	• REMOVE brake drum and CLEAN OUT lining dust and dirt.
• Scraping Noise	• Worn out lining part of rear brake shoe and lining.	• CHECK for lining worn down to rivets — REPLACE shoes if necessary.
	• Bent or misaligned shoe part of rear brake shoe and lining.	• CHECK for misaligned shoe, rubbing against brake drum. REPLACE shoes if necessary. REFER to Section 06-02 .
• Clicks	• Excessive clearance.	• CHECK parking brake shoe and lining installation specification.
	• Eccentric or wobbling brake drum. .	• INSPECT drum runout.
	• Excessive linkage friction.	• CHECK linkage pivot points for rust, binding, or lack of lubrication.
• Brake Does Not Apply or Hold	• Excessive clearance prevents complete brake application.	• CHECK brake cable for slack. REFER to Pinpoint Test A .
	• Grease soaked linings.	• REPAIR source of leak, INSTALL new linings. REFER to Section 06-02 .
	• Excessive linkage friction.	• CHECK for linkage binding, and misalignment. LUBRICATE all friction points.
	• Worn out linings.	• REPLACE rear brake shoe and lining. CHECK brake drum for scoring and REPLACE if necessary. REFER to Section 06-02 .
• Excessive Lining Wear	• Brake drag.	• CHECK parking brake cables or binding condition. INSPECT for broken or missing springs.
	• Rough brake drum surface.	• SMOOTH brake drum with emery paper, or REPLACE brake drum, if brake drum is badly scored.
		CAUTION: Brake drum to be replaced if inside diameter exceeds 229.36mm (9.030 inches).

tomsn048@gmail.com

	• Several dynamic stops.	• INSPECT the brake shoe and lining. REPLACE as necessary.
• Parking Brake Will Not Release	• Brake drag. • Worn or damaged parking brake control.	• REFER to Pinpoint Test B .

tomsn048@gmail.com

Pinpoint Tests

PINPOINT TEST A: PARKING BRAKE WILL NOT APPLY

A1 CHECK PARKING BRAKE CONTROL

- Operate the parking brake control.

Does parking brake control operate smoothly?

Yes	No
GO to **A2** .	SERVICE binding condition in parking brake control and RETEST system.

A2 CHECK PARKING BRAKE CABLES

- Raise and support vehicle.
- Inspect for broken or binding parking brake cables.

Is there a parking brake cable concern?

Yes	No
SERVICE parking brake cables as required. RETEST system.	GO to **A3** .

A3 CHECK PARKING BRAKE COMPONENTS

- Raise and support the vehicle.
- Remove the brake drums.
- Operate the parking brake control and observe the parking brake components.

Do the parking brake components operate?

Yes	No
CHECK the parking brake shoe and lining installation specification. REFER to the procedure in this section. RETEST system.	SERVICE worn or damaged parts. RETEST the system.

tomsn048@gmail.com

PINPOINT TEST B: PARKING BRAKE WILL NOT RELEASE

B1 CHECK PARKING BRAKE CABLE

- Release parking brake control.
- If the vehicle can't be moved, raise and support the vehicle.
- Release parking brake cable tension.
- Remove brake drum or rear disc brake rotor and disconnect parking brake rear cable and conduit.

Does the parking brake release?

Yes	No
GO to **B2** .	SERVICE the worn or damaged rear brake component. RETEST the system.

B2 PARKING BRAKE CABLE CHECK

- Release the parking brake control.

Does the parking brake control release?

Yes	No
INSPECT parking brake cable for binding. SERVICE as necessary. RETEST system.	SERVICE the worn or damaged parking brake control. RETEST the system.

tomsn048@gmail.com

Control, Aerostar

Removal

1. Remove the front and inboard rear screws attaching the boot to the floor. Pivot boot back on hinge and remove two rear screws. Remove the boot.

2. Disconnect the parking brake indicator light switch connector.

3. Place the control in the "released" position and insert the lock pin in the parking brake control (2780). Refer to Adjustments, Cable Tension Release in this section for procedure.

4. **CAUTION: Do not remove the steel lock pin from the parking brake control until the cable is connected to the control assembly. Pin removal releases the tension in the ratchet wheel causing the spring to unwind and release tension. If the pin is prematurely removed, spring tension in the parking brake control must be reset. Refer to Adjustments, Cable Tension, Resetting in this section.**

   Remove the cable anchor pin from the pivot hole in the control assembly ratchet plate. Guide the front parking brake cable and conduit (2853) from the parking brake control.

5. Remove the bolts retaining the parking brake control to the floor panel. Remove the parking brake control.

Installation

1. Route the front parking brake cable and conduit around the control assembly pulley and insert the cable anchor pin in the pivot hole in the ratchet plate.

2. Position the parking brake control with the front parking brake cable and conduit attached to it on the floor panel. The floor support is installed between the parking brake control and the floor. Install and tighten the retaining bolts.

3. Connect the parking brake light switch connector.

4. Remove the lock pin from the parking brake control to reset cable tension. Remove self-adjusting pawl lockout pin also, if one is installed.

5. **NOTE: For proper adjustment procedure, both pins must be removed from the parking brake control.**

   Position the boot over the parking brake control. Install and tighten the screws.

6. Apply and release the parking brake control several times. Make sure the parking brakes are applied and released and not dragging. Make sure the brake warning lamp is illuminated when the parking brake is applied.

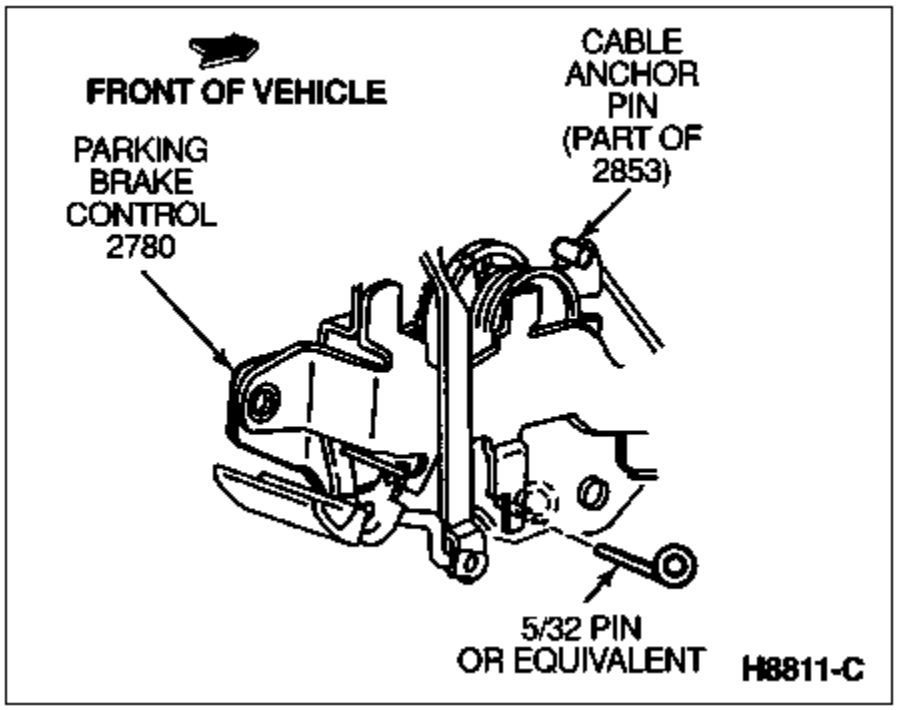
tomsn048@gmail.com

tomsn048@gmail.com

Control, Ranger

Removal

1. Remove the left cowl side trim panel (02345).
2. Disconnect the parking brake indicator light switch connector from the control assembly connector.
3. While an assistant relieves tension on the system by pulling on the parking brake intermediate cable or front parking brake cable and conduit (2853), insert a 4mm (5/32-inch) steel pin or equivalent drill bit into the hole provided in the parking brake control (2780).



4. Remove the cable anchor pin from the pivot hole in the control assembly ratchet plate. Guide the front parking brake cable and conduit from the parking brake control.
5. **CAUTION: Do not remove the steel lock pin from the parking brake control until the cable is connected to the parking brake control. Pin removal releases the tension in the ratchet wheel causing the spring to unwind and release tension. If the pin is prematurely removed, spring tension in the parking brake control must be reset. Refer to Adjustments, Cable Tension, Resetting in this section.**

   Remove the screw attaching the instrument panel to the parking brake control.

tomsn048@gmail.com

6. Remove bolts retaining the parking brake control to the left side cowl and remove the parking brake control from the vehicle.

Installation

1. Route the front parking brake cable and conduit around the parking brake control and insert the cable anchor pin in the pivot hole provided in the ratchet plate.

2. Position the parking brake control and install the attaching bolts. Tighten bolts to 17-23 Nm (13-17 lb-ft).

3. Install the screw attaching the instrument panel to the parking brake control.

4. Connect the parking brake warning indicator light switch to the parking brake control connector.

5. Carefully remove the lock pin (drill bit) from the parking brake control.

    - The system will automatically tension itself when the pin is removed.

6. Install the left cowl side trim panel.

7. Apply and release the parking brake several times to verify correct operation. Also, verify proper operation of the parking brake warning indicator light.

---

tomsn048@gmail.com

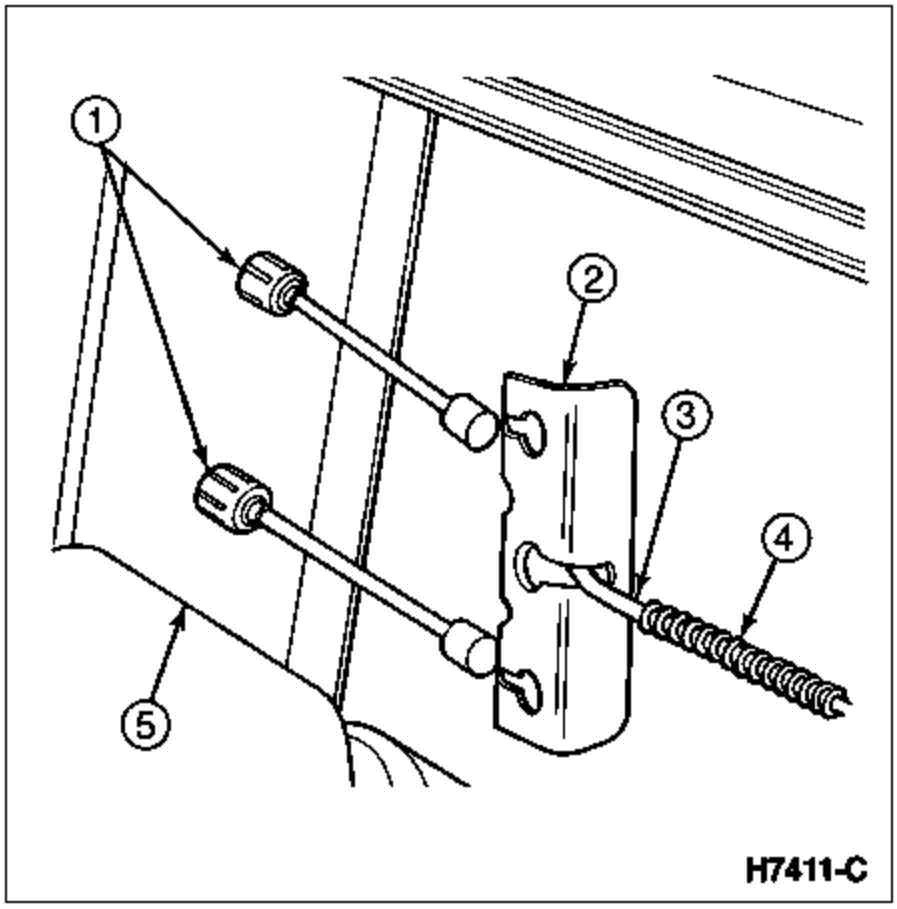
Cable and Conduit, Front, Aerostar

Removal

1. Place parking brake control (2780) in the "released" position and insert the lock pin in the control assembly. Refer to Adjustments, Cable Tension, Release in this section for procedure.

2. **NOTE: It may be necessary to loosen the fuel tank straps and partially lower the fuel tank to gain access to the cover.**

   Disconnect the parking brake rear cable and conduits (2A635) from the parking brake cable equalizer (2A602). Remove the parking brake cable equalizer from the front parking brake cable and conduit (2853).

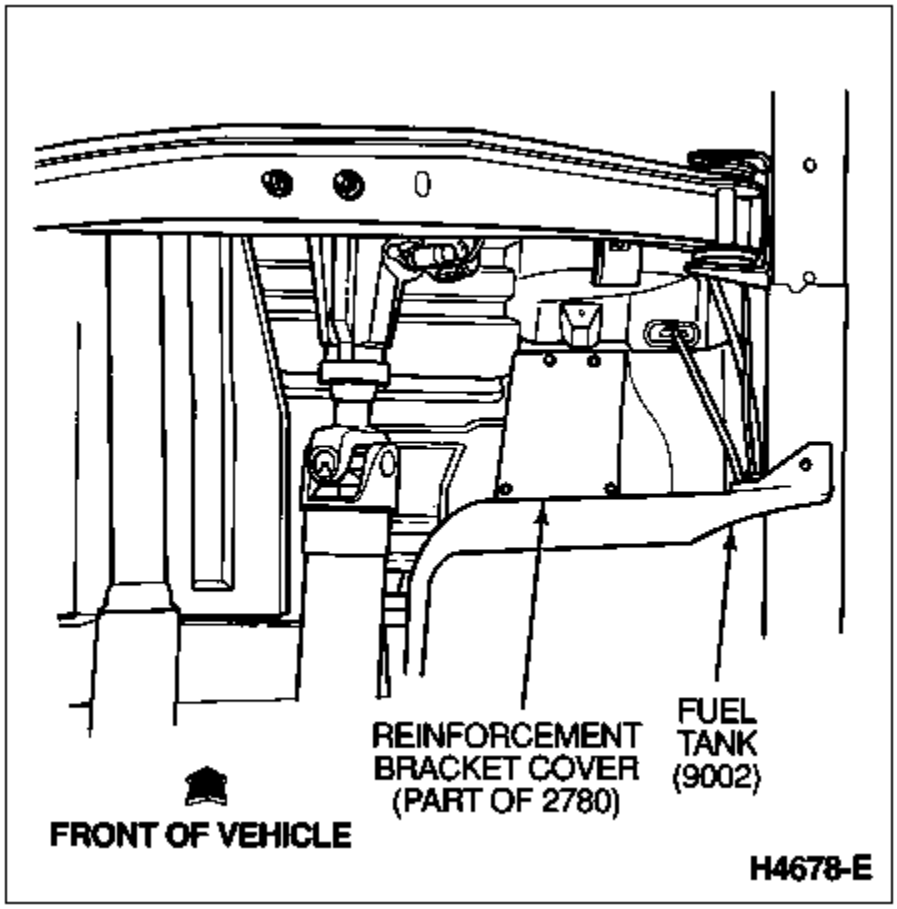


Item	Part Number	Description
1	2A635	Parking Brake Rear Cable and Conduit

tomsn048@gmail.com

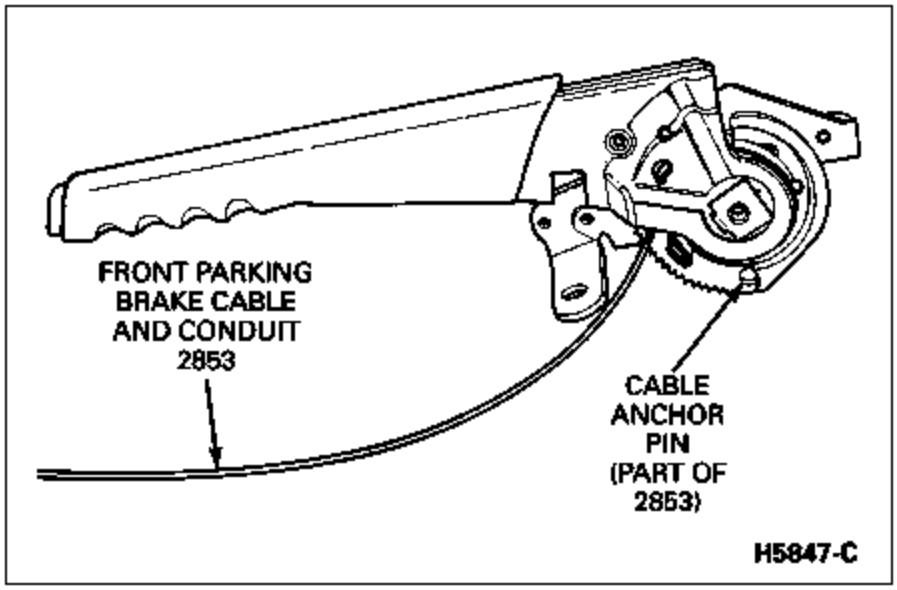
2	2A602	Parking Brake Cable Equalizer
3	2853	Front Parking Brake Cable and Conduit
4	2A651	Parking Brake Equalizer Cable Spring
5	5035	Rear Frame Crossmember

3. Remove the bolts retaining the cover to the underbody reinforcement bracket. Remove the cover.



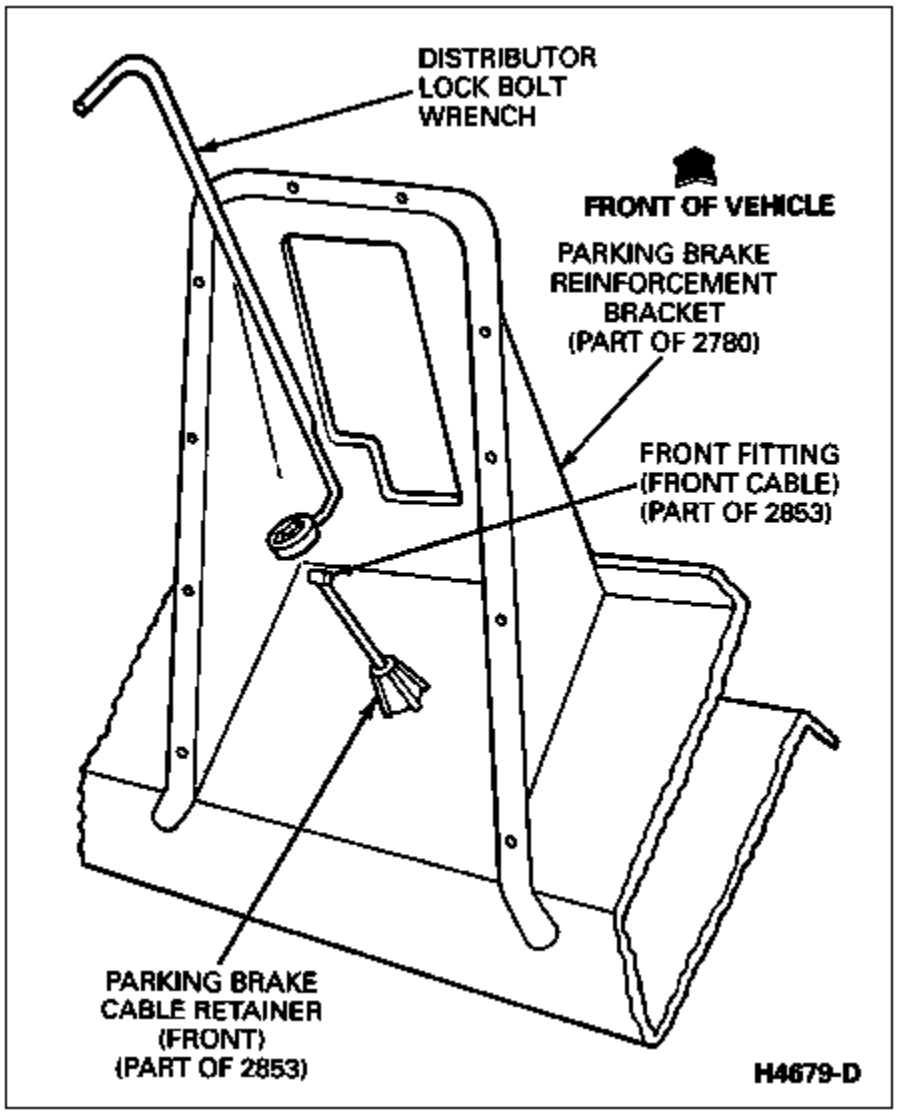
4. Remove the cable anchor pin from the pivot hole in the control assembly ratchet plate. Guide the front parking brake cable and conduit from the parking brake control.

tomsn048@gmail.com



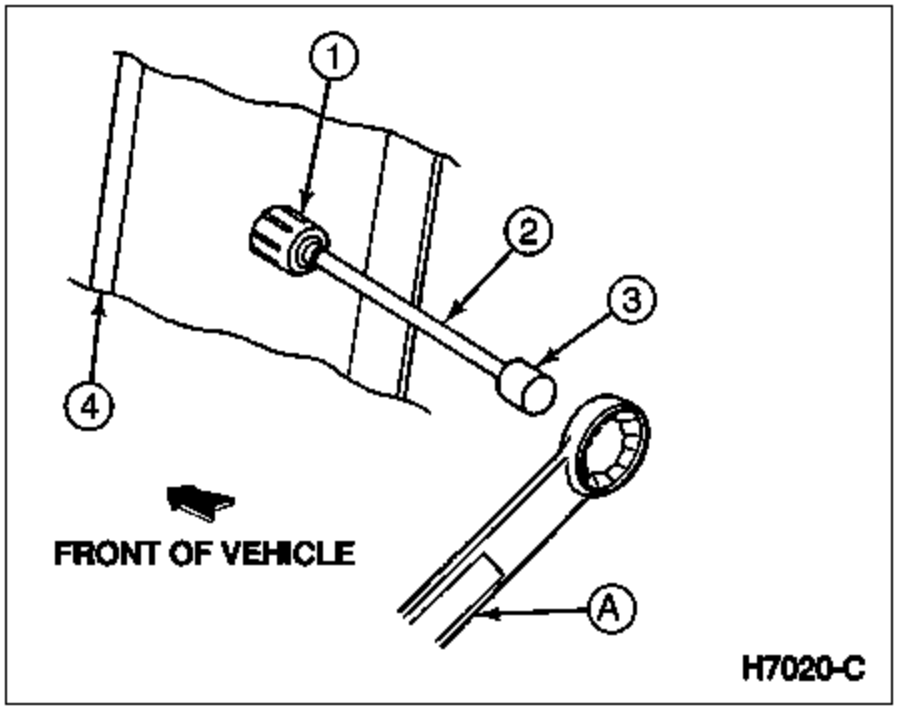
5. Insert a 1/2-inch box end 12-point distributor lock bolt wrench over the front fitting of the front parking brake cable and conduit. Push the wrench onto the rear parking brake cable retainer (2A709) in the rear frame crossmember (5035). Compress the retainer fingers and push the rear parking brake cable retainer rearward through the hole.

tomsn048@gmail.com



6. Insert a 1/2-inch box end 12-point wrench over the rear fitting of the front parking brake cable and conduit. Push the wrench onto the rear parking brake cable retainer fitting in the rear frame crossmember. Compress the retainer fingers and push the rear parking brake cable retainer forward through the hole. Pull the cable ends through the rear frame crossmembers and remove the front parking brake cable and conduit.

tomsn048@gmail.com



Item	Part Number	Description
1	—	Parking Brake Cable Retainer (Front) (Part of 2853)
2	2853	Front Parking Brake Cable and Conduit
3	—	Rear Fitting, Front Parking Brake Cable and Conduit (Part of 2853)
4	5035	Rear Frame Crossmember
A	—	Wrench, 12-Point Box End

Installation

1. Feed the front parking brake cable and conduit through the holes in both rear frame crossmembers. Push the rear parking brake cable retainers through the holes so the fingers expand over each hole.

2. Route the front parking brake cable and conduit around the control assembly pulley and insert the cable anchor pin in the pivot hole in the ratchet plate.

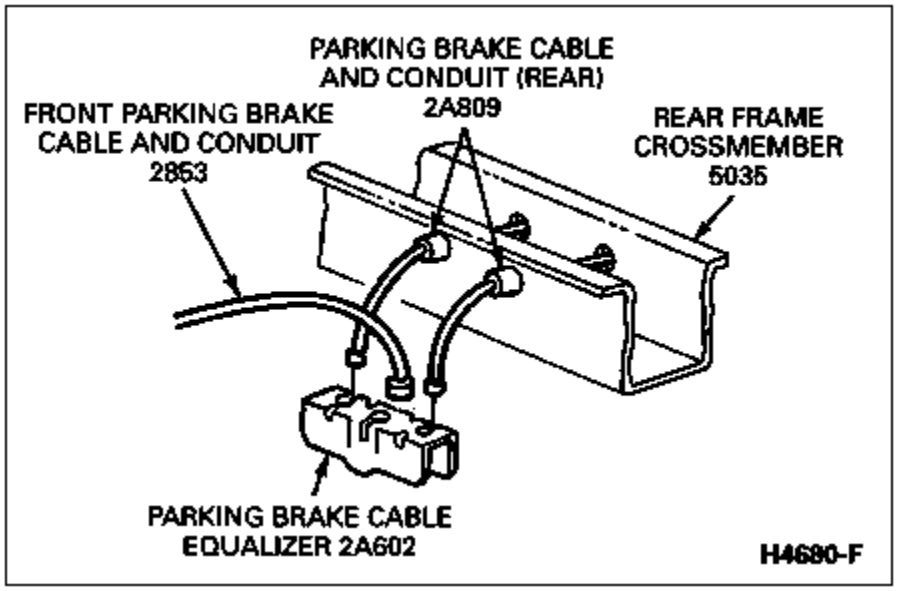
3. **NOTE: Before connecting front and rear cables verify that both rear cables are routed in front of the shocks and through clips.**

   Slide rear parking brake cable retainer over rear end of front parking brake cable and conduit.

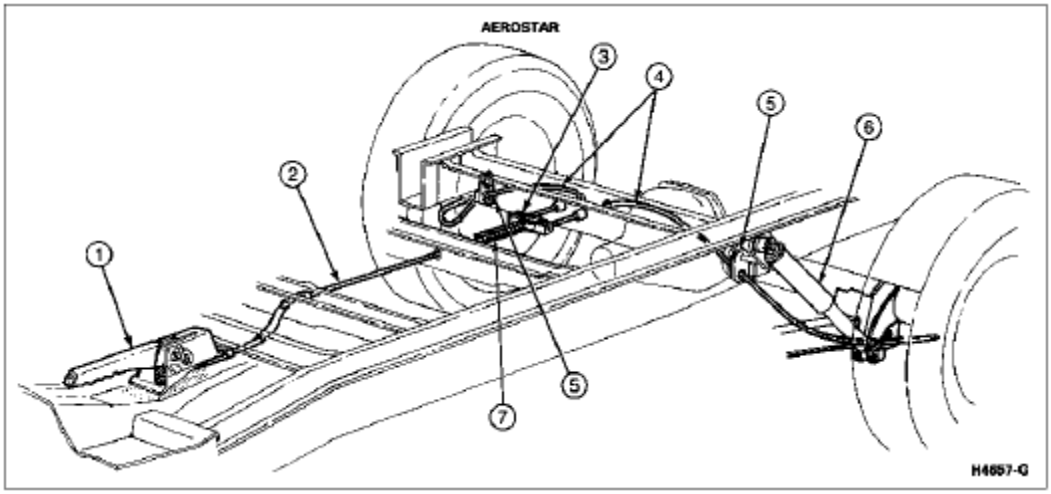
4. Connect the equalizer to front and rear cables by bending and inserting cables into equalizer then straighten.

tomsn048@gmail.com

5. Remove the lock pin from the parking brake control to apply cable tension.
6. Position the cover on the reinforcement bracket.
    - **Install and tighten the bolts AFTER visually checking to be sure the front parking brake cable and conduit is attached to the parking brake control.**
7. Position the boot over the parking brake control. Install and tighten the screws.
8. Apply and release the parking brake control several times. Make sure the parking brakes are applied, and not dragging when released.
    - Pin must be removed for proper adjustment.



Parking Brake System, Aerostar



tomsn048@gmail.com

Item	Part Number	Description
1	2780	Parking Brake Control
2	2853	Front Parking Brake Cable and Conduit
3	2A602	Parking Brake Cable Equalizer
4	2A635	Parking Brake Rear Cable and Conduit
5	N805422-S100	Clip
6	18125	Rear Shock Absorber
7	2A651	Parking Brake Equalizer Cable Spring

tomsn048@gmail.com

Cable and Conduit, Front (Ranger)

Removal

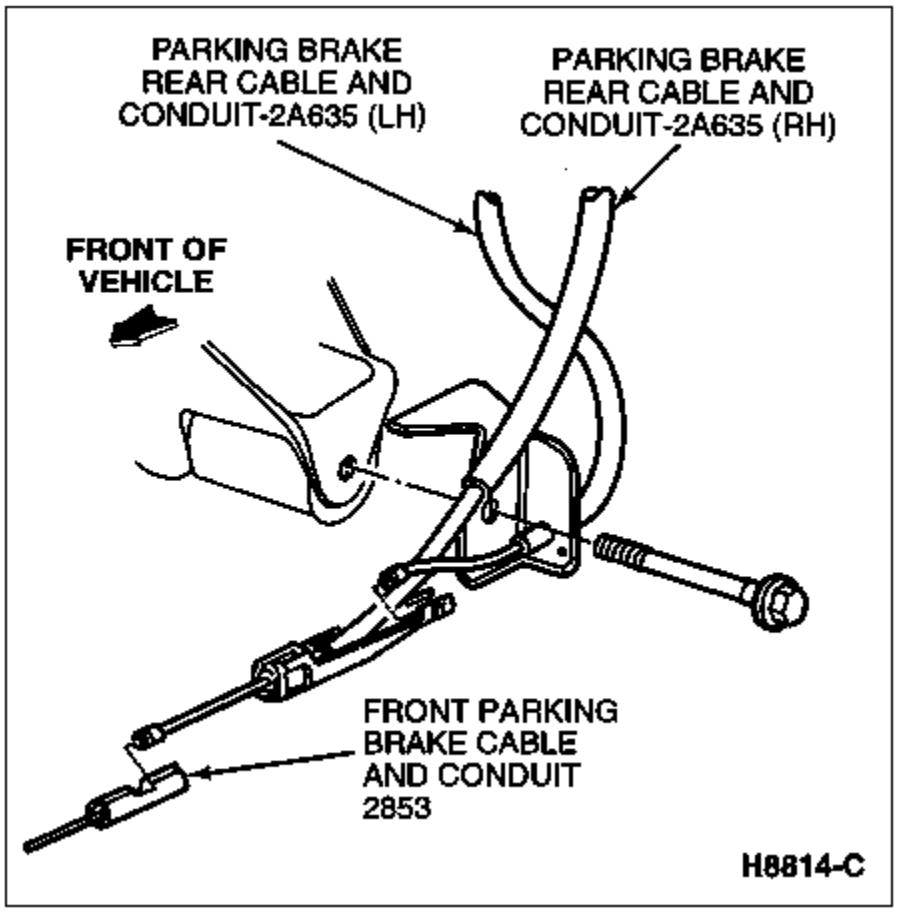
1. While an assistant relieves tension on the system by pulling on the parking brake intermediate cable or front parking brake cable and conduit (2853) insert a 4mm (5/32-inch) steel pin or equivalent drill bit into the hole provided in the parking brake control (2780).

2. Disconnect the parking brake intermediate cable or front parking brake cable and conduit from the LH parking brake rear cable and conduit (2A635).

3. To replace the front parking brake cable and conduit , remove the cable anchor pin from the pivot hole in the control assembly ratchet pin.

4. Guide the front parking brake cable and conduit from the parking brake control and disconnect it from the frame mounting bracket. Remove cable-to-frame attaching bolt, if bolt is present, and slide front parking brake cable and conduit from vehicle.

Ranger



tomsn048@gmail.com

Installation

1. Feed the front parking brake cable and conduit through the hole in the front frame mounting bracket. Push the retainer through the hole so the fingers expand over the hole.

2. Route the front parking brake cable and conduit around the control assembly pulley and insert the cable anchor pin in the pivot hole in the ratchet assembly.

3. If removed, install cable-to-frame attaching bolt.

4. Connect the front parking brake cable and conduit to the left rear parking brake rear cable and conduit.

5. For intermediate cable installation, feed cable through holes in center frame bracket.

6. Attach cable to front parking brake cable and conduit and to left rear parking brake rear cable and conduit.

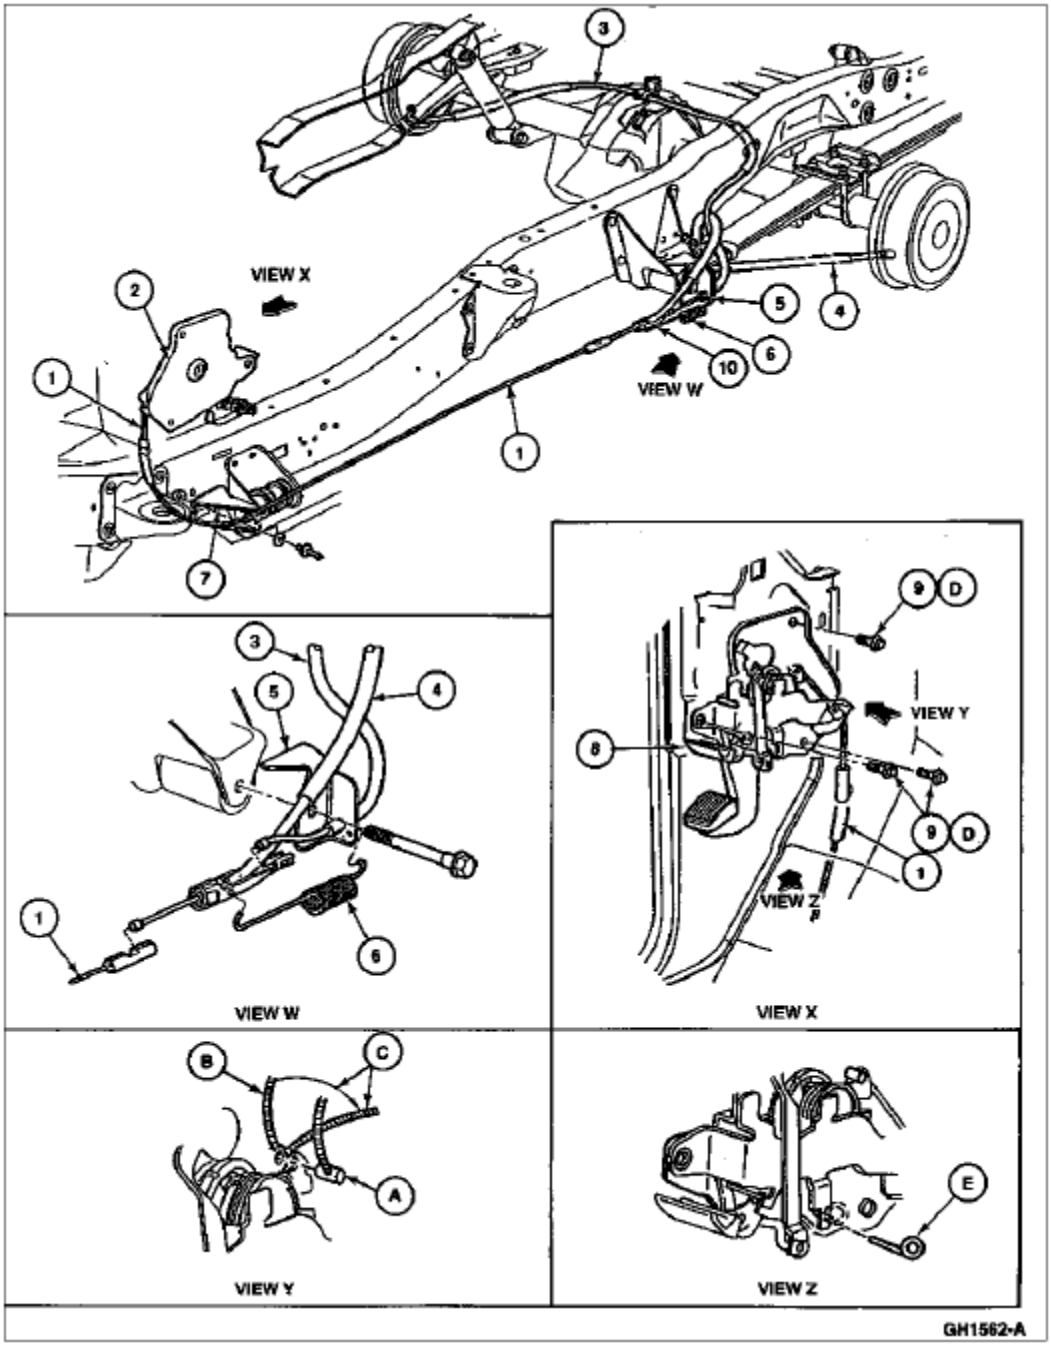
7. Carefully remove the lock pin (drill bit) from the parking brake control.

    a. The system will automatically tension itself when the pin is removed.

8. Apply and release the parking brake several times to verify correct operation. Also, verify proper operation of the parking brake warning indicator light.

Parking Brake System, Ranger

tomsn048@gmail.com



Item	Part Number	Description
1	2853	Front Parking Brake Cable and Conduit
2	2780	Parking Brake Control

E	—	4mm (5/32-Inch) Steel Pin or Equivalent Size Drill Bit

tomsn048@gmail.com

Cable and Conduit, Rear

Removal

1. While an assistant relieves tension on the system by pulling on the parking brake intermediate cable or front parking brake cable and conduit (2853), insert a 4mm (5/32-inch) steel pin or equivalent size drill bit into the hole provided in the parking brake control (2780).

2. Raise the vehicle and remove the hub cap, wheel and tire, and remove the brake drum (1126).

3. Disconnect the left parking brake rear cable and conduit (2A635) from the front parking brake cable and conduit (Ranger). For Aerostar, disconnect the left and right rear cables from the parking brake cable equalizer (2A602).

4. Using a 9/16-inch flare nut wrench, compress the prongs that retain the cable housing to the rear frame crossmember (5035) (Aerostar) and pull out the parking brake rear cable and conduit and housing.

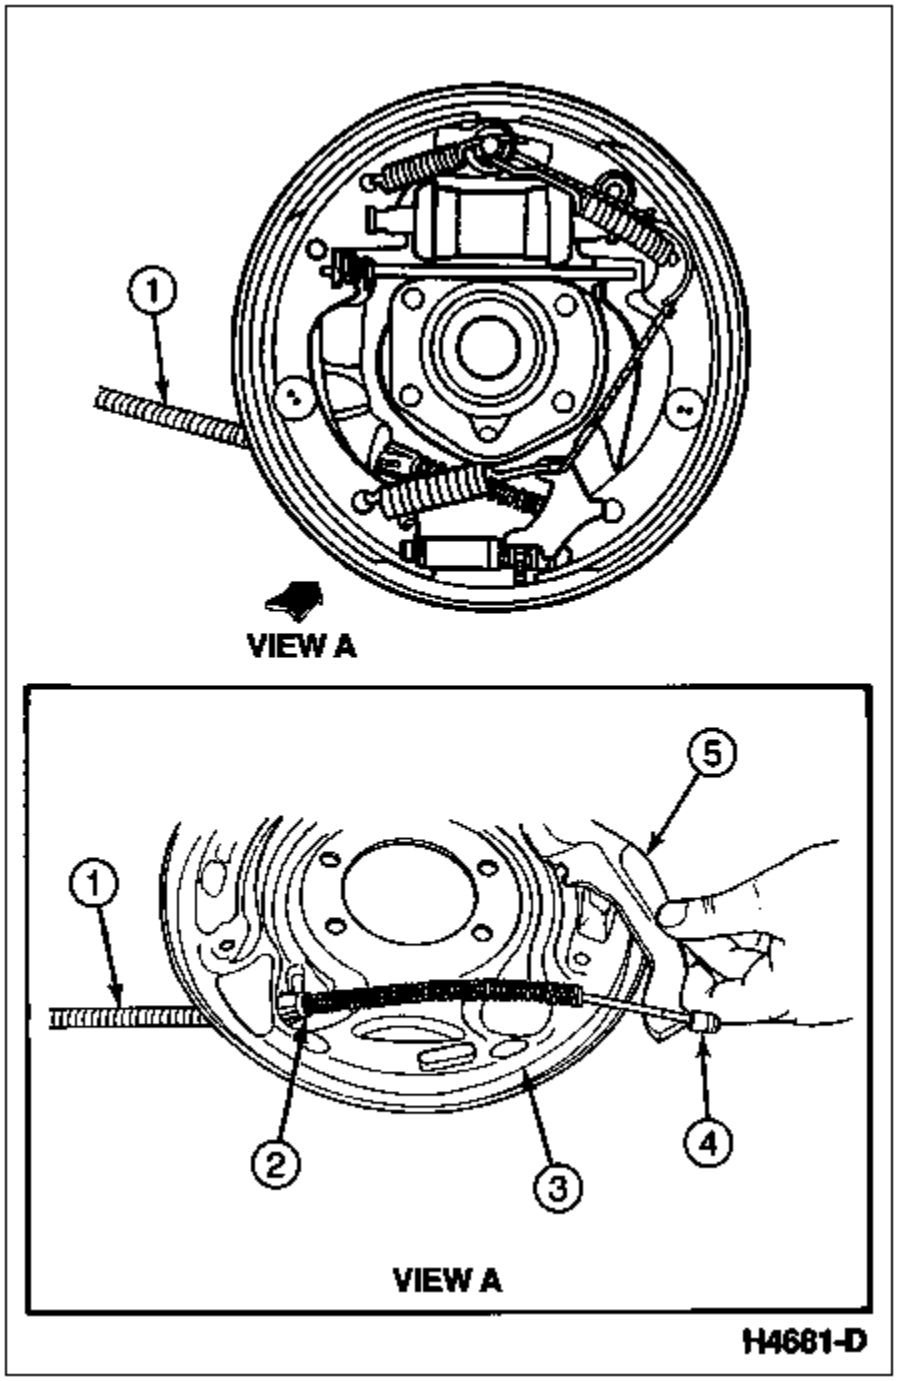
5. For Ranger, disconnect right parking brake rear cable and conduit from the parking brake cable equalizer and from the rear guide bracket.

6. At the wheel side of the brake backing plate (2211), compress the retainer fingers with a 9/16-inch flare nut wrench and remove the parking brake rear cable and conduit through the hole in the brake backing plate.

7. Lift the parking brake rear cable and conduit out of the slot in the parking brake lever (attached to the brake secondary shoe). Remove the parking brake rear cable and conduit through the backing plate hole.

Parking Brake Components

tomsn048@gmail.com

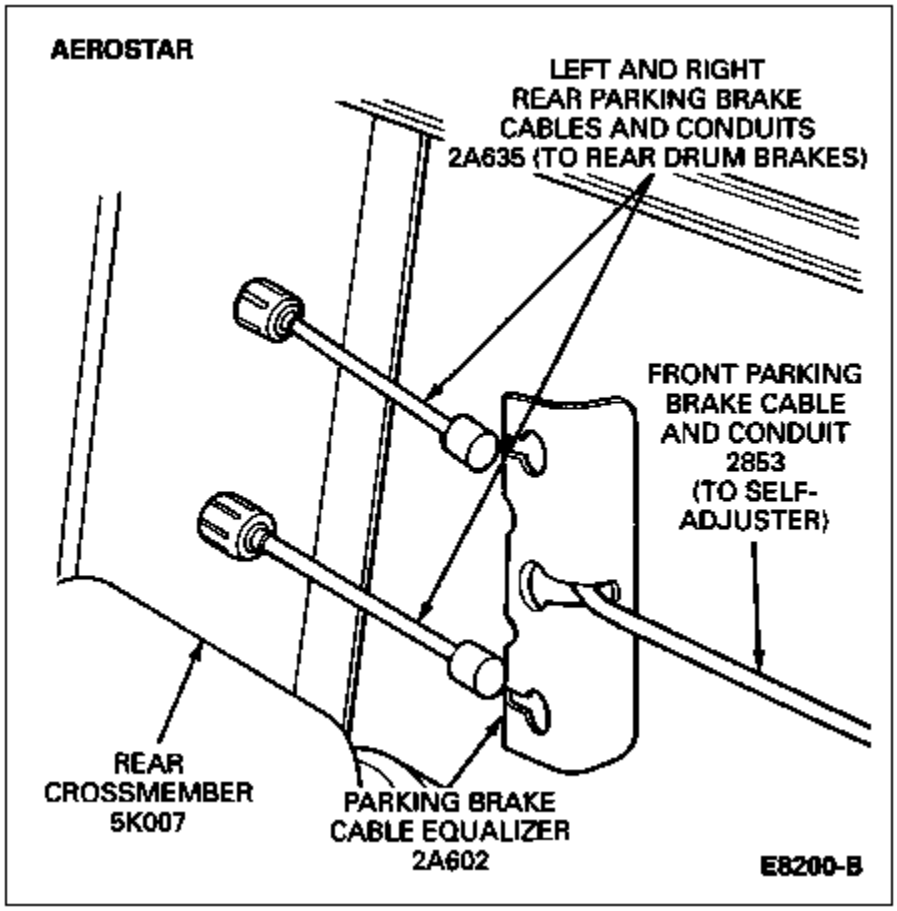


Item	Part Number	Description
1	2A635	Parking Brake Rear Cable and Conduit
2	—	Parking Brake Cable Retainer (Part of 2A635)
3	2211	Brake Backing Plate
4	—	Cable Anchor (Part of 2A635)
5	2A637	Parking Brake Lever

tomsn048@gmail.com

Installation

1. Route the parking brake rear cable and conduit through the hole in the brake backing plate.
2. Insert the cable anchor behind the slot in the parking brake lever. Make sure the parking brake rear cable and conduit is securely engaged in the parking brake lever so the rear parking brake cable retainer (2A709) is holding the parking brake rear cable and conduit in the parking brake lever.
3. Push the parking brake cable retainer clip (2A826) through the hole in the brake backing plate so the retainer fingers engage the brake backing plate.
4. Route the parking brake rear cable and conduit as shown in the illustrations.
5. Insert the front of the left and right parking brake rear cable and conduits through the rear frame crossmember until the prongs expand (Aerostar). For Ranger insert the front of the right parking brake rear cable and conduit into the rear guide bracket until the prongs expand.
6. For Aerostar, connect both right and left rear cables to the parking brake cable equalizer.



7. Connect the left rear parking brake cable to the front parking brake cable and conduit (Ranger).
8. Remove the lock pin from the parking brake control to apply cable tension.

tomsn048@gmail.com

9. Adjust rear brakes. Refer to Section 06-02 .
10. Install the brake drum, wheel, and hub cap.
11. Apply and release the parking brake control several times. Rotate both wheels to be sure that the parking brakes are not dragging.

---

tomsn048@gmail.com

Warning Indicator Switch, Aerostar

Removal

1. Remove the screws attaching the boot to the floor panel (remove the front screw first). Remove the boot.
2. Place the parking brake control (2780) in the released position and disconnect the wire from the parking brake warning indicator switch.
3. Remove the screw from the parking brake warning indicator switch and remove the parking brake warning indicator switch.

Installation

1. Position the parking brake warning indicator switch. Make sure the locator tab on the parking brake warning indicator switch is in the locator hole on the parking brake control. Tighten the screw to 1.4-2.3 Nm (12-20 lb-in).
2. Install the wire connector to the parking brake warning indicator switch and place the parking brake lever in the released position.
3. Install the boot over the lever and tighten the screws.

tomsn048@gmail.com

Warning Indicator Switch, Ranger

Removal

NOTE: The parking brake warning indicator switch is located on the parking brake pedal assembly.

1. From under the instrument panel, disconnect the wire from the parking brake warning indicator switch.

2. Remove the screw securing the parking brake warning indicator switch to the pedal assembly, and remove the switch.

Installation

1. Position the parking brake warning indicator switch carefully, making sure that locator tab on switch is in locator hole on parking brake control (2780). Tighten the retaining screw to 1.4-2.3 Nm (12-20 Lb-In).

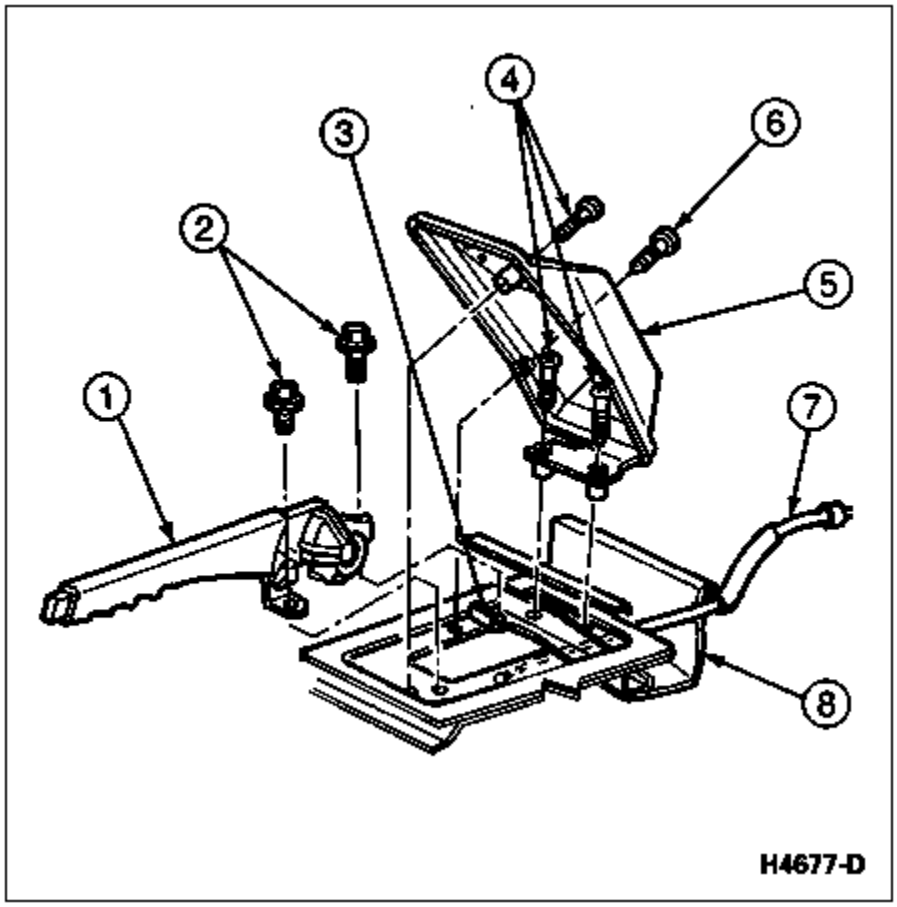
2. Connect the wire to the parking brake warning indicator switch and test for parking brake warning indicator operation.

tomsn048@gmail.com

Cable Tension

If any component in the parking brake system requires servicing, the cable tension must be released. After servicing is completed, the front parking brake cable and conduits (2853) and parking brake rear cable and conduits (2A635) are connected to the parking brake cable bracket (2530) and tension is reset. Refer to the following procedures for releasing and resetting cable tension.

Aerostar

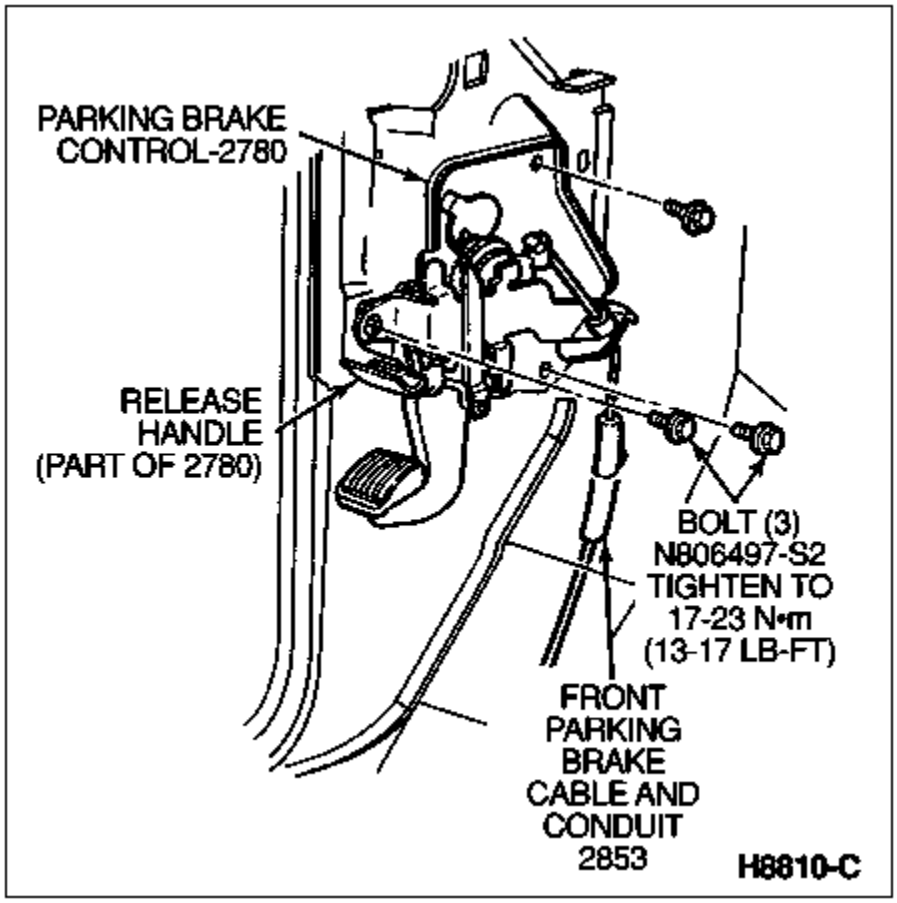


Item	Part Number	Description
1	2780	Parking Brake Control
2	N602549-S51M	Bolt (2 Req'd)
3	2A707	Support
4	N610131-S2	Screw
5	2A713	Parking Brake Lever Boot
6	388695-S2	Screw
7	2853	Front Parking Brake Cable and Conduit

tomsn048@gmail.com

8	5035	Rear Frame Crossmember

Ranger



tomsn048@gmail.com

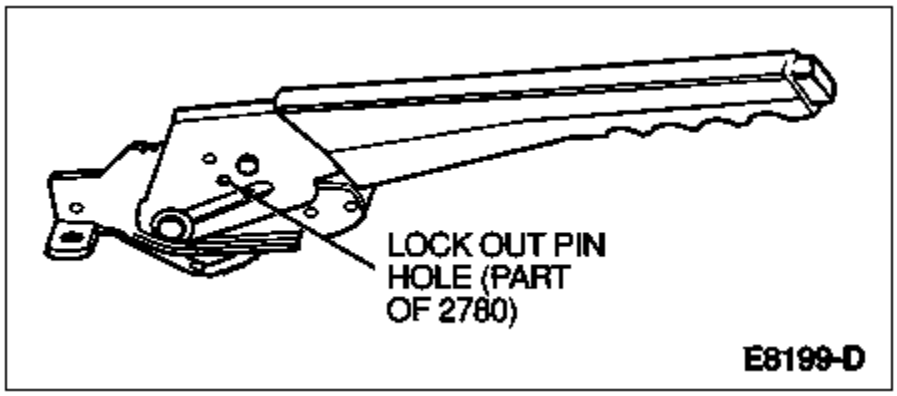
tomsn048@gmail.com

Cable Tension, Release

Release the parking brake cable tension as follows:

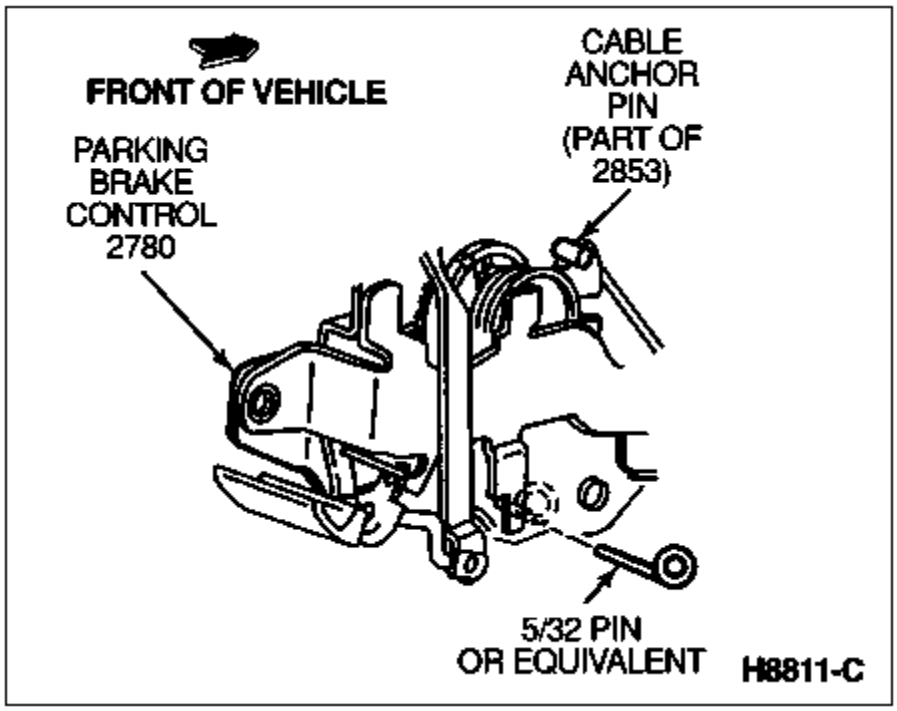
1. Place the parking brake control (2780) in the "released" position.
2. While an assistant relieves tension on the system by pulling on the parking brake intermediate cable, insert a 4mm (5/32-inch) steel pin or equivalent drill bit into the hole provided in the parking brake control.
3. On the Aerostar, insert a steel pin through the pawl lock out pin hole. The pin must be inserted from the inboard side of the parking brake control (larger hole) at a slightly upward and forward angle, then swept downward and rearward to displace the self-adjusting pawl. This locks out the self-adjusting pawl.

Aerostar



Ranger

tomsn048@gmail.com



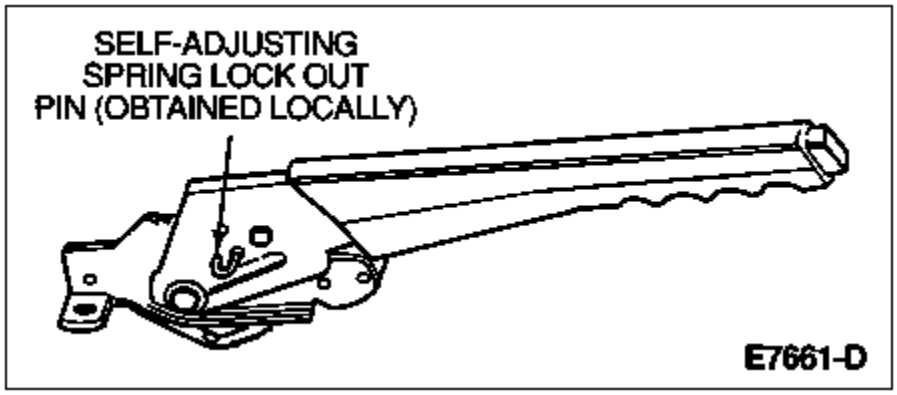
NOTE: Be careful not to damage the plastic coating on the cable strand. Remove the parking brake rear cable and conduits (2A635) from the parking brake cable bracket (2530).

4. Another method, which releases tension on the parking brake rear cable and conduits only, is to pull rearward on the parking brake rear cable and conduit about 25-50mm (1.0-2.0 inches) and place a clamp on the parking brake rear cable and conduit behind the rear frame crossmember (5035).

5. To reapply tension, connect all cables and remove the clamping device.

6. Another method which can be used on Aerostar vehicles is to remove the bolts attaching the parking brake control to the floor pan, and pull the parking brake control upward and forward to rotate the spring-loaded ratchet wheel as far as possible.

Aerostar



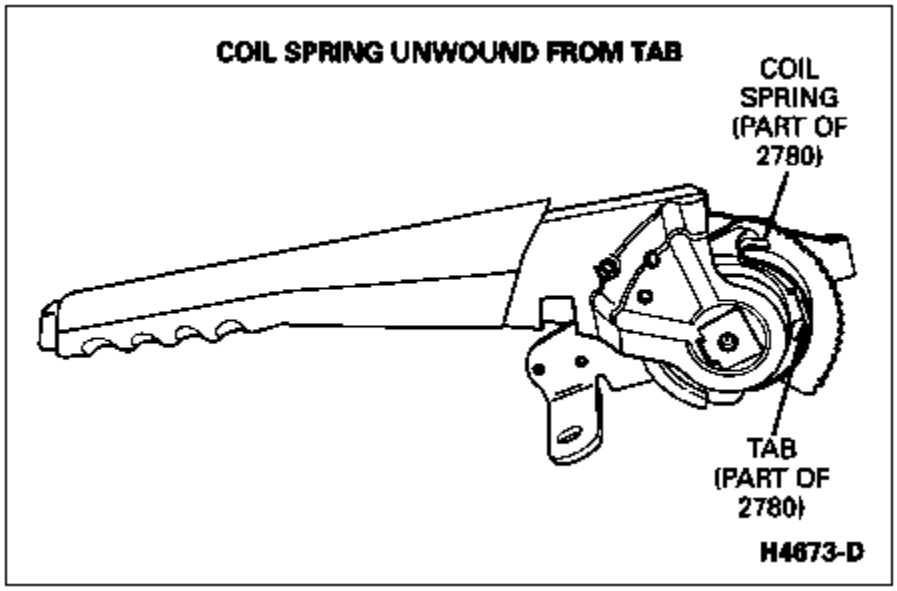
tomsn048@gmail.com

tomsn048@gmail.com

Cable Tension, Resetting

NOTE: Parking brake control spring tension is lost when the coil spring unwinds and disengages from the tab on the wheel. This can occur when the cables break, when servicing the system without inserting the lock pin or when the lock pin is removed before the cables are connected. DO NOT SERVICE THE PARKING BRAKE SYSTEM WITHOUT INSERTING THE LOCK PIN IN THE CONTROL ASSEMBLY. DO NOT REMOVE THE LOCK PIN FROM THE CONTROL WITH THE CABLES DISCONNECTED.

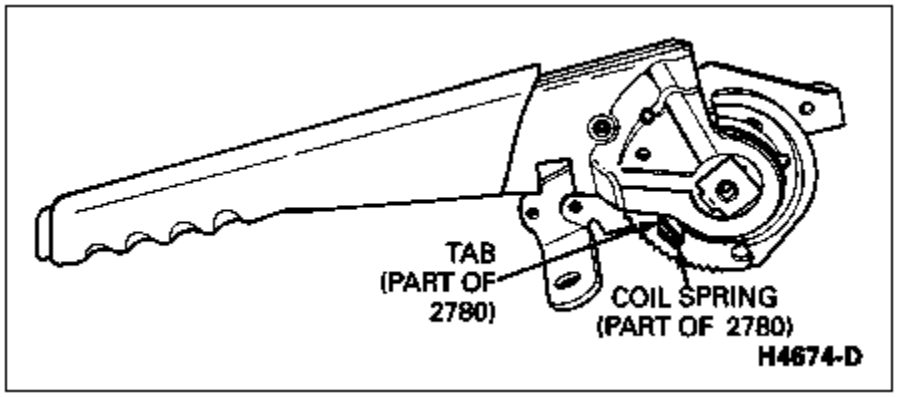
Aerostar



1. Remove the parking brake control as described in Removal and Installation, Control, Aerostar or Ranger in this section.
2. Engage the coil spring on the tab on the wheel in the parking brake control.

Aerostar

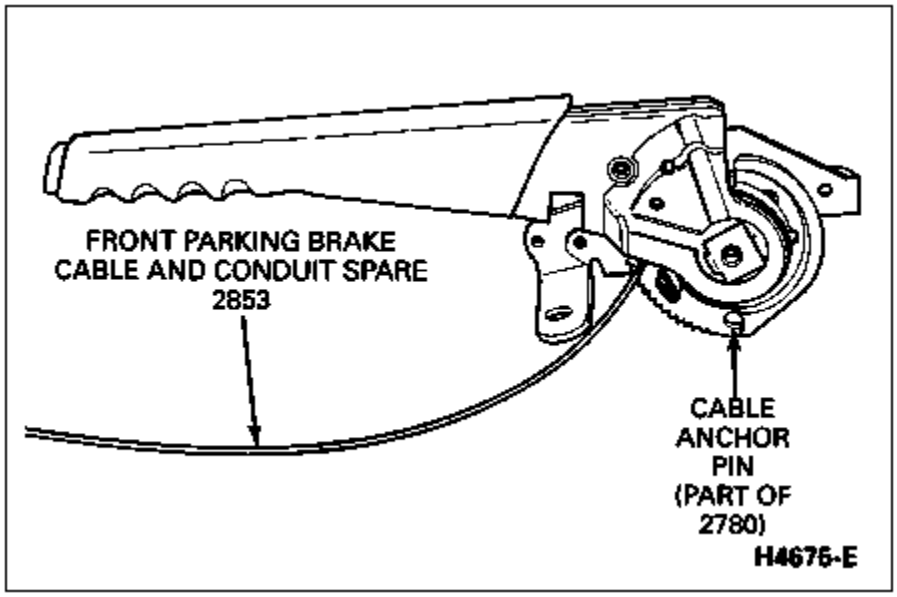
tomsn048@gmail.com



3. Place the control handle in the released position to unlock the self-adjusting pawl.

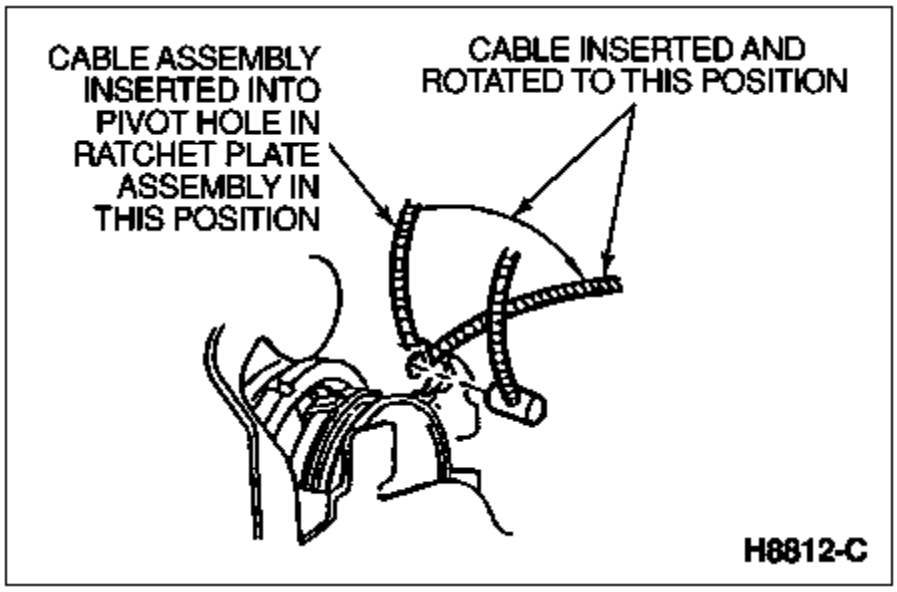
4. Slip a spare front parking brake cable and conduit (2853) around the pulley and insert the cable anchor pin into the pivot hole in the ratchet plate assembly.

Aerostar



Ranger

tomsn048@gmail.com



5. With the front parking brake cable and conduit on the floor, step on the front parking brake cable and conduit or clamp the end of the front parking brake cable and conduit in a vise.

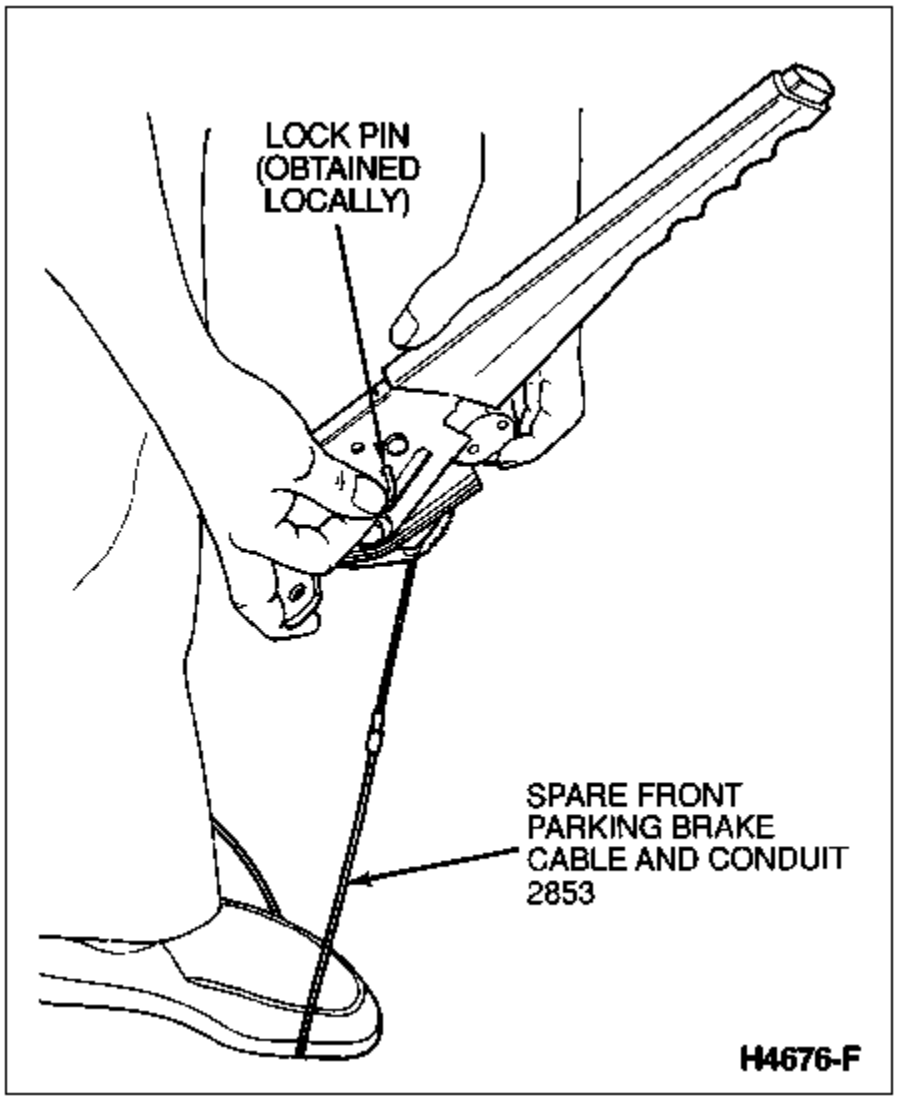
6. Pull on the assembly, holding the mounting bracket tightly against the body of the control, until cable tension rotates the cable track assembly so the lock pin can be fully seated through the plate.

7. Insert the lock pin so the assembly is in the "cable released" position.

8. Install the parking brake control. Refer to the Removal and Installation, Control, Aerostar or Ranger procedure in this section.

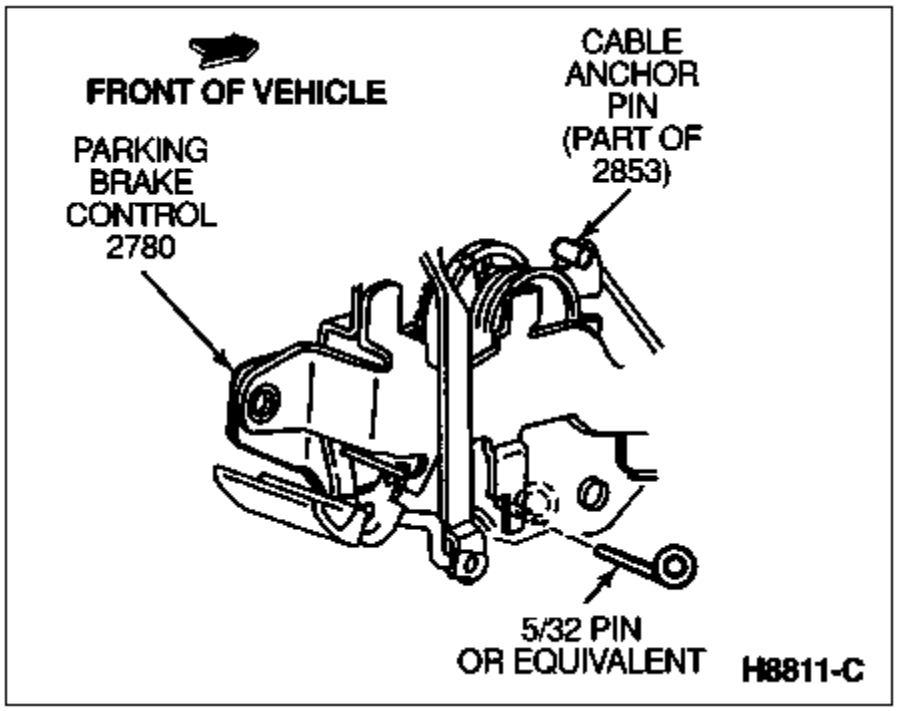
Aerostar

tomsn048@gmail.com



Ranger

tomsn048@gmail.com



tomsn048@gmail.com

Brake Fluid Level Check

Check the brake fluid level in the brake master cylinder reservoir and if necessary, fill to the MAX FILL line with High Performance DOT 3 Brake Fluid C6AZ-19542-AB or DOT 3 equivalent fluid meeting Ford specification ESA-M6C25-A, DOT 3.

tomsn048@gmail.com

Brake Pedal and Bracket

Automatic Transmission

Removal

1. **NOTE: Locking tab must be lifted before connector can be removed.**

   Disconnect wiring harness from the stoplight switch (13480) at the connector.

2. Remove the hairpin clip, slide the stoplight switch, push rod, brake master cylinder push rod spacer (2B129) and brake master cylinder push rod bushing (2474) away from the brake pedal (2455).

3. Remove the brake master cylinder push rod bushing and the stoplight switch from the brake pedal push rod by sliding switch up or down.

4. Remove one of the retainers holding the brake pedal shaft in the bracket.

5. Slide the brake pedal shaft out of the bracket and remove the brake pedal, inner brake master cylinder push rod bushings and spring washer.

6. Remove the outer brake master cylinder push rod bushings from the bracket.

Installation

1. Inspect the brake master cylinder push rod bushings for signs of wear or damage and replace if required. Relubricate the brake master cylinder push rod bushings with a light coating of Motorcraft SAE 30 X0-30-QSD or -DSD or -BSD or equivalent meeting Ford specification ESE-M2C153-E.

2. Insert the two outer brake master cylinder push rod bushings in the bracket. Place the brake pedal, inner brake master cylinder push rod bushings and spring washer in position inside the bracket.

3. Insert the brake pedal shaft through the bracket and brake pedal.

4. Install the retainer on the end of the brake pedal shaft.

5. **CAUTION: On Aerostar, make sure push rod orientation is correct. See illustration for correct orientation.**

   Position stoplight switch so the U-shaped side is nearest the brake pedal and directly over/under the pin. Then slide stoplight switch up/down trapping the brake pedal push rod and bushing between the switch side plates.

6. Push stoplight switch and brake pedal push rod assembly firmly toward brake pedal pin.

7. **CAUTION: When assembling, do not substitute other types of pin clips. Use only factory**

tomsn048@gmail.com

supplied hairpin clips.

Assemble outside white plastic brake master cylinder push rod spacer to pin and install hairpin clip to hold entire assembly.

8. **CAUTION: The stoplight switch wire harness must have sufficient length to travel with the stoplight switch during full stroke of brake pedal. If wire length is too short, reroute or repair harness as required.**

   Assemble the connector to the stoplight switch.

9. Check stoplight switch for proper operation.

Manual Transmission

Removal

1. Disconnect the wires to the stoplight switch located below instrument panel.
2. Remove the hairpin clip, slide the stoplight switch, the brake pedal push rod, the nylon brake master cylinder push rod spacer and brake master cylinder push rod bushing away from the brake pedal pin.
3. Remove the brake master cylinder push rod bushing and then the stoplight switch from the brake pedal push rod by sliding stoplight switch up or down.
4. Disconnect the clutch master cylinder push rod from the clutch pedal (7519).
5. Disconnect the clutch pedal position switch (CPP) (11A152) from the clutch master cylinder push rod.
6. Remove the retainer from the clutch pedal shaft.
7. Remove the clutch pedal and clutch pedal shaft from the brake and clutch bracket.
8. Remove the brake pedal.
9. Remove the spring washer and inner brake master cylinder push rod bushings from the brake pedal.
10. Remove the outer brake master cylinder push rod bushings from the brake and clutch pedal bracket.

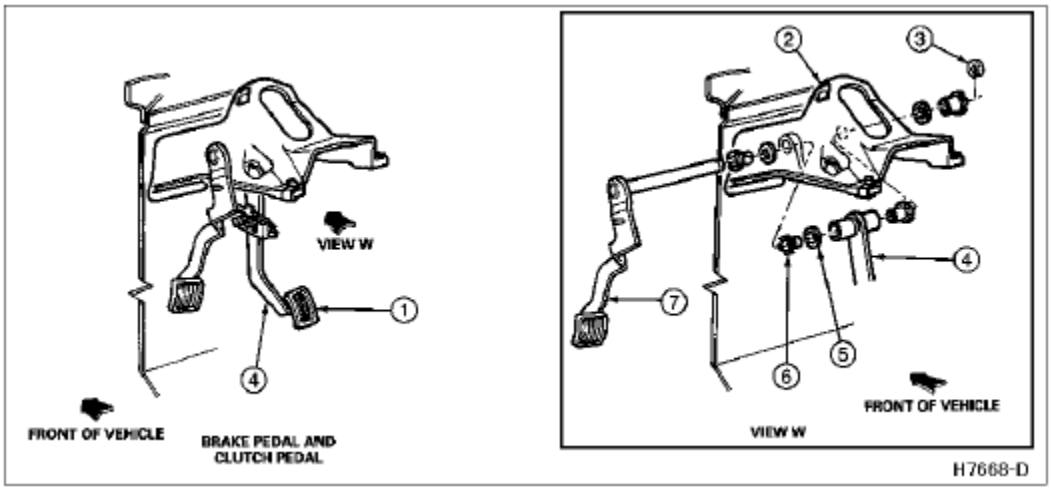
Installation

1. Inspect the brake master cylinder push rod bushings for signs of wear or damage; replace if required. Relubricate the brake master cylinder push rod bushings with a light coating of SAE 30 XO-30-QSD or -DSD, -BSD or equivalent meeting Ford specification ESE-M2C153-E.
2. Insert the two outer brake master cylinder push rod bushings in the brake and clutch pedal bracket.

tomsn048@gmail.com

3. Place the brake pedal, inner brake master cylinder push rod bushings and spring washer in position inside the brake and clutch pedal bracket.
4. Insert the clutch pedal and clutch pedal shaft through the bracket and brake pedal sleeve.
5. Install the retainer on the end of the clutch pedal shaft.
6. Connect the clutch pedal position switch on the clutch master cylinder push rod.
7. Connect the clutch master cylinder push rod to the clutch pedal.
8. Install the stoplight switch on the brake pedal.
9. Connect the brake pedal push rod and stoplight switch to the pin on the brake pedal.
10. Install the brake master cylinder push rod spacer and spring retainer attaching the stoplight switch and brake pedal push rod to the brake pedal.
11. Connect the wires to the stoplight switch.
12. Adjust the clip on the clutch pedal position switch.
13. Check system for correct operation.

Brake Pedal and Clutch Pedal Installation, Ranger Manual Transmission



Item	Part Number	Description
1	2457	Brake Pedal Pad
2	2L252	Brake and Clutch Pedal Bracket
3	97414-S	Retainer
4	2455	Brake Pedal
5	353574-S7M	Washer

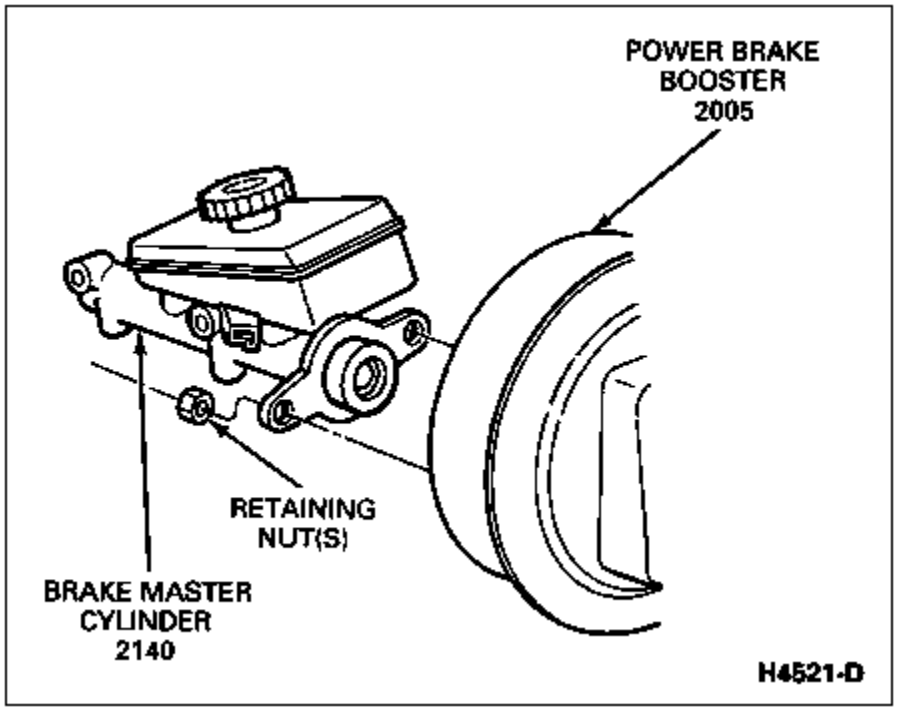
7	7519	Clutch Pedal

tomsn048@gmail.com

Brake Master Cylinder, Ranger

Removal

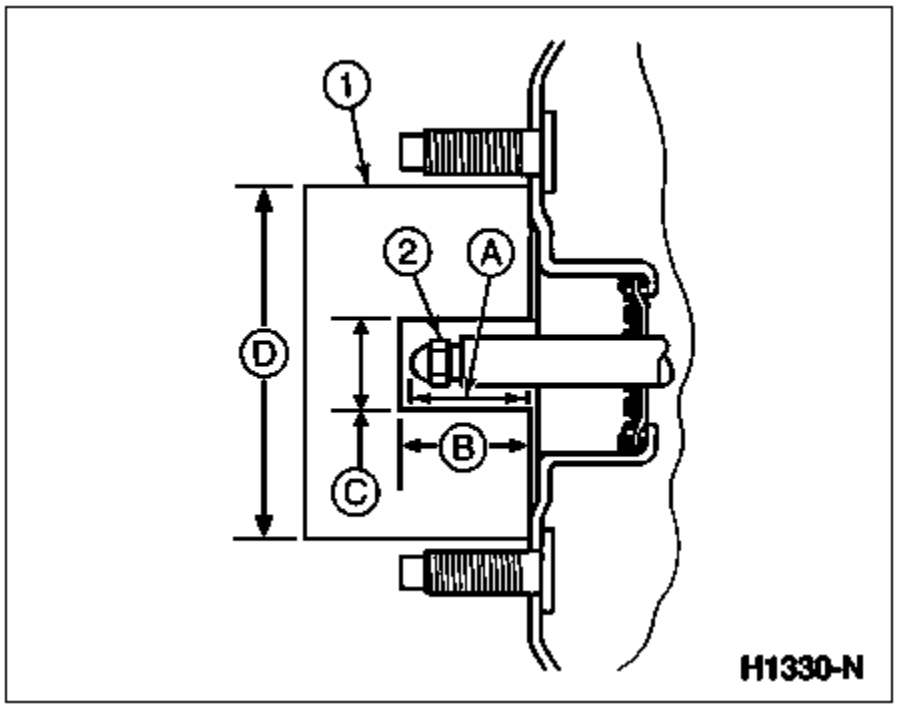
1. Disconnect the brake warning lamp indicator wire from the plastic reservoir low fluid level warning switch socket.
2. With the engine (6007) turned off, push the brake pedal (2455) down to expel vacuum from the power brake booster.
3. Disconnect the front brake tube (2264) and rear brake tube from the brake master cylinder (2140).
4. Remove the wraparound clip and attaching nut from the booster master cylinder mounting stud.
5. Remove the brake booster-to-master cylinder retaining nuts. Remove the brake master cylinder from the power brake booster.



Installation

NOTE: Before installing the brake master cylinder, check the distance from the outer end of the booster assembly push rod to the front face of the power brake booster. Turn the push rod adjustment screw in or out as required to obtain a length of 24.89-25.27mm (0.980-0.995 inch). Fabricate a gauge block using dimensions shown in the following illustration.

tomsn048@gmail.com



Item	Part Number	Description
1	—	Shop Fabricated Gauge
2	—	Adjustment Screw (Part of 2005)
A	—	24.89-25.27mm (0.980-0.995 Inch)
B	—	25.27mm (0.995 Inch)
C	—	19.05mm (0.75 Inch)
D	—	74.61mm (2.94 Inch)

1. Position the brake master cylinder over the booster push rod and onto the two studs on the power brake booster. Install the attaching nuts and tighten to 18-33 Nm (14-24 lb-ft).
2. Loosely connect the front brake tube and the rear brake tube to the brake master cylinder.
3. Position the wrap-around clip on the mounting stud. Install and tighten the attaching nut.
4. Tighten the tube nuts to 15-20 Nm (11-14 lb-ft).
5. Connect fluid level indicator switch.
6. Bleed the brake master cylinder as described in this section. Then fill the brake master cylinder reservoir (2K478) of the brake master cylinder with High Performance DOT 3 Brake Fluid C6AZ-19542-AB or DOT 3 equivalent meeting Ford specification ESA-M6C25-A, DOT 3 to the fluid fill line.

tomsn048@gmail.com

7. Install the gasket and brake master cylinder filler cap.

---

tomsn048@gmail.com

Brake Master Cylinder, Aerostar

Removal

NOTE: Care should be taken when removing the brake master cylinder (2140) to not scratch the exposed primary piston.

1. Disconnect wiring harness from low fluid level warning switch in the brake master cylinder reservoir (2K478).
2. Disconnect low fluid warning switch from brake master cylinder.
3. Disconnect brake pressure differential valve warning lamp switch (2B264) from combination valve.
4. Disconnect front and rear brake tubes from brake master cylinder.
5. Remove the two nuts that attach the brake master cylinder and master cylinder and booster bracket holder (2A248) to the power brake booster.
6. **CAUTION: Never reuse any brake fluid removed from the brake system during any repair operation. Always discard old brake fluid and replenish system with fresh brake fluid.**

   Discard fluid from brake master cylinder by turning over brake master cylinder and allowing fluid to pour through the filler opening of the brake master cylinder reservoir.

Installation

NOTE: DO NOT assemble brake master cylinder to power brake booster without square section interface seal.

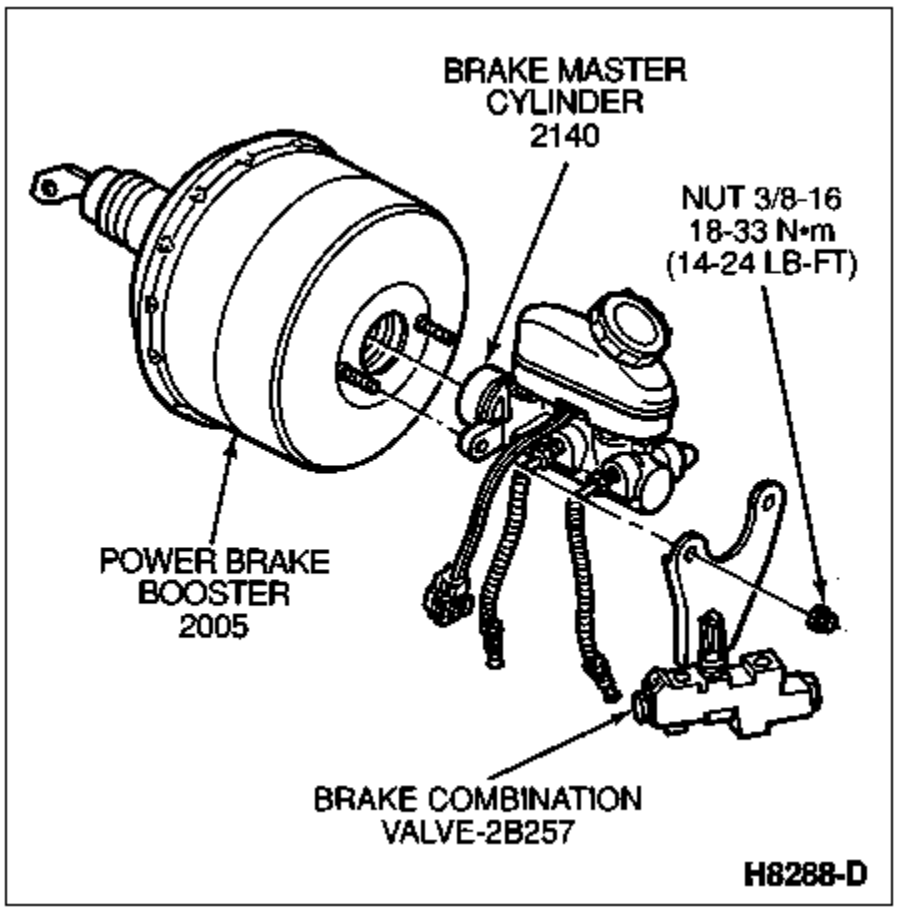
1. Make sure the interface seal is located in the annular groove in the brake master cylinder body where the brake master cylinder seals with the booster.
2. Install brake master cylinder to power brake booster.
3. Install combination valve bracket.
4. **NOTE: Use care to prevent scratching or other damage to exposed primary piston during handling.**

   Engage the primary piston socket to booster push rod before tightening. Tighten retaining nuts to 18-33 Nm (14-24 lb-ft).
5. Connect wiring harness to low fluid level warning switch. Connect differential pressure switch harness.
6. Attach front and rear brake tubes to brake master cylinder. Tighten tube fittings to 15-20 Nm (11-14

tomsn048@gmail.com

lb-ft).

7. Fill unit High Performance DOT 3 Brake Fluid C6AZ-19542-AB or DOT 3 equivalent meeting Ford specification ESA-M6C25-A, DOT 3 and bleed entire brake system to remove all entrapped air. Refer to Service Procedures, Hydraulic System Bleeding in this section.



tomsn048@gmail.com

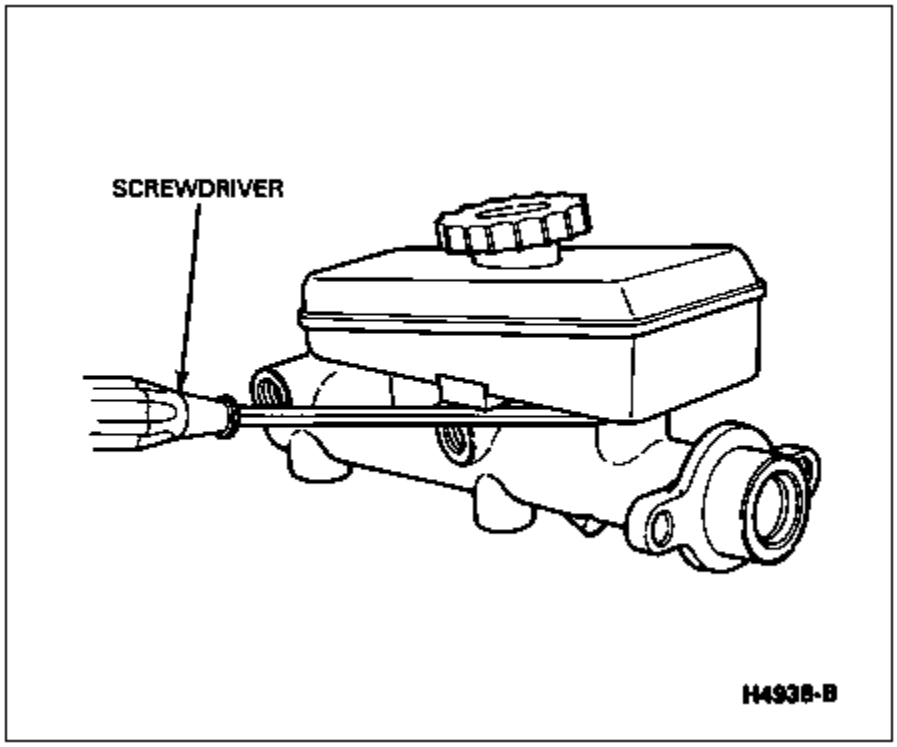
tomsn048@gmail.com

Brake Master Cylinder Reservoir, Ranger

Removal

1. Disconnect the brake warning lamp indicator wire from the plastic reservoir fluid level indicator socket. Drain the brake fluid from the brake master cylinder reservoir (2K478).

2. Using a large screwdriver, pry between the brake master cylinder reservoir and the brake master cylinder (2140) and remove the brake master cylinder reservoir.



Installation

1. **WARNING: WHENEVER THE BRAKE MASTER CYLINDER IS REPLACED, THE BRAKE TUBE GROMMETS MUST ALSO BE REPLACED OR LEAKAGE MAY OCCUR CAUSING BRAKE SYSTEM FAILURE.**

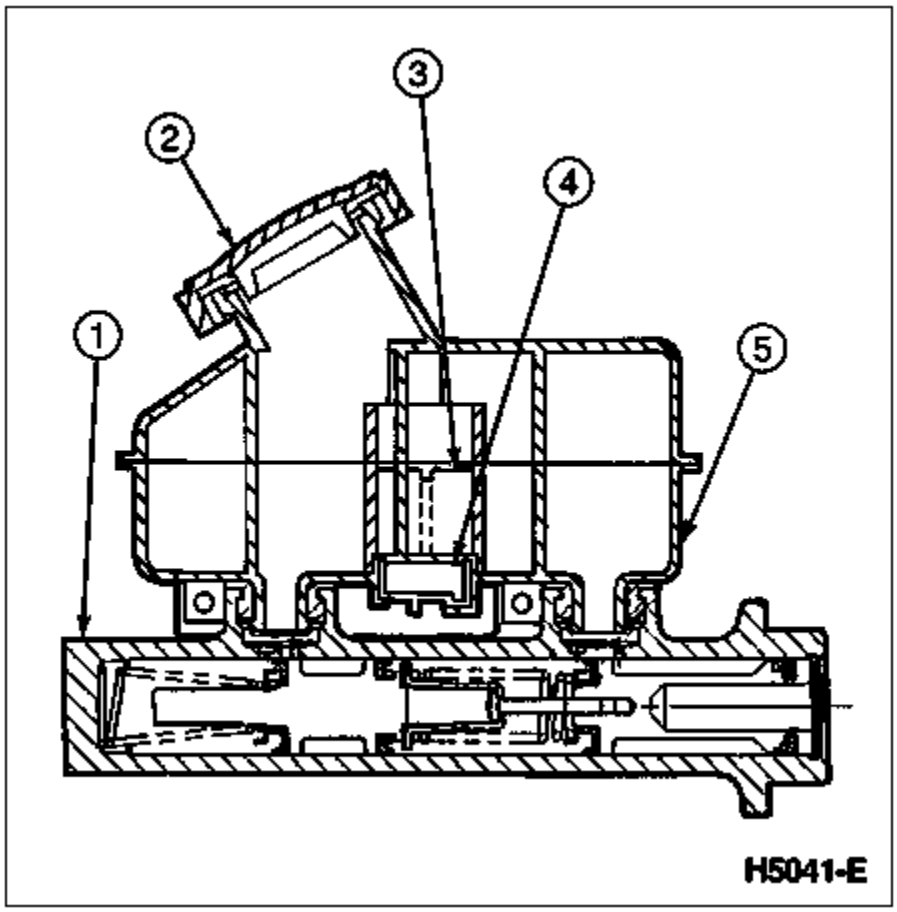
   Lubricate the two brake tube grommets included in Service Kit 2K478 with High Performance DOT 3 Brake Fluid C6AZ-19542-AB or DOT 3 equivalent meeting Ford specification ESA-M6C25-A, DOT 3. Insert the brake tube grommets into the brake master cylinder.

2. Press the brake master cylinder reservoir into the brake tube grommets with the fluid level indicator socket facing inboard. The brake master cylinder reservoir should snap in place indicating that it is secure.

tomsn048@gmail.com

3. Connect the brake warning lamp indicator wire to the fluid level indicator socket.

4. Fill the brake master cylinder reservoir with High Performance DOT 3 Brake Fluid C6AZ-19542-AB or DOT 3 equivalent meeting Ford specification ESA-M6C25-A, DOT 3.



Item	Part Number	Description
1	2140	Brake Master Cylinder
2	2162	Brake Master Cylinder Filler Cap
3	—	Float (Part of 2K478)
4	—	Fluid Level Indicator Switch (Part of 2K478)
5	2K478	Brake Master Cylinder Reservoir

tomsn048@gmail.com

tomsn048@gmail.com

Brake Master Cylinder Reservoir, Aerostar

Removal

1. Disconnect wiring harness from fluid level warning switch.
2. Disconnect wiring harness from differential pressure switch at combination valve.
3. Remove brake master cylinder filler cap (2162). Place shop rags under brake master cylinder (2140). Dip or siphon as much fluid out of the brake master cylinder reservoir (2K478) as possible.
4. Using a 5mm (.19-inch) punch and a light hammer, drive out retainer pins that hold brake master cylinder reservoir to brake master cylinder.
5. Using a large screwdriver, pry between the brake master cylinder reservoir and brake master cylinder and remove brake master cylinder reservoir from brake master cylinder.
6. Remove brake tube grommets if they didn't come off with the brake master cylinder reservoir. Discard brake tube grommets.

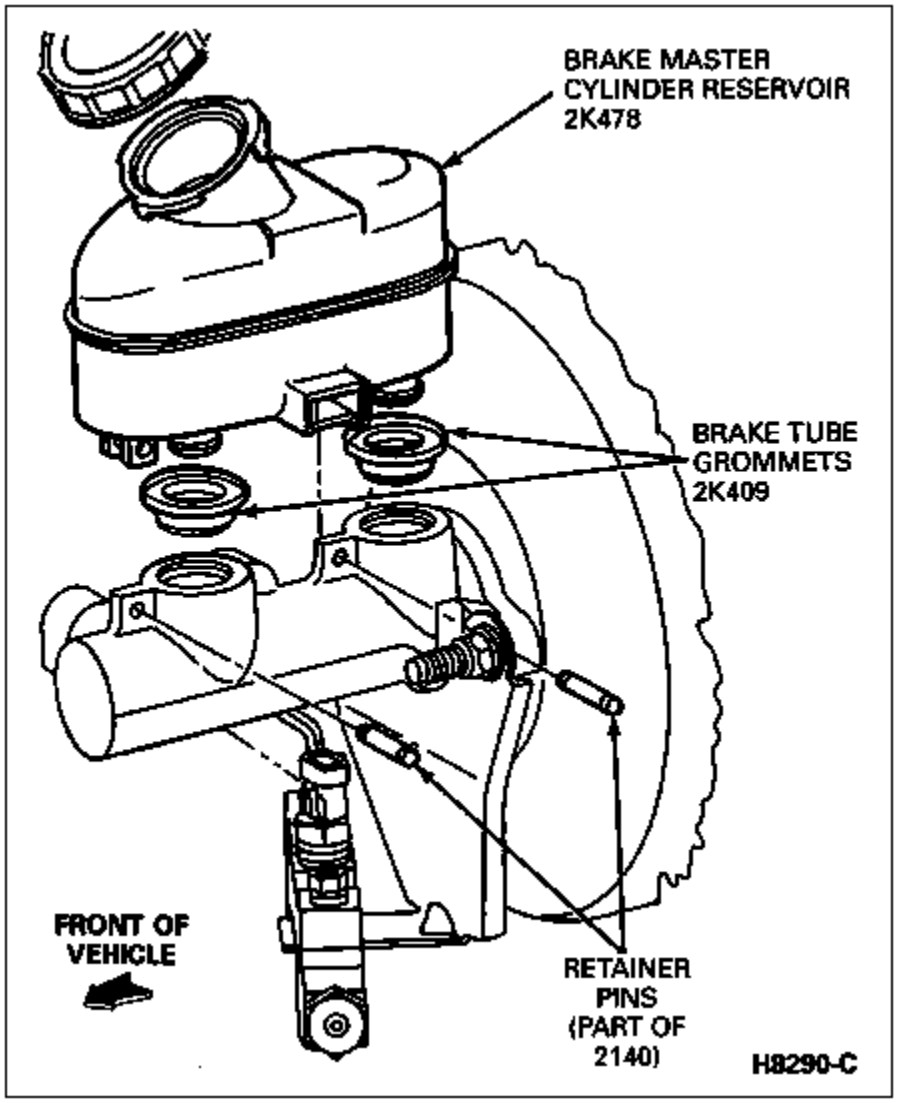
Installation

1. **CAUTION: Whenever the brake master cylinder reservoir is replaced, the brake tube grommets must be replaced.**

   Lubricate the two brake tube grommets included in service kit 2K478 with High Performance DOT 3 Brake Fluid C6AZ-19542-AB or DOT 3 equivalent meeting Ford specification ESA-M6C25-A, DOT 3. Insert brake tube grommets into the brake master cylinder.
2. Press the brake master cylinder reservoir into the brake tube grommets with the fluid level warning switch socket facing outboard (toward the driver's side of the vehicle). Snap brake master cylinder reservoir into place.
3. Using a 5mm (.19-inch) punch and a hammer, insert the reservoir retainer pins.
4. Connect the wiring harness for the fluid level warning switch.
5. **CAUTION: Never reuse any brake fluid removed from the brake system during any repair operation. Always discard old brake fluid and replenish system with fresh brake fluid.**

   Connect wiring harness for differential pressure switch at the brake combination valve.
6. Fill brake master cylinder reservoir to the MAX fill line with High Performance DOT 3 Brake Fluid C6AZ-19542-AB or DOT 3 equivalent meeting Ford specification ESA-M6C25-A, DOT 3.
7. Reinstall brake master cylinder filler cap. Check brake operation and system for leaks before road testing vehicle.

tomsn048@gmail.com



tomsn048@gmail.com

tomsn048@gmail.com

Caliper Hose

Removal

1. Raise and support the vehicle.
2. At the frame mounting point of the LH front brake hose (2078), disconnect the two front brake tube fittings.
3. At the frame mounting point, remove the front brake hose mounting clip.
4. At the front disc brake caliper (2B121), remove the front disc brake caliper flow bolt. Discard the copper washers.
5. Remove the front brake hose bolt securing the front brake hose to the front disc brake caliper.
6. Remove the front brake hose from the vehicle.

Installation

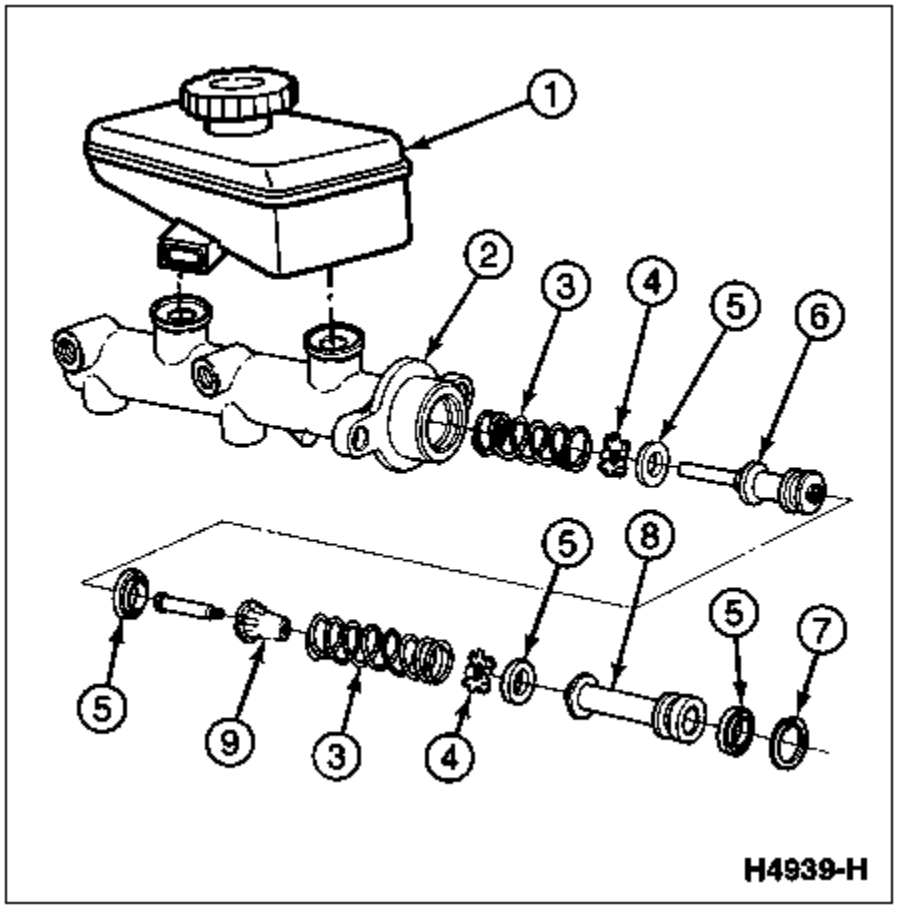
To install, reverse the removal procedure. Use new copper washers and tighten the front disc brake caliper flow bolt to 29.7-40.3 Nm (22-29 lb-ft). Tighten the front brake hose bolt to 3.4-4.5 Nm (30-39 lb-in). Tighten the two front brake tube fittings to 15-20 Nm (11-14 lb-ft).

tomsn048@gmail.com

Brake Master Cylinder

Remove the brake master cylinder (2140) from the vehicle. Refer to Removal and Installation, Brake Master Cylinder in this section.

Ranger Shown, Aerostar Similar



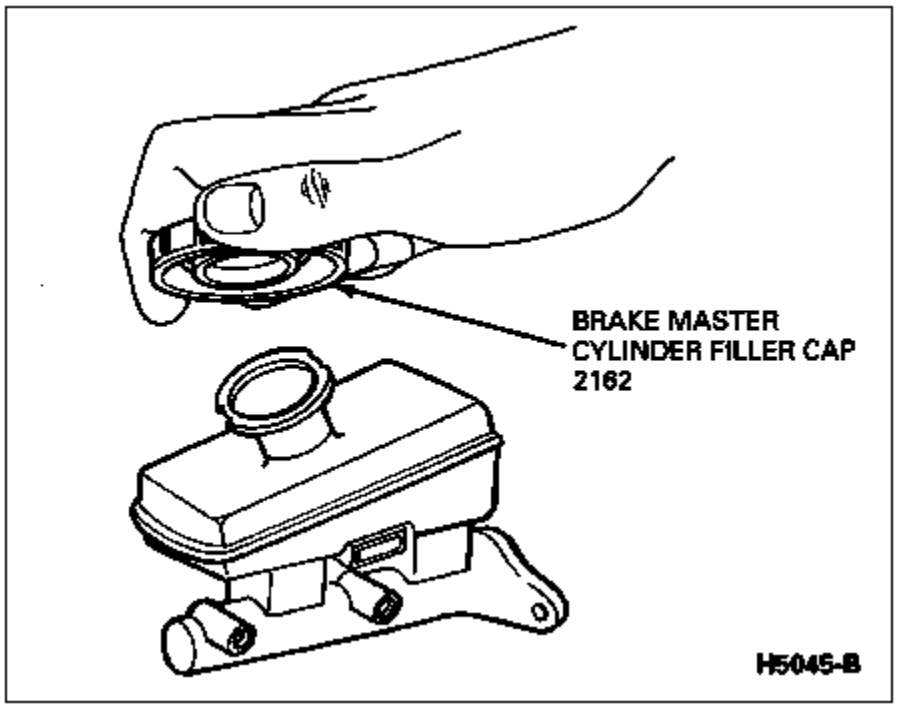
Item	Part Number	Description
1	2K478	Brake Master Cylinder Reservoir
2	2140	Brake Master Cylinder
3	—	Spring (Part of 2140)
4	—	Spring Seat (Part of 2140)
5	—	Piston Cup (Part of 2140)
6	—	Secondary Piston (Part of 2140)
7	—	Snap Ring (Part of 2140)

tomsn048@gmail.com

8	—	Primary Piston (Part of 2140)
9	—	Spring Retainer (Part of 2140)

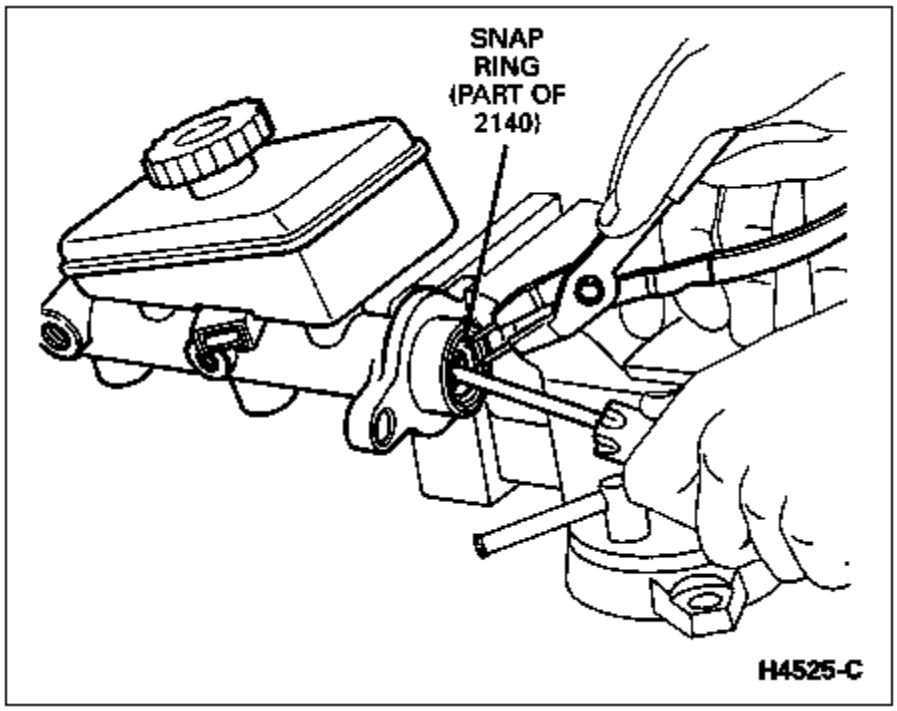
Disassembly

1. Clean the outside of the brake master cylinder and remove the brake master cylinder filler cap and diaphragm. Drain and discard any brake fluid that remains in the brake master cylinder.



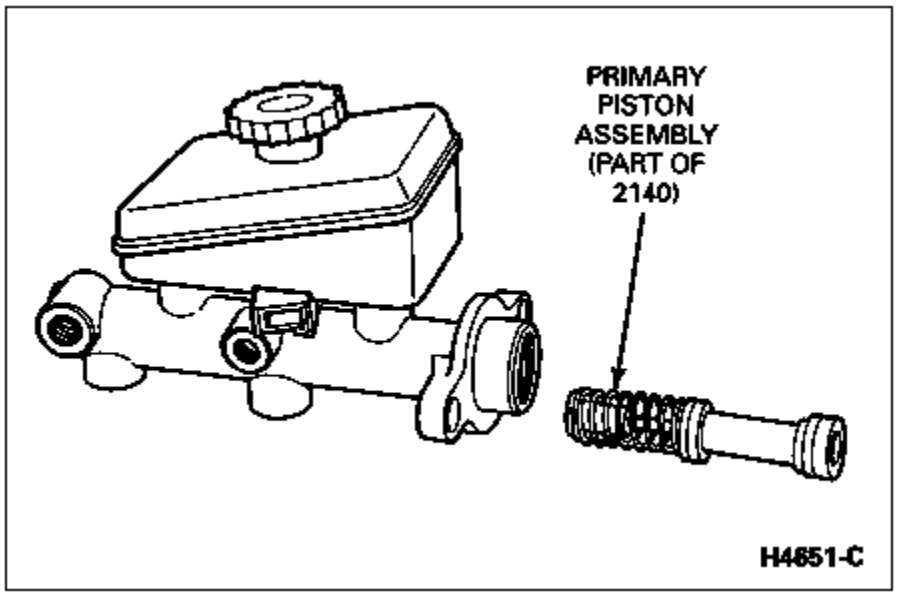
2. Depress the primary piston and remove snap ring from retaining groove at the rear of the master cylinder bore.

tomsn048@gmail.com



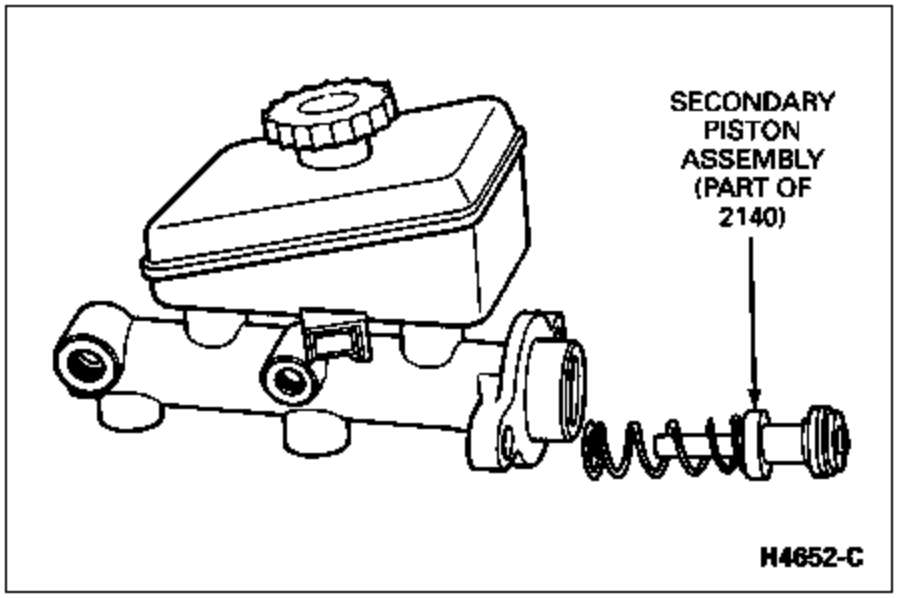
3. On Ranger, remove primary piston assembly from the master cylinder bore. Inspect for seal damage or twisting. Discard assembly.

   On Aerostar, remove the rear washer, seal and guide, along with the primary piston assembly from the bore.



4. Remove the secondary piston assembly by directing compressed air into the outlet port at the blind end of the bore while plugging the other port. Inspect for seal damage or twisting. Discard assembly.

tomsn048@gmail.com



5. **WARNING: DO NOT ATTEMPT TO HONE A MASTER CYLINDER BORE IF DAMAGE IS FOUND. IF BORE IS FOUND TO BE IN GOOD CONDITION, CHECK WITH YOUR FORD DEALER FOR AVAILABILITY OF SERVICE REPAIR KITS. IF NONE ARE AVAILABLE, BRAKE MASTER CYLINDER MUST BE REPLACED.**

   Inspect the master cylinder bore for signs of etching, pitting, scoring or other damage.

Assembly

1. Clean the master cylinder body with clean isopropyl alcohol to remove any contamination.
2. Dip the repair kit piston assemblies in clean brake fluid High Performance DOT 3 Brake Fluid C6AZ-19542-AB or equivalent DOT 3 fluid meeting Ford specification ESA-M6C25-A, DOT 3 to lubricate seals.
3. Carefully insert the complete secondary piston assembly in the master cylinder bore.
4. On Ranger, carefully insert the primary piston assembly in the master cylinder bore.

   On Aerostar, assemble the washer, rear seal and guide over the primary piston. Be careful not to scratch or damage the exposed section of the primary piston. Install into cylinder bore.
5. Depress the primary piston and install the snap ring in the cylinder bore groove.
6. Install the cap and diaphragm on the brake master cylinder reservoir (2K478).

tomsn048@gmail.com

tomsn048@gmail.com

Hydraulic System Bleeding

WARNING: BRAKE FLUID CONTAINS POLYGLYCOL ETHERS AND POLYGLYCOLS. AVOID CONTACT WITH EYES. WASH HANDS THOROUGHLY AFTER HANDLING. IF BRAKE FLUID CONTACTS EYES, FLUSH WITH RUNNING WATER FOR 15 MINUTES. GET MEDICAL ATTENTION IF IRRITATION PERSISTS. IF TAKEN INTERNALLY, DRINK WATER AND INDUCE VOMITING. GET MEDICAL ATTENTION IMMEDIATELY.

When any part of the hydraulic system has been disconnected for repair or replacement, air may get into the lines and cause spongy pedal action. This requires the bleeding of the hydraulic system after it has been properly connected to be sure all air is expelled from the brake cylinders and lines. The hydraulic system can be bled manually or with pressure bleeding equipment such as Rotunda Brake Bleeder 104-00064 or equivalent.

Bleed one wheel location at a time. Start the bleeding at the right rear wheel and then the left rear wheel. Then proceed to bleed the front brakes, starting with the right front brake and finish bleeding on the left front brake.

System Priming

When a brake master cylinder (2140) has been installed, or the brake system emptied or partially emptied, fluid may not flow from the bleeder screws during normal bleeding. It may be necessary to prime the brake master cylinder using the following procedure:

1. Use a tubing wrench to remove the front brake tube (2264) and the brake master cylinder outlet rear tube from the brake master cylinder.

2. Install short brake tubes in the brake master cylinder and position them so that they curve into the brake master cylinder reservoir (2K478), and the ends of the tubes are submerged in brake fluid.

3. Fill the brake master cylinder reservoir with new High Performance DOT 3 Brake Fluid C6AZ-19542-AB or DOT 3 equivalent meeting Ford specification ESA-M6C25-A, DOT 3.

4. **CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.**

   Have an assistant pump the brakes until clear, bubble-free fluid flows from both brake tubes.

5. Remove the short brake tubes and reinstall the front brake tube and brake master cylinder outlet rear tube on the brake master cylinder.

6. Bleed each brake tube at the brake master cylinder using the following procedure:

   a. Have an assistant pump the brake pedal (2455) 10 times and then hold firm pressure on the brake pedal.
   b. On the brake master cylinder, loosen the rearmost brake tube fitting with a tubing wrench until a stream of brake fluid comes out. Have an assistant maintain pressure on the brake pedal until the brake tube fitting is tightened again.
   c. Repeat this operation until clear, bubble-free fluid comes out from around the tube fitting.

tomsn048@gmail.com

Refill the brake master cylinder reservoir as necessary.

d. Repeat this bleeding operation at the front brake tube fitting.

7. If any of the brake tubes, disc brake calipers, or rear wheel cylinders have been removed, it may be helpful to prime the system by gravity bleeding. This should be done after the brake master cylinder is primed and bled.

   To gravity bleed the brake system:

   a. Fill the brake master cylinder with new High Performance DOT 3 Brake Fluid C6AZ-19542-AB or DOT 3 equivalent meeting Ford specification ESA-M6C25-A, DOT 3.
   b. Loosen both of the rear bleeder screws and leave them open until clear brake fluid flows. Be sure to check the brake master cylinder reservoir fluid level often and do not let it run dry.
   c. Tighten the wheel cylinder bleeder screws to 7-9 Nm (62-79 lb-in).
   d. One at a time, loosen the front caliper bleeder screws. Leave the bleeder screws open until clear fluid flows. Check the fluid level often in the brake master cylinder reservoir and do not let it run dry.
   e. Tighten the front caliper bleeder screws to 17-24 Nm (13-17 lb-ft).

8. After the brake system has been primed, bleed the brake system at each wheel (1007).

   Keep the brake master cylinder reservoir filled with High Performance DOT 3 Brake Fluid C6AZ-19542-AB or DOT 3 equivalent meeting Ford specification ESA-M6C25-A, DOT 3. **Never use brake fluid that has been drained from the system.**

Anti-Lock Brake System Bleeding

NOTE: The anti-lock brake system must be bled in two steps.

SPECIAL SERVICE TOOL(S) REQUIRED

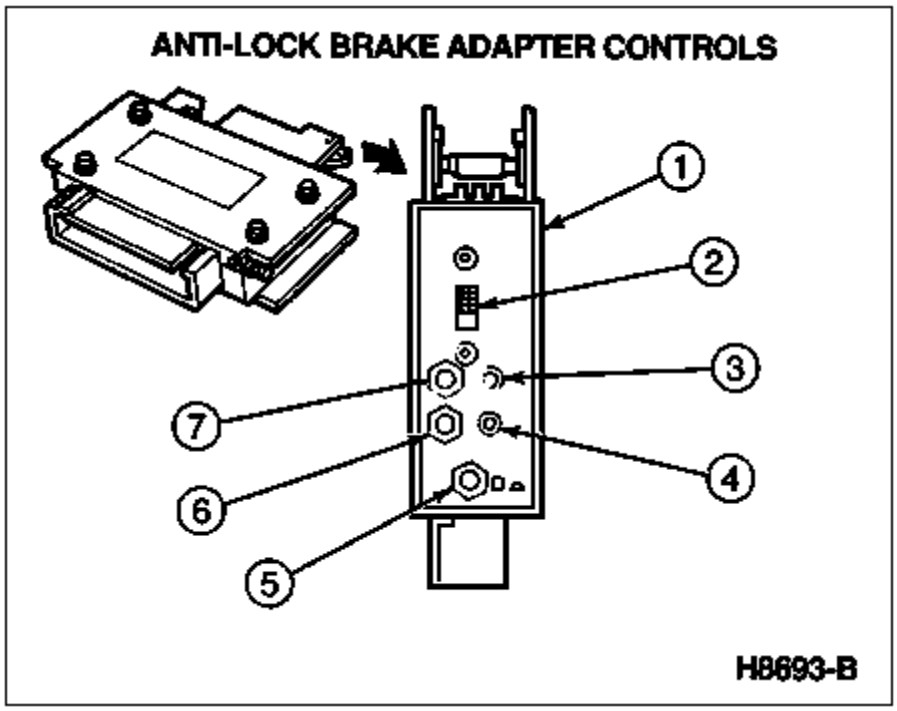
Description	Tool Number
Anti-Lock Brake Adapter	T90P-50-ALA
Jumper	T93T-50-ALA

1. **NOTE: The brake master cylinder and Hydraulic Control Unit must be bled using Anti-lock Brake Adapter T90P-50-ALA and Jumper T93T-50-ALA. If this procedure is not followed, air will be trapped in the HCU which eventually leads to a spongy brake pedal.**

   To bleed the brake master cylinder and HCU, disconnect the 40-pin plug from the Electronic Control Unit and install the anti-lock brake adapter to the wire harness 40-pin plug.

   Anti-Lock Brake Adapter Controls

tomsn048@gmail.com



Item	Part Number	Description
1	T90P-50-ALA	Anti-Lock Brake Adapter
2	—	Bleed/Harness Selector (Part of T90P-50-ALA)
3	—	Green "Motor On" Lamp (Part of T90P-50-ALA)
4	—	Red "Motor Off" Lamp (Part of T90P-50-ALA)
5	—	Valve Button (Part of T90P-50-ALA)
6	—	Abort Button (Part of T90P-50-ALA)
7	—	Motor Start Button (Part of T90P-50-ALA)

a. Place the bleed/harness selector in bleed position.
b. Turn the ignition switch (11572) ON. At this point the red OFF indicator on the adapter should turn on.
c. Push the motor button on the adapter down. This starts the pump motor. The red OFF indicator turns off and the green ON indicator turns on. The pump motor will run for 60 seconds once the motor button is pushed (you do not need to hold the button down). If the pump motor is to be turned off for any reason before this 60 seconds has elapsed, push the abort button and the pump motor will turn off.
d. After the first 20 seconds have passed, push and hold the valve button for 20 seconds. This bleeds any trapped air from the brake master cylinder and HCU.
e. The pump continues to run for an additional 20 seconds after the valve button is released.

2. Bleed the brake lines in the following order.

- Right rear

tomsn048@gmail.com

- Left rear
- Right front
- Left front

Manual Bleeding

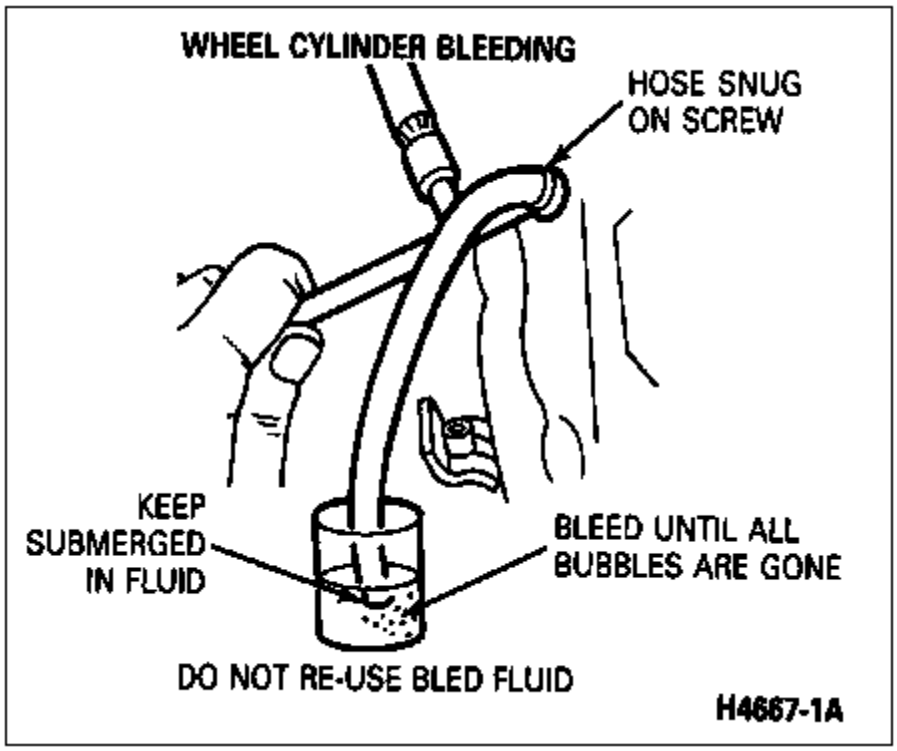
WARNING: BRAKE FLUID CONTAINS POLYGLYCOL ETHERS AND POLYGLYCOLS. AVOID CONTACT WITH EYES. WASH HANDS THOROUGHLY AFTER HANDLING. IF BRAKE FLUID CONTACTS EYES, FLUSH WITH RUNNING WATER FOR 15 MINUTES. GET MEDICAL ATTENTION IF IRRITATION PERSISTS. IF TAKEN INTERNALLY, DRINK WATER AND INDUCE VOMITING. GET MEDICAL ATTENTION IMMEDIATELY.

CAUTION: DO NOT allow the brake master cylinder reservoir to run dry during the bleeding operation. Keep the master cylinder reservoirs filled with the specified brake fluid. Never reuse the fluid that has been drained from the hydraulic system.

NOTE: Bleed the primary and secondary hydraulic brake systems separately.

1. On the brake master cylinder reservoir, loosen the master cylinder-to-hydraulic line fittings.
2. Wrap a shop cloth around the tubing below the fitting to absorb escaping brake fluid.
3. Push the brake pedal down slowly to the floor of the cab. This will force air trapped in the brake master cylinder to escape at the fitting.
4. Hold the brake pedal down and tighten the fitting. Release the brake pedal. Do not release the brake pedal until the fitting is tightened or air will re-enter the brake master cylinder reservoir.
5. Repeat this procedure until air ceases to escape at the fitting.
6. Place a box wrench on the bleeder screw on the rear anti-lock brake (RABS) system valve (if equipped). Attach a rubber drain tube to the bleeder fitting making sure the end of the tube fits snugly around the bleeder screw.
    a. Submerge the free end of the tube in a container partially filled with clean brake fluid. Loosen the bleeder screw approximately three-quarters of a turn.

tomsn048@gmail.com



b. Slowly press the brake pedal all the way down. Close the bleeder screw, and return the brake pedal to the fully-released position. Repeat this operation until air bubbles no longer appear at the submerged end of the bleeder tube.
c. When the fluid being expelled is completely free of air bubbles, close the bleeder screw and remove the bleeder tube.

7. Place a box wrench on the RH rear bleeder screw. Attach a rubber drain tube to the bleeder screw making sure the end of the tube fits snugly around the bleeder screw.

8. Submerge the free end of the tube in a container partially filled with clean brake fluid. Loosen the bleeder screw approximately three-quarters of a turn.

9. Slowly push the brake pedal all the way down. Close the bleeder screw, and return the brake pedal to the fully released position. Repeat this operation until air bubbles no longer appear at the submerged end of the bleeder tube.

10. When the fluid being expelled is completely free of air bubbles, close the bleeder screw and remove the bleeder tube.

11. Repeat this procedure at the LH rear bleeder screw. Refill the brake master cylinder reservoir after each wheel location is bled.

12. Bleed the front brakes starting with the right front brake and then the left front brake as described in Steps 7-11 of this procedure.

13. When the bleeding operation is complete, fill the brake master cylinder reservoir to the maximum level line.

Pressure Bleeding

tomsn048@gmail.com

WARNING: BRAKE FLUID CONTAINS POLYGLYCOL ETHERS AND POLYGLYCOLS. AVOID CONTACT WITH EYES. WASH HANDS THOROUGHLY AFTER HANDLING. IF BRAKE FLUID CONTACTS EYES, FLUSH WITH RUNNING WATER FOR 15 MINUTES, GET MEDICAL ATTENTION IF IRRITATION PERSISTS. IF TAKEN INTERNALLY, DRINK WATER AND INDUCE VOMITING. GET MEDICAL ATTENTION IMMEDIATELY.

CAUTION: Be sure the bleeder tank contains enough specified brake fluid High Performance DOT 3 Brake Fluid C6AZ-19542-AB or DOT 3 equivalent meeting Ford specification ESA-M6C25-A, DOT 3 to complete the bleeding operation. Charge the tank with approximately 69-206 kPa (10-30 psi) of air pressure. Never exceed 345 kPa (50 psi) of pressure. Never reuse brake fluid that has been drained from the hydraulic system.

NOTE: Bleed the longest line first.

1. Clean all dirt from the brake master cylinder filler cap.

2. **NOTE: Master cylinder pressure bleeder adapter tools are available from various manufacturers of pressure bleeding equipment. Follow the instructions of the manufacturer when installing the adapter.**

   Remove the brake master cylinder filler cap, and fill the brake master cylinder reservoir with the specified brake fluid. Install the pressure bleeder adapter tool, Rotunda Brake Bleeder 104-00064 or equivalent to the brake master cylinder, and attach the bleeder tank hose to the fitting on the adapter.

3. Place a 3/8-inch box wrench on the bleeder fitting on the right rear bleeder screw. Attach a bleeder tube snugly around the bleeder screw.

4. Open the valve on the bleeder tank to admit pressurized brake fluid to the brake master cylinder reservoir.

5. Submerge the free end of the tube on the bleeder screw in a partially filled container of clean brake fluid. Loosen the bleeder screw.

6. When air bubbles no longer appear in the fluid at the submerged end of the bleeder tube, close the bleeder screw and remove the tube. Repeat the bleed operation at the left rear, the right front, and the left front.

7. When the bleeding operation is completed, close the bleeder tank valve and remove the tank hose from the adapter fitting.

8. Remove the pressure bleeder adapter tool. Fill the brake master cylinder reservoir to the maximum level line. Install the brake master cylinder filler cap.

---

tomsn048@gmail.com

tomsn048@gmail.com

Brake Master Cylinder

Check the brake tubes and brake master cylinder (2140) mounting. The brake tubes and brake tube nuts must be tight without any signs of leakage. Tighten the brake tube fittings at the brake master cylinder to 15-20 Nm (11-14 lb-ft).

The following conditions are considered normal and are not indications that the brake master cylinder is in need of service:

- Low brake fluid level detected without signs of leakage. This condition is caused by displacement of brake fluid from the brake master cylinder reservoir (2K478) into the disc brake calipers to compensate for normal brake wear. Add brake fluid as needed.
- A momentary or slight squirt of brake fluid from the brake master cylinder reservoir upon application of the brake pedal (2455). This condition is caused by brake fluid displacement through the brake master cylinder reservoir compensating port as the brake master cylinder pistons move forward in the bore when the brakes are applied.
- Slight turbulence in the brake master cylinder reservoir fluid when the brake pedal is released. Turbulence occurs as brake fluid returns to the brake master cylinder after releasing the brakes.
- A trace of brake fluid found on the outside of the power brake booster below the brake master cylinder mounting flange. This condition results from the lubricating action of the brake master cylinder wiping seal.

tomsn048@gmail.com

Brake Lines and Hose

Inspect the brake tubes and hoses under the vehicle for damage and proper routing. Check the brake hoses routed to the disc brake calipers, and/or to the rear wheel cylinders (2261) for any signs of damage. The tube and hose fittings must be tight without signs of leakage.

tomsn048@gmail.com

Brake Fluid Leakage

The wet appearance of the outer cover of rubber brake hoses is called "sweating." This is a normal condition for neoprene rayon braid hose. The "sweating" condition is not evidence of a brake fluid leak and will not result in a loss of pressure in the system.

Replace a flexible brake hose if it shows signs of softening, cracking or other damage.

When installing a new brake hose, position the hose to avoid contact with other vehicle parts.

If signs of leakage are not present but the brake fluid level is low, it is possible that evidence of brake fluid leakage may have been washed off by rain or snow because brake fluid is water soluble. To determine if a leak exists, proceed as follows:

a. Fill the system
b. Bleed the system
c. Apply the brakes several times
d. Examine the system to verify that the brake fluid level is actually dropping
e. Locate and correct any external leak

Internal and external leaks are two problems that can affect a hydraulic brake system. The hydraulic brake system will not cause the vehicle to do any of the following:

- Vibrate
- Pull
- Grab
- Squeal
- Allow the brake pedal (2455) to pulse

In most cases the hydraulic system will not cause the brakes to drag. The sources of these problems are found elsewhere in the brake system, but it is a good policy to first check the entire hydraulic system for leaks before continuing to diagnose any other brake problems.

tomsn048@gmail.com

tomsn048@gmail.com

Brake Pedal Linkage

On dual-brake brake master cylinder (2140) with power brake booster (2005) equipped vehicles, the brake systems are designed to permit a full stroke of the brake master cylinder when the brake pedal (2455) is fully depressed. A brake pedal clearance adjustment is not required.

If pedal travel seems restricted, check for obstructions.

To release the brakes, fluid must flow back to the brake master cylinder through a return port when pedal pressure is released. To be sure the brake master cylinder piston moves back far enough to expose the return port, free play is built into the brake pedal linkage. This prevents the brake master cylinder piston from becoming trapped in a partially released position. If a problem is suspected, the brake pedal push rod and brake pedal should be checked to make sure they are not binding. Pedal free play is not always perceptible in dash-mounted booster systems, because the operating clearance for the brake master cylinder piston is adjusted at the booster push rod, rather than the pedal linkage.

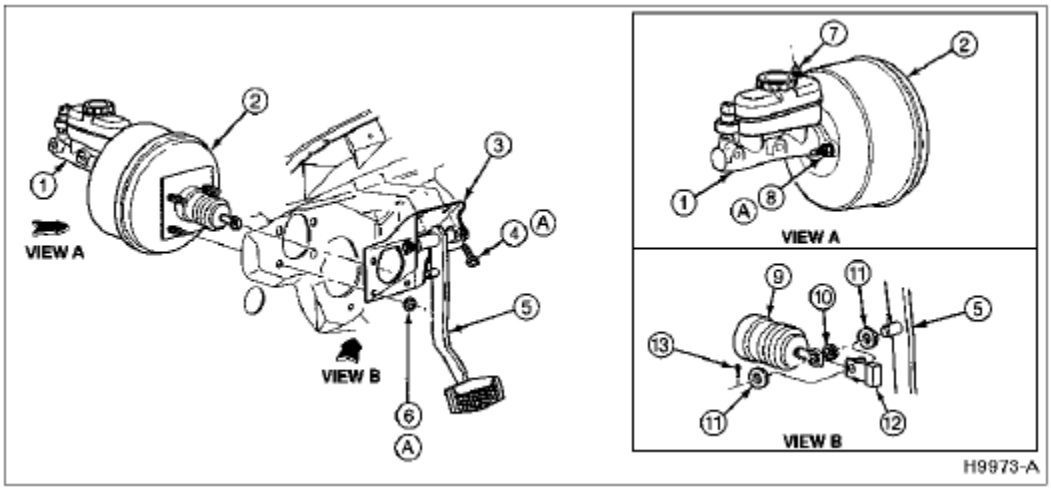
Brake Booster, Power

The only serviceable components of the power brake booster are the power brake booster check valve, the check valve grommet and the adjustable master cylinder push rod (Ranger only).

Power Brake Booster



Item	Part Number	Description
1	2140	Brake Master Cylinder
2	2005	Power Brake Booster
3	2L252	Brake Pedal Bracket
4	N804804-S102	Bolt, Brake Pedal Bracket-to-Dash Panel
5	2455	Brake Pedal
6	N620482-S2	Nut, Power Brake Booster-to-Brake Pedal Bracket
7	—	Vacuum Inlet Port (Part of 2005)
8	3828020-S	Nut, Brake Master Cylinder-to-Power Brake Booster
9	—	Boot (Part of 2005)
10	2474	Brake Master Cylinder Push Rod Bushing
11	2B129	Brake Master Cylinder Push Rod Spacer
12	13480	Stoplight Switch
13	38069-S100	Self-Locking Pin
A	—	Tighten to 22-28 Nm (16-21 Lb-Ft)

Removal

1. Disconnect the battery ground cable (14301).
2. To prevent strain on the brake lines, support the brake master cylinder with a wire or prop.
3. Remove the two brake master cylinder-to-power brake booster nuts.
4. Carefully pull the brake master cylinder off the power brake booster.
5. Using care not to strain the brake lines, position the brake master cylinder out of the way.
6. Disconnect the vacuum hose from the power brake booster vacuum inlet port.
7. Working under the instrument panel (04320), disconnect the electrical connector from the stoplight switch (13480).
8. Remove the self-locking clip from the brake pedal pin.
9. **NOTE: Before the next step, observe the position of the brake pedal push rod. The Aerostar brake pedal push rod has the large loop pointing down.**

   Remove the brake master cylinder push rod spacers (2B129), the brake pedal push rod, the stoplight switch and the brake master cylinder push rod bushing (2474) from the brake pedal pin.
10. Remove the four power brake booster-to-brake pedal bracket nuts.
11. At the engine compartment, pull the power brake booster off the dash panel (01610).

Installation

To install, reverse the removal procedure. Tighten all mounting nuts to 22-28 Nm (16-21 lb-ft). If necessary, adjust the brake master cylinder push rod. Refer to the Adjustments, Brake Booster to Master Cylinder Push Rod procedure in this section.

Brake Booster Check Valve

Removal and Installation

1. Remove the vacuum hose from the power brake booster check valve (2365).
2. Pull the power brake booster check valve from the power brake booster.
3. Remove the check valve grommet from the power brake booster.

To install, reverse the removal procedure.

A new check valve grommet must be installed whenever the power brake booster check valve is serviced.

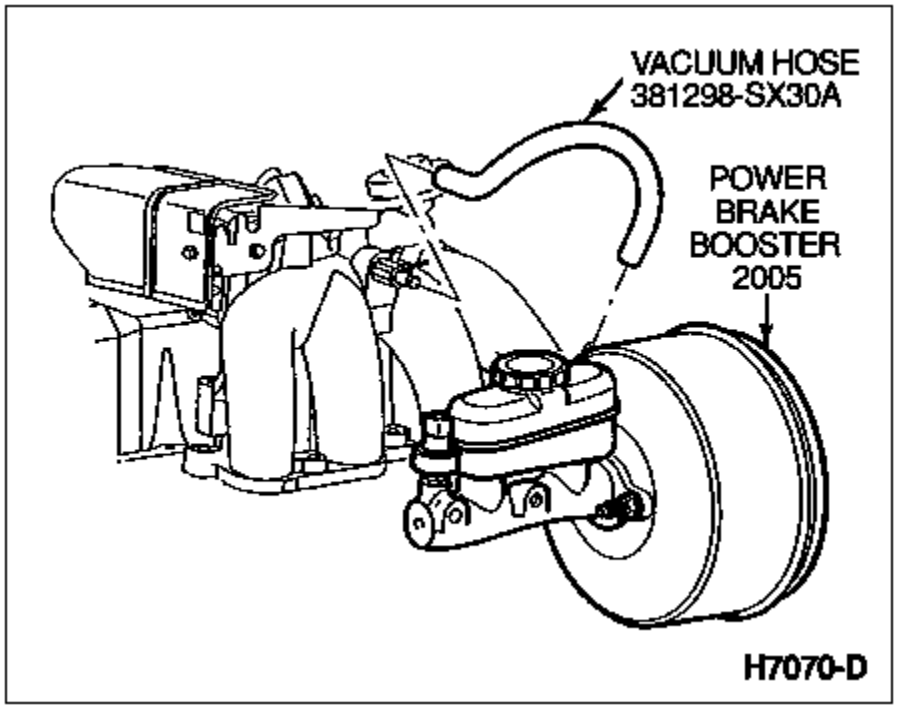
Brake Booster, Power

Wipe off the power brake booster and inspect for improper mounting or damage. After wiping, inspect for brake fluid leakage on the power brake booster that may have come from the brake master cylinder. Verify that all mounting nuts are securely tightened to the specified torque.

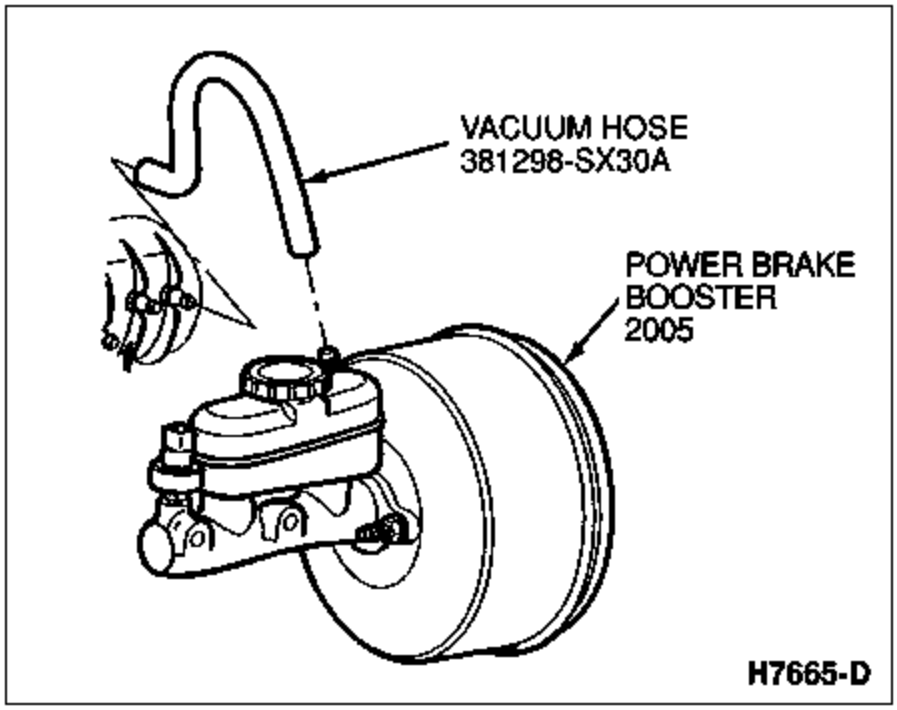
Vacuum Hose and Check Valve

Inspect the power brake booster vacuum hose for cracks, damage or collapse. Replace as necessary. Verify proper routing of the vacuum hose. Reroute as necessary. Remove the vacuum hose from the vacuum inlet port on the power brake booster and inspect the power brake booster check valve for damage and improper mounting. Apply vacuum and pressure to the power brake booster check valve and verify that air would flow only toward the engine. Check that all hose clamps are tightened securely.

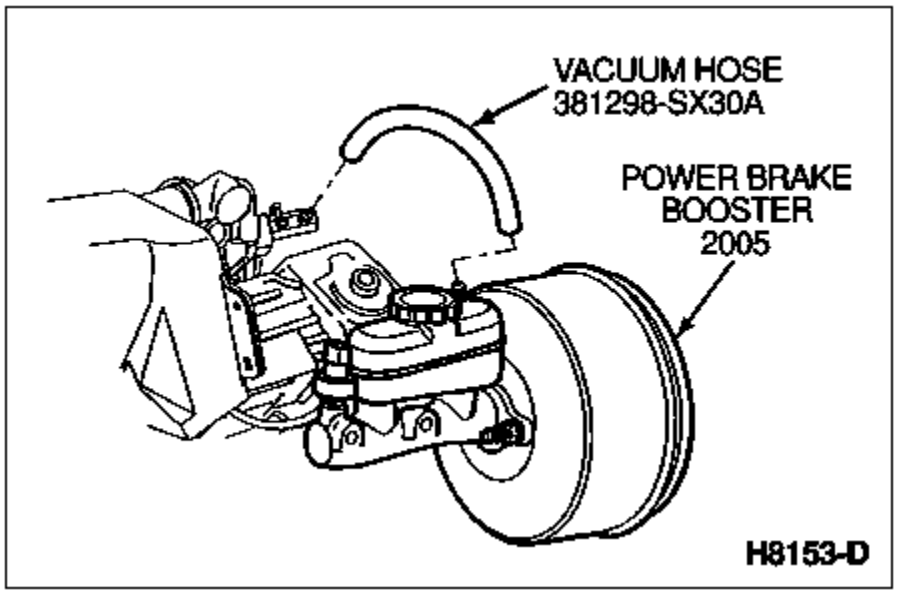
Vacuum Hose, 2.3L MFI Engine



Vacuum Hose, 4.0L MFI Engine



Vacuum Hose, 3.0L MFI Engine

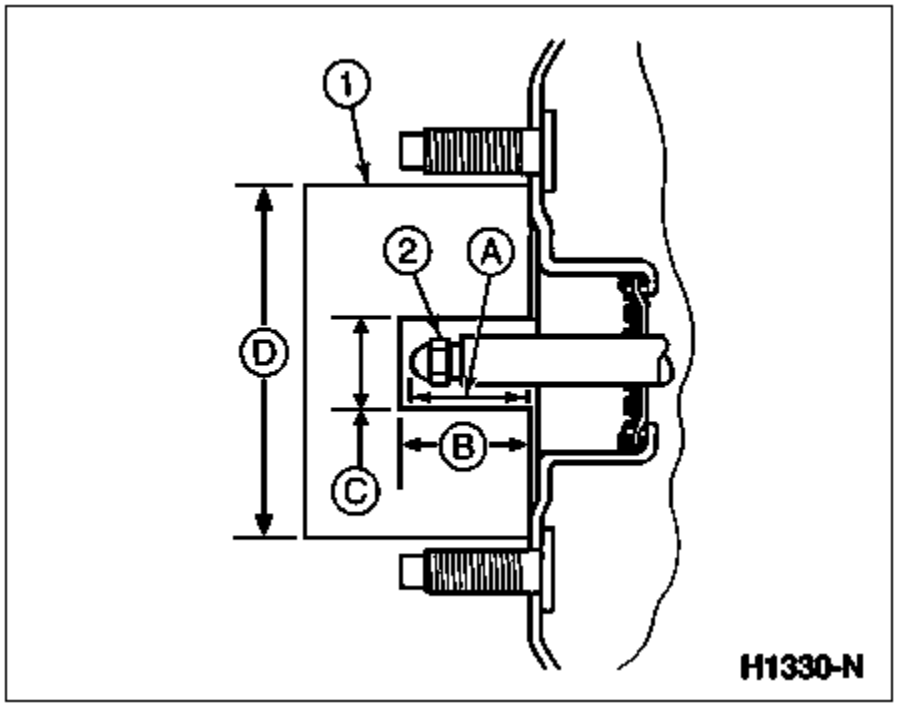


Brake Booster to Master Cylinder Push Rod, Ranger

NOTE: Brake master cylinder push rod adjustment on Aerostar vehicles should not be attempted due to lack of accessibility.

The master cylinder push rod has an adjustment screw to maintain the correct relationship between the master cylinder push rod and the brake master cylinder piston. If the master cylinder push rod is too long, it will prevent the brake master cylinder piston from completely releasing hydraulic pressure, causing the brakes to drag. If the master cylinder push rod is too short it will cause excessive brake pedal travel and an undesirable clunk in the power brake booster area. Remove the brake master cylinder for access to the master cylinder booster push rod.

To check the adjustment of the adjustment screw, fabricate a gauge using the dimensions shown in the following illustration, and place it against the brake master cylinder mounting surface of the power brake booster body as shown below. The engine (6007) must be running, with the vacuum hose connected to the power brake booster, while checking the adjustment. Adjust the push rod screw by turning the adjustment screw to meet the specifications shown.



Item	Part Number	Description
1	—	Gauge (Fabricate Locally)
2	—	Adjustment Screw (Part of 2005)
A	—	24.89mm (0.980 In.)

B	—	25.27mm (0.995 In.)
C	—	19.05mm (0.75 In.)
D	—	74.61mm (2.94 In.)

Symptom Chart

NOTE: Both the red BRAKE warning light diagnosis procedure and test drive are required prior to entering this section. Failure to perform these procedures will greatly diminish the effectiveness of this method of diagnosis.

There are times when a customer concern will not cause the REAR ABS warning light to illuminate or a code to be stored.

The symptom chart is intended to give the technician a starting point in resolving these types of concerns.

Symptom Description	Refer to
Unwarranted RABS activity	Symptom A
One or both rear wheels lock up	Symp tom B
Hard/soft brake pedal	Symptom C
Lack of decel. (med./hard braking)	Symptom D

WARNING: PERFORM INDICATED PINPOINT TEST OR DRIVE TEST STEPS ONLY. DO NOT PERFORM OTHER STEPS, ALTHOUGH WITHIN THE TEST BOX YOU MAY APPEAR TO BE DIRECTED TO DO SO. ALWAYS RETURN TO THE SYMPTOM CONDITION CHART IF NO RESOLUTION IS REACHED BY PERFORMING A PARTICULAR TEST.

SYMPTOM A: UNWARRANTED RABS ACTIVITY

Condition	Possible Source	Action
• Premature Loss of Rear Axle Speed Sensor Signal During Decel	• Metal chips on speed sensor pole piece.	• REFER to Pinpoint Test Step **6.6** .
	• Gap between speed sensor and speed sensor ring is greater than 1.14mm (0.045 inches).	• REFER to Drive Test Code 6, Step DT6.3 -DT6.5.
	• Missing or damaged speed sensor ring teeth.	• REFER to Drive Test Code 6, Step DT6.6 .
	• Speed sensor/speed sensor ring interference (gap is less than 0.127mm (0.005 inches).	• REFER to Drive Test Code 6, Step DT6.6 only.
• Intermittent Speed Sensor Signal to Anti-Lock Electronic Control Module During Decel	• Intermittent open or shorted speed sensor circuit.	• PERFORM intermittent diagnosis for Circuits 519 (LG/BK) and 523 (R/PK) between anti-lock electronic control module and speed sensor.

	• Intermittent open speed sensor circuit at intermediate connections especially bulkhead. • Chafed wire insulation or pinched wire due to improper routing causing intermittent short. • Underhood speed sensor test connector shorted.	• PERFORM intermittent diagnosis for Circuit 519 (LG/BK) and 523 (R/PK) at intermediate connectors. • INSPECT wiring harness from rear axle housing to frame side rail for chafing or rub marks. • INSPECT underhood speed sensor test connector for presence of cap, corrosion, and excessive dirt in the terminal cavities.
• Misadjusted rear brake shoes and linings or "Grabby" Brake Shoe Linings	• Rear brake adjustment too tight. • Linings are "grabby."	• REFER to Section 06-00 . • REFER to Section 06-00 .

SYMPTOM B: ONE OR BOTH REAR WHEELS LOCK UP

Condition	Possible Source	Action
• RABS Valve Failure	• Damaged RABS valve reset switch. • Leaky dump valve. • Hydraulically inoperative RABS valve.	• REFER to Drive Test Code 4, Steps DT4.2 and DT4.4 . • REFER to Drive Test Code 4, Step DT4.3 . • REFER to Drive Test Code 4, Step DT4.5 .
• RABS Speed Sensor Output Low or Lost at Lower Vehicle Speeds	• Speed sensor air gap too large. • Speed sensor/speed sensor ring assembly does not produce sufficient output.	• REFER to Drive Test Code 6, Step DT6.3 . • REFER to Drive Test Code 6, Step DT6.2 . PERFORM intermittent diagnosis for Circuit 519 (LG/BK) and 523 (R/PK) between anti-lock electronic control module and speed sensor. PERFORM intermittent diagnosis for Circuit 519 (LG/BK) and 523 (R/PK) at intermediate connectors.
• Base Brake Mechanical	• Brake related concern: Damp or contaminated rear	• REFER to Section 06-00 .

Concern	brake shoe linings.Stuck/leaking rear wheel cylinder.Overadjusted rear brake shoes and linings. • Hung-up parking brake. • Leaking rear axle seal.	• REFER to Section 06-05 . • REFER to the appropriate section in Group 05.
• 4x4 System Mechanical Electrical Concern (Aerostar Only)	• Hubs engaged although shift lever is in 4x2 position. • Faulty 4x4 indicator switch or short to 12V in 4x4 circuit 210 (LB).	• REFER to Section 07-07D . • REFER to Pinpoint Test Steps **5.3** and **5.5** .
• Vehicle Electrical Concern	• Stoplight input to anti-lock electronic control module not present. • Stoplights inoperative.	• REFER to Pinpoint Test Steps **11.1** -11.4. • REFER to Section 17-01 .

SYMPTOM C: HARD/SOFT BRAKE PEDAL

Condition	Possible Source	Action
• RABS Valve Inoperative (Hard/Soft)	• Stuck shut isolation valve (hard). • Leaky dump valve (soft). • Leaky isolation valve during RABS stop (soft).	• REFER to Drive Test Code 4, Step DT4.5 only. • REFER to Drive Test Code 4, Step DT4.3 only. • REFER to Drive Test Code 5, Step DT5.4 only.
• Vehicle Electrical Concern	• Stoplight switch always on while driving.	• REFER to Pinpoint Test Steps **11.1** -11.4.
• Base Brake Hydraulic Concern (Soft)	• Hydraulic leak in brake line tubing or rear brake hose, fitting, brake master cylinder, rear wheel cylinder, or disc brake caliper. • Air in brake system.	• REFER to Section 06-00 . • REFER to Section 06-00 .
• Base Brake Mechanical Concern (Hard)	• Brake related concern:Little or no vacuum boost.Stuck or inoperative rear wheel cylinder or disc brake caliper.Pinched or crimped brake tubing or rear brake hose.	• REFER to Section 06-00 .

SYMPTOM D: LACK OF DECELERATION DURING MEDIUM/HARD BRAKE APPLICATIONS

Condition	Possible Source	Action
• RABS Valve Inoperative	• Leaky dump valve.	• REFER to Drive Test Code 4, Step DT4.3 .
	• Stuck shut isolation valve.	• REFER to Drive Test Code 4, Step DT4.5 ONLY.
• RABS Speed Sensor Input to Anti-Lock Electronic Control Module Intermittent or Improper	• Short/open in frame or instrument panel harness (Circuits 519 and/or 523)At anti-lock electronic control module connector (Pins 3 and 10)At RABS speed sensor connectorAt bulkhead or other interconnectionPinched wire or worn insulation due to improper routingTest connector (in engine compartment)	• REFER to Pinpoint Test Steps 6.1-6.5 .
	• Metal chips on speed sensor.	• REFER to Pinpoint Test Step 6.6 .
	• Borderline speed sensor to speed sensor ring air gap, excessive speed sensor ring radial runout, damaged or missing speed sensor ring teeth.	• REFER to Drive Test Code 6, Steps DT6.3 - DT6.5 only.
• Base Brake Hydraulic Concern	• Hydraulic leak in rear brake hose or brake tubing, fitting, brake master cylinder, rear wheel cylinder, or disc brake caliper.	• REFER to Section 06-00 .
	• Air in brake system.	• REFER to Section 06-00 .
• Base Brake Mechanical Concern	• Brake related concern:Little or no vacuum boost.Stuck or inoperative brake tubing or rear brake hose.Pinched or crimped brake tubing or rear brake hose.Ineffective brake shoe or pad linings.	• REFER to Section 06-00 .

Inspection and Verification

System Pre-Check

NOTE: It is important that this procedure be performed first. Failure to do so may result in incorrect diagnosis of problem, wasted time, and improper replacement of good components.

The System Pre-Check is used to screen a vehicle for relatively simple diagnostic repairs, such as loose connectors, blown fuses, etc. However, the System Pre-Check is also used to prepare the vehicle for further diagnostics. In addition, warning light concerns are dealt with in this check.

NOTE: This repair procedure is written for REAR ABS II (RABS II) systems (as opposed to REAR ABS I [RABS I] systems). RABS II systems are standard for 1992 and later Aerostar, as well as 1993 and later Rangers. In the event that you are not sure if you have a RABS I or a RABS II system in your vehicle, check the module part number. Anti-lock electronic control module part numbers for RABS II will begin with either: F29F-2C018- or F37F-2C018-. All other part numbers should be considered to be a RABS I. Refer to the repair manual for that model year vehicle.

The anti-lock electronic control module (2C018) uses both the red BRAKE and yellow REAR ABS instrument panel warning lights to alert the driver to a system malfunction. Both lights must be working properly to assist in concern diagnosis. The steps listed below must be followed prior to beginning the RABS II diagnostic procedure.

Warning Lamp Indicators

The red BRAKE warning light is constantly monitored by the anti-lock electronic control module. If the red light illuminates, the anti-lock electronic control module will disable the RABS II system. For this reason, diagnosing and resolving any base brake concerns illuminating the red BRAKE warning light will, in most cases, resolve a perceived RABS II concern.

Pinpoint Tests

Assuming the red BRAKE warning light diagnosis has been performed and passed, and the REAR ABS warning light is illuminated, the code retrieved is used to designate the appropriate pinpoint test. The pinpoint tests are relatively simple and will be effective in most situations. If resolution is not reached by the end of the pinpoint test, additional, more in-depth procedures are provided in the drive tests.

Drive Tests

The drive tests will aid in diagnosing more complex concerns, and in general, are more time consuming to perform than the pinpoint tests.

NOTE: Do not proceed to any pinpoint test unless directed to do so.

At times, running completely through both pinpoint and drive tests will not lead to concern resolution. Often, the concern is due to an intermittent connection, termination, or a damaged circuit. An attempt has been made to point out obvious sources for potential intermittents within the pinpoint tests. However, it should be noted that several circuits pass through one or more connections between components. These are also areas of potential concern and should be considered. Refer to the Intermittent Diagnosis procedure.

Vehicle Setup

For 4-wheel drive vehicles, shift into 2-wheel drive. Drive the vehicle to a level area, and place the shift lever in PARK for automatic transmissions and NEUTRAL for manual transmissions. Turn the ignition off, set the parking brake and turn on the running lamps. Place blocks behind the wheels.

WARNING: PLACE BLOCKS BEHIND THE REAR WHEELS AND IN FRONT OF THE FRONT WHEELS TO PREVENT THE VEHICLE FROM MOVING WHILE THE SYSTEM PRE-CHECK IS BEING DONE.

Release the parking brake and continue to Brake Light Self-Check.

Brake Light Self-Check

The red BRAKE warning light is used to indicate a low brake fluid level condition or parking brake applied condition. To check this light, insert the key in the ignition lock cylinder and turn it to the START position. The BRAKE warning light should glow in this position. If it fails to glow, service the electrical system as required. Go to System Pre-Check Test B , Red Brake Light OFF and Does Not Self-Check.

Allow the key to spring back from the START position to the RUN position. At this time the red BRAKE warning light should turn off. If it does not turn off, recheck the parking brake switch to make sure that it is fully disengaged. If the red BRAKE warning light is still on, service the base brake system. In the event that the red brake warning light remains on, go to System Pre-Check Test E , Red Brake Light ON.

Rear Anti-Lock Bulb Diagnostics

The yellow REAR ABS warning light is used to indicate a malfunction and a deactivation of the RABS II system. To check this light, first follow the procedure above for Brake Light Self-Check, and allow the key to spring back from START position to the RUN position. The REAR ABS light should perform a self-check by glowing for approximately two seconds and then turn off. If it fails to glow, service the RABS lamp electrical system . Go to System Pre-Check Test A , Yellow REAR ABS Light OFF and Does Not Self-Check. If it turns back on and does not flash, then a system concern has been detected. Refer to procedures for obtaining diagnostic trouble code.

On-Board Diagnostics

If the yellow REAR ABS warning light begins to flash, this indicates that the keep-alive memory (KAM) power to the anti-lock electronic control module has been disrupted. If this condition occurs, service the RABS II KAM power system as required. Go to System Pre-Check Test C , Yellow REAR ABS Light Self-Check OK, but Light Automatically Begins Flashing.

Diagnostic Trouble Codes (DTC), Retrieving

NOTE: Verify the ignition switch (11572) is in the RUN position (engine does not need to be running). Next, locate the black RABS II diagnostic connector. The diagnostic connector has two mating halves (one of which has a black/orange wire connected to it). Disconnect the two halves.

1. Attach one end of a jumper wire to the black with orange stripe wire side of the diagnostic connector.
2. Momentarily ground the opposite end of the jumper wire by connecting it to a good chassis ground for 1-2 seconds.

Grounding this wire should start the REAR ABS lamp flashing. If grounding this wire does not start the REAR ABS lamp flashing, go to System Pre-Check Test D , Yellow REAR ABS Light Self-Check OK, but No Diagnostic Trouble Code When Diagnostics started.

CAUTION: Care must be taken to connect only the black/orange stripe wire to ground. Connecting the mating connector wire to ground will result in a blown fuse.

The code consists of a number of short flashes and ends with a long flash. Count the short flashes and include the following long flash in the count to obtain the code number. For example, three short flashes followed by one long flash indicates diagnostic trouble Code 4. The code will continue to repeat itself until the key is turned off. It is recommended that the code be verified by reading it several times. This code will be used later for system repair instructions, it should be written down for future use. A diagnostic trouble code of 16 will be obtained when the module detects normal system operation.

Diagnostic Trouble Codes (DTC), Erasing

The last step of the System Pre-Check always includes clearing the keep-alive memory (KAM). To do this, simply turn off the ignition while the diagnostic connector halves are separated as described in the procedures for obtaining the diagnostic trouble code above, after which the diagnostic connector should be reassembled to provide KAM power to the anti-lock electronic control module. If at this time a valid code has been obtained, go to the appropriate pinpoint test for that code.

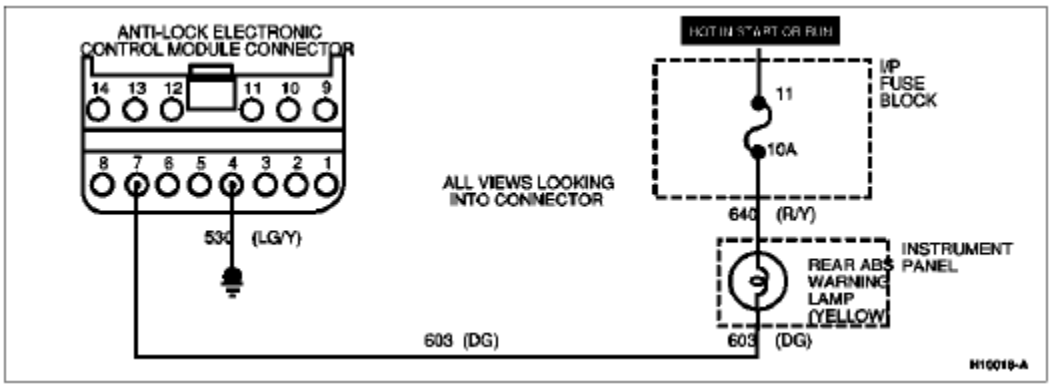
Pinpoint Tests, System Pre-Check

CONDITIONS AND ACTIONS

CONDITION	ACTION TO TAKE
Yellow REAR ABS light OFF and does not self-check.	See System Pre-Check Test A.
Red brake light OFF and does not self-check.	See System Pre-Check Test B.
Yellow REAR ABS light self-check OK, but light automatically begins flashing.	See System Pre-Check Test C.
Yellow REAR ABS light self-check OK, but no diagnostic trouble code when diagnostics started.	See System Pre-Check Test D.
Red brake light ON when key in RUN position.	See System Pre-Check Test E.

SYSTEM PRE-CHECK TEST A: YELLOW REAR ABS LIGHT OFF AND DOES NOT SELF-CHECK

Affected Circuits(s)/Electrical Component(s)



Description

The anti-lock electronic control module (2C018) will turn on the REAR ABS light for 1-2 seconds after the key has been turned from the OFF to the RUN position. If REAR ABS light prove out fails to occur, it may be caused by a burned-out bulb or an open fuse to Circuit 640 (R/Y). An open in Circuit 603 (DG) will also keep the light prove out from occurring.

Possible Contributing Base Brake Component/Vehicle Wiring Concerns

- Open fuse Circuit 640 (R/Y)
- Missing power to warning lamp (open Circuit 640 [R/Y])
- Open Circuit 603 (DG)
- Burned out REAR ABS warning lamp bulb
- Terminal backout in the module harness connector at Pin 7
- Module connector not fully mated with anti-lock electronic control module
- Defective anti-lock electronic control module
- Open REAR ABS ground (Circuit 530 [LG/Y])

NOTE: Use Rotunda 73 digital Multimeter 105-R0051 or equivalent for electrical tests.

A1 REAR ABS LIGHT FUSE

- Remove and inspect REAR ABS light fuse.

Is the fuse blown?

Yes	No
CHECK for short to ground between fuse panel and warning lights. REPAIR short and REPLACE fuse. REPEAT System Pre-Check.	REINSTALL fuse and GO to **A2** .

A2 MODULE HARNESS CONNECTOR

- Check to make sure module harness is fully plugged into anti-lock electronic control module.

Are connections secure?

Yes	No
GO to **A3** .	CONNECT harness to anti-lock electronic control module. REPEAT System Pre-Check.

A3 ANTI-LOCK ELECTRONIC CONTROL MODULE GROUND

NOTE: When checking resistance in the anti-lock system, always disconnect the battery to starter relay cable. Improper resistance may occur with the vehicle battery connected.

- Check for good anti-lock electronic control module ground:
  - Disconnect battery to starter relay cable.
  - Remove harness connector from anti-lock electronic control module.
  - Set multimeter on the 200-ohm scale.
  - Check for resistance between harness connector Pin 4 and chassis ground.

Is resistance less than 1.0 ohm?

Yes	No
RECONNECT battery ground cable. GO to **A4** .	CHECK for open in anti-lock electronic control module ground wire. CHECK for loose, dirty or broken connector pins. REPAIR as necessary. REPEAT System Pre-Check.

A4 REAR ABS LIGHT POWER

- Check for voltage to REAR ABS light:
  - Remove harness connector from anti-lock electronic control module.
  - Set multimeter on 20 VDC scale position.
  - Turn ignition to the ON position.
  - Check voltage between harness connector Pin 7 and a known good chassis ground.

Are 9 volts present?

Yes	No
REPLACE anti-lock electronic control module. REPEAT System Pre-Check.	GO to **A5** .

A5 POWER TO REAR ABS LIGHT FUSE

- Check for voltage to fuse.
  - Set multimeter to 20 VDC scale.
  - Turn ignition to the ON position.
  - Check voltage between panel fuse connector and known good chassis ground.

Are 9 volts present?

Yes	No
GO to **A6** .	REPAIR fuse panel or vehicle electrical system. REPEAT System Pre-Check.

A6 RABS LIGHT BULB

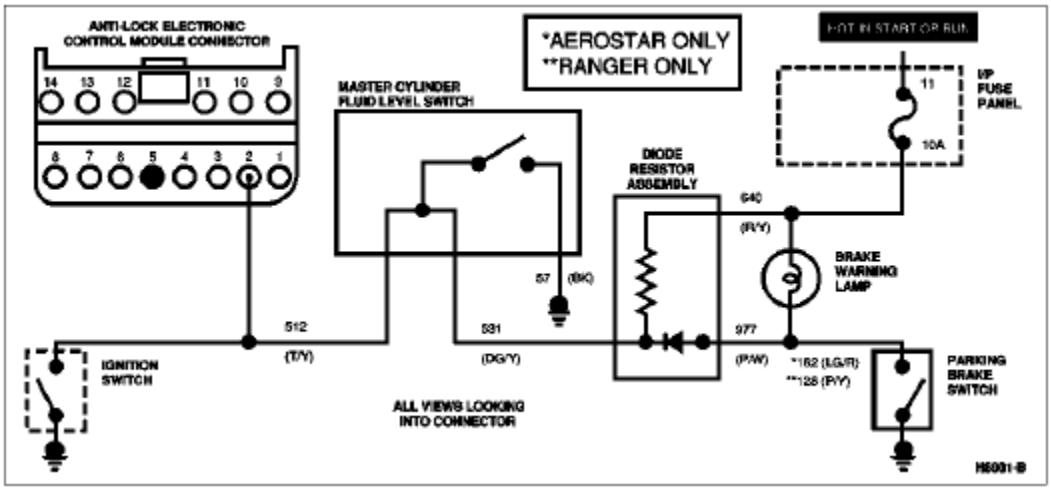
- Check REAR ABS light bulb.

Is the bulb OK?

Yes	No
REPAIR open between RABS light fuse and Pin 7 of the anti-lock electronic control module wiring harness connector. REPEAT System Pre-Check.	REPLACE bulb. REPEAT System Pre-Check.

SYSTEM PRE-CHECK TEST B: RED BRAKE LIGHT OFF AND DOES NOT SELF-CHECK

Affected Circuit(s)/Electrical Component(s)



Description

If the red BRAKE light does not turn on when the key is in the START position, service the warning bulb system as required. The most likely cause of non-functioning red BRAKE light(s) is a burned-out bulb or an open fuse.

Possible Contributing Base Brake Component/Vehicle Wiring Concerns

- Open brake warning light bulb (RED)
- Open power fuse
- Open Circuits 640 (R/Y), 977 (P/W), 512 (T/LG), 531 (DG/Y), 162 (LG/R) (Aerostar), 128 (P/Y) (Ranger)
- Open resistor/diode circuit
- Unseated master cylinder fluid level switch connector
- Defective ignition bulb prove out switch.

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for electrical tests.

B1 RED BRAKE WARNING LIGHT/FUSE

- Turn ignition to RUN position.
- Apply parking brake.

- Observe red BRAKE warning light.

Does the BRAKE warning light function?

Yes	No
RELEASE parking brake GO to **B2** .	REPAIR brake warning circuit. CHECK for open fuse. CHECK for burned-out bulb or open Circuits 640 (R/Y), 162 (LG/R). REPEAT System Pre-Check.

B2 CHECK FOR CORRODED FLUID LEVEL CONNECTOR PINS

- Remove fluid level switch connector located on brake master cylinder.
- Inspect both halves of fluid level switch connector for corrosion or connector pin back-out.

Are the connections clean and secure?

Yes	No
GO to **B3** .	REPAIR/REPLACE connector as needed. REPEAT System Pre-Check.

B3 CHECK FOR UNSEATED CONNECTOR

- Key OFF.
- Firmly reconnect fluid level switch connector located on brake master cylinder.
- Turn key to START position.
- Observe red BRAKE light.

Does the BRAKE light function?

Yes	No
Condition is resolved. REPEAT System Pre-Check.	GO to **B4** .

B4 DIODE RESISTOR ELEMENT/CIRCUIT 531

- Disconnect fluid level switch.
- Connect jumper wire from Circuit 531 (DG/Y) to known chassis ground.
- Observe red BRAKE light.

Does the BRAKE light function?

Yes	No
LEAVE fluid level switch disconnected. GO to **B5** .	REPAIR open Circuits 977 (P/W), 531 (DG/Y) or open diode/resistor element. REPEAT System Pre-Check.

B5 MASTER CYLINDER FLUID LEVEL SWITCH

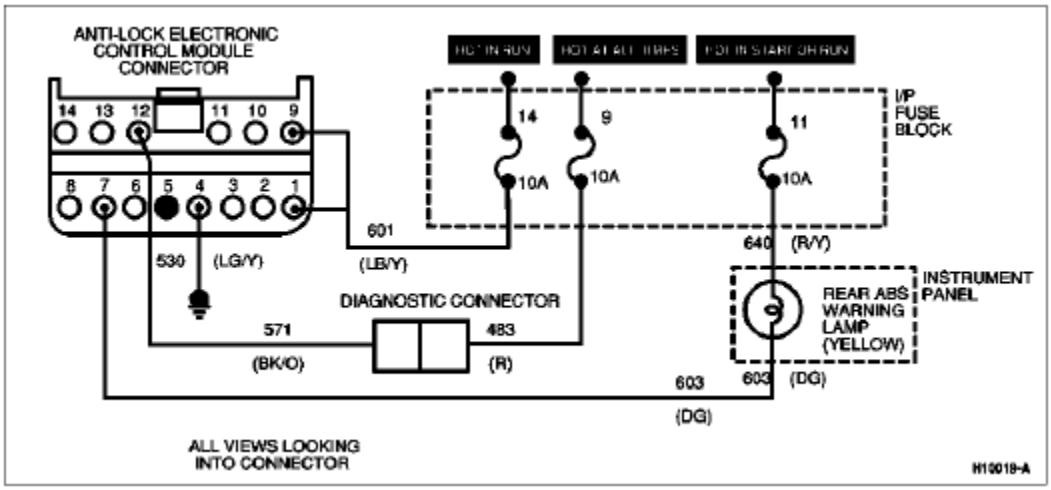
- Connect jumper wire from Circuit 531 (DG/Y) to Circuit 512 (T/LG).
- Turn key to START position.
- Observe red BRAKE light.

Does the BRAKE light function?

Yes	No
Master cylinder fluid level switch is defective. REFER to Section 06-06 for fluid level switch removal and installation procedures. REPEAT System Pre-Check.	Open in Circuit 512 (T/LG) or defective ignition switch. REPAIR/REPLACE and REPEAT System Pre-Check.

SYSTEM PRE-CHECK TEST C: YELLOW REAR ABS LIGHT SELF-CHECK OK, BUT LIGHT AUTOMATICALLY BEGINS FLASHING

Affected Circuit(s)/Electrical Component(s)



Description

The RABS warning light will automatically begin a flash-out sequence if the diagnostic line Circuit 571 or 483 is shorted to ground. This will result in a blown fuse for the keep-alive memory power for the anti-lock electronic control module. An open keep-alive memory (KAM) fuse is most likely caused by a grounded diagnostic connector.

Possible Contributing Base Brake Component/Vehicle Wiring Concerns

- Intermittent anti-lock electronic control module power circuit
- Intermittent anti-lock electronic control module ground circuit
- Intermittent anti-lock electronic control module light circuit
- Blown fuse

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for electrical tests.

C1 OBSERVE REAR ABS LIGHT FOR FLASH SEQUENCE

- Observe REAR ABS light and determine if the flashing is a diagnostic trouble code (one or more short pulses followed by one long pulse).

Is the flash sequence a diagnostic trouble code?

Yes	No
INSPECT Circuits 571 (BK/O) and 483 (R) for short to ground. REPAIR circuit and REPLACE RABS KAM fuse. (See Owner's Manual.) REPEAT System Pre-Check.	GO to **C2** .

C2 INTERMITTENT POWER TO ANTI-LOCK ELECTRONIC CONTROL MODULE

- Remove the anti-lock electronic control module harness connector from the anti-lock electronic control module.
- Set multimeter to 20VDC scale.
- Turn the ignition to the ON position.
- Shake the instrument panel harness while measuring battery voltage between Pin 1, Pin 9 and chassis ground.

Is voltage steady and greater than 9 volts?

Yes	No
GO to **C3** .	REPAIR Circuit 601 (LB/PK). REPEAT System Pre-Check.

C3 DAMAGED ANTI-LOCK ELECTRONIC CONTROL MODULE GROUND

- Disconnect the battery ground cable.
- Set the multimeter on the 200-ohm scale.
- Shake the anti-lock electronic control module harness while reading the resistance between Pin 4 and chassis ground.

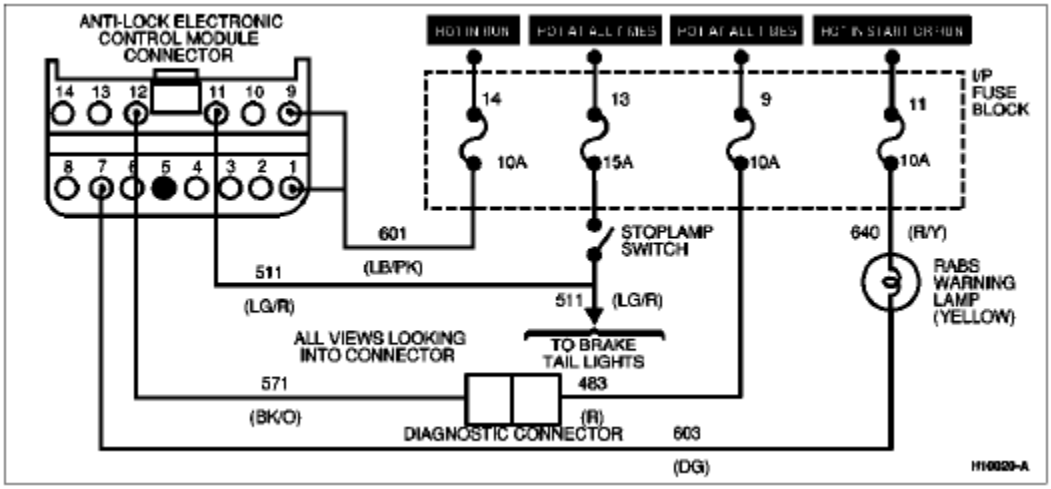
Is resistance steady and less than 1 ohm?

Yes	No

REPLACE anti-lock electronic control module. RECONNECT the battery ground cable. REPEAT System Pre-Check.	REPAIR poor ground in Circuit 530 (BK/W). RECONNECT the battery ground cable. REPEAT System Pre-Check.

SYSTEM PRE-CHECK TEST D: YELLOW REAR ABS LIGHT SELF-CHECK OK, BUT NO FLASHOUT CODE WHEN DIAGNOSTICS IS STARTED

Affected Circuit(s)/Electrical Component(s)



Description

The RABS warning light should automatically begin a flash-out sequence if the diagnostic connector is shorted to ground for at least one second. This flashout sequence can be observed by watching the REAR ABS light. There are a few conditions which will prevent the flashout from occurring. These must be resolved before continuing the RABS repair process.

Possible Contributing Base Brake Component/Vehicle Wiring Concerns

- Burned-out brake taillights
- Missing RABS power (Circuit 601 [LB/PK]) and associated fuse
- Shorted RABS light circuit (Circuit 603 [DG])
- Incorrect anti-lock electronic control module type (RABS I vs. RABS II)

TABLE I. ORIGINAL EQUIPMENT — RABS I VS. RABS II

Vehicle Type	Model Year	RABS System
Aerostar	91	RABS I (See Note)

Aerostar	92-93	RABS II
Ranger	89-92	RABS I (See Note)
Ranger	93	RABS II

NOTE: A RABS I system which has previously been serviced may have its anti-lock electronic control module upgraded to a RABS II. In the event that you are uncertain whether you have a RABS I or RABS II anti-lock electronic control module, check the anti-lock electronic control module part number to be certain of the type of system you have. Part number F29F-2C018 — RABS II anti-lock electronic control module; part number F37F-2C018 — RABS II anti-lock electronic control module; all others — RABS I anti-lock electronic control module.

WARNING: DO NOT INSTALL A RABS I ANTI-LOCK ELECTRONIC CONTROL MODULE IN A RABS II SYSTEM.

CAUTION: RABS I vehicles which have been upgraded with RABS II anti-lock electronic control module will NOT have keep-alive memory and therefore will not be able to store codes when the vehicle is turned off.

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for electrical tests.

D1 DETERMINE IF SYSTEM IS RABS I OR RABS II

- Determine if the ABS system is a RABS I or a RABS II system. (See TABLE 1 after this test for assistance.)

Is module RABS I?

Yes	No
This shop manual does not cover RABS I anti-lock electronic control module. SEE appropriate shop manual for vehicle which you are servicing.	GO to **D2** .

D2 CHECK FOR SHORTED BRAKE SWITCH

- Observe rear brake lights.

Are the brake lights on continuously?

Yes	No
REPAIR shorted stoplight switch. REPEAT System Pre-Check.	GO to **D3** .

D3 CHECK FOR BURNED-OUT REAR BRAKE LIGHTS

- Press on brake pedal while observing rear brake lights.

Do the brake lights function?

Yes	No
GO to **D4** .	REPAIR brake light system: Burned-out bulbs or open Circuit 511 (LG). REPEAT System Pre-Check.

D4 CHECK FOR LOSS OF BRAKE INPUT TO ANTI-LOCK ELECTRONIC CONTROL MODULE

- Remove the anti-lock electronic control module harness connector from the anti-lock electronic control module. Check for terminal back-out.
- Set multimeter to 20 VDC range.
- Press on brake pedal hard enough to turn on rear brake lights.
- Measure voltage from RABS harness connector Pin 11 to chassis ground while brake pedal is pressed.

Are 9 volts or more present?

Yes	No
LEAVE anti-lock electronic control module disconnected. GO to **D5** .	REPAIR open in Circuit 511 (LG). RECONNECT anti-lock electronic control module. REPEAT System Pre-Check.

D5 CHECK POWER TO THE ANTI-LOCK ELECTRONIC CONTROL MODULE

- Turn the ignition to the ON position.
- Measure the voltage between RABS harness connector Pin 1 (or Pin 9) and chassis ground.

Are 9 volts or more present?

Yes	No
LEAVE anti-lock electronic control module disconnected. GO to **D6** .	REPAIR Circuit 601 (LB/PK) or associated fuse. RECONNECT anti-lock electronic control module. REPEAT System Pre-Check.

D6 CHECK FOR SHORTS IN ANTI-LOCK ELECTRONIC CONTROL MODULE HARNESS CONNECTOR

- With same set up as in Step D5, observe yellow REAR ABS light.

Is the REAR ABS light on?

Yes	No

CHECK for short to ground in Circuit 603 (DG). RECONNECT the anti-lock electronic control module. REPEAT System Pre-Check.	LEAVE anti-lock electronic control module disconnected. GO to **D7**.

D7 CHECK CIRCUIT 571 (BK/O) CONTINUITY

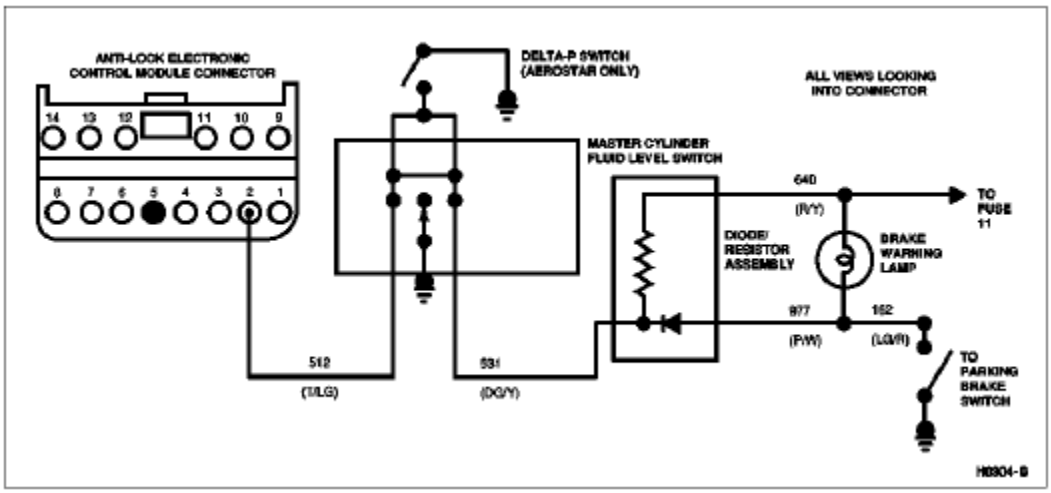
- Set the multimeter to the 200-ohm scale.
- Disconnect the RABS diagnostic connector from its mating half (Circuits 571 [BK/O] and 483 [R]).
- Measure resistance of Circuit 571 (BK/O) from diagnostic connector to module harness connector Pin 12.

Is the resistance less than 20 ohms?

Yes	No
REPLACE anti-lock electronic control module.	REPAIR Circuit 571 (BK/O). RECONNECT RABS II anti-lock electronic control module. REPEAT System Pre-Check.

SYSTEM PRE-CHECK TEST E: RED BRAKE WARNING LIGHT STAYS ON WHEN KEY IS IN RUN POSITION

Affected Circuit(s)/Electrical Component(s)



Description

Red BRAKE light ON with ignition switch ON and parking brake released.

Possible Contributing Component/Vehicle Wiring Faults

- Ground short on Circuit 977 (P/W)
- Ground short on Circuit 162 (LG/R)
- Damaged parking brake switch
- Damaged Delta-P switch (Aerostar Only)

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for electrical tests.

E1 CHECK IF BOTH WARNING LIGHTS ARE ON

- Disengage parking brake.
- Key ON.

Do both the red BRAKE warning light and yellow RABS light come on?

Yes	No
PULL code. DTC 4: GO to Pinpoint Test 4 . DTC 12: GO to Pinpoint Test 12 .	GO to **E2** .

E2 CHECK PARKING BRAKE SWITCH

- Key OFF.
- Disconnect parking brake switch from harness connector.
- Key ON.

Does the red BRAKE warning light remain on?

Yes	No
Aerostar: GO to **E3** . Ranger: REPAIR ground short in Circuits 977 or 162.	REPEAT System Pre-Check.

E3 CHECK DELTA-P SWITCH (AEROSTAR ONLY)

- Key OFF.
- Disconnect low vacuum switch from harness connector.
- Key ON.

Does the red BRAKE warning light remain on?

Yes	No
REPAIR ground short in Circuits 977 or 162. REPEAT System Pre-Check.	REPLACE Delta-P switch. REPEAT System Pre-Check.

Intermittent Diagnosis Guidelines

An understanding of code storage and automatic code erasure is important.

First, codes can only be stored if the anti-lock electronic control module (2C018) has power. The anti-lock electronic control module gets primary power from the ignition feed into Pins 1 and 9. If this voltage is missing or less than 11V, the anti-lock electronic control module will not initialize and therefore, a code cannot be stored. However, any code already in memory will be retained as long as the keep-alive memory power is available. Code 16 (system OK) is present whenever the anti-lock electronic control module sees the required voltage (assuming no other diagnostic trouble codes are present).

Some codes read out in the System Pre-Check may not result in any trouble found in the pinpoint test performed. Most likely, this is an indication of an intermittent electrical concern.

To minimize misdiagnosis, refer to the Intermittent Diagnosis procedure if no resolution has been reached by the end of a particular pinpoint test.

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for electrical tests.

PINPOINT TEST ID: INTERMITTENT DIAGNOSIS PROCEDURE

ID1 CLEAR CODES, RECONNECT COMPONENTS

- Remove the pinout box.
- Reinstall any components removed and reconnect all connections.
- Clear all codes.
- Key ON.

Does the REAR ABS warning light prove out?

Yes	No
GO to **ID3** .	GO to **ID2** .

ID2 SERVICE CONNECTOR/TERMINAL FAULT

- Most likely problem is at one of the affected component connectors such that terminals unseat or back out upon installation. At each affected connection, look for:
  - Bent terminals.
  - Damaged connector terminal locks.
  - Damaged connector wedge.

    NOTE: If one of the above conditions is found, check the length of the affected circuit

once the connection is remade. If the wire is too tight (short), damage is likely to recur once vehicle is given back to the customer. Repair the wire as necessary to correct tight wire conditions.

Are any of the above conditions noted?

Yes	No
REPAIR connector and terminal as necessary. GO to **ID7** .	GO to **ID6** .

ID3 WIGGLE TEST

- Leave key on.

  NOTE: Start at one component and wiggle connector by connector until the whole circuit has been tested.

- Wiggle an affected circuit in one location only.
- Observe REAR ABS warning light.

Is the REAR ABS warning light on?

Yes	No
REPAIR the wire terminal or connector as identified in the wiggle test. GO to **ID5** .	GO to **ID4** .

ID4 VERIFY ALL CIRCUITS HAVE BEEN TESTED

Have all affected circuits for the code being serviced been tested?

Yes	No
Key OFF. GO to **ID6** .	GO to **ID3** and CHECK next circuit.

ID5 RETRIEVE CODE

- Retrieve code.

Is this code different than the code being serviced?

Yes	No
GO to the appropriate pinpoint test.	REPAIR the wire, terminal, or connector as necessary. GO to **ID7** .

ID6 VERIFY ALL APPROPRIATE DIAGNOSTIC PROCEDURES HAVE BEEN RUN

NOTE: All steps of the pinpoint test for the code being serviced must be completed. (If some tests were performed, then go to the pinpoint step last completed and continue.)

Has the System Pre-Check been run and a code been retrieved?

Yes	No
RETURN to the pinpoint test and PROCEED.	RETURN to procedure(s) not yet performed and PROCEED.

ID7 VERIFY CONDITION RESOLVED

- Clear all codes.
- Key OFF.
- Retrieve code.

Is Code 16 set?

Yes	No
STOP. Concern has been corrected.	If code being repaired still exists, GO to **ID4** . If different code is set, GO to appropriate pinpoint test for the code obtained.

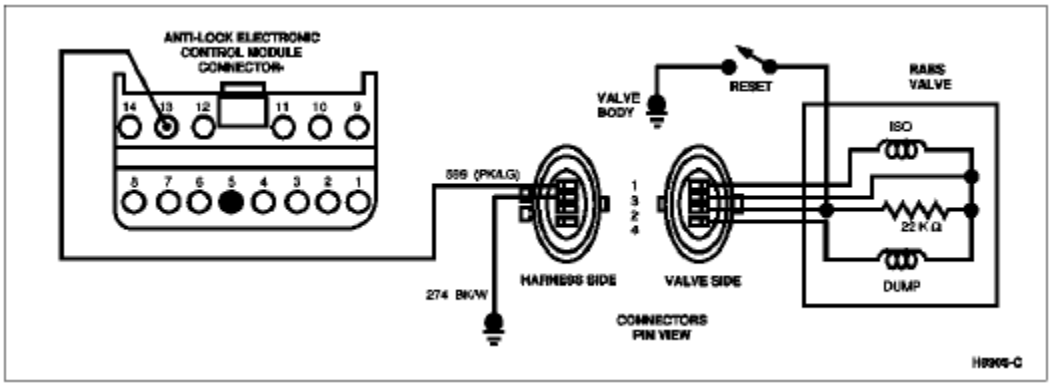
Pinpoint Tests, After System Pre-Check

CONDITION CHART

CONDITION	ACTION TO TAKE
Yellow REAR ABS light flashes 2 times. Open RABS 11 isolation solenoid circuit.	See Pinpoint Test Code 2.
Yellow REAR ABS light flashes 3 times. Open RABS 11 dump solenoid circuit.	See Pinpoint Test Code 3.
Yellow REAR ABS light flashes 4 times. Red BRAKE warning light illuminated. Open/grounded RABS valve reset circuit.	See Pinpoint Test Code 4.
Yellow REAR ABS light flashes 5 times. Excessive dump solenoid activity.	See Pinpoint Test Code 5.
Yellow REAR ABS light flashes 6 times. Erratic rear brake anti-lock sensor circuit.	See Pinpoint Test Code 6.
Yellow REAR ABS light flashes 7 times. No isolation solenoid during self-check.	See Pinpoint Test Code 7.
Yellow REAR ABS light flashes 8 times. No dump solenoid during self-check.	See Pinpoint Test Code 8.
Yellow REAR ABS light flashes 9 times. High speed sensor resistance.	See Pinpoint Test Code 9.
Yellow REAR ABS light flashes 10 times. Low speed sensor resistance.	See Pinpoint Test Code 10.
Yellow REAR ABS light flashes 11 times. Stoplamp switch always closed.	See Pinpoint Test Code 11.
Yellow REAR ABS light flashes 12 times. Loss of hydraulic brake fluid during anti-lock stop.	See Pinpoint Test Code 12.
Yellow REAR ABS light flashes 13 times. RABS 11 module failure.	See Pinpoint Test Code 13.
Yellow REAR ABS light flashes 16 times or more. Drive test.	See Pinpoint Test Code 16.

PINPOINT TEST CODE 2: OPEN RABS II ISOLATION SOLENOID CIRCUIT

Affected Circuit(s)/Electrical Component(s)



Description

NOTE: Refer to Obtaining the Diagnostic Trouble Code in this section for procedure to obtain flashout code.

NOTE: For easier access to the Aerostar RABS valve connector, construct a jumper harness with a 4-pin connector F07Z-14A464-B and four sections of 18-inch long wire. The wire sections should be of different colors or labeled for quick reference.

CAUTION: When checking resistance in the RABS II system, always disconnect the battery ground cable (14301). Improper resistance readings may occur with the vehicle battery connected.

Code 2 is generated by the anti-lock electronic control module's detection of an open circuit in Circuit 599 (PK/LG). The code may also be generated by a failed isolation solenoid (open coil) internal to the RABS valve or a failed internal anti-lock electronic control module circuit.

Possible Contributing Base Brake Component/Vehicle Wiring Concerns

- Terminal backout in the anti-lock electronic control module harness connector at Pin 13
- Terminal backout in the RABS valve harness connector at Pin 1
- Bulkhead connector (between engine compartment and instrument panel (04320)) terminal backout or loose connection
- Anti-lock electronic control module (2C018) or RABS valve connectors not fully mated with component
- Intermittent open circuit in Circuit 599 (PK/LG)

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for electrical tests.

2.1 VERIFY INTEGRITY OF ANTI-LOCK ELECTRONIC CONTROL MODULE CONNECTION

- Turn the ignition OFF.
- Disconnect battery ground cable.
- Remove the module connector.
- Pull gently on Pin 13 (PK/LG) just behind the harness connector.

Is connector clean and secure?

Yes	No
LEAVE anti-lock electronic control module connector disconnected. GO to 2.2 .	REPAIR terminal or connector as needed. If terminals are not serviceable, REPLACE anti-lock electronic control module. GO to 2.6 .

2.2 VERIFY INTEGRITY OF RABS VALVE CONNECTION

- Remove RABS valve connector.
- Inspect RABS valve component connector for contamination or loose terminals.
- Pull gently on Pin 1 (PK/LG) just behind the harness connector.

Is terminal clean and secure?

Yes	No
LEAVE RABS valve connector disconnected. GO to 2.3 .	REPAIR terminal or connector as needed. If not repairable, REPLACE RABS valve. GO to 2.6 .

2.3 CHECK FOR CONTINUITY ALONG HARNESS CIRCUIT 599 (PK/LG)

- Verify multimeter is on 200-ohm scale.
- Measure resistance between anti-lock electronic control module harness connector Pin 13 and RABS valve harness connector Pin 1.

Is resistance less than 10 ohms?

Yes	No
Circuit is not open. GO to 2.4 .	FIND and REPAIR open circuit along Circuit 599 (PK/LG). GO to 2.6 .

2.4 CHECK FOR OPEN RABS VALVE ISOLATION SOLENOID

- Verify multimeter is on 200-ohm scale.
- Measure resistance between RABS valve Pins 1 and 3.

Is resistance less than 6 ohms?

Yes	No
Circuit is not open. GO to 2.5 .	OPEN circuit in RABS valve. REPLACE RABS valve. GO to 2.6 .

2.5 MAKE SURE ALL STEPS ARE COMPLETED

CAUTION: Be sure to complete all steps. Failure to do so could lead to replacement of

good components.

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE anti-lock electronic control module. GO to Step **2.6** . If anti-lock electronic control module has been replaced and no resolution has been reached, REPLACE RABS valve. GO to Step **2.6** .	GO to diagnostic step last completed and continue.

2.6 CLEAR CODE/PULL CODE

- Turn ignition OFF.
- Reconnect battery ground cable.

NOTE: When the battery ground cable has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

- Verify all connectors are installed.
- Locate and disconnect the diagnostic connector from its mating half (Circuits 571 [BK/O] and 483 [R]).
- Turn ignition ON.
- Begin diagnostic trouble code flashout by connecting Circuit 571 (BK/O) to a chassis ground for at least 1 second.
- Observe and count code.

Is Code 16 set?

Yes	No
GO to Drive Test Code 16 .	If Code 2, GO to **2.7** . If different code, GO to pinpoint test for corresponding code.

2.7 PINPOINT TEST STATUS

Has pinpoint test been completed?

Yes	No
GO to **2.8** .	RETURN to last pinpoint test completed.

2.8 VERIFY INTEGRITY OF VEHICLE WIRING

If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

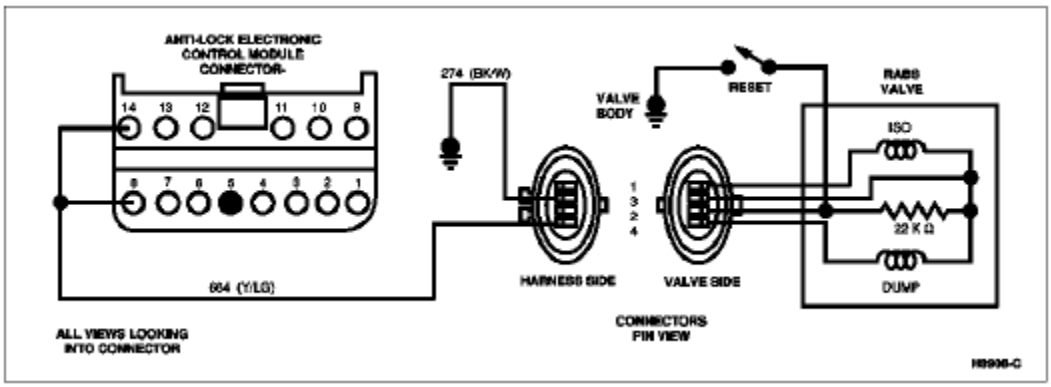
- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on this pinpoint test system schematic.

Is resolution achieved?

Yes	No
STOP. Repair is complete. GO to Drive Test Code 16 .	GO to **2.5** .

PINPOINT TEST CODE 3: OPEN RABS II DUMP SOLENOID CIRCUIT

Affected Circuit(s)/Electrical Component(s)



Description

Code 3 is generated by the anti-lock electronic control module's detection of an open circuit in line 664 (Y/LG) or 274 (BK/W). The code may also be generated by a failed dump solenoid (open coil) internal to the RABS valve or a failed internal anti-lock electronic control module circuit.

Possible Contributing Base Brake Component/Vehicle Wiring Concerns

- Terminal backout in the anti-lock electronic control module harness connector at Pins 8 or 14
- Terminal backout in the RABS valve harness connector at Pin 4
- Bulkhead connector (between engine compartment and instrument panel) terminal backout or loose connection
- Anti-lock electronic control module or RABS valve connectors not fully mated with component
- Intermittent open circuit in line 664 (Y/LG)

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for electrical tests.

3.1 VERIFY INTEGRITY OF ANTI-LOCK ELECTRONIC CONTROL MODULE CONNECTION

- Turn ignition to the OFF position.
- Disconnect battery ground cable.
- Remove the anti-lock electronic control module connector.
- Inspect anti-lock electronic control module Pins 8 and 14.
- Pull gently on each wire just behind Pins 8 and 14 on harness connector.

Are connections clean and secure?

Yes	No
LEAVE anti-lock electronic control module connector disconnected. GO to **3.2** .	Terminal(s) in anti-lock electronic control module connector are loose, bent, deformed, corroded, or missing. REPAIR terminal or connector as needed. If not repairable, REPLACE anti-lock electronic control module. GO to **3.6** . Terminals 8 or 14 in harness connector move back or come free of connector. REPAIR terminal or connector as needed. GO to **3.6** .

3.2 VERIFY INTEGRITY OF RABS VALVE CONNECTION

- Remove RABS valve connector.
- Inspect RABS valve connector Pin 4.
- Gently pull on Pin 4 wire just behind harness connector.

Are connections clean and secure?

Yes	No
LEAVE RABS valve connector disconnected. GO to **3.3** .	Terminal(s) in RABS valve connector are loose, bent, deformed, corroded, or missing. REPAIR terminal or connector as needed. If not repairable, REPLACE RABS valve. GO to **3.6** Terminal(s) in harness connector move back or come free of connector. REPAIR terminal or connector as needed. GO to **3.6** .

3.3 CHECK FOR CONTINUITY ALONG HARNESS CIRCUIT 664 (Y/LG) FROM ANTI-LOCK ELECTRONIC CONTROL MODULE CONNECTOR PINS 8 AND 14

- Set multimeter on 200-ohm scale.
- Measure resistance between anti-lock electronic control module harness connector Pin 8 and RABS valve harness connector Pin 4.
- Measure resistance between anti-lock electronic module harness connector Pin 14 and RABS valve

harness connector Pin 4.

Is resistance less than 1 ohm?

Yes	No
Circuit is not open. GO to **3.4** .	FIND and REPAIR open circuit along 664 (Y/LG). GO to **3.6** .

3.4 CHECK FOR OPEN RABS DUMP VALVE SOLENOID

- Verify multimeter is on 200-ohm scale.
- Measure resistance between RABS valve Pins 4 and 3.

Is resistance less than 3 ohms?

Yes	No
Circuit is not open. GO to **3.5** .	Open circuit in RABS is indicated. REPLACE RABS valve. GO to **3.6** .

3.5 MAKE SURE ALL STEPS ARE COMPLETED

CAUTION: Be sure to complete all steps. Failure to do so may lead to replacement of good parts.

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE anti-lock electronic control module. GO to Step **3.6** . If anti-lock electronic control module has been replaced and no resolution has been reached, REPLACE RABS valve. GO to Step **3.6** .	GO to diagnostic step last completed and CONTINUE.

3.6 CLEAR CODE/PULL CODE

- Turn ignition OFF.

NOTE: When the battery ground cable has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

- Reconnect battery ground cable.
- Verify all connectors are installed.
- Locate and disconnect the diagnostic connector from its mating half (Circuits 571 [BK/O] and 483 [R]).
- Turn ignition ON.
- Begin diagnostic trouble code flashout by connecting Circuit 571 (BK/O) to a chassis ground for at least 1 second.
- Observe and count code.

Is Code 16 set?

Yes	No
GO to Drive Test Code 16 .	If Code 2, GO to **3.7** . If different code, GO to pinpoint test for corresponding code.

3.7 PINPOINT TEST STATUS

Have all prior pinpoint tests been completed?

Yes	No
GO to **3.8** .	RETURN to last pinpoint test completed.

3.8 VERIFY INTEGRITY OF VEHICLE WIRING

If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

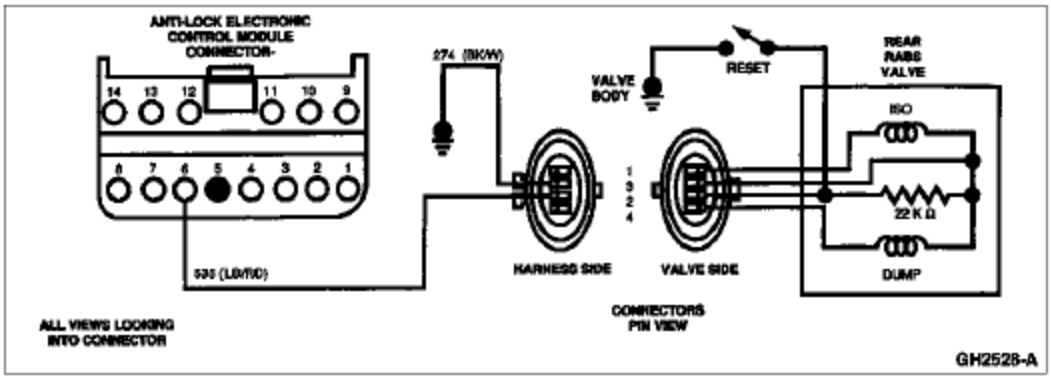
- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on this pinpoint test system schematic.

Is resolution achieved?

Yes	No
STOP. Repair is complete. GO to Drive Test Code 16 .	GO to **3.5** .

PINPOINT TEST CODE 4: OPEN/GROUNDED RABS VALVE RESET CIRCUIT

Affected Circuit(s)/Electrical Component(s)



Description

Code 4 is generated by the anti-lock electronic control module's detection of a resistance falling below 18 k Ohms (short) or above 26 k Ohms (open) in Circuit 535 (LB/R). This can indicate an open or short in the reset switch circuit, or a hydraulic leak into dump section of the valve.

Possible Contributing Base Brake Component/Vehicle Wiring Concerns

- Terminal backout in the module harness connector at Pin 6
- Terminal backout in the RABS valve harness connector at Pins 2 or 3
- Bulkhead connector (between engine compartment and instrument panel) terminal backout or loose connection
- Anti-lock electronic control module or RABS valve connectors not fully mated with component
- Intermittent open or open circuit in Circuits 535 (LB/R), or 274 (BK/W)
- Intermittent short or short circuit in Circuit 535 (LB/R)
- Defective RABS valve

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for electrical tests.

4.1 VERIFY INTEGRITY OF RABS VALVE CONNECTION

- Remove RABS valve connector.
- Inspect RABS valve component connector Pins 2 and 3.
- Inspect RABS valve harness connector Pins 2 and 3.
- Pull gently on Pin 2 wire just behind the harness connector.
- Pull gently on Pin 3 just behind the harness connector.

Are connections clean and secure?

Yes	No
LEAVE RABS valve connector disconnected. GO to **4.2** .	Terminals in RABS valve connector are loose, bent, deformed, corroded, or missing. REPAIR terminal or connector as needed. If not repairable, REPLACE RABS valve. GO to **4.10** .

	Terminal(s) in harness connector move back or come free of connector. REPAIR terminal or connector as needed. GO to **4.10** .

4.2 VERIFY INTEGRITY OF ANTI-LOCK ELECTRONIC CONTROL MODULE CONNECTION

- Turn the ignition OFF.
- Disconnect battery ground cable.
- Inspect anti-lock electronic control module component connector Pin 6.
- Inspect anti-lock electronic control module harness connector Pin 6.
- Pull gently on Pin 6 wire just behind the harness connector.

Are connections clean and secure?

Yes	No
LEAVE anti-lock electronic control module connector disconnected. GO to **4.3** .	Terminal(s) in anti-lock electronic control module connector are loose, bent, deformed, corroded, or missing. REPAIR terminal or connector as needed. If not repairable, REPLACE anti-lock electronic control module. GO to **4.10** . Terminal 6 in harness connector moves back or comes free of connector. REPAIR terminal or connector as needed. GO to **4.10** .

4.3 CHECK FOR CLOSED RABS VALVE RESET SWITCH

- Verify multimeter is on 200k Ohm scale.
- Measure resistance between RABS valve connector Pin 2 and RABS valve body.

Is resistance greater than 10 k Ohms?

Yes	No
Reset switch is not closed. GO to **4.4** .	Shorted circuit in RABS valve is indicated. REPLACE RABS valve. GO to **4.10** .

4.4 CHECK RESISTANCE BETWEEN RABS VALVE RESET SWITCH AND RABS VALVE COMMON

- Verify multimeter is on 30k Ohm scale.
- Measure resistance between RABS valve Pins 2 and 3.

Is resistance between 18-26 k Ohms for aluminum RABS valve?

Yes	No

GO to 4.5.	Shorted or open circuit in RABS valve is indicated. REPLACE RABS valve. GO to 4.9.

4.5 CHECK FOR CONTINUITY ALONG GROUND CIRCUIT 274 (BK/W)

- Set multimeter on 200-ohm scale.
- Measure resistance between RABS valve harness connector Pin 3 and negative battery post.

Is resistance 3 ohms or less?

Yes	No
Circuit is not open. GO to 4.6.	FIND and REPAIR open circuit along Circuit 274 (BK/W). GO to 4.10.

4.6 CHECK FOR SHORT ALONG HARNESS CIRCUIT 535 (LB/R)

- Set multimeter on 200-ohm scale.
- Measure resistance between module harness connector Pin 6 and chassis ground.

Is resistance greater than 12 ohms?

Yes	No
Circuit is not shorted. GO to 4.7.	FIND and REPAIR short circuit along Circuit 535 (LB/R). GO to 4.10.

4.7 CHECK FOR CONTINUITY ALONG HARNESS CIRCUIT 535 (LB/R)

- Set multimeter on 200-ohm scale.
- Measure resistance between anti-lock electronic control module harness connector Pin 6 and RABS valve harness connector Pin 2.

Is resistance less than 10 ohms?

Yes	No
Circuit is not open. GO to 4.8.	FIND and REPAIR open circuit along Circuit 535 (LB/R). GO to 4.10.

4.8 MAKE SURE ALL STEPS ARE COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: Make sure to complete all steps. Failure to do so could lead to replacement of

good parts.

Have all prior diagnostic steps been completed as described above?

Yes	No
GO to Step **4.9** .	GO to diagnostic step last completed and CONTINUE.

4.9 ISOLATE RABS MODULE

- Verify all wiring is connected.
- Reconnect battery ground cable.

NOTE: When the battery ground cable has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

- Clear codes.
- Turn ignition key to ON position.

Is ABS indicator light on?

Yes	No
REPLACE anti-lock electronic control module. GO to **4.10** .	GO to Drive Test Code 16 . If code 4 is reset, REPLACE RABS valve. GO to **4.10** .

4.10 CLEAR CODE/PULL CODE

- Locate and disconnect the diagnostic connector from its mating half (Circuits 571 (BK/O) and 483 (R).
- Turn ignition ON.
- Begin diagnostic trouble code flashout by connecting Circuit 571 (BK/O) to a chassis ground for at least 1 second.
- Observe and count code.

Is Code 16 set?

Yes	No
GO to Drive Test Code 16 .	If no code is set, GO to **4.11** . If different code is set, GO to pinpoint test for corresponding code.

4.11 VERIFY PINPOINT TEST IS COMPLETE

Have all prior pinpoint tests been completed?

Yes	No

GO to **4.12** .	GO to **4.3** .

4.12 VERIFY INTEGRITY OF VEHICLE WIRING

If the above steps have been completed, the most likely cause of the concern is wiring related.

- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for all affected circuits as shown on the Pinpoint Test system schematic.

Is resolution achieved?

Yes	No
GO to Drive Test Code 16 .	GO to Drive Test Code 4 .

PINPOINT TEST CODE 5: EXCESSIVE DUMP SOLENOID ACTIVITY, AEROSTAR ONLY

Description

Code 5 is generated when the maximum number of allowable dump pulses has be en exceeded. The system will only recognize this condition during an anti-lock stop in 2WD mode. The code may be caused by a blocked RABS dump valve orifice, a stuck dump valve, an open circuit in Circuit 210 (LB), a worn or damaged 4x4 transfer case that causes the vehicle to remain in 4x4 after 4x2 has been selected, or mechanical problems in the rear brake system. (Brake drums (1126) may lock.)

Possible Contributing Base Brake Component/Vehicle Wiring Concerns

- Parking brake drag
- Rear brake assembly grabbing or hanging up
- Connector corrosion or contamination
- Intermittent open circuit in Circuit 210 (LB)
- Pierced wire insulation to battery power (4x4 only)

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for electrical tests.

5.1 DRIVE STATUS

- Determine if vehicle is in 2- or 4-wheel drive when code occurs.

Is vehicle in 4-wheel drive?

Yes	No
GO to **5.2** .	GO to **5.3** .

5.2 CHECK FOR INCORRECT 4WD SWITCH SIGNAL, OR SHORT TO POWER TO ANTI-LOCK ELECTRONIC CONTROL MODULE

- Disconnect anti-lock electronic control module harness connector from anti-lock electronic control module to deactivate RABS.
- Key ON.
- Shift into 4x4 mode.
- Set multimeter to 20VDC scale.
- Measure voltage between Pin 5 of the anti-lock electronic control module harness and chassis ground.

Is the measured voltage less than 1V?

Yes	No
GO to **5.3** .	REPAIR 4x4 indicator switch or REPAIR short in Circuit 210 (LB). REFER to the appropriate section in Group 07 for procedures. GO to **5.4** .

5.3 CHECK FOR LOW OR ERRATIC SPEED SENSOR SIGNAL

- Disconnect anti-lock electronic control module harness connector.
- Position vehicle on hoist and raise both front and rear wheels just enough to clear the floor.
- Start the engine and turn the wheels at 8 km/h (5 mph).
- Place multimeter on 2000mV AC scale.
- Measure the voltage across anti-lock electronic control module harness connector Pins 3 and 10.

Is the voltage less than 650mV RMS or is speed sensor signal erratic?

Yes	No
COMPLETE pinpoint test for Code 6, Steps 6.2 through 6.8, then RETURN. GO to **5.4** to verify.	REINSTALL anti-lock electronic control module connector. GO to Drive Test Code 5 .

5.4 MAKE SURE ALL STEPS ARE COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: Make sure to complete all pinpoint test steps. Failure to do so could cause replacement of good parts.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE anti-lock electronic control module. GO to Step **5.5** . If anti-lock electronic control module has been	GO to diagnostic step last completed and CONTINUE.

replaced and no resolution has been reached, REPLACE RABS valve. GO to Step **5.5** .	

5.5 CLEAR CODE/PULL CODE

- Turn ignition OFF.

NOTE: When the battery ground cable has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

- Reconnect battery ground cable.
- Verify all connectors are installed.
- Locate and disconnect the diagnostic connector from its mating half (Circuits 571 [BK/O] and 483 [R]).
- Turn ignition ON.
- Begin diagnostic trouble code flashout by connecting Circuit 571 (BK/O) to a chassis ground for at least 1 second.
- Observe and count code.

Is Code 16 set?

Yes	No
GO to Drive Test Code 16 .	If Code 5, GO to **5.6** . If different GO to pinpoint test for corresponding code.

5.6 PINPOINT TEST STATUS

Have all prior pinpoint tests been completed?

Yes	No
GO to **5.7** .	RETURN to last pinpoint test completed.

5.7 VERIFY INTEGRITY OF VEHICLE WIRING

If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

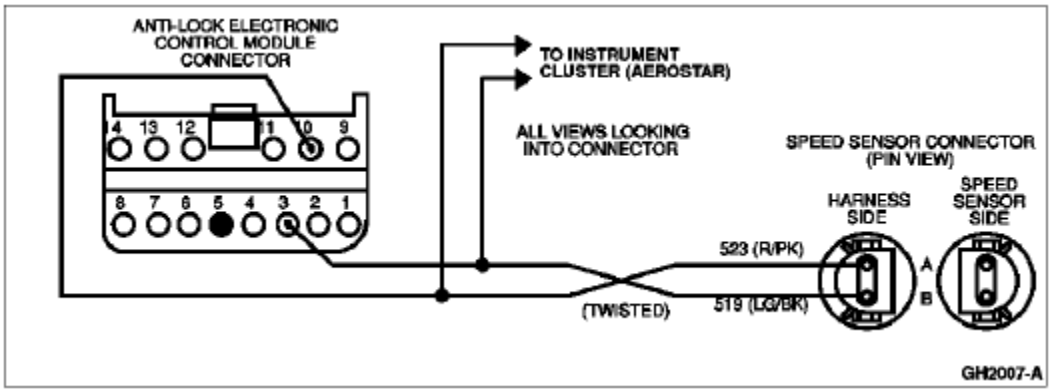
- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on the main schematic.

Is resolution achieved?

Yes	No
STOP. Repair is complete. GO to Drive Test Code 16 .	GO to Drive Test Code 5 .

PINPOINT TEST CODE 6: ERRATIC REAR BRAKE ANTI-LOCK SENSOR CIRCUIT

Affected Circuit(s)/Electrical Component(s)



Description

Code 6 is generated by the anti-lock electronic control module's detection of an interruption in the continuous signal from the speed sensor while rolling, caused by an intermittent open internal to the speed sensor, Circuit 519 (LG/BK) or Circuit 523 (R/PK), or a damaged speed sensor ring. This condition can be detected anytime the brake pedal (2455) is not applied and 20 seconds has elapsed since the ignition self-test.

Possible Contributing Base Brake Component/Vehicle Wiring Concerns

- Terminal backout in the anti-lock electronic control module harness connector at Pins 3 and 10
- Terminal backout in the RABS speed sensor harness connector at Pins A and B
- Bulkhead connector (between engine compartment and instrument panel) terminal backout or loose connection
- Anti-lock electronic control module or RABS speed sensor connectors are not fully mated with component
- Intermittent open/short circuit in Circuits 519 (LG/BK) or 523 (R/PK)
- Damaged speed sensor (possibly metal shavings on pole piece)
- Damaged speed sensor ring (possibly teeth missing)

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for electrical tests.

6.1 VERIFY INTEGRITY OF ANTI-LOCK ELECTRONIC CONTROL MODULE CONNECTION

- Turn ignition OFF.
- Disconnect battery ground cable.
- Remove the anti-lock electronic control module connector.

- Inspect anti-lock electronic control module component connector for contamination and loose or bent terminals.
- Pull gently on Circuit 519 (LG/BK) just behind Pin 3 on the harness connector.
- Pull gently on Circuit 523 (R/PK) just behind Pin 10 on the harness connector.

Are all connections clean and secure?

Yes	No
LEAVE anti-lock electronic control module connector disconnected. GO to **6.2** .	Terminal(s) in component connector are corroded, bent, or loose. REPAIR terminals or connector as needed. If not repairable, REPLACE anti-lock electronic control module. GO to **6.7** . Terminal(s) in harness connector are corroded, bent, or move back or come free of connector. REPAIR terminals or connector as needed. GO to **6.7** .

6.2 VERIFY INTEGRITY OF SPEED SENSOR CONNECTION

- Verify ignition is OFF.
- Remove speed sensor connector.
- Inspect speed sensor component connector for contamination and bent or loose terminals.
- Gently pull on Circuit 519 (LG/BK) behind Pin B of harness connector.
- Gently pull on Circuit 523 (R/PK) behind Pin A of harness connector.

Are all connections clean and secure?

Yes	No
REINSTALL RABS speed sensor connector. GO to **6.3** .	Terminal(s) in component connector are corroded, bent, or loose. REPAIR terminal or connector as needed. If not repairable, REPLACE RABS speed sensor. GO to **6.7** . Terminal(s) in harness connector are corroded, bent, or move back or come free of connector. REPAIR terminal or connector as needed. GO to **6.7** .

6.3 VERIFY PROPER SPEED SENSOR WIRE ROUTING

- Inspect wire routing.

Are wires clean and secure?

Yes	No
GO to **6.4** .	REPAIR as necessary. GO to **6.7** .

6.4 VERIFY SPEED SENSOR INTEGRITY

- Set multimeter on the 20k Ohm scale.
- Check resistance between Pins A and B of the sensor connector.

Is resistance between 800 and 3500 ohms?

Yes	No
GO to 6.5 .	REPLACE RABS speed sensor. GO to 6.6 .

6.5 CHECK FOR ERRATIC SPEED SENSOR SIGNAL AND LOOSE WIRE CONNECTORS

- Set multimeter on the 20k Ohm scale.
- Check resistance between Pin 10 and Pin 3 of the harness connector while shaking the harness from sensor to anti-lock electronic control module.

Is reading steady and between 800 and 3500 ohms?

Yes	No
Signal is not erratic. GO to 6.6 .	FIND and REPAIR open/short circuit along Circuits 519 (LG/BK) and 523 (R/PK). GO to 6.7 .

6.6 CHECK FOR METAL CHIPS ON SPEED SENSOR MAGNET POLE PIECE

- Verify ignition is OFF.
- Remove the speed sensor from the rear axle housing and inspect for a buildup of metal chips on speed sensor magnetic pole.

Are metal chips present?

Yes	No
DRAIN and CLEAN rear axle housing. GO to 6.7 .	LEAVE speed sensor out. GO to 6.7 .

6.7 MAKE SURE ALL STEPS ARE COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: Make sure to complete all test steps. Failure to do so could cause replacement of good parts.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE anti-lock electronic control module. GO to Step **6.8** . If anti-lock electronic control module has been replaced and no resolution has been reached, REPLACE rear axle speed sensor. GO to Step **6.8** .	GO to diagnostic step last completed and CONTINUE.

6.8 CLEAR CODE/PULL CODE

- Turn ignition OFF.

  NOTE: When the battery ground cable has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

- Reconnect battery ground cable.
- Verify all connectors are installed.
- Locate and disconnect the diagnostic connector from its mating half (Circuits 571 [BK/O] and 483 [R]).
- Turn ignition ON.
- Begin diagnostic trouble code flashout by connecting Circuit 571 (BK/O) to a chassis ground for at least 1 second.
- Observe and count code.

Is Code 16 set?

Yes	No
GO to Drive Test Code 16 .	If Code 6, GO to **6.9** . If different code, GO to pinpoint test for corresponding code.

6.9 PINPOINT TEST STATUS

Have all prior pinpoint tests been completed?

Yes	No
GO to **6.10** .	RETURN to last pinpoint test completed.

6.10 VERIFY INTEGRITY OF VEHICLE WIRING

If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

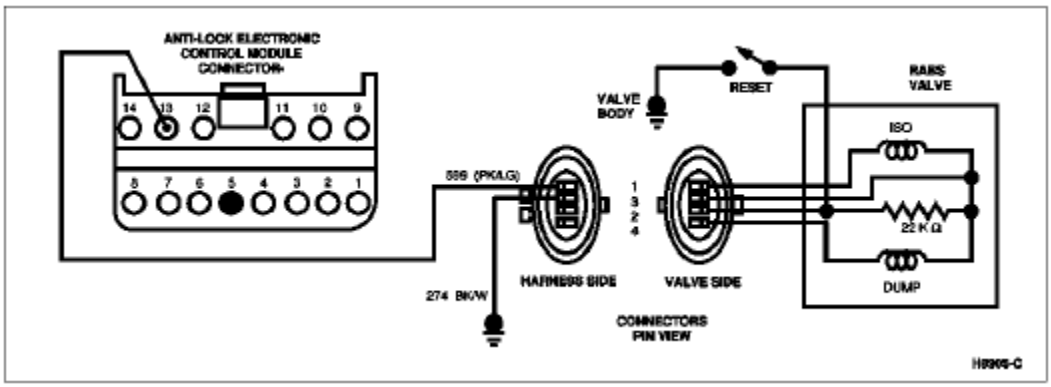
- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on this pinpoint test system schematic.

Is resolution achieved?

Yes	No
STOP. Repair is complete GO to Drive Test Code 16 .	GO to Drive Code Test 6 .

PINPOINT TEST CODE 7: NO ISOLATION SOLENOID DURING SELF-CHECK

Affected Circuit(s)/Electrical Component(s)



Description

Code 7 is generated when the anti-lock electronic control module detects a missing isolation solenoid output. This can only be detected during an ignition self-check or during a RABS stop.

Possible Contributing Base Brake Component/Vehicle Wiring Concerns

- Module internal fuse blown or internal open circuit
- Shorted isolation solenoid internal to the RABS valve
- Intermittent short or shorted circuit in Circuit 599 (PK/LG)
- Contamination or bent Pins 1 and 3 of RABS valve connector shorting together

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for electrical tests.

7.1 CHECK FOR RABS VALVE ISOLATION SOLENOID OR WIRING SHORTED TO GROUND

- Turn the ignition OFF.
- Disconnect battery ground cable.
- Remove the anti-lock electronic control module connector.
- Set the multimeter on the 200-ohm scale.
- Measure the resistance between anti-lock electronic control module harness connector Pin 13 and

chassis ground.

Is resistance less than 3 ohms?

Yes	No
Circuit is shorted. LEAVE module connector disconnected. GO to 7.2 .	Circuit is not shorted. Leave module connector disconnected. GO to 7.5 .

7.2 CHECK INTEGRITY OF RABS VALVE CONNECTION

- Remove RABS valve connector.
- Inspect RABS valve component connector and Pins 1 and 3.

Are connections clean and secure?

Yes	No
LEAVE RABS valve connector disconnected. GO to 7.3 .	REPAIR terminals or connector as needed. If not repairable, REPLACE RABS valve. GO to 7.6 .

7.3 CHECK FOR SHORTED RABS ISOLATION SOLENOID

- Verify RABS valve connector removed.
- Set the multimeter on the 200-ohm scale.
- Measure the resistance between Pins 1 and 3 of RABS valve connector.

Is resistance 3-6 ohms?

Yes	No
LEAVE RABS valve connector disconnected. GO to 7.4 .	REPLACE RABS valve. GO to 7.6 .

7.4 CHECK FOR SHORT TO GROUND ALONG HARNESS CIRCUIT 599 (PK/LG)

- Set multimeter on 20k Ohm scale.
- Measure resistance between anti-lock electronic control module harness connector Pin 13 (PK/LG) and chassis ground.

Is resistance less than 20 k Ohms?

Yes	No
REPAIR short in Circuit 599 (PK/LG) between anti-lock electronic control module and RABS valve. GO to 7.6 .	Conflict of information. REPEAT 7.2 .

7.5 MAKE SURE ALL STEPS ARE COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: Make sure to complete all steps. Failure to do so could lead to replacement of good parts.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE anti-lock electronic control module. GO to Step **7.6**. If anti-lock electronic control module has been replaced and no resolution has been reached, REPLACE RABS valve. GO to Step **7.6**.	GO to diagnostic step last completed and CONTINUE.

7.6 CLEAR CODE/PULL CODE

- Turn ignition OFF.

NOTE: When the battery ground cable has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

- Reconnect battery ground cable.
- Verify all connectors are installed.
- Locate and disconnect the diagnostic connector from its mating half (Circuits 571 [BK/O] and 481 [R]).
- Turn ignition ON.
- Begin diagnostic trouble code flashout by connecting Circuit 571 (BK/O) to a chassis ground for at least 1 second.
- Observe and count code.

Is DTC 16 present?

Yes	No
GO to Drive Test Code 16.	If Code 7, GO to **7.7**. If different code, GO to pinpoint test for corresponding code.

7.7 PINPOINT TEST STATUS

Have all prior pinpoint tests been completed?

Yes	No

GO to **7.8** .	RETURN to last pinpoint test completed.

7.8 VERIFY INTEGRITY OF VEHICLE WIRING

If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

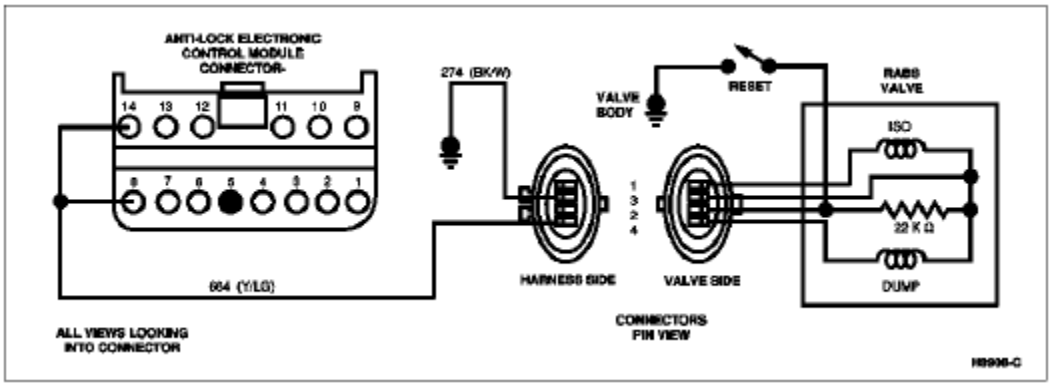
- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on this pinpoint test system schematic.

Is resolution achieved?

Yes	No
STOP. Repair is complete, GO to Drive Test Code 16 .	GO to **7.5** .

PINPOINT TEST CODE 8: NO DUMP SOLENOID DURING SELF-CHECK

Affected Circuit(s)/Electrical Component(s)



Description

Code 8 is generated when the anti-lock electronic control module detects a missing dump solenoid output. This concern can only be detected during an ignition self-test or during a RABS stop.

Possible Contributing Base Brake Component/Vehicle Wiring Concerns

- Anti-lock electronic control module internal fuse blown or internal open circuit
- Shorted dump solenoid internal to RABS valve
- Intermittent short or shorted circuit in Circuit 664 (Y/LG)
- Bulkhead connector between engine compartment and instrument panel terminals shorted

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for electrical tests.

8.1 CHECK FOR RABS VALVE DUMP SOLENOID OR WIRING SHORTED TO GROUND

- Turn the ignition OFF.
- Disconnect battery ground cable.
- Remove the anti-lock electronic control module connector.
- Set the multimeter on the 200-ohm scale.
- Measure the resistance between anti-lock electronic control module harness connector Pin 8 and chassis ground.
- Measure the resistance between anti-lock electronic control module harness connector Pin 14 and chassis ground.

Is resistance between 1 and 3 ohms?

Yes	No
LEAVE anti-lock electronic control module connector disconnected. GO to **8.4** .	LEAVE anti-lock electronic control module connector disconnected. GO to **8.2** .

8.2 CHECK FOR SHORTED RABS DUMP SOLENOID

- Remove RABS valve connector.
- Set the multimeter on the 200-ohm scale.
- Measure the resistance between Pins 3 and 4 of RABS valve connector.

Is resistance greater than 1 ohm?

Yes	No
LEAVE RABS valve connector disconnected. GO to **8.3** .	REPLACE RABS valve. GO to **8.5** .

8.3 CHECK FOR SHORT TO GROUND ALONG HARNESS CIRCUIT 664 (Y/LG)

- Set multimeter on 20-ohm scale.
- Measure resistance to ground between anti-lock electronic control module harness connector Pin 8 and valve harness connector Pin 4.
- Measure resistance to ground between module harness connector Pin 14 and valve harness connector Pin 4.

Is resistance less than 10 ohms?

Yes	No
REPAIR short in Circuit 664 (Y/LG) between anti-lock electronic control module and RABS valve. GO to **8.5** .	Conflict of information. REPEAT **8.1** .

8.4 MAKE SURE ALL STEPS ARE COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: Make sure to complete all steps. Failure to do so could lead to replacement of good parts.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE anti-lock electronic control module. GO to Step **8.5**. If anti-lock electronic control module has been replaced and no resolution has been reached, REPLACE RABS valve. GO to Step **8.5**.	GO to diagnostic step last completed and CONTINUE.

8.5 CLEAR CODE/PULL CODE

- Turn ignition OFF.

NOTE: When the battery ground cable has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

- Reconnect battery ground cable.
- Verify all connectors are installed.
- Locate and disconnect the diagnostic connector from its mating half (Circuits 571 [BK/O] and 483 [R]).
- Turn ignition ON.
- Begin diagnostic trouble code flashout by connecting Circuit 571 (BK/O) to a chassis ground for at least 1 second.
- Observe and count code.

Is DTC 16 present?

Yes	No
GO to Drive Test Code 16.	If Code 8, GO to **8.6**. If different code, GO to pinpoint test for corresponding code.

8.6 PINPOINT TEST STATUS

Have all prior pinpoint tests been completed?

Yes	No

GO to **8.7** .	RETURN to last pinpoint test completed.

8.7 VERIFY INTEGRITY OF VEHICLE WIRING

If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

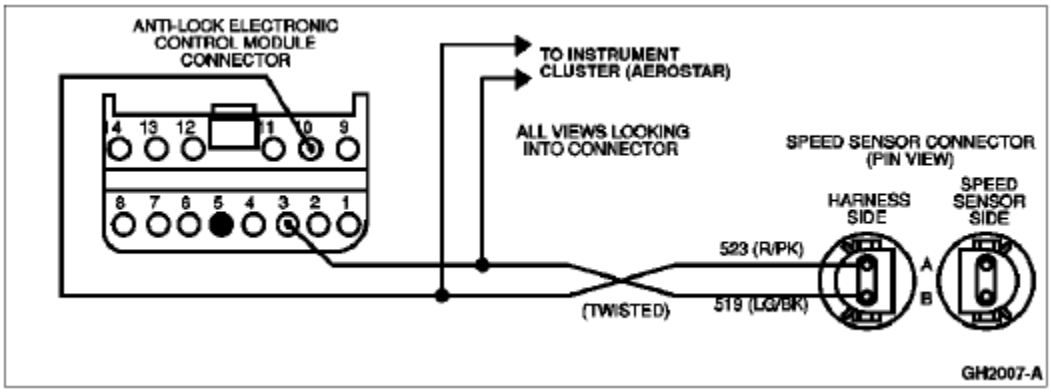
- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on this pinpoint test system schematic.

Is resolution achieved?

Yes	No
STOP. Repair is complete, GO to Drive Test Code 16 .	GO to **8.4** .

PINPOINT TEST CODE 9: HIGH SPEED SENSOR RESISTANCE

Affected Circuit(s)/Electrical Component(s)



Description

Code 9 is generated by the anti-lock electronic control module's detection of high speed sensor resistance. The anti-lock electronic control module will consider the speed sensor circuit to have a high resistance when it exceeds approximately 3 k Ohms. The code may also be generated by a failed internal anti-lock electronic control module circuit.

Possible Contributing Base Brake Component/Vehicle Wiring Concerns

- Terminal backout in the anti-lock electronic control module harness connector at Pin 3 or Pin 10
- Terminal backout in the RABS speed sensor harness connector at Pins A or B
- Module or RABS speed sensor connector not fully mated with component
- Open or intermittent open circuit in Circuits 519 (LG/BK) or 523 (R/PK)

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for electrical tests.

9.1 VERIFY INTEGRITY OF ANTI-LOCK ELECTRONIC CONTROL MODULE CONNECTION

- Turn ignition OFF.
- Disconnect battery ground cable.
- Remove the anti-lock electronic control module connector.
- Pull gently on Circuit 519 (LG/BK) just behind Pin 10 on the harness connector.
- Pull gently on Circuit 523 (R/PK) just behind Pin 3 on the harness connector.

Is terminal fully engaged?

Yes	No
LEAVE anti-lock electronic control module connector disconnected. GO to **9.2** .	REPAIR terminal or connector as needed. GO to **9.6** .

9.2 VERIFY INTEGRITY OF SPEED SENSOR CONNECTION

- Remove speed sensor connector.
- Inspect speed sensor component connector for contamination or loose terminals.
- Gently pull on Circuit 519 (LG/BK) behind Pin B of harness connector.
- Gently pull on Circuit 523 (R/PK) behind Pin A of harness connector.

Are terminals clean and secure?

Yes	No
LEAVE speed sensor connector disconnected. GO to **9.3** .	REPAIR terminal or connectors as needed, if not repairable, REPLACE RABS speed sensor. GO to **9.6** .

9.3 CHECK FOR CONTINUITY ALONG HARNESS CIRCUITS 519 (LG/BK) and 523 (R/PK)

- Set multimeter on 200-ohm scale.
- Measure resistance between anti-lock electronic control module harness connector Pin 3 and speed sensor harness connector Pin B.
- Measure resistance between anti-lock electronic control module harness connector Pin 10 and speed sensor harness connector Pin A.

Is resistance less than 10 ohms?

Yes	No
Circuit is not open. GO to **9.4** .	FIND and REPAIR open circuit along Circuit 519 (LG/BK) and 523 (R/PK). GO to **9.6** .

9.4 CHECK FOR OPEN SPEED SENSOR

- Verify multimeter is on 20k Ohm scale.
- Measure resistance between RABS speed sensor Pins A and B.

Is resistance less than 3500 ohms?

Yes	No
GO to 9.5 .	REPLACE RABS speed sensor. GO to 9.6 .

9.5 MAKE SURE ALL STEPS ARE COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: Make sure to complete all steps. Failure to do so could cause replacement of good parts.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE anti-lock electronic control module. GO to Step 9.6 . If anti-lock electronic control module has been replaced and no resolution has been reached, REPLACE rear axle speed sensor. GO to Step 9.6 .	GO to diagnostic step last completed and CONTINUE.

9.6 CLEAR CODE/PULL CODE

- Turn ignition OFF.

NOTE: When the battery ground cable has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

- Reconnect battery ground cable.
- Verify all connectors are installed.
- Locate and disconnect the diagnostic connector from its mating half (Circuits 571 [BK/O] and 483 [R]).
- Turn ignition ON.
- Begin diagnostic trouble code flashout by connecting Circuit 571 (BK/O) to a chassis ground for at least 1 second.

- Observe and count code.

Is DTC 16 present?

Yes	No
GO to Drive Test Code 16 .	If Code 9, GO to **9.7** . If different code, GO to pinpoint test for corresponding code.

9.7 PINPOINT TEST STATUS

Have all prior pinpoint tests been completed?

Yes	No
GO to **9.8** .	RETURN to last pinpoint test completed.

9.8 VERIFY INTEGRITY OF VEHICLE WIRING

If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

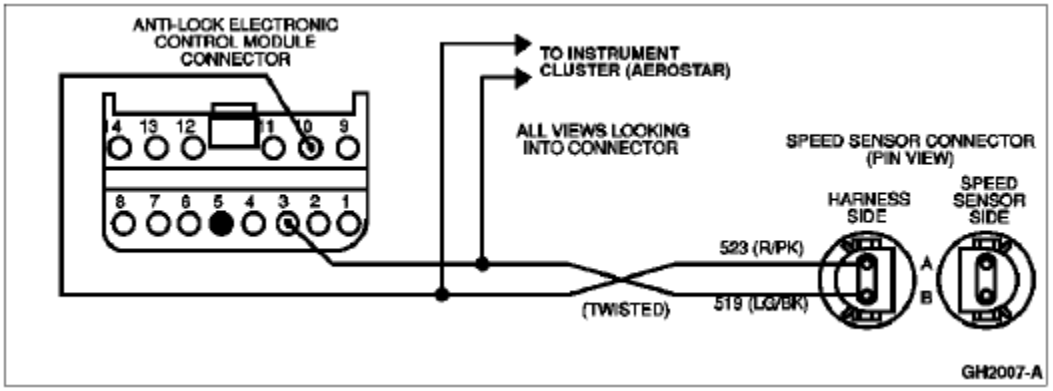
- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on this pinpoint test system schematic.

Is resolution achieved?

Yes	No
STOP. Repair is complete, GO to Drive Test Code 16 .	GO to **9.5** .

PINPOINT TEST CODE 10: LOW SPEED SENSOR RESISTANCE

Affected Circuit(s)/Electrical Component(s)



Description

Code 10 is generated by the anti-lock electronic control module's detection of low speed sensor resistance. The code may also be generated by a short circuit in the Circuits 519 (LG/BK) or 523 (R/PK), or a failed internal anti-lock electronic control module circuit.

Possible Contributing Base Brake Component/Vehicle Wiring Concerns

- Short between anti-lock electronic control module harness connector Pin 3 and Pin 10
- Short between RABS speed sensor connector Pins A and B
- Bulkhead connector (between engine compartment and instrument panel) speed sensor terminals shorted together
- Intermittent short circuit in Circuits 519 (LG/BK) or 523 (R/PK)
- Short in instrument cluster (Aerostar)

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for electrical tests.

10.1 VERIFY INTEGRITY OF ANTI-LOCK ELECTRONIC CONTROL MODULE CONNECTION

- Turn ignition OFF.
- Disconnect battery ground cable.
- Remove the anti-lock electronic control module connector.
- Pull gently on wire just behind Pin 3 on the harness connector.
- Pull gently on wire just behind Pin 10 on the harness connector.

Is terminal fully engaged?

Yes	No
LEAVE anti-lock electronic control module connector disconnected. GO to **10.2** .	REPAIR terminal or connector as needed. GO to **10.7** .

10.2 VERIFY INTEGRITY OF SPEED SENSOR CONNECTION

- Remove speed sensor connector.
- Inspect speed sensor component connector.
- Gently pull on wire behind Pin B of harness connector.
- Gently pull on wire behind Pin A of harness connector.

Are all connections clean and secure?

Yes	No
LEAVE speed sensor connector disconnected.	Terminal(s) in component connector are loose, bent, deformed, or corroded. REPAIR terminal or connectors as needed, if not repairable, REPLACE speed sensor. GO to **10.7** .

GO to **10.3** .	Terminal(s) in harness connector move back or come free of connector. REPAIR terminal or connector as needed. GO to **10.7** .

10.3 CHECK FOR SHORT ALONG HARNESS CIRCUIT 519 (LG/BK) WITH CIRCUIT 523 (R/PK)

- Set multimeter on 20k Ohm scale.
- Verify instrument cluster connection is disconnected (Aerostar).
- Verify speed sensor connector is disconnected.
- Measure resistance between anti-lock electronic control module harness connector Pin 3 and Pin 10.

Is resistance greater than 20k Ohms?

Yes	No
Circuits are not shorted. GO to **10.4** .	FIND and REPAIR short along Circuits 519 (LG/BK) and 523 (R/PK). GO to **10.7** .

10.4 CHECK FOR SHORT TO CHASSIS GROUND ALONG CIRCUIT 523 (R/PK)

- Verify multimeter is on 20k Ohm scale.
- Measure resistance between anti-lock electronic control module harness connector Pin 10 and chassis ground.

Is resistance greater than 20k Ohms?

Yes	No
Circuit is not shorted. GO to **10.5** .	FIND and REPAIR short circuit along Circuit 523 (R/PK). GO to **10.7** .

10.5 CHECK FOR SHORTED SPEED SENSOR

- Verify multimeter is on 20k Ohm scale.
- Measure resistance between RABS speed sensor Pins A and B.

Is resistance steady and 800-3500 ohms?

Yes	No
GO to **10.6** .	REPLACE speed sensor. GO to **10.7** .

10.6 MAKE SURE ALL STEPS ARE COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: Make sure to complete all steps. Failure to do so could cause replacement of good parts.

Have all prior diagnostic steps been completed as described above?

Yes	No
If Aerostar, GO to Step **10.7**. If Ranger, REPLACE anti-lock electronic control module. GO to Step **10.7**. If anti-lock electronic control module has been replaced and no resolution has been reached, REPLACE rear axle speed sensor. GO to Step **10.7**.	GO to diagnostic step last completed and CONTINUE.

10.7 CLEAR CODE/PULL CODE

- Turn ignition OFF.

NOTE: When the battery ground cable has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

- Reconnect battery ground cable.
- Verify all connectors are installed (leave instrument cluster disconnected Aerostar only).
- Locate and disconnect the diagnostic connector from its mating half (Circuits 571 [BK/O] and 483 [R]).
- Turn ignition ON.
- Begin diagnostic trouble code flashout by connecting Circuit 571 (BK/O) to a chassis ground for at least 1 second.
- Observe and count code.

Is Code 16 set?

Yes	No
If Aerostar, REPLACE instrument cluster. GO to Drive Test Code 16. If Ranger, GO to Drive Test Code 16.	If Ranger, Code 10, GO to **10.8**. If Aerostar, Code 10, REPLACE anti-lock electronic control module. GO to **10.8**. If different code, GO to pinpoint test for corresponding code.

10.8 PINPOINT TEST STATUS

Have all prior pinpoint tests been completed?

Yes	No
GO to **10.9**.	RETURN to last pinpoint test completed.

10.9 VERIFY INTEGRITY OF VEHICLE WIRING

If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

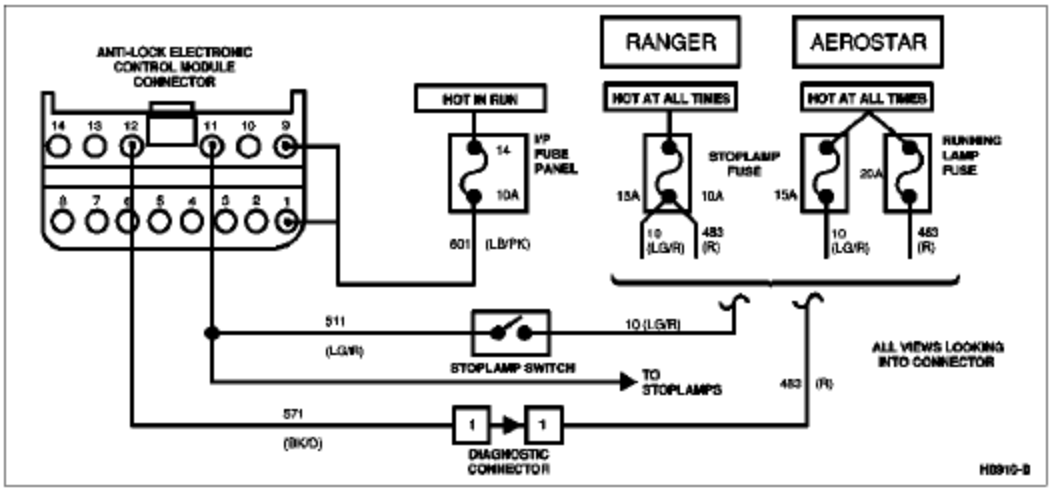
- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on this pinpoint test system schematic.

Is resolution achieved?

Yes	No
STOP. Repair is complete GO to Drive Test Code 16 .	GO to **10.6** .

PINPOINT TEST CODE 11: STOPLAMP SWITCH ALWAYS CLOSED

Affected Circuit(s)/Electrical Component(s)



Description

Code 11 is caused by the stoplight switch (13480) being closed prior to the vehicle moving. If the stoplight switch remains closed when the vehicle begins to move, the REAR ABS warning light will turn on at approximately 26 km/h (16 mph). Code 11 will not be latched in the anti-lock electronic control modules memory until the speed of the vehicle exceeds 60 km/h (37 mph) for at least 10 seconds. If the vehicle does not exceed 60 km/h (37 mph) for at least 10 seconds, then the REAR ABS warning light will turn on but the anti-lock electronic control module will not latch a code. Code 11 can be caused by a driver who is resting his or her foot on the brake pedal with just enough pressure to close the stoplight switch, while driving at least 60 km/h (37 mph) for a minimum of 10 seconds. When this occurs, a Code 11 will be latched by the anti-lock electronic control module.

Possible Contributing Base Brake Component/Vehicle Wiring Concerns

- Terminal backout in the anti-lock electronic control module harness connector at Pin 11
- Missing (burned-out) stoplight bulbs. All stoplight bulbs must be missing or burned-out to cause a Code 11
- An intermittent/continuous open in Circuit 810 (R/LG) for Aerostar or 511 (LG) for Ranger. This open

would be between module connector Pin 11 and the stoplight switch
- Worn or damaged stoplight switch

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for electrical tests.

11.1 CHECK VEHICLE STOPLIGHT OPERATION

- Turn ignition to the OFF position.
- Apply pressure to the brake pedal and then release pressure while observing the stoplights.

Do lights work properly?

Yes	No
GO to **11.4** .	Lights do not illuminate. GO to **11.2** . Lights always illuminated. REPAIR or REPLACE stoplight switch. GO to **11.6** .

11.2 CHECK VEHICLE STOPLIGHTS

- Check vehicle stoplight bulbs.

  NOTE: Both stoplight bulbs need to be burned out to cause a Code 11.

Are the stoplight bulbs burned out?

Yes	No
REPLACE stoplight bulbs and GO to **11.6** .	GO to **11.3** .

11.3 CHECK FOR BLOWN STOPLIGHT FUSE

- Remove and visually inspect stoplight fuse located in the fuse panel.

Is the fuse blown?

Yes	No
REPLACE fuse and investigate reason for blown fuse. GO to **11.6** .	CHECK Circuit 511 (LG) for open condition. If none found, then REPAIR or REPLACE stoplight switch. GO to **11.6** .

11.4 CHECK FOR CONTINUITY BETWEEN ANTI-LOCK ELECTRONIC CONTROL MODULE CONNECTOR PIN 11 AND THE STOPLIGHT SWITCH

- Set multimeter on 20-volt scale.
- Step on brake pedal.
- Measure voltage between module connector Pin 11 and chassis ground.

Is the voltage greater than 9 volts?

Yes	No
REINSTALL all connectors. CALL the Hotline.	Voltage is less than 2 volts. FIND and REPAIR open circuit between anti-lock electronic control module connector (Pin 11), and stoplight switch. REINSTALL all connectors. GO to **11.5** .

11.5 MAKE SURE ALL STEPS ARE COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

  CAUTION: Make sure to complete all steps. Failure to do so could cause replacement of good components.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE anti-lock electronic control module. GO to **11.6** . If anti-lock electronic control module has been replaced and no resolution has been reached, REPLACE stoplight switch. GO to **11.6** .	GO to diagnostic step last completed and continue.

11.6 CLEAR CODE/PULL CODE

- Turn ignition OFF.

  NOTE: When the battery ground cable has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

- Reconnect battery ground cable.
- Verify all connectors are installed.
- Locate and disconnect the diagnostic connector from its mating half (Circuits 571 [BK/O] and 483 [R]).
- Turn ignition switch ON.
- Begin diagnostic trouble code flashout by connecting Circuit 571 (BK/O) to a chassis ground for at least 1 second.
- Observe and count code.

Is Code 16 set?

Yes	No
GO to Drive Test Code 16 .	If Code 11, GO to **11.7** . If different code, GO to pinpoint test for corresponding code.

11.7 PINPOINT TEST STATUS

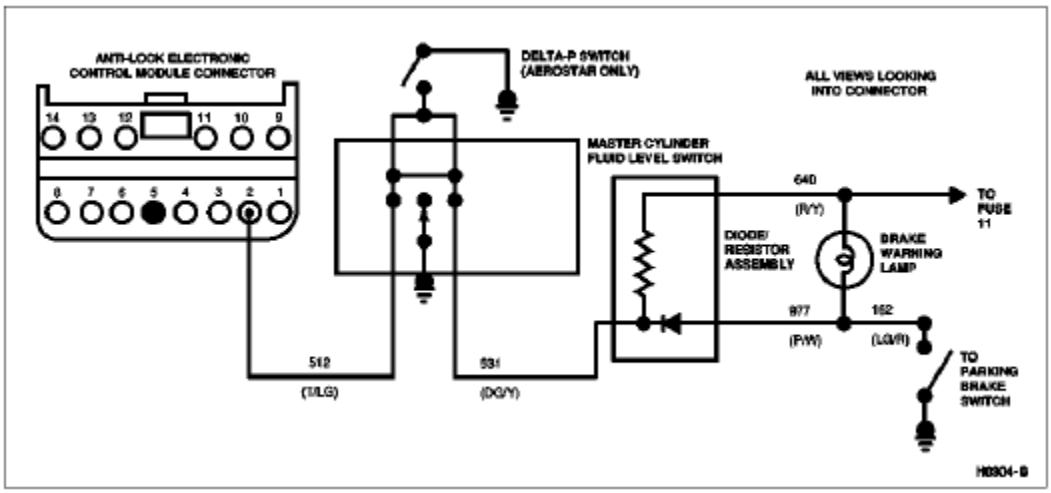
Have all pinpoint tests been completed?

Yes	No
GO to Drive Test Code 16 .	RETURN to last pinpoint test completed.

PINPOINT TEST CODE 12: LOSS OF HYDRAULIC BRAKE FLUID DURING AN ANTI-LOCK STOP

Pinpoint Test 12: Yellow Rear ABS Warning Light Flashes 12 Times When Retrieving Diagnostic Trouble Codes (Code 12)

Affected Circuit(s)/Electrical Component(s)



Description

Code 12 is generated when the anti-lock electronic control module detects that the brake fluid level in the brake master cylinder reservoir (2K478) is low for one or more seconds. It can also be generated by a short in the stoplight circuit.

Possible Contributing Base Brake Component/Vehicle Wiring Concerns

- Low brake master cylinder fill level
- Brake fluid leaks in vehicle brake system

- Worn or damaged master cylinder brake fluid level switch, or brake fluid level circuit shorted to ground
- Brake master cylinder reservoir float that sticks in the bottom of brake master cylinder reservoir or does not float
- Failed diode-resistor element in stoplight circuit
- Damaged ignition switch
- Ground short in Circuits 512 (T/LG) or 531 (DG/Y)
- Damaged anti-lock electronic control module

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for electrical tests.

12.1 CHECK WARNING LIGHTS

- Key OFF.
- Locate and disconnect the diagnostic connector from its mating half (Circuits 571 [BK/O] and 483 [R]).
- Reconnect diagnostic connector.
- Key ON.

Do BOTH the red BRAKE and yellow RABS lamps come on?

Yes	No
HARD fault. GO to **12.2** .	If the brakes have been repaired recently, or if brake fluid has been added to the system recently, MOST likely, the Code 12 was falsely set at that time and the RABS is OK. If this is NOT the case, GO to Pinpoint Test ID for intermittent diagnosis procedures for the affected circuits. REFER to the system schematic for this pinpoint test. If yellow RABS lamp is ON and Code 12 is present, REPAIR open circuit on Pin 2, Circuit 512 (T/LG).

12.2 CHECK BRAKE FLUID LEVEL IN MASTER CYLINDER

- Key OFF.
- Check the brake fluid level in the brake master cylinder reservoir.

Is the fluid level within specification?

Yes	No
GO to **12.3** .	CHECK for leaks in the brake system. REPAIR as required. FILL brake master cylinder reservoir to the required level. GO to **12.9** .

12.3 VERIFY FLOAT BUOYANCY

- Remove the brake master cylinder filler cap.
- Attempt to push down the float with a clean, blunt steel implement, then let it float back up.

Does the float go down then float back up?

Yes	No
GO to 12.4 .	The float stays on the bottom of the brake master cylinder reservoir. REPLACE the brake master cylinder reservoir. BLEED the brake system. GO to 12.9 .

12.4 CHECK CIRCUIT 531 (DG/Y) FOR GROUND SHORT

- Key OFF.
- Disconnect brake fluid level switch harness connector.
- Disengage parking brake.
- Check for ground short on Circuit 531 (DG/Y) at brake fluid level switch harness connector.

Is there a ground short?

Yes	No
REPAIR ground short in Circuit 531 (DG/Y). RECONNECT all components. GO to 12.9 .	GO to 12.5 .

12.5 CHECK DIODE/RESISTOR ELEMENT

- Engage parking brake.
- Check for ground short on Circuit 531 (DG/Y) at brake fluid level switch harness connector.

Is there a ground short?

Yes	No
REPLACE resistor/diode element. RECONNECT all components. GO to 12.9 .	GO to 12.6 .

12.6 CHECK CIRCUIT 512 (T/LG) FOR GROUND SHORT

- Key OFF.
- Disconnect battery ground cable.
- Disconnect fluid level switch.
- Disconnect ignition switch.
- Disconnect anti-lock electronic control module.
- Check for short to ground on Pin 2 of anti-lock electronic control module harness connector (Circuit 512 [T/LG]).

Is there a ground short?

Yes	No
REPAIR ground short in Circuit 512 (T/LG). RECONNECT all components. GO to **12.9** .	GO to **12.7** .

12.7 CHECK IGNITION SWITCH

- Reconnect ignition switch.
- Check for short to ground on Pin 2 of anti-lock electronic control module harness connector (Circuit 512 [T/LG]).

Is there a ground short?

Yes	No
REPLACE ignition switch. RECONNECT all components. GO to **12.9** .	GO to **12.8** .

12.8 CHECK BRAKE FLUID LEVEL SWITCH

- Reconnect brake fluid level switch.
- Check for short to ground on Pin 2 of anti-lock electronic control module harness connector (Circuit 512 [T/LG]).

Is there a ground short?

Yes	No
REPLACE brake fluid level switch. RECONNECT all components. GO to **12.9** .	REPLACE anti-lock electronic control module. GO to **12.9** .

12.9 CLEAR CODE/PULL CODE

- Key OFF.

  NOTE: When the battery ground cable has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

- Verify all connectors are installed.
- Locate and disconnect the diagnostic connector from its mating half (Circuits 571 [BK/O] and 483 [R]).
- Key ON.
- Begin diagnostic trouble code flashout by grounding Circuit 571 (BK/O) for 1 second.

Was DTC 16 or 12 retrieved?

Yes	No

DTC 16. GO to Pinpoint Test DT4 .DTC 12. If all steps are complete, GO to Pinpoint Test ID . If all steps are not complete, return to the last step completed and continue.	A different code. GO to pinpoint test for corresponding DTC.

Code 13, RABS II Module Failure

Description

Code 13 is generated when a fault is found with the anti-lock electronic control module. The anti-lock electronic control module must be replaced and Drive Test Code 16 must be performed.

Code 16

Description

Code 16 is always present, unless a system concern has been detected and a diagnostic trouble code has been stored. This code should be used by the technician to verify that the RABS system is OK.

Code 16 will be output by the anti-lock electronic control module (2C018) when one of two conditions exist:

1. The technician grounds Circuit 571 (BK/O).

2. The RABS keep-alive memory (KAM) fuse has blown.

   If the KAM fuse has blown, the REAR ABS warning light will begin flashing Code 16 (or a diagnostic trouble code if a concern has been detected) if the stoplight switch (13480) is depressed (Ranger), or the running lamps are turned on (Aerostar).

   Therefore, check the KAM fuse when diagnosing complaints of REAR ABS light flashing.

PINPOINT TEST DT4: DRIVE TEST CODE 4

Purpose

CAUTION: Perform this test only when directed to do so. This drive test is only designed to resolve a Code 4 condition. Performing this test for any other reason will often lead to incorrect diagnosis of system problem and incorrect replacement of components.

This drive test assumes that pinpoint test Code 4 has been completed. If this is not the case, complete the test before proceeding.

If Pinpoint Test Code 4 is not successful in resolving the system concern, this drive test can be used to conduct additional, more in depth, diagnostics.

Drive Description

This drive test is designed to induce a Code 4 if there is a system concern that can create a Code 4 on a repeatable basis. Carefully record the data when performing the drive test. Know what part of the drive test you are in when a diagnostic trouble Code 4 is detected.

DT4.1 VERIFY PROPER WARNING LIGHT PROVE OUT

- Start the vehicle and observe the REAR ABS warning light for proper warning light prove out.

Does the REAR ABS warning light prove out properly?

Yes	No
GO to **DT4.2** .	GO to System Pre-Check Pinpoint Test A . RETURN to this step after completion.

DT4.2 RABS VALVE RESET SWITCH CHECK

CAUTION: Do not exceed 16 km/h (10 mph) to prevent flat-spotting of tires.

- Drive the vehicle at approximately 16 km/h (10 mph) on dry pavement.
- Press on brake pedal hard enough to lock all four wheels.
- After the vehicle has stopped, place the vehicle in PARK and take foot off the brake pedal.
- Wait 30 seconds.

Does the RABS warning light come on?

Yes	No
Key OFF. GO to **DT4.4** .	Key OFF. GO to **DT4.3** .

DT4.3 RABS HYDRAULIC VALVE LEAK TEST

- Press hard on the brake pedal and keep pressure on the brake pedal for 30 seconds.
- While keeping pressure on the brake pedal, monitor the height of the brake pedal.

NOTE: The condition is similar to the master cylinder bypass condition. It is important that the brake pedal be quickly and forcefully applied to rule out master cylinder bypass as the cause if a hydraulic leak is detected. Typically, master cylinder bypass only occurs at low line pressures.

Does the brake pedal drop slowly toward the floor?

Yes	No
REPLACE RABS valve. GO to Drive Test Code 16 to verify concern is resolved.	RETURN to **DT4.1** .

DT4.4 OBTAIN DIAGNOSTIC TROUBLE CODE

- Obtain Diagnostic Trouble Code.

Is Code 4 obtained?

Yes	No

Key OFF. GO to **DT4.5** .	If Code 16 is obtained: inconsistent result If RABS warning light did come on in **DT4.2** then a Diagnostic Trouble Code other than Code 16 should be stored. REPEAT **DT4.4** and VERIFY Code 16 is obtained. If any other code is obtained, GO to the pinpoint test for the code obtained. If no code is obtained, GO to System Pre-Check Pinpoint Test D .

DT4.5 BLOCKED ISOLATION ORIFICE

- Disconnect anti-lock electronic control unit.
- Raise the vehicle on a hoist far enough to allow all wheels to spin freely.
- Verify that the vehicle is in 4x2 mode and the hubs are unlocked (4x4 only).
- Start the vehicle, place in DRIVE and allow rear wheels to spin at idle for at least 30 seconds.
- Apply the brake pedal with the force of a normal traffic stop.

Do the rear wheels react uncharacteristically slowly or continue to spin?

Yes	No
RECONNECT anti-lock electronic control unit. REPLACE anti-lock brake control module. GO to Drive Test—Code 16 to verify concern is resolved.	Anti-lock brake control module valve is OK. RECONNECT anti-lock electronic control unit. RETURN to Pinpoint Test — Code 4 (Step **4.11**).

PINPOINT TEST DT5: DRIVE TEST CODE 5

Purpose

CAUTION: Only perform this test when directed to do so. This drive test is only designed to resolve a Code 5 condition. Performing this test for any other reason will often lead to incorrect diagnosis of system problem and incorrect replacement of components.

This drive test assumes that pinpoint test Code 5 has been completed. If this is not the case, complete the test before proceeding.

If the pinpoint test Code 5 is not successful in resolving the system concern, this drive test can be used to conduct additional, more in depth, diagnostics.

Drive Description

NOTE: 4-wheel drive issue Aerostar only.

This drive test is designed to induce a Code 5 if there is a condition that can create a Code 5 on a repeatable basis. Carefully record the data when performing the drive test. It is important to know what part of the drive test you are in when diagnostic trouble Code 5 is detected.

Discuss with the customer to determine if the vehicle was in four-wheel drive when the light came on (Aerostar only). During normal 4x2 anti-lock operation, the anti-lock electronic control module energizes the dump solenoid a maximum of 16 times without interruption. Conditions experienced in 4x2 operation will not require more than 16 dump pulses. If the anti-lock electronic control module notices that conditions call for a 17th dump pulse, it assumes there is a problem with RABS II system, deactivates the system (turning the REAR ABS warning light on), and sets a Code 5. During normal 4x4 operation, (Aerostar only) the anti-lock electronic control module only allows 16 dump pulses but does not deactivate the anti-lock electronic control module or light the yellow REAR ABS warning light if more than 16 dump pulses are requested. If, for reasons described below, the anti-lock electronic control module receives incorrect information from the 4x4 switch, and therefore improperly assumes the vehicle is in 4x2, a Code 5 will often be improperly set. The most common reasons for incorrect information being sent to the anti-lock electronic control module are:

- 4x4 indicator switch worn or damaged.
- Vehicle wiring concern in Circuit 210 (LB) between the 4x4 indicator switch and the anti-lock electronic control module.
- Customer has switched from 4x4 to 4x2 but the transfer case has not yet disengaged.

  NOTE: The customer must also enter an anti-lock stop, at the same time, for this event to occur.

- AWD system does not properly disengage upon brake application (Aerostar AWD ONLY).

DT5.1 VERIFY PROPER WARNING LIGHT PROVE OUT

- Start the vehicle and observe the REAR ABS warning light for proper warning light prove out.

Does the REAR ABS warning light prove out properly?

Yes	No
GO to **DT5.2** .	GO to System Pre-Check Pinpoint Test A . RETURN.

DT5.2 BASE BRAKE STOPPING TEST

- Remove the harness connector from the anti-lock electronic control module.
- Drive the vehicle at approximately 32 km/h (20 mph).
- Perform a light to medium (normal traffic) stop.

Do the rear wheels lock up?

Yes	No
RECONNECT anti-lock electronic control module. REFER to Base Brake Diagnosis in Section 06-00 for Rear-Wheel Lock.	RECONNECT anti-lock electronic control module. GO to **DT5.3** .

DT5.3 DRY ROAD STOP TEST

CAUTION: Do not exceed 16 km/h (10 mph) to prevent flat-spotting of tires.

- Drive the vehicle at approximately 16 km/h (10 mph) on dry pavement.
- Press on brake pedal hard enough to lock all four wheels and observe the left rear wheel in the driver's mirror.

Do the rear wheels lock up? (Momentary lockup followed by spinup is permissible.)

Yes	No
REPLACE anti-lock electronic control module. GO to Drive Test—Code 16 to verify concern is resolved.	GO to **DT5.4** .

DT5.4 VERIFY PROPER RABS OPERATION IN 4X2

WARNING: PERFORM THIS TEST ON AN AXLE HOIST ONLY.

NOTE: Because vehicle is not on the ground, wheels will spin for a significant time. This is not indicative of vehicle braking performance.

- Place vehicle on the hoist and raise high enough to clear all wheels off the ground.
- Verify vehicle is in 4x2 mode. (Aerostar only)
- Place vehicle transmission in Drive Low (automatic) or First gear (manual).
- Accelerate vehicle drive wheels to 16 km/h (10 mph).
- Press hard on the brake pedal until wheels stop.

Do the rear wheels first lock up and then spin?

Yes	No
LEAVE key ON. GO to **DT5.5** .	REPLACE anti-lock electronic control module. GO to Drive Test Code 16 to verify concern is resolved.

DT5.5 OBTAIN DIAGNOSTIC TROUBLE CODE

- Obtain diagnostic trouble code.

Is Code 5 obtained?

Yes	No
Inconsistent result DT5.4 indicates RABS valve is functioning correctly. CLEAR code REPEAT DT5.4. If result repeats, RETURN to pinpoint	Code obtained is Code 16. RETURN to pinpoint test — Code 5, Step **5.6** . Code obtained is NOT Code 5. GO to the pinpoint test for the code obtained.

test — Code 5, Step **5.6** .	No code is obtained. GO to System Pre-Check, Pinpoint Test D .

PINPOINT TEST DT6: DRIVE TEST CODE 6

Purpose

CAUTION: Only perform this test when directed to do so. This drive test is only designed to resolve a Code 6 condition. Performing this test for any other reason will often lead to incorrect diagnosis of system problem and incorrect replacement of components.

This drive test assumes that pinpoint test Code 6 has been completed. If this is not the case, complete the test before proceeding.

If pinpoint test Code 6 is not successful in resolving the system concern, this drive test can be used to conduct additional, more in depth, diagnostics.

Drive Description

This drive test is designed to induce a Code 6 if there is a system concern that can create a Code 6 on a repeatable basis. Carefully record the data when performing the drive test. It is important to know what part of the drive test you are in when a Code 6 diagnostic trouble code is detected.

DT6.1 VERIFY INTEGRITY OF ANTI-LOCK ELECTRONIC CONTROL MODULE CONNECTION

- Turn ignition OFF.
- Disconnect battery ground cable.
- Remove the anti-lock electronic control module connector.
- Inspect anti-lock electronic control module component connector for contamination and loose or bent terminals.
- Pull gently on Circuit 519 (LG/BK) just behind Pin 10 on the harness connector.
- Pull gently on Circuit 523 (R/PK) just behind Pin 3 on the harness connector.

Are all connections clean and secure?

Yes	No
LEAVE anti-lock electronic control module connector disconnected. GO to **DT6.2** .	Terminal(s) in component connector are corroded, bent, or loose. REPAIR terminals or connector as needed. If not repairable, REPLACE anti-lock electronic control module. GO to **DT6.7** . Terminal(s) in harness connector are corroded, bent, or move back or come free of connector. REPAIR terminals or connector as needed. GO to **DT6.7** .

DT6.2 VERIFY INTEGRITY OF SPEED SENSOR CONNECTION

- Verify ignition is OFF.
- Remove speed sensor connector.
- Inspect speed sensor component connector for contamination and bent or loose terminals.
- Gently pull on Circuit 519 (LG/BK) behind Pin A of harness connector.
- Gently pull on Circuit 523 (R/PK) behind Pin B of harness connector.

Are all connections clean and secure?

Yes	No
REINSTALL speed sensor connector. GO to **DT6.3** .	Terminal(s) in component connector are corroded, bent, or loose. REPAIR terminal or connector as needed. If not repairable, REPLACE speed sensor. GO to **DT6.7** . Terminal(s) in harness connector are corroded, bent, or move back or come free of connector. REPAIR terminal or connector as needed. GO to **DT6.7** .

DT6.3 VERIFY PROPER SPEED SENSOR WIRE ROUTING

- Inspect wire routing.

Are wires secure and properly routed?

Yes	No
GO to **DT6.4** .	FIND and REPAIR as necessary. GO to **DT6.7** .

DT6.4 VERIFY SPEED SENSOR INTEGRITY

- Set multimeter on the 20k Ohm scale.
- Check resistance between Pins A and B of the sensor connector.

Is resistance between 900 and 2500 ohms?

Yes	No
GO to **DT6.5** .	REPLACE RABS speed sensor. GO to **6.6** .

DT6.5 CHECK FOR ERRATIC SPEED SENSOR SIGNAL AND LOOSE WIRE CONNECTORS

- Set multimeter on the 20k Ohm scale.

- Check resistance between Pin 10 and Pin 3 of the harness connector while shaking the harness from speed sensor to anti-lock electronic control module.

Is reading steady and between 900 and 2500 ohms?

Yes	No
Signal is not erratic. GO to **DT6.6** .	FIND and REPAIR open/short circuit along Circuits 519 (LG/BK) and 523 (R/PK). GO to **DT6.7** .

DT6.6 CHECK FOR METAL CHIPS ON SPEED SENSOR MAGNET POLE PIECE

- Verify ignition is OFF.
- Remove the speed sensor from the rear axle housing and inspect for a buildup of metal chips on speed sensor magnetic pole.

Are metal chips present?

Yes	No
LEAVE speed sensor out. GO to **DT6.7** .	DRAIN and CLEAN rear axle housing. GO to **DT6.7** .

DT6.7 MAKE SURE ALL STEPS ARE COMPLETED

CAUTION: Be sure to complete all steps. Failure to do so could lead to replacing good components.

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE anti-lock electronic control module. GO to **DT6.8** . If anti-lock electronic control module has been replaced and no resolution has been reached, REPLACE rear axle speed sensor. GO to **DT6.8** .	GO to diagnostic step last completed and CONTINUE.

DT6.8 CLEAR CODE/PULL CODE

- Turn ignition OFF.

NOTE: When the battery ground cable has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the

strategy.

- Reconnect battery ground cable.
- Verify all connectors are installed.
- Locate and disconnect the diagnostic connector from its mating half (Circuits 571 [BK/O] and 483 [R]).
- Turn ignition ON.
- Begin diagnostic trouble code flashout by connecting Circuit 571 (BK/O) to a chassis ground for at least 1 second.

Can DTC 16 or 6 be determined?

Yes	No
Diagnostic trouble code = 16. GO to Pinpoint Test DT1 .Diagnostic trouble code = 6. GO to **DT6.9** .	Diagnostic trouble code is different than before. GO to Pinpoint Test for corresponding code.

DT6.9 PINPOINT TEST STATUS

Has pinpoint test been completed?

Yes	No
GO to **DT6.10** .	RETURN to last pinpoint test completed.

DT6.10 VERIFY INTEGRITY OF VEHICLE WIRING

If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

- REFER to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on system schematic.

Is resolution achieved?

Yes	No
STOP. Repair is complete. GO to Pinpoint Test DT1 .	Problem is intermittent. GO to Drive Test Code 6 .

PINPOINT TEST DT1: DRIVE TEST CODE 16

Purpose

This drive test will be used when either of the two conditions listed below exists.

- Required Repair Verification

This drive procedure will be used after all vehicle repairs. Once a vehicle has been repaired, it is necessary to verify the repair by driving the vehicle. This is because the anti-lock electronic control module is unable to

detect some system concerns until the vehicle is being driven a certain way. Therefore the drive verification test is a very important step.

- Symptom Evaluation Drive

When a vehicle is brought to the dealer, the customer may only have a general concern about the way their vehicle is braking. In these situations there may not be a clear system concern to troubleshoot. In this type of situation, this drive test is designed to produce common system concern symptoms. Use this drive test to determine a symptom. Once a symptom is found, a symptom troubleshooting procedure can be followed to repair the vehicle.

Drive Description

This drive test is designed to be a generic drive test that is used for three purposes listed below.

- To verify a repair of the RABS system on a vehicle.
- To attempt to recreate an intermittent concern.
- To attempt to detect a symptom when a diagnostic trouble code or a concern symptom is not known.

DT1.1 KEEP-ALIVE MEMORY (KAM) FUSE CHECK

- Key ON. Observe REAR ABS light prove out.
- Turn on headlamps and press on the brake pedal.
- With the headlamps ON and while pushing on the brake pedal, monitor the yellow REAR ABS light in the dash for 10 seconds.

Does the REAR ABS light prove out normally?

Yes	No
GO to **DT1.2** .	REPLACE KAM fuse (SEE Owner's Manual for fuse location). REPEAT **DT1.1** .

DT1.2 LOW SPEED REAR ABS STOP

NOTE: Wetting down the area where stop is to be performed will aid this test.

- An assistant to observe rear wheels would be helpful.
- Drive vehicle at approximately 16 km/h (10 mph).
- Press on brake pedal hard enough to lock all four wheels, and observe the left rear wheel in the driver's mirror.
- Repeat the second step, except observe right rear wheel in passenger mirror.

Do either or both rear wheels lock consistently and is REAR ABS light on? (Momentary lockup is permissible.)

Yes	No
GO to Symptom Chart B . One or both rear	GO to **DT1.3** . If other symptoms are detected, GO to **DT1.6** . If REAR ABS light comes on and

wheels lock up.	stays on, GO to **DT1.7** .

DT1.3 CHECK FOR UNWARRANTED RABS ACTIVITY

NOTE: Stop should be performed on dry pavement.

- Drive vehicle at approximately 32 km/h (20 mph).
- Perform a light to medium (normal traffic) stop.
- Turn off the windshield wipers if they are on. (Wipers can cause a pulsation in the brake pedal that can be mistaken for RABS activity.) Feel for pulsation in the brake pedal within 10 seconds after the vehicle has come to a stop.

Is there any pulsation in the brake pedal any time during the stop or within 10 seconds after the vehicle has stopped and is REAR ABS light on?

Yes	No
GO to Symptom Chart A , Unwarranted RABS Activity.	GO to **DT1.4** . If other symptoms are detected, GO to **DT1.6** . If REAR ABS light comes on and stays on, GO to **DT1.7** .

DT1.4 BRAKE STOP LAMP/SWITCH CHECK

- Turn ignition switch ON.
- Press on the brake pedal.
- Release brake pedal.

Do the stoplamps come on and then turn off properly?

Yes	No
GO to **DT1.5** .	GO to Pinpoint Test Code 11 .

DT1.5 DETERMINE DRIVE TEST IS COMPLETE

Has customer concern been addressed and corrected by previous actions?

Yes	No
STOP. Vehicle RABS function has been verified.	REFER to Symptom Chart A , Unwarranted RABS Activity.

DT1.6 DETERMINE NEXT DIAGNOSTIC STEP BASED ON BRAKE SYMPTOM

- Hard or soft brake pedal
- Lack of sufficient vehicle deceleration upon brake application

Are any of the above symptoms present?

Yes	No
GO to Symptom Chart C , Hard or Soft Brake Pedal.	Concern is not in the RABS system. REFER to Section 06-00 for diagnosis.

DT1.7 OBTAIN DIAGNOSTIC TROUBLE CODE

- Obtain diagnostic trouble code.

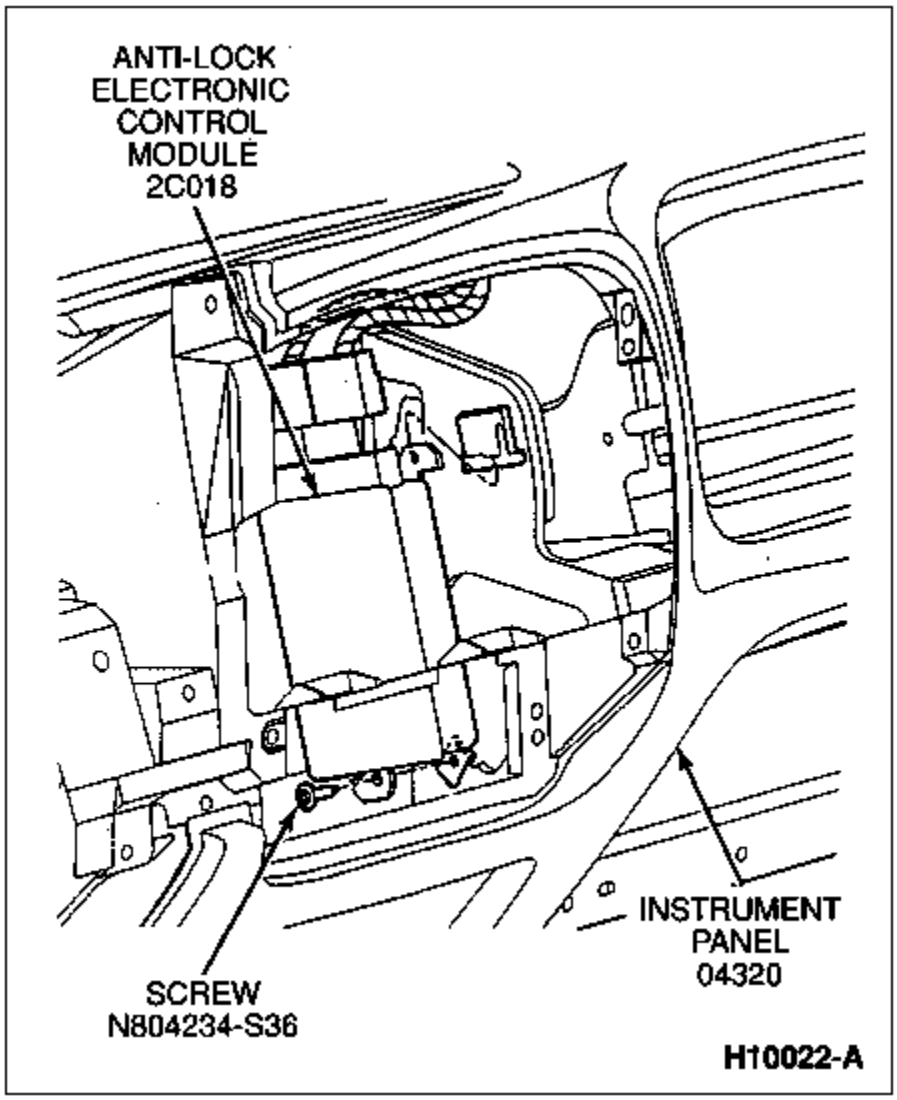
Is the diagnostic trouble code the same as before and has the entire pinpoint test for the code been completed?

Yes	No
REDO steps once more.	RETURN to the last step completed in the pinpoint test. If different code is obtained, GO to the pinpoint test for the code obtained. If no code is obtained, GO to System Pre-Check Test Pinpoint D.

Anti-Lock Electronic Control Module

Removal

1. Remove the instrument panel finish panel (044D70). Refer to Section 01-12 .
2. Remove the anti-lock electronic control module-to-instrument panel screw.



3. Slide the anti-lock electronic control module (2C018) to release the upper tab from the instrument panel brace.

4. Disconnect the electrical connectors and remove the anti-lock electronic control module.

Installation

To install, reverse the removal procedure.

Anti-Lock Electronic Control Module, Aerostar

Removal

1. Disconnect the wiring harness from the RABS II connector by depressing the plastic tab on the connector and pulling the connector off.
2. Remove the two nuts that retain the anti-lock electronic control module (2C018) to the instrument panel anti-shake brace.
3. Remove the anti-lock electronic control module from the anti-shake brace.

Installation

1. Position the anti-lock electronic control module on the anti-shake brace.
2. Install the two nuts that hold the anti-lock electronic control module to the anti-shake brace.
3. Connect the wiring harness to the anti-lock electronic control module.
4. Check the system for proper operation.

RABS Valve, Ranger

Removal

1. At the RABS valve, disconnect and plug the RABS valve input and output tubes.
2. Disconnect the wiring harness to the RABS valve.
3. Remove the bolt retaining the RABS valve to the frame side rail (5015) and remove the RABS valve.

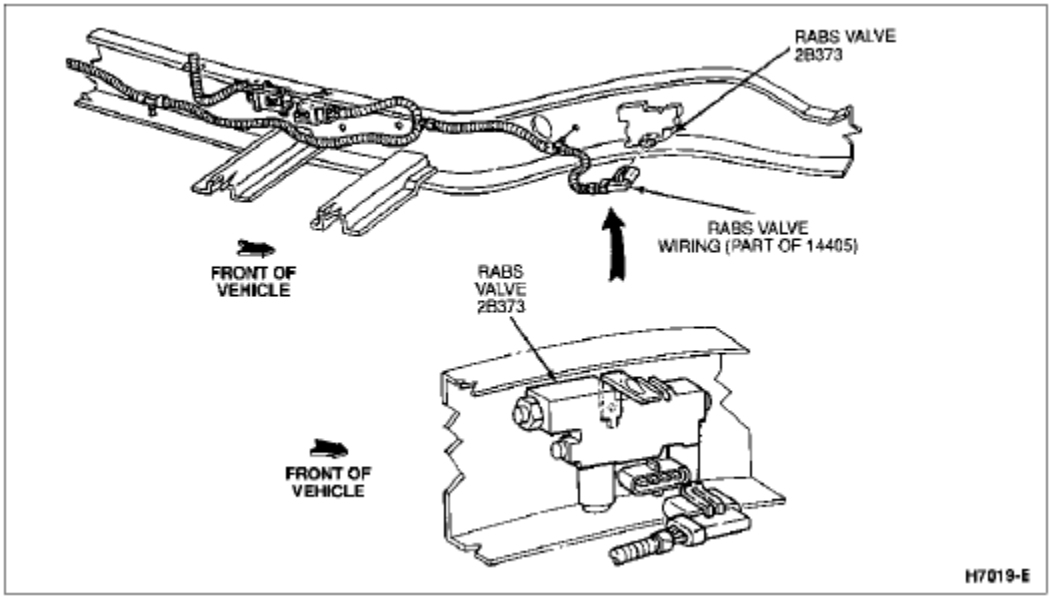
Installation

1. Position the RABS valve on the frame side rail. Install the bolt and tighten to 20-25 Nm (14-19 lb-ft).
2. Connect the wiring harness connector to the RABS valve.
3. **CAUTION: Do not overtighten the fittings.**

   Connect the RABS valve input and output tubes to the RABS valve. Tighten the fittings to 15-20 Nm (11-14 lb-ft).
4. **NOTE: It is not necessary to energize the RABS system electrically to bleed the rear brakes.**

   Bleed the rear brake system as described in Section 06-06 .

RABS Valve, Ranger



RABS Valve, Aerostar

Removal

1. At the RABS valve, disconnect and plug the RABS valve input and output tubes.
2. Disconnect the wiring harness connector from the RABS valve.
3. Remove the screw that retains the RABS valve to the fender apron. Remove the RABS valve.

Installation

1. Position the RABS valve on the fender apron. Install the retaining screw and tighten to 3.3-4.5 Nm (30-39 lb-in).
2. Connect the wiring harness connector to the RABS valve.
3. **CAUTION: Do not overtighten the fittings.**

   Connect the RABS valve input and output tubes to the RABS valve. Tighten the tube fittings to 15-20 Nm (11-14 lb-ft).
4. Bleed the brake system as described in Section 06-06 . It is not necessary to energize the RABS system electrically to bleed the rear brakes.

RABS Sensor

Removal

1. At the rear axle housing (4010) pull the wiring harness connector from the speed sensor.

2. Remove the speed sensor hold down bolt and remove the speed sensor from the rear axle housing.

Installation

1. Clean the rear axle housing mounting surface. Use care to prevent dirt from entering the rear axle housing.

2. Inspect and clean the magnetized sensor pole piece to make sure that it is free from loose metal particles which could cause erratic system operation. Inspect the speed sensor O-ring for damage and replace if necessary.

3. **NOTE: Do not apply force to the plastic sensor connector. The sensor flange should slide to the mounting surface. This will make sure the air gap setting is between 0.127-1.143mm (0.005-0.045 inches).**

   Lightly lubricate the speed sensor O-ring with motor oil, align the bolt hole, and install.

4. Install the speed sensor hold-down bolt and tighten to 34-40 Nm (25-29 lb-ft).

5. Push the connector on the speed sensor.

Brake Master Cylinder Reservoir Checking and Filling

Brake fluid level in the brake master cylinder reservoir (2K478) should be between 4mm (0.16 inch) below the MAX line on the side of the brake master cylinder reservoir and the MAX line. If brake fluid is low, the red BRAKE warning indicator will illuminate. To add brake fluid, clean and remove the brake master cylinder reservoir cap and pour clean brake fluid up to the MAX line. Use Ford High Performance DOT 3 Brake Fluid C6AZ-19552-AA or DOT 3 equivalent fluid meeting Ford specification ESA-M6C25-A, DOT3. If brake fluid has to be added often, check all hydraulic connections for leaks.

Symptom Charts

- Unwarranted ABS Activity—Refer to Symptom A .
- Wheels Lock Up—Refer to Symptom B .
- Hard/Soft Brake Pedal—Refer to Symptom C .
- Lack of Decel. (Med./Hard Braking)—Refer to Symptom D .
- Vehicle Pulls During Braking—Refer to Symptom E .
- ABS Warning Light ON Intermittently with Code System Pass—Refer to Symptom F .

WARNING: PERFORM INDICATED PINPOINT TEST OR DRIVE TEST STEPS ONLY — DO NOT PERFORM OTHER STEPS (ALTHOUGH WITHIN THE TEST BOX, YOU MAY APPEAR TO BE DIRECTED TO DO SO). ALWAYS RETURN TO THE SYMPTOM CONDITION CHART IF NO RESOLUTION IS REACHED BY PERFORMING A PARTICULAR TEST.

SYMPTOM A: UNWARRANTED ABS ACTIVITY

Condition	Possible Source	Action
• Loss of Sensor Signal During Vehicle Deceleration. Sensor Signal Drops Out at Low Speed	• Tone ring is damaged. • Sensor output is weak. • Air gap too large.	• INSPECT both front wheel end tone rings and the rear axle tone ring. • Left Front Sensor — GO to Pinpoint Test LL . • Right Front Sensor — GO to Pinpoint Test MM . • Rear Axle Sensor — GO to Pinpoint Test NN .
• Maladjusted Rear Brakes or "Grabby" Brake Shoe or Pad Linings	• Rear brake adjustment too tight. • Linings are "contaminated".	• REFER to Section 06-00 . • REFER to Section 06-00 .

SYMPTOM B: WHEELS LOCK UP

Condition	Possible Source	Action
• Base Brake Mechanical Concern	• Damp or contaminated rear brake shoe linings, stuck/leaking wheel cylinder, over-adjusted rear brakes. • Hung-up parking brake. • Leaking rear axle seal.	• REFER to Section 06-00 . • REFER to Section 06-05 . • REFER to the appropriate section in Group 05.

tomsn048@gmail.com

SYMPTOM C: HARD OR SOFT BRAKE PEDAL

Condition	Possible Source	Action
• Base Brake Hydraulic Concern (Soft)	• Hydraulic leak in brake line or hose, fitting, master cylinder, wheel cylinder, or caliper. • Air in brake system.	• REFER to Section 06-00 . • REFER to Section 06-00 .
• Base Brake Mechanical Concern (Hard)	• Little or no vacuum boost. • Stuck or inoperative wheel cylinder or caliper. • Pinched or crimped brake line or hose.	• REFER to Section 06-00 .

SYMPTOM D: LACK OF DECELERATION DURING MEDIUM/HARD BRAKE APPLICATIONS

Condition	Possible Source	Action
• Base Brake Hydraulic Concern	• Hydraulic leak in brake line or hose, fitting, master cylinder, wheel cylinder, or caliper. • Air in brake system.	• REFER to Section 06-00 . • REFER to Section 06-00 .
• Base Brake Mechanical Concern	• Little or no vacuum boost. • Stuck or inoperative wheel cylinder or caliper. • Pinched or crimped brake line or hose. • Ineffective brake shoe or pad linings.	• REFER to Section 06-00 .

SYMPTOM E: VEHICLE PULLS DURING BRAKING

Condition	Possible Source	Action
• Base Brake Mechanical Concern	• Improperly adjusted rear brake. • Frozen or binding caliper (one side of vehicle). • Uneven brake pad or shoe wear.	• REFER to Section 06-00 . • REFER to Section 06-00 . • REFER to Section 06-00 .
• Base Brake Hydraulic Concern	• Pinched or crimped brake line or hose.	• REFER to Section 06-00 .

SYMPTOM F: ABS WARNING LIGHT ON INTERMITTENTLY WITH SYSTEM PASS CODE

Condition	Possible Source	Action

tomsn048@gmail.com

• Intermittent Loss of Power to Anti-Lock Brake Control Module	• Ignition Circuit 601 loose or shorted. • Loose anti-lock brake control module grounds. • Loose power lug at power distribution box.	• INSPECT Circuit 601 from ignition switch to anti-lock brake control module harness connector for opens/shorts especially at the bulkhead connector. CORRECT as necessary. • INSPECT anti-lock brake control module grounds for looseness, corrosion or excessive dirt. CORRECT as necessary. • CORRECT condition.

Inspection and Verification, System Precheck

NOTE: It is imperative that this procedure be performed first. Failure to do so may result in incorrect diagnosis of problem, wasted time, and improper replacement of good components.

If not using a Rotunda Fluke Frequency Meter, 105-R0053, higher wheel speed may be required in order for the frequency meter to function correctly.

The System Precheck is used to screen a vehicle for relatively simple diagnostic repairs such as loose connectors, blown fuses, etc. However, the System Precheck is also used to prepare the vehicle for further diagnostics. In addition, warning lamp faults are dealt with in this test.

PINPOINT TEST PC: SYSTEM PRECHECK

PC1 PERFORM UNDERHOOD SYSTEM PRECHECK

- Verify that all of the following connectors are connected and the terminals are secure and free of contaminants or corrosion.
  - 40-pin ECU connector
  - 8-pin HCU connector
  - 2-pin pump motor connector
  - 2-pin front sensor connectors (2)
- Open power distribution box and verify that both the ABS power relay and pump motor relay and diode are fully seated.
- Gently pull on relay and diode terminals beneath power distribution box to make sure all are secure.
- Verify that both the system fuse and pump motor fuse are present and intact.
- Verify that the system ground eyelet at the left-hand radiator support is firmly attached to the weld stud and is free of corrosion and excessive dirt.

Are all connections secure and fuses operational?

Yes	No
GO to **PC2** .	CORRECT condition. GO to **PC2** .

tomsn048@gmail.com

PC2 PERFORM UNDER-VEHICLE SYSTEM PRECHECK

- Verify that the 3-pin acceleration connector (4x4 only) and the 2-pin rear axle sensor connector are connected and the terminals are secure and free of contaminants or corrosion.

Are all connectors, terminals and grounds secure?

Yes	No
GO to **PC3** .	REPAIR as required. GO to **PC3** .

PC3 CHECK ABS WARNING LIGHT SEQUENCE (KEY ON/ENGINE OFF)

- Observe ABS warning light on dash.
- Turn ignition to ON.

Does ABS warning light come on?

Yes	No
Light flashes. Diagnostic circuit grounded. CORRECT condition. Stays on for 3 seconds and goes out (normal bulb prove-out). GO to **PC6** . Comes on and stays on (hard light). GO to **PC4** .	GO to **PC7** .

PC4 CODE RETRIEVAL EQUIPMENT HOOKUP

- Verify that an ABS concern has been detected (ABS warning light ON).
- Key OFF.
- Using Rotunda New Generation Star (NGS) Tester 007-00500 or equivalent.
  - Connect tester to ISO-9141 connector located under steering column.

Is equipment hooked up properly?

Yes	No
GO to **PC5** .	REATTEMPT **PC4** . REPAIR as required.

PC5 RETRIEVE ABS DIAGNOSTIC TROUBLE CODES

- Using Rotunda New Generation Star (NGS) Tester 007-00500 or equivalent:
  - Key in RUN.
  - Read out and record all diagnostic trouble codes.

tomsn048@gmail.com

CAUTION: Be sure to read out and record all codes. Failure to do so may result in improper diagnosis and unnecessary repairs.

Are codes present?

Yes	No
Starting with the first code recorded, GO to the pinpoint test for that code.	System pass. If previous action has been taken, concern most likely has been corrected and ABS system is OK. Otherwise, GO to Symptom Chart F . Cannot communicate. GO to Pinpoint Test V .

PC6 ROAD TEST VEHICLE

NOTE: Step PC6 is optional, for additional information only.

- Drive vehicle and observe ABS warning light.

Does ABS warning light come on during any of the following?

- **When vehicle moves initially (light comes on at or near 6 mph)**
- **While driving under 40 km/h (25 mph)**
- **While driving at or over 40 km/h (25 mph)**
- **While in an anti-lock stop**

Yes	No
At or near 10 km/h (6 mph), concern most likely found during pump check. GO to **PC4** . VERIFY pump diagnostic trouble code has been set. While driving under 40 km/h (25 mph), most likely cause is missing wheel speed sensor output. GO to **PC4** . VERIFY sensor diagnostic trouble code has been set. While driving over 40 km/h (25 mph), most likely cause is an erratic wheel speed sensor output. GO to **PC4** . VERIFY sensor diagnostic trouble code has been set.	Vehicle has abnormal ABS or brake system operation. GO to Symptom Chart . No abnormal operation or symptoms detected. GO to **PC4** . VERIFY No Code (System OK) is present.

PC7 ABS WARNING LIGHT DOES NOT PROVE OUT/CHECK BULB

- Inspect ABS warning light bulb in dash.

Is the bulb blown?

Yes	No

tomsn048@gmail.com

REPLACE bulb. GO to **PC3** .	LEAVE bulb out. GO to **PC8** .

PC8 VERIFY ABS WARNING LAMP FEED IS INTACT

- Key OFF.
- Insert 12V test light between ABS bulb socket (+) and a known good chassis ground.
- Key ON.

Does test light illuminate?

Yes	No
GO to **PC9** .	REPAIR open circuit or short to ground on warning light feed. REINSERT bulb back into socket. GO to **PC3** .

PC9 VERIFY ABS WARNING LAMP GROUND BETWEEN BULB AND ABS DIODE

- Open power network box and remove ABS diode.
- Verify diode terminals are clean and firmly in place.
- Check for continuity between ABS bulb socket ground and diode terminal in power network box for Circuit 603 (DG).

Is there continuity?

Yes	No
GO to **PC10** .	REPAIR open circuit in warning light ground or loose terminal. REINSERT ABS diode. GO to **PC3** .

PC10 VERIFY INTACT ABS WARNING LAMP GROUND BETWEEN ABS DIODE AND ABS POWER RELAY

- Remove ABS power relay.
- Verify relay terminals are clean and firmly in place.
- Check for continuity between ABS diode Circuit 532 (O/Y) and ABS Power Relay Circuit 532 (O/Y).

Is there continuity?

Yes	No
GO to **PC11** .	REPAIR open circuit in Circuit 532 (O/Y) between ABS diode and ABS power relay or loose terminals. REINSERT ABS diode and system relay. GO to **PC3** .

tomsn048@gmail.com

PC11 CHECK GROUND BETWEEN ABS POWER RELAY AND CHASSIS GROUNDS

- Inspect chassis ground stud at left-hand radiator support for loose or corroded eyelets.
- Clean and tighten any loose or dirty ground eyelets.
- Check for continuity between ABS power relay Circuit 57 (BK) and left-hand radiator support chassis ground stud.

Is there continuity?

Yes	No
REINSERT ABS power relay. REPLACE ABS warning bulb. REPEAT Steps PC8 -PC11 looking for intermittent condition (see Intermittent Diagnosis).	REPAIR open circuit between ABS power relay and chassis ground. REINSERT ABS power relay. GO to **PC3** .

Manually Clearing Diagnostic Codes

The Rotunda New Generation Star (NGS) Tester 007-00500 is used to clear diagnostic trouble codes (DTCs) by performing the ABS code clear procedure. **No other manual method can be used to clear DTCs** .

Automatic Memory Erasing

A diagnostic trouble code will be automatically erased if no system concerns occur for 80 ignition cycles.

Warning Lamp Indicators

The anti-lock brake system uses one amber ABS warning light to alert the driver of malfunctions in the system.

The amber ABS warning light will come on for numerous reasons. It warns the driver that the ABS has been disabled. Normal power-assisted braking remains but the wheels can lock during a panic stop while the indicator is on. Certain procedures must be followed to find the concern in this situation. They are explained in this section.

If system is OK, Code System Pass will be present.

On-Board Diagnostics

The anti-lock brake control module is capable of performing on-board diagnostics using Rotunda NGS Tester 007-00500 or equivalent.

The anti-lock brake control module monitors system operation and can store all defined diagnostic trouble codes in its memory. It is important to understand that there are some concerns the anti-lock brake control module cannot recognize. Therefore, if a symptom exists and no diagnostic trouble codes are stored by the anti-lock brake control module, other diagnostic steps must be followed.

The module cannot store a diagnostic trouble code if there is no power to the module. This concern can be found by following the System Precheck procedures.

tomsn048@gmail.com

Diagnostic Trouble Codes, Retrieving

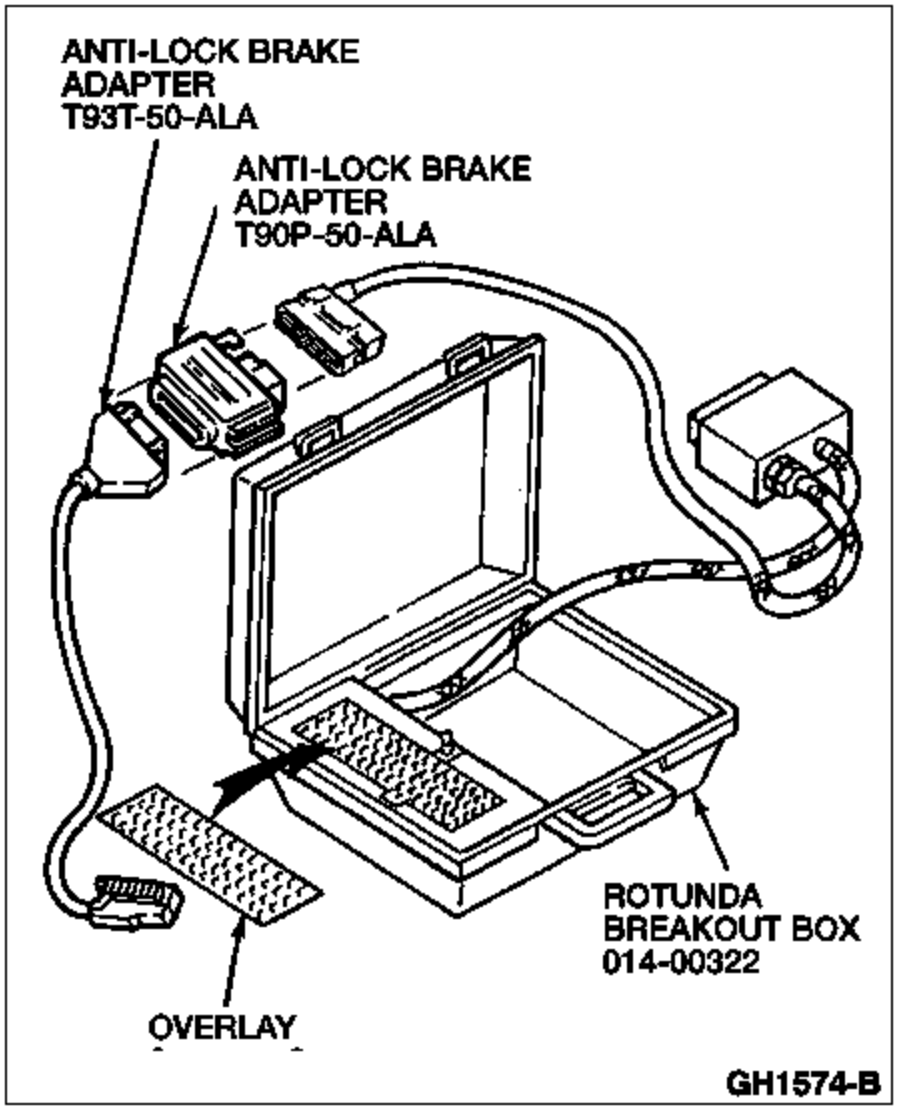
The diagnostic trouble codes can be retrieved from the anti-lock brake control module in the following manner.

1. Connect the New Generation Star (NGS) Tester or equivalent to the ISO-9141 connector located under the steering column.
2. Turn on the tester and follow the menus provided to perform ABS code retrieval.
3. Record all the codes. "System Pass" indicates that no codes are stored.

Breakout Box Function

1. Disconnect the 40-pin plug from the anti-lock brake control module.
2. Connect the Anti-Lock Brake Adapter T93T-50-ALA to the 40-pin plug on the vehicle harness.
3. Connect the adapter's 60-pin plug to the Breakout Box cable.
4. Install overlay box.
5. Refer to pinpoint test procedures for specific repair directions.

tomsn048@gmail.com



tomsn048@gmail.com

tomsn048@gmail.com

Anti-Lock Electrical Quick Check Chart

This chart is used as a reference and is meant to be used in conjunction with the Rotunda Breakout Box 014-00322 or equivalent, the overlay and Anti-Lock Brake Adapter T93T-50-ALA.

Many of the values given for various components depend on the presence of a good ground at Pin 1.

NOTE: The Pin 1 chassis ground must be verified as sound before any quick electrical check involving Pin 1 may be used. At any time, any known good chassis ground may be substituted for a Pin 1 designation.

NOTE: Connections between components must be verified as sound before replacement of affected components. Failure to observe above will often lead to improper replacement of components and incorrect resolution of concern. Replacement of good components will not resolve a vehicle wiring concern.

Keep in mind that a measurement falling outside the specification can mean one of two things:

1. The wiring between two components is worn or damaged, or
2. The component is not electrically correct.

NOTE: Perform the following measurements with Rotunda Digital/Analog Volt-Ohmmeter 105-R0053 or equivalent. Check DVOM accuracy.

ANTI-LOCK QUICK CHECK CHART
NOTE: The correct overlay MUST be installed before making electrical checks.

Measure Between				
Item to Be Tested	**Ignition Mode**	**Pin Number(s)**	**Scale/Range**	**Specification**
Anti-Lock Brake Control Module Ground Check	Off Off Off	1 + Chassis Gnd 14 + Chassis Gnd 17 + Chassis Gnd	Ohms Ohms Ohms	Continuity Continuity Continuity
Battery Power to Anti-Lock Brake Control Module Check	On	20 + 1	Volts	9.5V Minimum
Jumper Pins 1 + 19 (Energizing ABS Power Relay)	On	17 + 1	Volts	9.5V Minimum
Power from ABS Power Relay				Verify ABS Warning Lamp is OFF
ABS Power Relay Coil	Off	19 + 20	Ohms	52-68 Ohms
Pump Motor Relay Coil	Off	17 + 29	Ohms	52-68 Ohms
ABS Warning Light Ground Through System Relay	Off	17 + 1	Ohms	Continuity
IFR Isolation (Inlet) Valve	Off	17 + 34	Ohms	5-8 Ohms

tomsn048@gmail.com

Resistance				
IFL Isolations (Inlet) Valve Resistance	Off	17 + 40	Ohms	5-8 Ohms
IRA Isolation (Inlet) Valve Resistance	Off	17 + 33	Ohms	5-8 Ohms
OFR Dump (Outlet) Valve Resistance	Off	17 + 15	Ohms	3-6 Ohms
OFL Dump (Outlet) Valve Resistance	Off	17 + 26	Ohms	3-6 Ohms
ORA Dump (Outlet) Valve Resistance	Off	17 + 27	Ohms	3-6 Ohms
FR Wheel Speed Sensor Resistance	Off	23 + 36	k Ohms	1.0-1.4 k Ohms
FL Wheel Speed Sensor Resistance	Off	24 + 25	k Ohms	1.0-1.4 k Ohms
Sensor Output				
Rotate Front Wheels and Rear Axle @ 60 rpm				
FR (4x4)	Off	23 + 36	Hz and mV	5.8 mV/Hz or Greater
FR (4x2)	Off	23 + 36	Hz and mV	5.0 mV/Hz or Greater
FL (4x4)	Off	24 + 25	Hz and mV	5.8 mV/Hz or Greater
FL (4x2)	Off	24 + 25	Hz and mV	5.0 mV/Hz or Greater
Diode	Off	18 (Meter Polarity +) or 17 (Meter Polarity -)	Diode Check	0.5 Volts
Remove ABS Power Relay	Off	18 (Meter Polarity +) or 17 (Meter Polarity -)	Diode Check	Infinity m Ohms

Note: Check for continuity between Pin 1 and chassis ground or invalid results may be obtained. Results not matching specification indicate either a wiring or component concern. Further analysis is needed before any component is replaced. Refer to pinpoint tests for proper diagnostic procedures.

Note: To check wheel speed sensor output, measurements of BOTH the frequency and the voltage output must be taken. The actual speed the wheels are turning is not important — the result of voltage output divided by the frequency will not change with wheel speed. However, it is crucial that both the frequency measurement and the voltage output measurement be taken at the SAME wheel speed. If not using a Rotunda Fluke Frequency Meter 105-R0053, higher wheel speed may be required in order for the frequency meter to function correctly.

tomsn048@gmail.com

tomsn048@gmail.com

Drive Test

Purpose

This drive test will be used when either of two conditions exists.

1. Recommended Repair Verification

   This drive procedure can be used after all vehicle repairs. Because the anti-lock brake control module is unable to detect some system concerns until the vehicle is being driven in a certain way, this drive test can be helpful in developing further confidence in the 4WABS system operation before delivery to the customer.

2. Symptom Evaluation Drive

   When a vehicle is brought to the dealer, the customer may only have a general concern about the way the vehicle is braking. In these situations there may not be a clear system concern to troubleshoot. This drive test is designed to produce common system concern symptoms. Use this drive test to determine a symptom. Once a symptom is found, a symptom troubleshooting procedure can be followed to repair the vehicle.

Drive Description

This is designed to be a generic drive test that is used for three purposes listed below.

1. To verify a repair of the ABS system on a vehicle.
2. To attempt to recreate an intermittent concern.
3. To attempt to detect a symptom when a diagnostic trouble code or a concern symptom is not known.

PINPOINT TEST DT1: DRIVE TEST — CODE SYSTEM PASS

DT1.1 LOW SPEED ABS STOP

NOTE: Wetting down the area where stop is to be performed will aid this test.

- Drive vehicle at approximately 16 km/h (10 mph).
- Spike brake pedal hard enough to lock all four wheels.

NOTE: Momentary lockup is permissible.

Does ABS cycle?

tomsn048@gmail.com

Yes	No
ABS light is not on. GO to Symptom B , Wheel Lockup. ABS light comes on and stays on. GO to **DT1.7** .	Other symptoms are detected. GO to **DT1.6** . ABS light is not on. GO to **DT1.2** .

DT1.2 CHECK FOR UNWARRANTED ABS ACTIVITY

- Drive vehicle at approximately 32 km/h (20 mph).
- Perform a light to medium (normal traffic) stop.
- Turn off the windshield wipers if they are on. Feel for pulsation in the brake pedal.

  NOTE: In this event, the vehicle may pull as soon as the pump motor begins to run. If the vehicle does pull when the pump motor turns on, the front sensor opposite the pull should be checked using the UNWARRANTED ABS ACTIVITY Symptom Chart. If the pump motor turns on and no pull is felt, the rear speed sensor should be checked using the UNWARRANTED ABS ACTIVITY Symptom Chart.

- If a vehicle pulls immediately upon braking and the pump motor does not run, use the VEHICLE PULLS WHILE BRAKING Symptom to diagnose the concern.

Does the pump motor turn on and are brake pedal pulsations felt any time during the stop?

Yes	No
ABS light is not on. GO to Symptom A , Unwarranted ABS Activity. ABS light comes on and stays on. GO to **DT1.7** .	Other symptoms are detected. GO to **DT1.6** . ABS light is not on. GO to **DT1.3** .

DT1.3 CHECK FOR HIGH SENSOR GAP

- Clear all codes.
- Key OFF.
- Start vehicle and select Drive Low (Automatic) or 1st forward gear (Manual).
- Allow vehicle to creep forward at idle for at least 45 seconds.

Does the ABS warning light come on?

Yes	No
GO to **DT1.8** .	GO to **DT1.4** .

DT1.4 CHECK FOR MARGINALLY HIGH SENSOR GAP

- Clear all codes.

tomsn048@gmail.com

- Key OFF.
- Start vehicle and accelerate slowly to 40 km/h (25 mph). Let at least 45 seconds elapse before reaching 40 km/h (25 mph).

Does the ABS warning light come on?

Yes	No
GO to **DT1.8** .	GO to **DT1.5** .

DT1.5 DRIVE TEST IS COMPLETE

Has customer concern been addressed and corrected by previous actions?

Yes	No
STOP. Vehicle ABS function has been verified.	GO to Intermittent Test .

DT1.6 DETERMINE NEXT DIAGNOSTIC STEP BASED ON BRAKE SYMPTOM

- Hard or soft brake pedal.
- Lack of sufficient vehicle deceleration upon brake application.
- Vehicle pulls during braking and pump motor does NOT run.

Are any of the above symptoms present?

Yes	No
GO to Symptom Chart .	Concern is NOT in the ABS system. REFER to Section 06-00 for diagnosis.

DT1.7 OBTAIN DIAGNOSTIC TROUBLE CODE

- Obtain ABS diagnostic trouble code.

Is the diagnostic trouble code the same as before and the ENTIRE pinpoint test for the code completed?

Yes	No
PERFORM Intermittent Diagnosis .	Pinpoint test is NOT complete. RETURN to the last step completed in the pinpoint test. Code obtained is NOT the same. GO to the pinpoint for the code obtained. No code or Code System Pass is obtained. GO to System Precheck .

tomsn048@gmail.com

DT1.8 DETERMINE WHICH SENSOR SIGNAL IS INCORRECT

- Obtain diagnostic trouble code.

Is code obtained C1155, C1145, C1230, C1158, C1148, C1229, C1258, C1259, C1260, C1233, C1234, C1237?

Yes	No
GO to appropriate sensor output pinpoint test.	Code System Pass is not obtained. GO to the pinpoint test for the code obtained. No code or Code System Pass is obtained. GO to Inspection and Verification System Precheck .

tomsn048@gmail.com

Intermittent Diagnostic Guidelines

As previously mentioned, intermittent concerns are the most difficult concerns to diagnose.

An understanding of code storage and automatic code erasure is important.

First, codes can only be stored if the anti-lock brake control module has power. The anti-lock brake control module gets primary power from the ignition feed into Pin 20. If this voltage is missing or less than 9.5V, the anti-lock brake control module will not initialize and therefore, a code cannot be stored. A System Pass (system OK) will be present whenever the module sees the required voltage assuming no other failures are present.

A previously stored diagnostic trouble code will be automatically erased if no system concerns occur for 80 ignition cycles.

Therefore, some codes read out in the System Precheck may not result in any trouble found in the pinpoint test performed. In most cases, this is an indication of an intermittent electrical concern.

To minimize misdiagnosis, use the Intermittent Diagnosis Procedure if no resolution has been reached by the end of a particular pinpoint test.

If you are at this point because the warning light is on and you have been unable to obtain any code, go to Pinpoint Test V. This procedure is only meant to address those problems that have been reduced to an intermittent wiring concern.

PINPOINT TEST ID: INTERMITTENT DIAGNOSIS PROCEDURE

ID1 CLEAR CODES, RECONNECT COMPONENTS

- Remove the Rotunda Breakout Box 014-00322 or equivalent.
- Reinstall any components removed and remake all connections.
- Clear all codes.
- Key ON.

Does the ABS warning light prove out?

Yes	No
GO to **ID3**.	GO to **ID2**.

ID2 SERVICE CONNECTOR/TERMINAL CONCERN

- Most likely concern is at one of the affected component connectors such that terminals unseat or

tomsn048@gmail.com

back out upon installation. At EACH affected connection, including intermediate connections, look for:

- Bent terminals.
- Damaged connector terminal locks.
- Damaged connector wedge.

NOTE: If one of the above conditions is found, check the tightness of the affected circuit once the connection is remade. If the wire is too tight (short), damage is likely to recur once vehicle is given back to the customer. Service the wire as necessary to correct tight wire conditions.

Are any of the above conditions noted?

Yes	No
SERVICE connector and terminal as necessary. GO to **ID5** .	GO to **ID6** .

ID3 WIGGLE TEST

- Leave key ON.
- Wiggle an affected circuit in one location only.

NOTE: Start at one component and wiggle connector by connector until the whole circuit has been tested.

- Observe ABS warning light.

Is the ABS warning light on?

Yes	No
Key off. GO to **ID5** .	GO to **ID4** .

ID4 VERIFY ALL CIRCUITS HAVE BEEN TESTED

Have all affected circuits for the code being serviced been tested?

Yes	No
Key off. GO to **ID6** .	GO to **ID3** and CHECK next circuit.

ID5 RETRIEVE CODE

- Retrieve code.

Is this code different than the code being serviced?

Yes	No
	REPAIR the wire, terminal, or connector as

tomsn048@gmail.com

GO to the appropriate pinpoint test.	necessary. RETURN to the pinpoint test and PROCEED.

ID6 VERIFY ALL APPROPRIATE DIAGNOSTIC PROCEDURES HAVE BEEN RUN

- Has the System Precheck been run and a code been retrieved?

NOTE: If only some tests were performed, go to the pinpoint step last completed and continue.

Have all steps of the pinpoint and symptom tests for the codes being serviced been performed?

Yes	No
RETURN to the pinpoint test and PROCEED.	RETURN to procedure(s) not yet performed and PROCEED.

tomsn048@gmail.com

DIAGNOSTIC TROUBLE CODE INDEX

DIAGNOSTIC TROUBLE CODE INDEX

DTC	Concern	Sets At	Pinpoint Test
B1342	Anti-Lock Brake Control Module Failure	Key On	Replace Anti-Lock Brake Control Module
C1101	ABS Hydraulic Valve Circuit Failure	Key On	A
C1185	ABS Power Relay Output Circuit Failure	Key On	B
B1317	Battery Voltage High	Key On	C
B1318	Battery Voltage Low	Key On	D
C1198	LF Inlet Valve Coil Circuit Failure	Key On	E
C1194	LF Outlet Valve Coil Circuit Failure	Key On	F
C1214	RF Inlet Valve Coil Circuit Failure	Key On	G
C1210	RF Outlet Valve Coil Circuit Failure	Key On	H
C1206	Rear Axle Inlet Valve Coil Circuit Failure	Key On	J
C1202	Rear Axle Outlet Valve Coil Circuit Failure	Key On	K
C1155	LF Wheel Speed Sensor Input Circuit Failure	Key On	L
C1158	LF Wheel Speed Sensor Coherency Fault	40 km/h (25 mph)	LL
C1258	LF Wheel Speed Comparison Failure	19 km/h (12 mph)	LL
C1233	LF Wheel Speed Sensor Input Missing	>2 Min.	LL
C1145	RF Wheel Speed Sensor Input Circuit Failure	Key On	M
C1148	RF Wheel Speed Sensor Coherency Fault	40 km/h (25 mph)	MM
C1259	RF Wheel Speed Comparison Fault	19 km/h (12 mph)	MM
C1234	RF Wheel Speed Sensor Input Missing	>2 Min.	MM
C1230	Rear Axle Wheel Speed Sensor Input Circuit Failure	Key On	N
C1229	Rear Axle Wheel Speed Sensor Coherency Fault	40 km/h (25 mph)	NN
C1260	Rear Axle Wheel Speed Sensor Wheel Speed Comparison Fault	19 km/h (12 mph)	NN
C1237	Rear Axle Wheel Speed Sensor Input Missing	>2 Min.	NN
C1096	ABS Hydraulic Pump Motor Circuit	7 km/h (4 mph)	S
C1102	ABS Acceleration Switch Circuit Failure	See NOTE Below	T
C1095	ABS Hydraulic Pump Motor Circuit Failure	Key On	U

tomsn048@gmail.com

Note: DTC C1102 indicates a G-Switch circuit failure. If the yellow ABS warning lamp comes on at key ON, check for a ground short on Pins 30, 31, or 32. If the yellow ABS lamp comes on at approximately 32 km/h (20 mph), there is either: 1) a battery short on Pins 30, 31 or 32; 2) an open on Pins 30 and 31; or 3) an open on Pin 32. If the yellow ABS lamp comes on after driving the vehicle for 2 minutes at approximately 72 km/h (45 mph), check for an open on Pin 30 or 31 (one pin only).

The G-Switch is installed on 4x4 vehicles only. If an anti-lock brake control module from a 4x4 vehicle is installed on a 4x2 vehicle, the DTC 1102 will be stored and the yellow ABS lamp will be illuminated. The anti-lock brake control module can be reprogrammed with the New Generation Star (NGS) Tester.

---

tomsn048@gmail.com

Pinpoint Tests

NOTE: Do not proceed to any pinpoint test unless directed to do so.

These tests are specific for each code. However, jumping to a pinpoint test as a first step can be misleading. The tests have been written under the assumption that the System Precheck has been performed and passed.

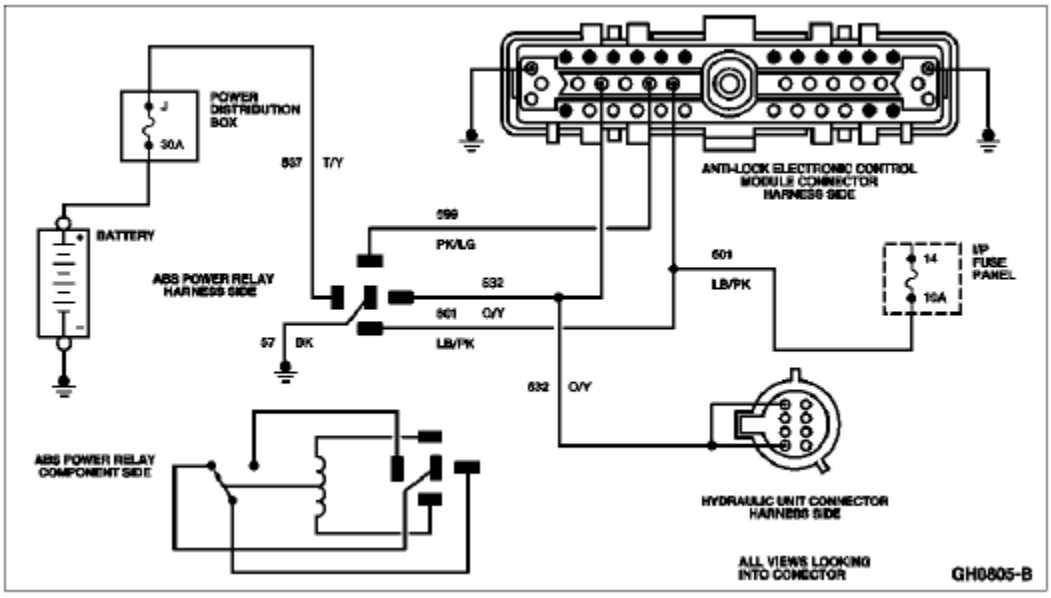
At times, running completely through the pinpoint test will not lead to problem resolution. Often, the concern is due to an intermittent connection, termination, or circuit concern. Refer to the Intermittent Diagnosis Guides in this section when situations like this arise.

It should be also noted that several circuits pass through one or more interconnections between components. These are also areas of potential concern and should be considered.

NOTE: Use Rotunda New Generation Star (NGS) Tester 007-00500 or equivalent to perform electrical tests.

PINPOINT TEST A: ABS HYDRAULIC VALVE CIRCUIT FAILURE (CODE C1101)

Affected Circuit(s)/Electrical Component(s)



Description

tomsn048@gmail.com

DTC C1101 is generated when the ECU detects an intermittent circuit failure in the HCU valves or valve wiring harness.

Possible Contributing Component/Vehicle Wiring Faults

DTC C1101

- Intermittent valve failures.
- Intermittent wiring condition in Circuit 532 (O/Y) to both Pins 1 and 4 of the 8-pin HCU valve block connector.

A1 MEASURE VALVE RESISTANCE AT HCU

- Disconnect 8-pin connector from HCU.
- Measure resistance between the following on the COMPONENT side of the 8-way:
  - Pin 1, Pin 4 and Pin 2 (RA Inlet) 5-8 Ohms
  - Pin 1, Pin 4 and Pin 3 (RA Outlet) 3-6 Ohms
  - Pin 1, Pin 4 and Pin 5 (FR Inlet) 5-8 Ohms
  - Pin 1, Pin 4 and Pin 6 (FR Outlet) 3-6 Ohms
  - Pin 1, Pin 4 and Pin 7 (FL Inlet) 5-8 Ohms
  - Pin 1, Pin 4 and Pin 8 (FL Outlet) 3-6 Ohms

NOTE: The valve resistance will change rapidly. While monitoring valve coil resistance, tap the anti-lock hydraulic control unit lightly with a rubber mallet to simulate conditions of rough road driving.

Does the resistance on any valve move out of specification at any time?

Yes	No
High or low valve resistance detected. REPLACE HCU. PERFORM ABS brake bleed procedure with bleeder box. GO to **A5** .	GO to **A2** .

A2 TEST FOR INTERMITTENT INTERNAL VALVE BLOCK SHORT

- Measure resistance between the following on the COMPONENT side of the HCU 8-pin connector:
  - Pin 1 and valve block.
  - Pin 4 and valve block.

NOTE: The valve resistance will change rapidly. While monitoring valve coil resistance, tap the anti-lock hydraulic control unit lightly with a rubber mallet to simulate conditions of rough road driving.

Is the measured resistance less than 10M ohms at any time?

Yes	No
REPLACE HCU. PERFORM ABS brake bleed procedure with bleeder box. GO to **A5** .	GO to **A3** .

tomsn048@gmail.com

A3 CHECK FOR INTERMITTENT BATTERY VOLTAGE AT HCU CONNECTOR

NOTE: The voltage reading will change rapidly.

- Install breakout box (BOB). Ensure that correct overlay is installed.
- Jumper BOB Pin 19 to Pin 1 or Pin 14.
- Set up DVOM to measure voltage between BOB Pin 17 and Pin 1 or Pin 14.
- While monitoring the voltage, tap the anti-lock hydraulic control unit lightly with a rubber mallet to simulate conditions of rough road driving.

Does the voltage fall below 9 volts at any time?

Yes	No
REPAIR source of high resistance or open circuit in one of the following: Circuit 532 (O/Y) between HCU and ABS power relay, Circuit 537 (T/Y) between battery and ABS power relay. GO to **A5**.	GO to **A4**.

A4 CONCLUDE INTERMITTENT DIAGNOSIS

- Perform Pinpoint Test ID, Intermittent Diagnosis Procedure for the affected circuits. Refer to the mini-schematic.

Is wiring fault located?

Yes	No
REPAIR wiring fault as required. GO to **A5**.	REPLACE ECU. GO to **A5**.

A5 VERIFY CONCERN IS RESOLVED

- Key OFF.
- Reconnect and reassemble all components.
- Install NGS Tester.
- Key ON. Clear codes.
- Drive over rough road and through a car wash.
- Pull codes.

Is System Pass obtained?

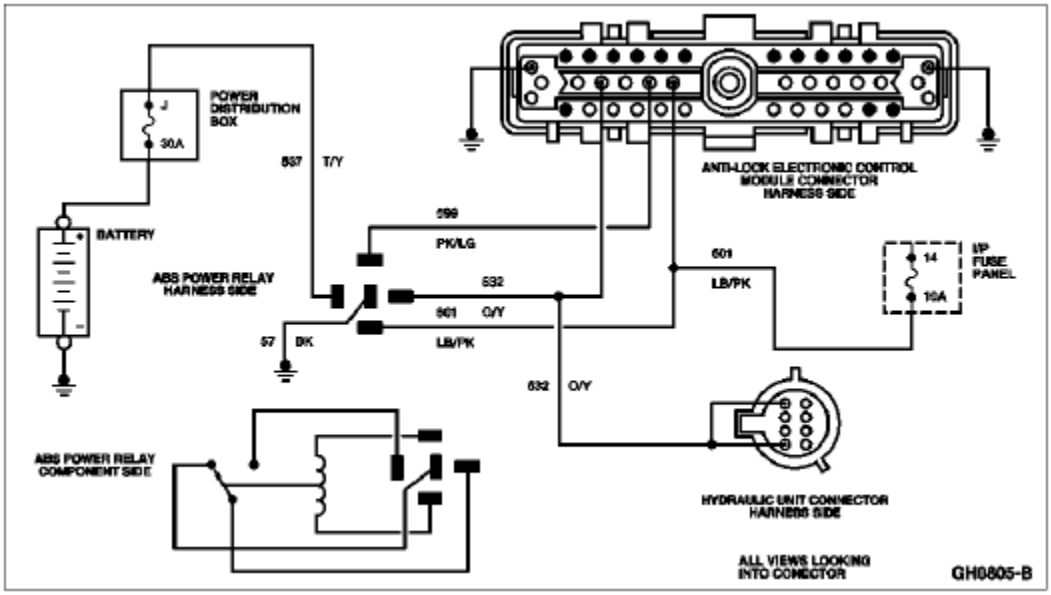
Yes	No
STOP. Repair is complete.	Same code is present. REPEAT **A1** to CHECK for second related concern. A new code is present. GO to the appropriate

tomsn048@gmail.com

	pinpoint test.

PINPOINT TEST B: ABS POWER RELAY CIRCUIT OUTPUT FAILURE (CODE C1185)

Affected Circuit(s)/Electrical Component(s)



Description

DTC C1185 is generated when the ECU detects an open or ground short on Circuits 537 (T/Y), 599 (PK/LG) or 532 (O/Y).

Possible Contributing Component/Vehicle Wiring Faults

DTC C1185

- Open or short to ground on Circuits 537 (T/Y), 599 (PK/LG) or 532 (O/Y).
- Open in Circuit 601 (LB/BK) to relay coil only. Circuit 601 to module intact.
- 30 amp fuse open.
- ABS power relay coil or contacts open.

B1 CHECK FOR VOLTAGE AT PIN 17

- Measure and record battery voltage.
- Install breakout box (BOB). Ensure that correct overlay is installed.

tomsn048@gmail.com

- Jumper breakout box Pin 19 to Pin 1 or Pin 14.
- Key ON. Measure voltage at BOB Pin 17.

Is voltage between 9.5 and 18 volts and within .5 volts of battery voltage?

Yes	No
GO to **B2** .	GO to **B4** .

B2 VERIFY DTC C1185

- Key OFF.
- Reconnect ECU.
- Key ON.

Is ABS light on?

Yes	No
GO to **B3** .	Intermittent fault. REFER to Pinpoint Test ID , Intermittent Diagnosis Procedure for all affected circuits (REFER to mini-schematic).

B3 RETRIEVE DTCS

- Connect NGS Tester and pull DTCs.

Is DTC C1185 present?

Yes	No
REPLACE ECU. GO to **B14** .	GO to appropriate pinpoint test.

B4 CHECK 30A FUSE

- Inspect 30A fuse for open.

Is fuse OK?

Yes	No
GO to **B7** .	GO to **B5** .

B5 CHECK CIRCUIT 537 (T/Y) FOR GROUND SHORT

- Remove ABS power relay.
- Check for ground short on Circuit 537 (T/Y) between 30A fuse and relay connector.

tomsn048@gmail.com

Is a ground short detected?

Yes	No
REPAIR as required. GO to **B14** .	GO to **B6** .

B6 CHECK CIRCUIT 532 (O/Y) FOR GROUND SHORT

- Remove ABS power relay.
- Disconnect 8-way HCU valve connector.
- Check for ground short on Circuit 532 (O/Y) between relay connector, BOB Pin 17, and HCU 8-way connector Pins 1 and 4.

Is a ground short detected?

Yes	No
REPAIR as required. GO to **B14** .	REPLACE relay. GO to **B14** .

B7 CHECK POWER TO 30A FUSE

- Remove 30A fuse.
- Key ON. Measure voltage at power side of fuse.
- Key OFF.

Is B+ present?

Yes	No
GO to **B8** .	REPAIR power feed to 30A fuse. REFER to EVTM for power distribution. GO to **B14** .

B8 CHECK CIRCUIT 537 (T/Y) FOR OPEN

- Key OFF.
- Remove ABS power relay.
- Measure resistance between relay and 30A fuse along Circuit 537 (T/Y).
- Install fuse.

Is resistance less than 1 ohm?

Yes	No
GO to **B9** .	REPAIR open/high resistance in Circuit 537 (T/Y) as required. GO to **B14** .

B9 CHECK CIRCUIT 599 (PK/LG) FOR GROUND SHORT

tomsn048@gmail.com

- Key OFF.
- Check for ground short at Circuit 599 (PK/LG) (BOB Pin 19).

Is circuit OK?

Yes	No
GO to **B10** .	REPAIR Circuit 599 (PK/LG) for ground short. GO to **B14** .

B10 CHECK CIRCUIT 599 (PK/LG) FOR OPEN

- Key OFF.
- Measure resistance between ABS power relay and BOB Pin 19 along Circuit 599 (PK/LG).

Is resistance less than 1 ohm?

Yes	No
GO to **B11** .	REPAIR open/high resistance in Circuit 599 (PK/LG) as required. GO to **B14** .

B11 CHECK CIRCUIT 532 (O/Y) FOR OPEN

- Key OFF.
- Measure resistance between ABS power relay and BOB Pin 17 along Circuit 532 (O/Y).

Is resistance less than 1 ohm?

Yes	No
GO to **B12** .	REPAIR open/high resistance in Circuit 532 (O/Y) as required. GO to **B14** .

B12 CHECK RELAY COIL

- Remove ABS power relay.
- Measure resistance across relay coil (terminals 85 and 86).

Is resistance between 60 and 80 ohms?

Yes	No
GO to **B13** .	REPLACE relay. GO to **B14** .

B13 CHECK VOLTAGE TO RELAY COIL

- Key ON. Measure voltage at Circuit 601 (LB/BK) on ABS power relay connector.

tomsn048@gmail.com

- Key OFF.

Is B+ present?

Yes	No
REPLACE ABS power relay. RETEST.	REPAIR open in Circuit 601 (LB/BK) between splice and relay. REFER to mini-schematic. GO to **B14** .

B14 VERIFY CONCERN IS RESOLVED

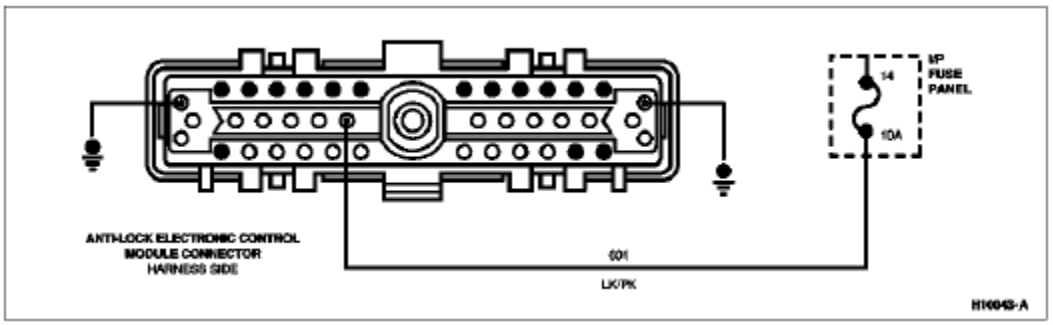
- Key OFF.
- Reconnect and reassemble all components.
- Connect NGS Tester.
- Key ON. Clear codes.
- Perform Drive Test DT1.
- Pull codes.

Is System Pass obtained?

Yes	No
STOP. Repair is complete.	Same code is present. REPEAT **B1** to CHECK for second related concern. A new code is present. GO to the appropriate pinpoint test.

PINPOINT TEST C: BATTERY VOLTAGE HIGH (CODE B1317)

Affected Circuit(s)/Electrical Component(s)



Description

tomsn048@gmail.com

DTC B1317 is generated when the ECU detects system voltage was greater than 18.0 volts for more than 5 seconds.

Possible Contributing Component/Vehicle Wiring Faults

DTC B1317

- 24 volt jump.
- Charging system over-voltage condition.

C1 CHECK RECENT VEHICLE HISTORY

- The most likely cause for DTC B1317 is jump-starting the vehicle with a 24 volt system used on many towing repairs.

Has the vehicle been jump-started by a towing service within the past two weeks?

Yes	No
STOP. Repair is complete.	GO to **C2** .

C2 MEASURE VOLTAGE AT PIN 20

- Key ON, engine running. Measure voltage at BOB Pin 20.

Is voltage 18 volts or greater?

Yes	No
REPAIR charging system for over-voltage condition.	GO to **C3** .

C3 CHECK ECU

- Key OFF.
- Reconnect and reassemble all components.
- Install NGS Tester.
- Key ON. Clear codes.
- Key OFF.
- Key ON, pull codes.

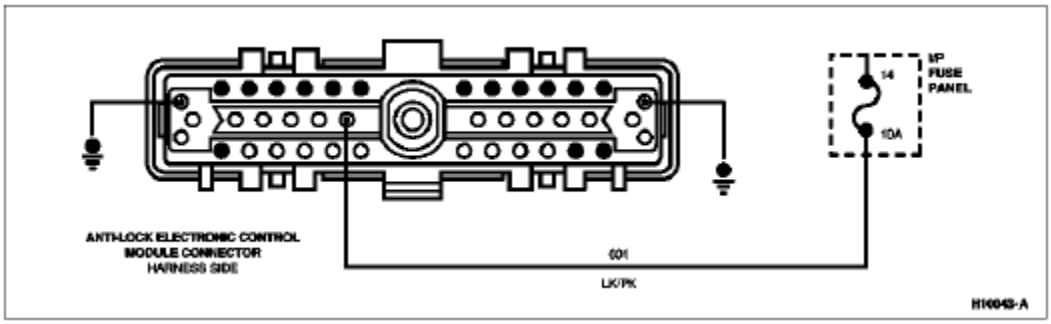
Is System Pass obtained?

Yes	No
REPAIR charging system for intermittent over-voltage condition.	DTC B1317 is present. REPLACE ECU. A new code is present. GO to the appropriate pinpoint test.

tomsn048@gmail.com

PINPOINT TEST D: BATTERY VOLTAGE LOW (CODE B1318)

Affected Circuit(s)/Electrical Component(s)



Description

DTC B1318 is generated when the ECU detects system voltage was less than 9.5 volts for more than 5 seconds.

Possible Contributing Component/Vehicle Wiring Faults

DTC B1318

- Charging system under-voltage condition.
- Excessive resistance in ECU ground circuits (Pins 1 and 14).
- Excessive resistance in Circuit 601 (LB/PK) to Pin 20.

D1 MEASURE BATTERY VOLTAGE B+

- Measure and record battery voltage

Is battery voltage greater than 9.5 volts?

Yes	No
GO to **D2** .	REPAIR charging system for under-voltage condition.

D2 VERIFY DTC B1318

tomsn048@gmail.com

- Connect NGS Tester.
- Key ON, clear codes.
- Key OFF.
- Key ON, pull codes.

Is DTC B1318 present?

Yes	No
GO to **D3** .	A new code is present. GO to appropriate pinpoint test. System Pass is obtained. Concern is intermittent. PERFORM Pinpoint Test ID , Intermittent Diagnosis Procedure on all affected circuits. REFER to mini-schematic.

D3 CHECK ECU GROUND

- Install breakout box (BOB). Ensure that correct overlay is installed.
- Inspect ground stud for corrosion.
- Measure resistance between BOB Pins 1 and 14 and chassis ground.

Is resistance less than 0.5 ohm?

Yes	No
REPLACE ECU. GO to **D4** .	REPAIR high resistance in ECU ground circuit. GO to **D4** .

D4 VERIFY CONCERN IS RESOLVED

- Key OFF.
- Reconnect and reassemble all components.
- Install NGS Tester.
- Key ON. Clear codes.
- Perform Drive Test DT1 .
- Pull codes.

Is System Pass obtained?

Yes	No
STOP. Repair is complete.	Same code is present. REPEAT **D1** to CHECK for second related concern. A new code is present. GO to the appropriate pinpoint test.

PINPOINT TEST E: LF INLET SOLENOID VALVE CONCERN DIAGNOSIS (CODE

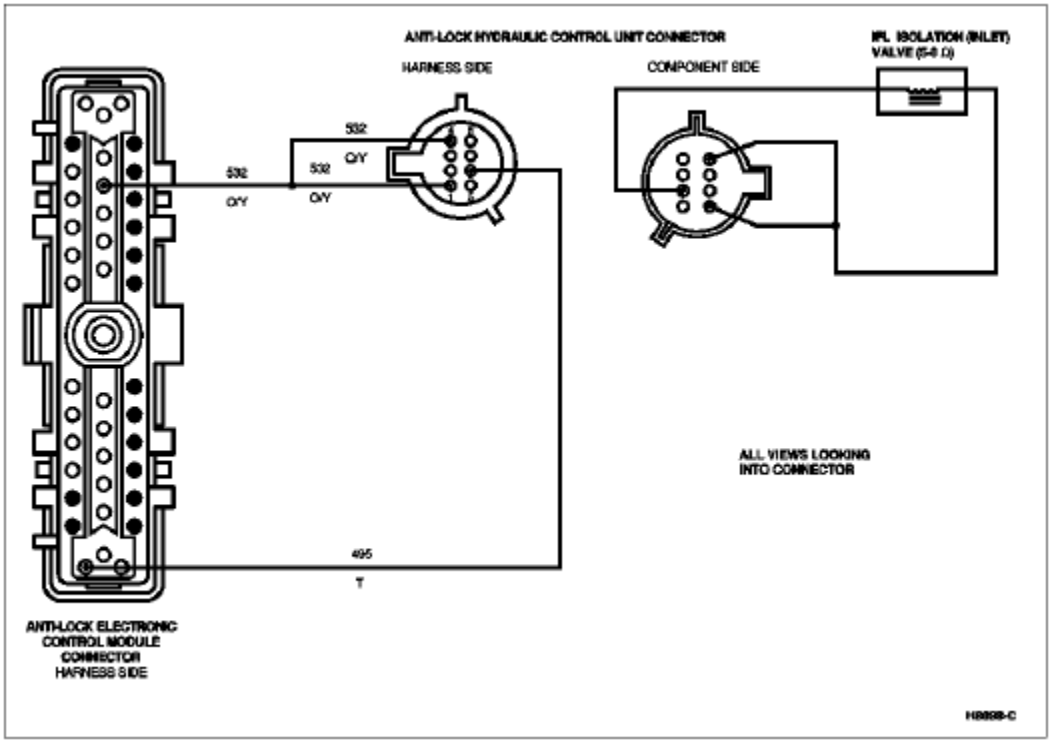
tomsn048@gmail.com

C1198)

Possible Code(s)

DTC C1198 — Open circuit to valve block or anti-lock brake control module, open or shorted valve coil or internal anti-lock electronic control module defect.

Affected Circuit(s)/Electrical Component(s)



Description

Code C1198 is generated by the ECU's detection of an open or shorted Circuit 495 (T) and by an open or shorted inlet front left (IFL) valve coil or an open or shorted driver in the anti-lock brake control module.

Possible Contributing Component/Vehicle Wiring Concerns

- Intermittent open Circuit 495 (T).
- Terminal backout in anti-lock brake control module connector Pins 17 and 40.
- Terminal backout in valve block connector Pins 1, 4 and 6.
- Open or shorted inlet front left (IFL) valve coil.
- Open or shorted driver in anti-lock brake control module.

E1 DIAGNOSTIC TROUBLE CODE C1198: CHECK VALVE COIL, CIRCUIT 495 (T) AND THE ANTI-LOCK ELECTRONIC CONTROL MODULE

tomsn048@gmail.com

- Ignition OFF.
- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.
- Verify terminals at Pins 17 and 40 are clean and secure in the anti-lock brake control module harness connector.
- Measure resistance between Pins 17 and 40.

Is reading between 5 and 8 ohms?

Yes	No
GO to **E5** .	GO to **E2** .

E2 CHECK VALVE COIL

- Disconnect 8-pin valve block connector.
- Verify terminals on both halves of the 8-way connector are clean and secure.
- Measure resistance between Pins 1 and 6 and Pins 4 and 6 on the valve block.

Are both readings between 5 and 8 ohms?

Yes	No
REMOVE ABS power relay. REPAIR open or short to ground in Circuits 495 (T) and 532 (O/Y) between valve block harness connector and anti-lock brake control module connector. INSTALL relay. GO to **E4** .	REPLACE HCU. GO to **E4** .

E3 CHECK IF ALL STEPS HAVE BEEN COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

  CAUTION: If the above is not complete, chances are that replacement of this or any other system component without specific direction will not, in most circumstances, resolve the concern and will consequently result in customer dissatisfaction.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE anti-lock brake control module. GO to **E4** .	GO to last diagnostic step completed and CONTINUE.

E4 CHECK FOR CODE REPEATABILITY

- Clear all codes.
- Key OFF.
- Key ON.

tomsn048@gmail.com

- Retrieve code(s).

Is Code System Pass set?

Yes	No
Concern has been corrected. Go to **E5** .	Code C1198 still exists. GO to **E3** . Different code is set. GO to appropriate pinpoint test. Code C1198 still exists and anti-lock brake control module has been replaced. **NOTE: The anti-lock system is disabled with the Rotunda Breakout Box 014-00322 or equivalent installed.** INSTALL Rotunda Breakout Box 014-00322 with overlay. REPEAT Test Step **E1** while DRIVING vehicle. LOOK for any change in indicated continuity (turning on the DVOM beeper will help). INSPECT Circuits 532 and 495 along their entire length from the sensor connector to the anti-lock brake control module harness connector for chafing or any other damage that could lead to any open or shorted condition. REPAIR as required.

E5 VERIFY INTEGRITY OF VEHICLE WIRING

NOTE: If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on the pinpoint test mini-schematic.

Is resolution achieved?

Yes	No
GO to **E4** for system OK verification.	Most likely concern is HCU. REPLACE HCU. PERFORM anti-lock bleed procedure. GO to **E4** .

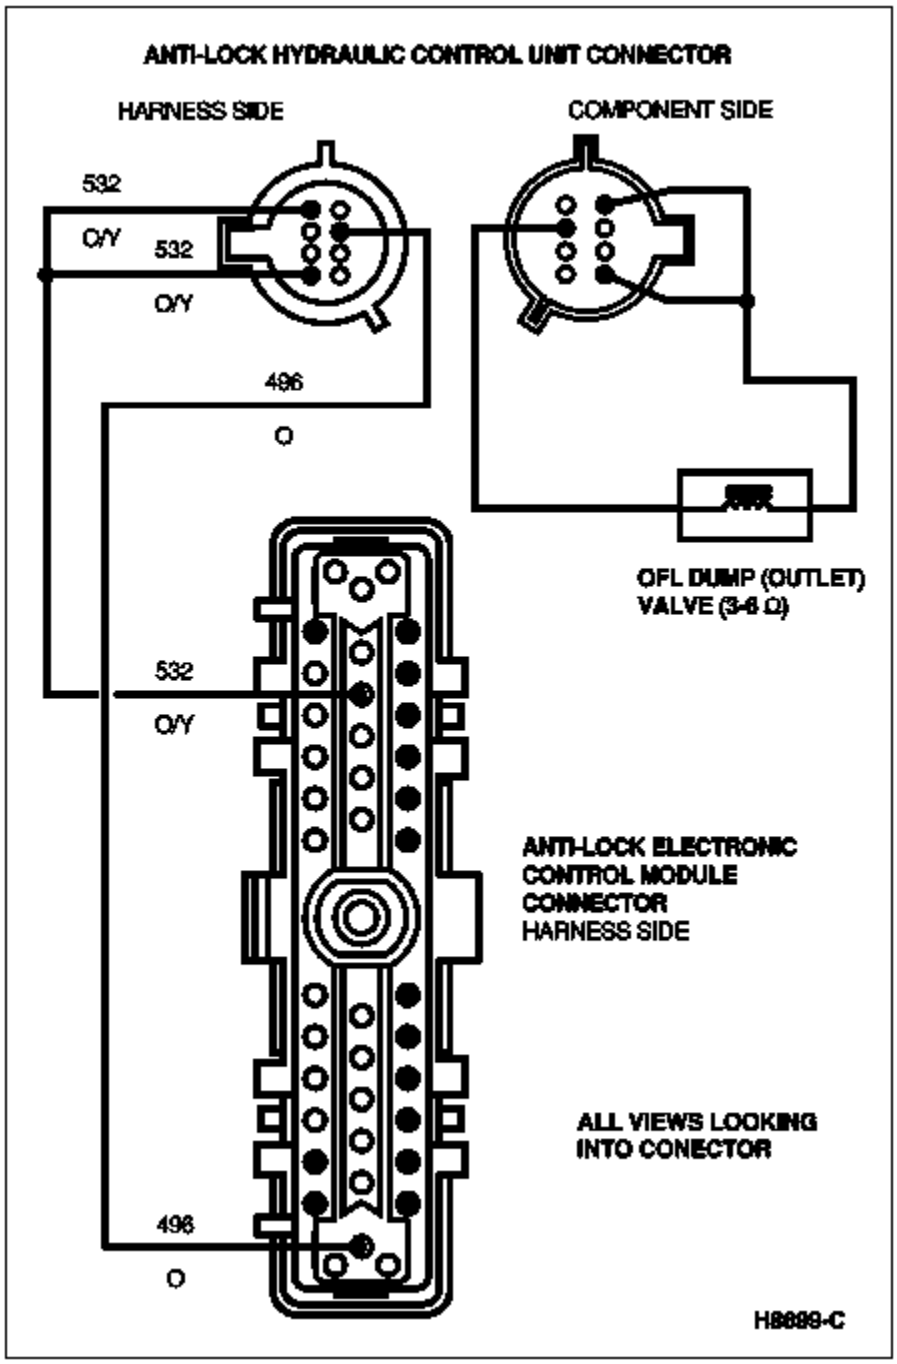
PINPOINT TEST F: LF OUTLET SOLENOID CONCERN DIAGNOSIS (CODE C1194)

Possible Code(s)

tomsn048@gmail.com

C1194 — Open circuit to valve block or anti-lock brake control module, open or shorted valve coil or internal anti-lock electronic control module damage.

Affected Circuit(s)/Electrical Component(s)



Description

Code C1194 is generated by the anti-lock electronic control module's detection of an open or shorted Circuit 496 (O) and by an open or shorted outlet front left (OFL) valve coil or an open or shorted driver in the anti-lock brake control module.

tomsn048@gmail.com

Possible Contributing Component/Vehicle Wiring Concerns

- Intermittent open Circuit 496 (O).
- Terminal backout in anti-lock brake control module connector Pins 17 and 26.
- Terminal backout in valve block connector Pins 1, 4, and 7.
- Open or shorted outlet front left (OFL) valve coil.
- Open or shorted driver in anti-lock brake control module.

F1 DIAGNOSTIC TROUBLE CODE C1194: CHECK VALVE COIL, CIRCUIT 496 AND THE ANTI-LOCK ELECTRONIC CONTROL MODULE

- Ignition OFF.
- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.
- Verify terminals at Pins 17 and 26 are clean and secure in the anti-lock brake control module harness connector.
- Measure resistance between Pins 17 and 26.

Is reading between 3 and 6 ohms?

Yes	No
GO to **F5** .	GO to **F2** .

F2 CHECK VALVE COIL

- Disconnect 8-pin valve block connector.
- Verify terminals on both halves of the valve block 8-way connector are clean and secure.
- Measure resistance between Pins 1 and 7 and Pins 4 and 7 on the valve block.

Are both readings between 3 and 6 ohms?

Yes	No
REMOVE ABS power relay. SERVICE open or short to ground in Circuits 496 (O) and 532 (O/Y) between valve block harness connector and anti-lock brake control module connector. INSTALL relay. GO to **F4** .	REPLACE HCU. GO to **F4** .

F3 CHECK IF ALL STEPS HAVE BEEN COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: If the above is not complete, chances are that replacement of this or any other system component without specific direction will not, in most circumstances, resolve the concern and will consequently result in customer dissatisfaction.

tomsn048@gmail.com

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE anti-lock brake control module. GO to **F4** .	GO to last diagnostic step completed and CONTINUE.

F4 CHECK FOR CODE REPEATABILITY

- Clear all codes.
- Key OFF.
- Key ON.
- Retrieve code(s).

Is Code System Pass set?

Yes	No
Concern has been corrected. GO to **F5** .	Code C1194 still exists. GO to **F3** . Different code is set. GO to appropriate pinpoint test. Code C1194 still exists and ECU has been replaced. **NOTE: The anti-lock system is disabled with the Rotunda Breakout Box 014-00322 or equivalent installed.** INSTALL Rotunda Breakout Box 014-00322 with overlay. REPEAT Test Step **F1** while DRIVING vehicle. LOOK for any change in indicated continuity (turning on the DVOM beeper will help). INSPECT Circuits 532 (O/Y) and 496 (O) along their entire length from the sensor connector to the anti-lock brake control module harness connector for chafing or any other damage that could lead to any open or shorted condition. REPAIR as required.

F5 VERIFY INTEGRITY OF VEHICLE WIRING

NOTE: If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on the pinpoint test mini-schematic.

Is resolution achieved?

tomsn048@gmail.com

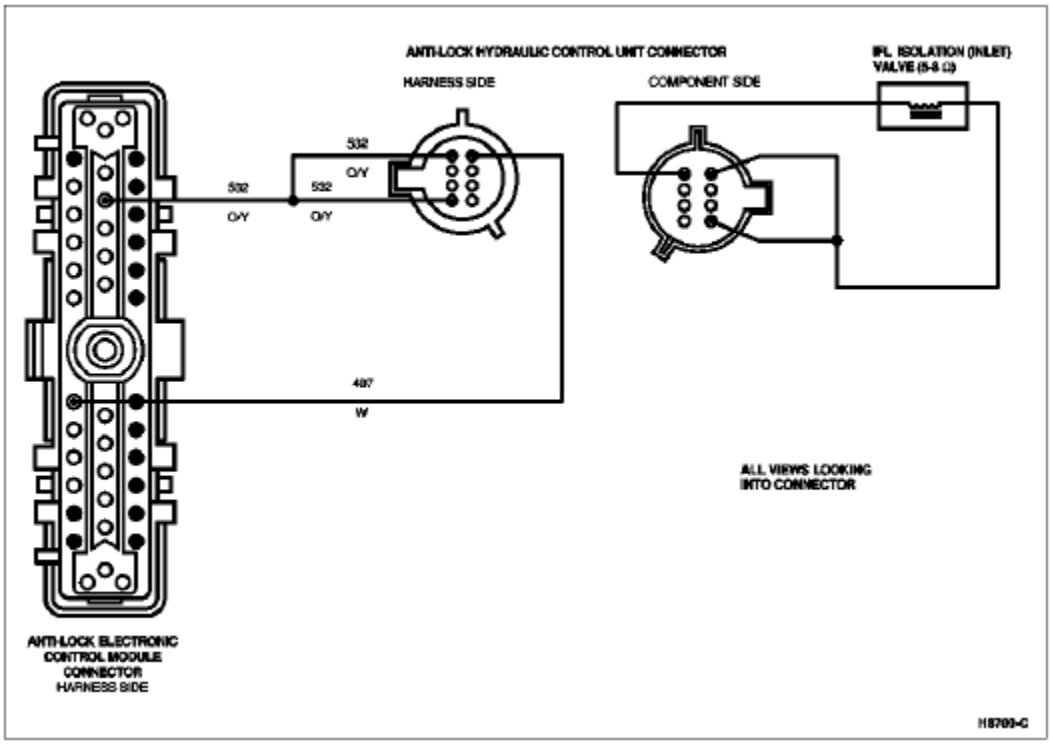
Yes	No
GO to F4 for system OK verification.	Most likely concern is in HCU. REPLACE HCU and PERFORM anti-lock bleed procedure. GO to F4 .

PINPOINT TEST G: RF INLET SOLENOID VALVE CONCERN DIAGNOSIS (CODE C1214)

Possible Code(s)

C1214 — Open circuit to valve block or anti-lock brake control module, open or shorted valve coil or internal anti-lock electronic control module damage.

Affected Circuit(s)/Electrical Component(s)



Description

Code C1214 is generated by the anti-lock electronic control module's detection of an open or shorted Circuit 497 (W) and by an open or shorted inlet front right (IFR) valve coil or an open or shorted driver in the anti-lock brake control module.

Possible Contributing Component/Vehicle Wiring Concerns

- Intermittent open Circuit 497 (W).

tomsn048@gmail.com

- Terminal backout in anti-lock brake control module connector Pins 17 and 34.
- Terminal backout in valve block connector Pins 1, 4, and 8.
- Open or shorted inlet front right (IFR) valve coil.
- Open or shorted driver in anti-lock brake control module.

G1 DIAGNOSTIC TROUBLE CODE C1214: CHECK VALVE COIL CIRCUIT 497 (W) AND THE ECU

- Ignition OFF.
- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.
- Verify terminals at Pins 17 and 34 are clean and secure in the anti-lock brake control module harness connector.
- Measure resistance between Pins 17 and 34.

Is reading between 5 and 8 ohms?

Yes	No
GO to **G5** .	GO to **G2** .

G2 CHECK VALVE COIL

- Disconnect 8-pin valve block connector.
- Verify terminals on both halves of the valve block 8-way connector are clean and secure.
- Measure resistance between Pins 1 and 8 and Pins 4 and 8 on the valve block.

Are both readings between 5 and 8 ohms?

Yes	No
REMOVE ABS power relay. REPAIR open or short to ground in Circuits 497 (W) and 532 (O/Y) between valve block harness connector and anti-lock brake control module connector. INSTALL relay. GO to **G3** .	REPLACE HCU. GO to **G4** .

G3 CHECK IF ALL STEPS HAVE BEEN COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: If not complete, chances are that replacement of this or any other system component without specific direction will not, in most circumstances, resolve the concern and will consequently result in customer dissatisfaction.

Have all prior diagnostic steps been completed as described above?

tomsn048@gmail.com

Yes	No
REPLACE anti-lock brake control module. GO to **G4** .	GO to last diagnostic step completed and CONTINUE.

G4 CHECK FOR CODE REPEATABILITY

- Clear all codes.
- Key OFF.
- Key ON.
- Retrieve code(s).

Is Code System Pass set?

Yes	No
Concern has been corrected. GO to **G5** .	Code C1214 still exists. GO to **G3** . Different code is set. GO to appropriate pinpoint test. Code C1214 still exists and ECU has been replaced. **NOTE: The anti-lock system is disabled with the Rotunda Breakout Box 014-00322 or equivalent installed.** INSTALL Rotunda Breakout Box 014-00322 with overlay. REPEAT Test Step **G1** while driving vehicle. LOOK for any change in indicated continuity (turning on the DVOM beeper will help). INSPECT Circuits 532 (O/Y) and 497 (W) along their entire length from the sensor connector to the anti-lock brake control module harness connector for chafing or any other damage that could lead to any open or shorted condition. REPAIR as required.

G5 VERIFY INTEGRITY OF VEHICLE WIRING

NOTE: If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on the pinpoint test mini-schematic.

Is resolution achieved?

tomsn048@gmail.com

Yes	No
GO to **G4** for system OK verification.	Most likely concern is in HCU. REPLACE HCU and PERFORM anti-lock bleed procedure. GO to **G4** .

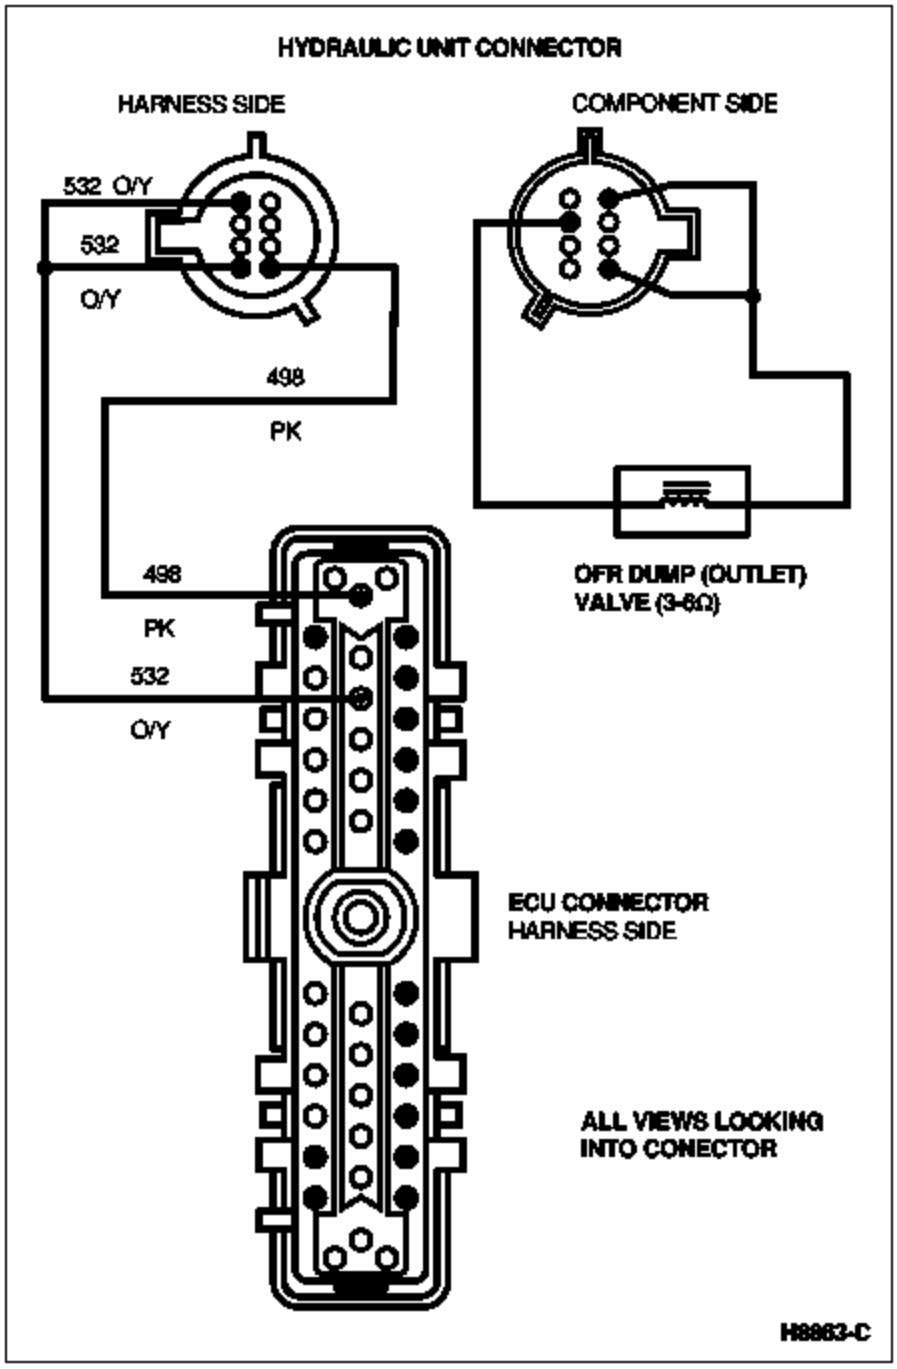
PINPOINT TEST H: RF OUTLET SOLENOID VALVE CONCERN DIAGNOSIS (CODE C1210)

Possible Code(s)

C1210 — Open circuit to valve block or anti-lock brake control module, open or shorted valve coil or internal anti-lock electronic control module damage.

Affected Circuit(s)/Electrical Component(s)

tomsn048@gmail.com



Description

Code C1210 is generated by the anti-lock electronic control module's detection of an open or shorted Circuit 498 (PK) and by an open or shorted outlet front right (OFR) valve coil or an open or shorted driver in the anti-lock brake control module.

Possible Contributing Component/Vehicle Wiring Concerns

- Intermittent open Circuit 498 (PK).
- Terminal backout in anti-lock brake control module connector Pins 17 and 15.

tomsn048@gmail.com

- Terminal backout in valve block connector Pins 1, 4, and 5.
- Open or shorted outlet front right (OFR) valve coil.
- Open or shorted driver in anti-lock brake control module.

H1 DIAGNOSTIC TROUBLE CODE C1210: CHECK VALVE COIL, CIRCUIT 498 AND THE ANTI-LOCK ELECTRONIC CONTROL MODULE

- Ignition OFF.
- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.
- Verify terminals at Pins 17 and 15 are clean and secure in the anti-lock brake control module harness connector.
- Measure resistance between Pins 17 and 15.

Is reading between 3 and 6 ohms?

Yes	No
GO to **H5** .	GO to **H2** .

H2 CHECK VALVE COIL

- Disconnect 8-pin valve block connector.
- Verify terminals on both halves of the valve block 8-way connector are clean and secure.
- Measure resistance between Pins 1 and 5 and Pins 4 and 5 on the valve block.

Are both readings between 3 and 6 ohms?

Yes	No
REMOVE ABS power relay. REPAIR open or short to ground in Circuits 498 (PK) and 532 (O/Y) between valve block harness connector and anti-lock brake control module connector. INSTALL relay. GO to **H4** .	REPLACE HCU. GO to **H4** .

H3 CHECK IF ALL STEPS HAVE BEEN COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: If the above is not complete, chances are that replacement of this or any other system component without specific direction will not, in most circumstances, resolve the concern and will consequently result in customer dissatisfaction.

Have all prior diagnostic steps been completed as described above?

Yes	No

tomsn048@gmail.com

REPLACE anti-lock brake control module. GO to **H4**.	GO to last diagnostic step completed and CONTINUE.

H4 CHECK FOR CODE REPEATABILITY

- Clear all codes.
- Key OFF.
- Key ON.
- Retrieve code(s).

Is Code System Pass set?

Yes	No
Concern has been corrected. GO to **H5**.	Code C1210 still exists. GO to **H3**. Different code is set. GO to appropriate pinpoint test. Code C1210 still exists and anti-lock brake control module has been replaced. **NOTE: The anti-lock system is disabled with the Rotunda Breakout Box 014-00322 or equivalent installed.** INSTALL Rotunda Breakout Box 014-00322 with overlay. REPEAT Test Step **H1** while driving vehicle. LOOK for any change in indicated continuity (turning on the DVOM beeper will help). INSPECT Circuits 532 (O/Y) and 498 (PK) along their entire length from the sensor connector to the anti-lock brake control module harness connector for chafing or any other damage that could lead to any open or shorted condition. REPAIR as required.

H5 VERIFY INTEGRITY OF VEHICLE WIRING

NOTE: If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

- Refer to Pinpoint Test ID, Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on the pinpoint test mini-schematic.

Is resolution achieved?

Yes	No

tomsn048@gmail.com

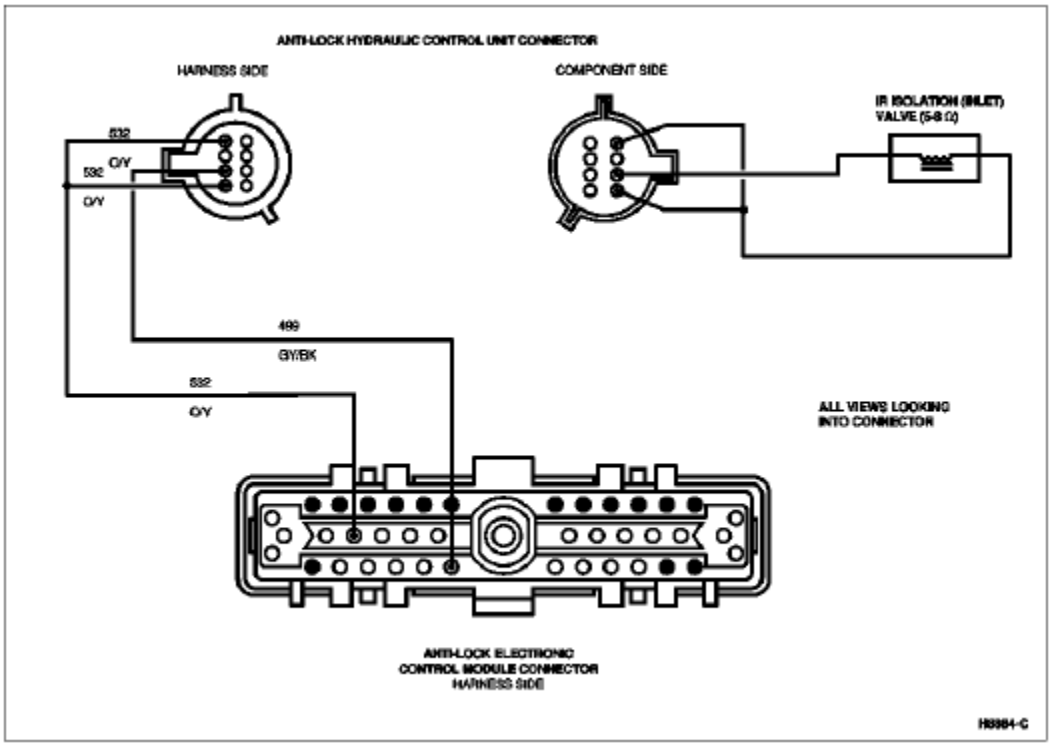
GO to **H4** for system OK verification.	Most likely concern was in HCU. REPLACE HCU and PERFORM anti-lock bleed procedure. GO to **H4** .

PINPOINT TEST J: REAR AXLE INLET SOLENOID VALVE CONCERN DIAGNOSIS (CODE C1206)

Possible Code(s)

C1206 — Open circuit to valve block or anti-lock brake control module, open or shorted valve coil or internal anti-lock electronic control module damage.

Affected Circuit(s)/Electrical Component(s)



Description

Code C1206 is generated by the anti-lock electronic control module's detection of an open or shorted Circuit 499 (GY/BK) and by an open or shorted inlet rear axle (IRA) valve coil or an open or shorted driver in the anti-lock brake control module.

Possible Contributing Component/Vehicle Wiring Concerns

- Intermittent open Circuit 499 (GY/BK).
- Terminal backout in ECU connector Pins 17 and 33.

tomsn048@gmail.com

- Terminal backout in valve block connector Pins 1, 4, and 2.
- Open or shorted inlet rear axle (IRA) valve coil.
- Open or shorted driver in anti-lock brake control module.

J1 DIAGNOSTIC TROUBLE CODE C1206: CHECK VALVE COIL, CIRCUIT 499 (GY/BK) AND THE ANTI-LOCK ELECTRONIC CONTROL MODULE

- Ignition OFF.
- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.
- Verify terminals at Pins 17 and 33 are clean and secure in the anti-lock brake control module harness connector.
- Measure resistance between Pins 17 and 33.

Is reading between 5 and 8 ohms?

Yes	No
GO to **J5** .	GO to **J2** .

J2 CHECK VALVE COIL

- Disconnect 8-pin valve block connector.
- Verify terminals in both halves of the valve block 8-way connector are clean and secure.
- Measure resistance between Pins 1 and 2 and Pins 4 and 2 on the valve block.

Are both readings between 5 and 8 ohms?

Yes	No
REMOVE ABS power relay. REPAIR open or short to ground in Circuits 499 (GY/BK) or 532 (O/Y) between valve block harness connector and anti-lock brake control module connector. GO to **J4** .	REPLACE HCU. GO to **J4** .

J3 CHECK IF ALL STEPS HAVE BEEN COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: If the above is not complete, chances are that replacement of this or any other system component without specific direction will not, in most circumstances, resolve the concern and will consequently result in customer dissatisfaction.

Have all prior diagnostic steps been completed as described above?

Yes	No

tomsn048@gmail.com

REPLACE anti-lock brake control module. GO to J4 .	GO to last diagnostic step completed and CONTINUE.

J4 CHECK FOR CODE REPEATABILITY

- Clear all codes.
- Key OFF.
- Key ON.
- Retrieve code(s).

Is Code System Pass set?

Yes	No
Concern has been corrected. GO to J5 .	Code C1206 still exists. GO to J3 . Different code is set. GO to appropriate pinpoint test. Code C1206 still exists and anti-lock brake control module has been replaced. **NOTE: The anti-lock system is disabled with the Rotunda Breakout Box 014-00322 or equivalent installed.** INSTALL Rotunda Breakout Box 014-00322 with overlay. REPEAT Test Step J1 while driving vehicle. LOOK for any change in indicated continuity (turning on the DVOM beeper will help). INSPECT Circuits 532 (O/Y) and 499 (GY/BK) along their entire length from the sensor connector to the anti-lock brake control module harness connector for chafing or any other damage that could lead to any open or shorted condition. REPAIR as required.

J5 VERIFY INTEGRITY OF VEHICLE WIRING

NOTE: If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on the pinpoint test mini-schematic.

Is resolution achieved?

Yes	No

tomsn048@gmail.com

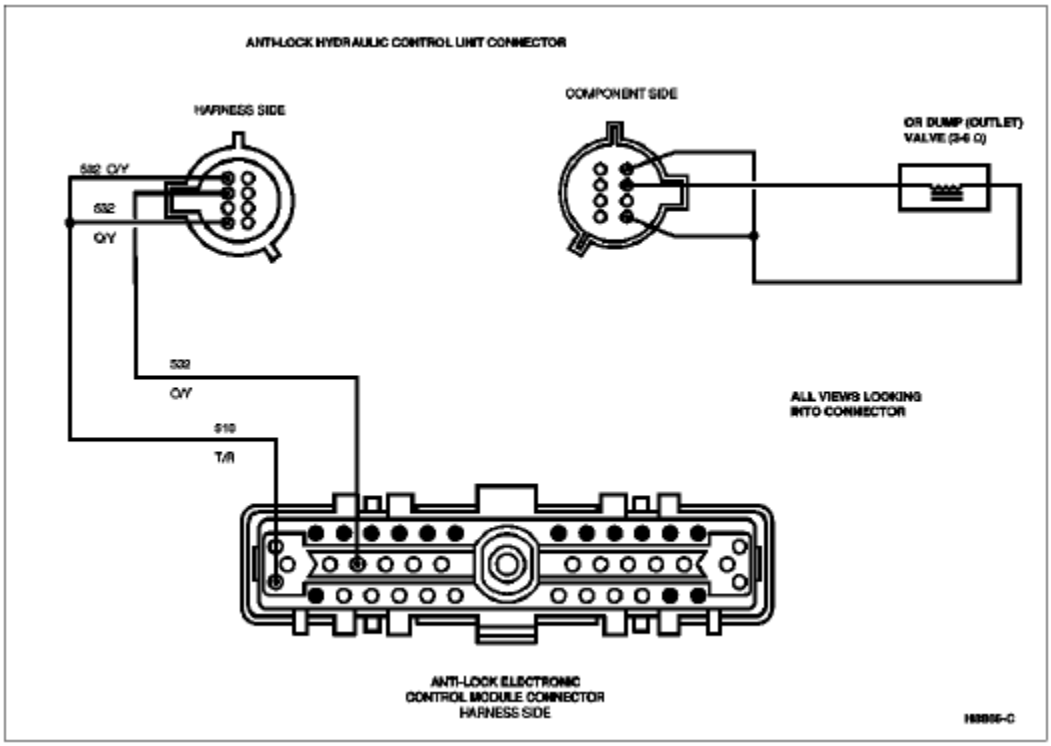
GO to **J4** for system OK verification.	Most likely concern is in HCU. REPLACE HCU and PERFORM anti-lock bleed procedure. GO to **J4**.

PINPOINT TEST K: REAR AXLE OUTLET SOLENOID CONCERN DIAGNOSIS (CODE C1202)

Possible Code(s)

C1202 — Open circuit to valve block or anti-lock brake control module, open or shorted valve coil or internal anti-lock electronic control module damage.

Affected Circuit(s)/Electrical Component(s)



Description

Code C1202 is generated by the anti-lock electronic control module's detection of an open or shorted Circuit 510 (T/R) and by an open or shorted outlet rear axle (ORA) valve coil or an open or shorted driver in the anti-lock brake control module.

Possible Contributing Component/Vehicle Wiring Concerns

- Intermittent open Circuit 510 (T/R).
- Terminal backout in anti-lock brake control module connector Pins 17 and 27.

tomsn048@gmail.com

- Terminal backout in valve block connector Pins 1, 4, and 3.
- Open or shorted outlet rear axle (ORA) valve coil.
- Open or shorted driver in anti-lock brake control module.

K1 DIAGNOSTIC TROUBLE CODE C1202: CHECK VALVE COIL, CIRCUIT 510 (T/R) AND THE ANTI-LOCK ELECTRONIC CONTROL MODULE

- Ignition OFF.
- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.
- Verify terminals at Pins 17 and 27 are clean and secure in the anti-lock brake control module connector.
- Measure resistance between Pins 17 and 27.

Is reading between 3 and 6 ohms?

Yes	No
GO to **K5** .	GO to **K2** .

K2 CHECK VALVE COIL

- Disconnect 8-pin valve block connector.
- Verify terminals on both halves of the valve block 8-way connector are clean and secure.
- Measure resistance between Pins 1 and 3 and Pins 4 and 3 on the valve block.

Are both readings between 3 and 6 ohms?

Yes	No
REMOVE ABS power relay. REPAIR open or short to ground in Circuits 510 (T/R) or 532 (O/Y) between valve block harness connector and anti-lock brake control module connector. INSTALL relay. GO to **K4** .	REPLACE HCU.

K3 CHECK IF ALL STEPS HAVE BEEN COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: If the above is not complete, chances are that replacement of this or any other system component without specific direction will not, in most circumstances, resolve the concern and will consequently result in customer dissatisfaction.

Have all prior diagnostic steps been completed as described above?

Yes	No

tomsn048@gmail.com

REPLACE anti-lock brake control module. GO to **K4**.	GO to last diagnostic step completed and CONTINUE.

K4 CHECK FOR CODE REPEATABILITY

- Clear all codes.
- Key OFF.
- Key ON.
- Retrieve code(s).

Is Code System Pass set?

Yes	No
Concern has been corrected. GO to **K5**.	Code C1202 still exists. GO to **K3**. Different code is set. GO to appropriate pinpoint test. Code C1202 still exists and Step K2 is complete. **NOTE: The anti-lock system is disabled with the Rotunda Breakout Box 014-00322 or equivalent installed.** INSTALL Rotunda Breakout Box 014-00322 with overlay. REPEAT Test Step **K1** while driving vehicle. LOOK for any change in indicated continuity (turning on the DVOM beeper will help). INSPECT Circuits 532 (O/Y) and 499 (GY/BK) along their entire length from the sensor connector to the anti-lock brake control module harness connector for chafing or any other damage that could lead to any open or shorted condition. REPAIR as required.

K5 VERIFY INTEGRITY OF VEHICLE WIRING

NOTE: If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

- Refer to Pinpoint Test ID, Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on the pinpoint test mini-schematic.

Is resolution achieved?

Yes	No

tomsn048@gmail.com

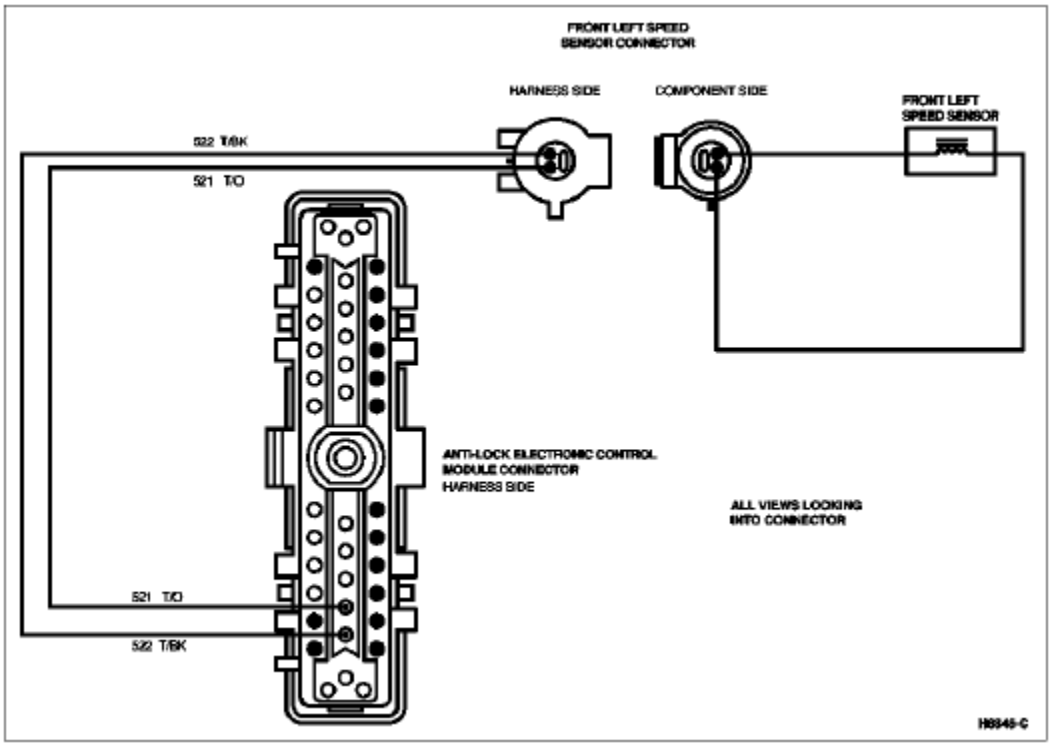
GO to **K4** for system OK verification.	Most likely concern is in HCU. REPLACE HCU and PERFORM anti-lock bleed procedure. GO to **K4** .

PINPOINT TEST L: LF WHEEL SPEED SENSOR INPUT CIRCUIT FAILURE (STATIC) (CODE C1155)

Possible Code(s)

C1155 — Electrically shorted or open front left speed sensor circuit or coil.

Affected Circuit(s)/Electrical Component(s)



Description

Code C1155 is generated by the anti-lock electronic control module's detection of an open or shorted wheel speed sensor coil or an open or shorted condition in Circuits 521 (T/O) or 522 (T/BK) between the wheel speed sensor and the anti-lock brake control module. If this fault is detected during the anti-lock electronic control module's self-check after KEY ON, the ABS warning lamp will come on immediately. This is generally an indication of a constant wiring or component fault. If the ABS warning lamp proves out normally and comes on later when the vehicle is driven, this is generally an indication of an intermittent wiring or component fault.

Possible Contributing Component/Vehicle Wiring Concerns

tomsn048@gmail.com

- Poor connection at front left wheel sensor
- Terminal damage or backout in anti-lock brake control module connector Pins 24 or 25
- Terminal damage or backout in two-pin sensor connector
- Open or shorted front left speed sensor coil
- Open or shorted Circuit 521 (T/O) or 522 (T/BK)
- Improper front left wheel speed sensor cable routing leading to above
- Defective front left wheel speed sensor electrical test circuit in anti-lock brake control module

L1 DIAGNOSTIC TROUBLE CODE C1155: CHECK FRONT LEFT SPEED SENSOR ELECTRICAL FAULT

- Ignition OFF.
- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.
- Measure resistance between Pins 24 and 25.

Is reading between 1.0-1.4 k Ohms?

Yes	No
GO to **L8** .	GO to **L2** .

L2 CHECK RESISTANCE AT FRONT LEFT WHEEL SPEED SENSOR

- Disconnect left front speed sensor connector.
- Measure resistance between the two pins on the speed sensor component connector.

Is reading between 1.0-1.4 k Ohms?

Yes	No
Speed sensor checks good. GO to **L3** .	REPLACE speed sensor. GO to **L11** .

L3 CHECK CIRCUIT 521 (T/O) CONTINUITY

- Measure resistance between Pin 24 on the Rotunda Breakout Box 014-00322 or equivalent and wheel speed sensor harness connector pin for Circuit 521 (T/O).

Is there continuity (zero or near zero ohms)?

Yes	No
Circuit 521 (T/O) checks OK. GO to **L4** .	REPAIR open or high resistance on Circuit 521 (T/O). GO to **L11** .

L4 CHECK CIRCUIT 522 (T/BK) CONTINUITY

tomsn048@gmail.com

- Measure resistance between Pin 25 on the Rotunda Breakout Box 014-00322 or equivalent and wheel speed sensor harness connector pin for Circuit 522 (T/BK).

Is there continuity (zero or near zero ohms)?

Yes	No
Circuit 522 (T/BK) checks OK. GO to **L5** .	REPAIR open or high resistance on Circuit 522 (T/BK). GO to **L11** .

L5 CHECK CIRCUIT 521 (T/O) SHORT TO GROUND

- Measure resistance between Pins 1 and 24 on the Rotunda Breakout Box 014-00322 or equivalent.

Is there continuity?

Yes	No
REPAIR short to ground on Circuit 521 (T/O). GO to **L11** .	Circuit 521 (T/O) checks OK. GO to **L6** .

L6 CHECK CIRCUIT 522 (T/BK) SHORT TO GROUND

- Measure resistance between Pins 1 and 25 on the Rotunda Breakout Box 014-00322 or equivalent.

Is there less than 10 ohms measured?

Yes	No
REPAIR short to ground on Circuit 522 (T/BK). GO to **L7** .	Circuit 522 (T/BK) checks OK. GO to **L8** .

L7 CHECK FOR SHORT TO CAN

- Measure resistance between spindle near sensor can and either coil circuit at sensor connector.

Is resistance less than 10 ohms?

Yes	No
Internal short in speed sensor detected. REPLACE speed sensor. GO to **L11** .	GO to **L8** .

L8 CHECK WHEEL END ROUTING FOR DAMAGE

- Inspect the wheel speed sensor cable at the affected wheel end for chafing or other wiring damage.

Is damage found?

tomsn048@gmail.com

Yes	No
REPLACE speed sensor. CORRECT any obvious routing issues. GO to **L11** .	GO to **L9** .

L9 CHECK FOR WIRING INTERMITTENTS

NOTE: If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on the pinpoint test mini-schematic.

Is resolution obtained?

Yes	No
GO to **L11** for system verification.	Wiring system has been verified as intact. GO to **L10** .

L10 CHECK IF ALL STEPS HAVE BEEN COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: If the above is not complete, chances are that replacement of this or any other system component without specific direction will not, in most circumstances, resolve the concern and will consequently result in customer dissatisfaction.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE speed sensor. GO to **L11** for system verification. If no resolution, REPLACE anti-lock brake control module. GO to **L11** for system verification.	GO to last diagnostic step completed and CONTINUE.

L11 CHECK FOR CODE REPEATABILITY

- Remove Rotunda Breakout Box 014-00322 or equivalent and reinstall all components.
- Clear all codes.
- Key OFF.
- Key ON.
- Retrieve code(s).

Is Code System Pass set?

Yes	No

tomsn048@gmail.com

STOP. Concern has been corrected.	Code being repaired still exists. Concern has NOT been corrected. RETURN to last diagnostic step completed and PROCEED. Different code is set. GO to appropriate pinpoint test. Code being serviced still exists and Test L9 is completed. **NOTE: The anti-lock system is disabled with the Rotunda Breakout Box 014-00322 or equivalent installed.** INSTALL Rotunda Breakout Box 014-00322 or equivalent with Overlay. REPEAT Test Steps **L3** -L6 while driving vehicle. LOOK for any change in indicated continuity (turning on the DVOM beeper will help). INSPECT Circuits 521 (T/O) and 522 (T/BK) along their entire length from the speed sensor connector to the anti-lock brake control module harness connector for chafing or any other damage that could lead to any open or shorted condition. REPAIR as required.

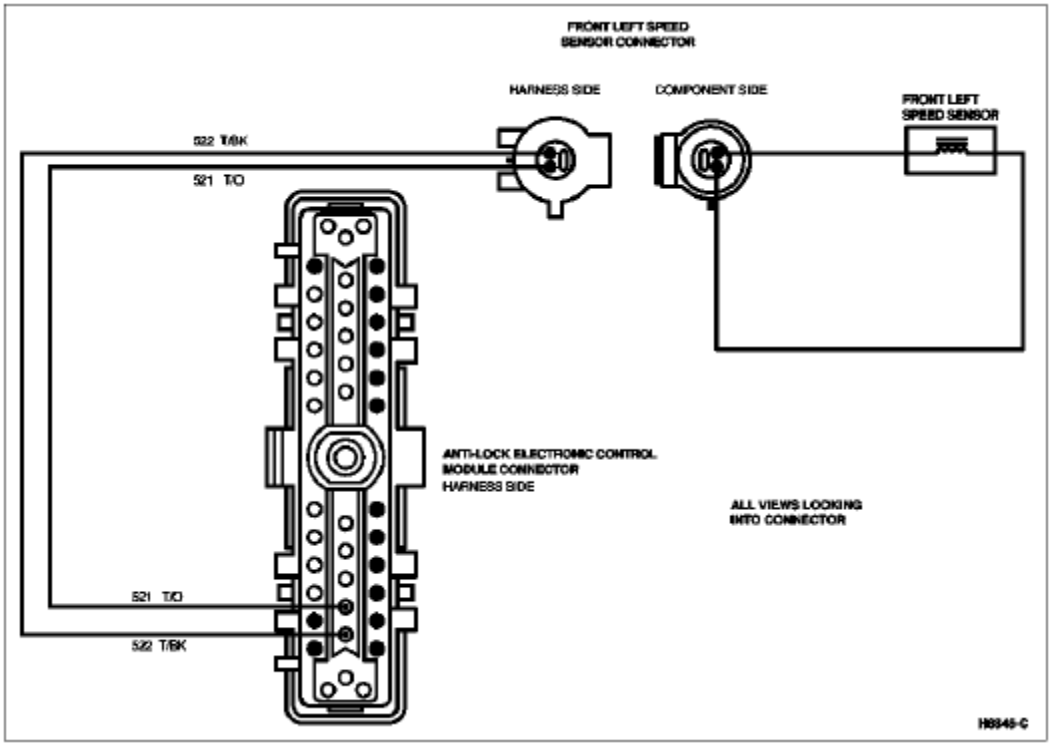
PINPOINT TEST LL: LF WHEEL SPEED SENSOR COHERENCY FAULT (DYNAMIC) (CODES C1158, C1258, and C1233)

Possible Code(s)

C1158, C1258, C1233

Affected Circuit(s)/Electrical Component(s)

tomsn048@gmail.com



Description

Codes C1158, C1258, and C1233 are generated by the anti-lock electronic control module's detection of a missing, erratic, or otherwise improper wheel speed signal from the left front wheel speed sensor. The codes are set for specific faults at various vehicle speeds that are as follows:

Code C1158: Anti-lock brake control module detects that the front left wheel speed information is erratic.

Code C1258: Anti-lock brake control module detects that the front left wheel speed information does not match the right front and rear axle wheel speed information.

Code C1233: Anti-lock brake control module detects that the front left wheel speed signal has dropped out when it was previously there. This code is not dependent upon vehicle speed.

Codes C1158, C1258 and C1233 CANNOT be set with the vehicle stationary. The vehicle should be driven when attempting to duplicate the concern. If Code C1158, C1258 or C1233 is set, then the ABS warning lamp will come on and will remain on until the vehicle is shut off. However, if the condition is corrected, the ABS warning lamp will be turned off by the anti-lock brake control module and the system will again be operational.

Possible Contributing Component/Vehicle Wiring Concerns

- Damaged/missing tone ring teeth or missing tone ring
- Air gap too small or too large
- Excessive rear axle vibration
- Weak speed sensor
- Loose speed sensor
- INTERMITTENT short or open in Circuit 521 (T/O) or 522 (T/BK)

tomsn048@gmail.com

NOTE: If above codes are stored with C1155, check for intermittent short to ground or open. If above codes only are stored, the concern is output related and it is not necessary to check for intermittent open/short conditions.

- Disturbances caused by electrical interference induced into the sensor circuit from nearby ungrounded source (static charges)
- Defective trigger circuit in anti-lock brake control module

LL1 DIAGNOSTIC TROUBLE CODES C1158, C1258 or C1233: INSPECT SPEED SENSOR MOUNTING/TONE RING

- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.
- Raise vehicle on hoist.
- Inspect the left front tone ring for any damaged or missing teeth. Rotate wheel to ensure all teeth are checked.
- Inspect the speed sensor mounting in the wheel end for looseness.

CAUTION: Examine the ring carefully with good light. Failure to catch issues with the tone ring will lead to unnecessary component replacement and wasted diagnosis time.

Is tone ring damage or sensor looseness found?

Yes	No
Tone ring is damaged or missing. REPLACE tone ring. GO to **LL5** to CHECK for proper sensor output. Sensor is loose. TIGHTEN speed sensor bolt to specifications. GO to **LL5** to CHECK for proper sensor output.	GO to **LL2** .

LL2 CHECK FRONT LEFT SPEED SENSOR OUTPUT AT ANTI-LOCK ELECTRONIC CONTROL MODULE

- Lower vehicle so that wheels are just far enough off the ground to permit all wheels to turn.
- Remove left front wheel. Knock back the front disc brake caliper so that the wheel can move as freely as possible. Remount the wheel.
- 4x2s ONLY, spin front left wheel and maintain a constant speed of 60 rpm (1 revolution per second).
- 4x4s ONLY, place in 4x4 low mode. Start engine and allow wheels to spin and stabilize at engine idle speed.

NOTE: Perform the following measurements with Rotunda 105-R0053 Digital/Analog Volt-Ohmmeter or equivalent. If not using Rotunda 105-R0053 or Fluke Frequency Meter, higher wheel speed may be required in order for the frequency meter to function correctly.

- Set the Rotunda Digital/Analog Volt-Ohmmeter 105-R0053 or equivalent, to the frequency counter (Hz) setting. Measure and record the frequency between Pins 24 and 25 on the Rotunda Breakout Box 014-00322 or equivalent.

tomsn048@gmail.com

- Change the meter to the A/C mV setting. Measure and record the voltage output between Pins 24 and 25 on the Rotunda Breakout Box 014-00322 or equivalent.

  NOTE: Measurements of BOTH the frequency and the voltage output must be taken. The actual speed the wheels are turning is not important — the result of voltage output divided by the frequency will not change with wheel speed. However, it is crucial that both the frequency measurement and the voltage measurement be taken at the SAME wheel speed.

- Determine the sensor output in mV/Hz:
- Output — A/C Voltage/Frequency

Is the sensor output greater than 5.0 mV/Hz (4x2), 5.8 mV/Hz (4x4)?

Yes	No
Output at anti-lock brake control module indicates that the air gap and speed sensor strength are OK. GO to **LL7** .	Speed sensor output at anti-lock brake control module is insufficient. GO to **LL3** .

LL3 CHECK FRONT LEFT SENSOR OUTPUT AT SPEED SENSOR

- Disconnect the speed sensor connector at the left radiator support.
- 4x2s ONLY, spin front left wheel and maintain a constant speed of 60 rpm (1 revolution per second).
- 4x4s ONLY, place in 4x4 low mode. Key ON and allow wheels to spin and stabilize at engine idle speed.
- Set the meter to the frequency counter (Hz) setting. Measure and record the frequency between the two pins of the speed sensor component connector.

  NOTE: Measurements of BOTH the frequency and the voltage output must be taken. The actual speed the wheels are turning is not important — the result of voltage output divided by the frequency will not change with wheel speed. However, it is crucial that both the frequency measurement and the voltage measurement be taken at the SAME wheel speed.

- Change the meter to the A/C mV setting. Measure and record the voltage output between the two pins of the speed sensor component connector.
- Determine the sensor output in mV/Hz:
- Output — A/C Voltage/Frequency

Is the sensor output greater than 5.0 mV/Hz (4x2), 5.8 mV/Hz (4x4)?

Yes	No
Output indicates that air gap and speed sensor strength are OK at the speed sensor. GO to **LL7** .	GO to **LL4** .

LL4 CHECK SPEED SENSOR/TONE RING AIR GAP

- Remove the speed sensor from the front wheel hub and spindle.
- Inspect mounting boss and speed sensor mounting plate for any metal flash or debris. Clean as necessary.

tomsn048@gmail.com

- Remount speed sensor securely.
- Measure the air gap between the speed sensor and tone ring teeth. Repeat in at least two more wheel positions to ensure that gap does not vary as the wheel is turned.

  NOTE: Feeler gauges can be mounted to a welding rod and inserted between the vanes of the front disc brake hub and rotor to measure air gap precisely.

Is the gap consistent and less than 1.78mm (0.070 inch)?

Yes	No
REPLACE speed sensor. GO to **LL5** .	Gap is greater than 1.78mm (0.070 inch). Air gap is too large. REPLACE tone ring. GO to **LL5** . Gap is not consistent. Tone ring is not pressed on straight or axle end play is too great. GO to **LL6** .

LL5 RECHECK FRONT LEFT SPEED SENSOR OUTPUT

- 4x2s ONLY, spin front left wheel and maintain a constant speed of 60 RPM (1 revolution per second).
- 4x4s ONLY, place in 4x4 low mode. Start engine and allow wheels to spin and stabilize at engine idle speed.
- Set the meter to the frequency counter (Hz) setting. Measure and record the frequency between the two pins of the sensor component connector.

  NOTE: Measurements of BOTH the frequency and the voltage output must be taken. The actual speed the wheels are turning is not important — the result of voltage output divided by the frequency will not change with wheel speed. However, it is crucial that both the frequency measurement and the voltage measurement be taken at the SAME wheel speed.

- Change the meter to the A/C mV setting. Measure and record the voltage output between the two pins of the sensor component connector.
- Determine the sensor output in mV/Hz:
- Output — A/C Voltage/Frequency

Is sensor output greater than 5.0 mV/Hz 4x2, or 5.8 mV/Hz 4x4?

Yes	No
Output is now OK. Concern is most likely resolved. A drive test is recommended to VERIFY sensor output is OK for customer driving conditions.	VERIFY tone ring is pressed straight and fully onto the rotor hub. CORRECT as needed. REPEAT **LL5** . If no resolution, REPLACE speed sensor. DO NOT leave this test until output is OK.

LL6 RESOLVE INCONSISTENT AIR GAP CONCERN

- Remove the front disc brake hub and rotor and inspect the tone ring/hub mounting surface. Verify the tone ring is pressed straight and fully onto the hub. Correct before proceeding.
- Reinstall the front disc brake hub and rotor.

tomsn048@gmail.com

- Verify wheel end play is within allowable limits (refer to Section 04-01A or Section 04-01B). Correct as necessary.
- Measure the air gap between the speed sensor and tone ring teeth. Repeat in at least two more wheel positions to ensure that gap does not vary as the wheel is turned.

NOTE: Feeler gauges can be mounted to a welding rod and inserted between the vanes of the front disc brake hub and rotor to measure air gap precisely.

Is the gap consistent and less than 1.78mm (0.070 inch)?

Yes	No
GO to **LL5** to RECHECK speed sensor output.	Gap is greater than 1.78mm (0.070 inch). Air gap is too large. GO to **LL4** to RESOLVE large air gap concern. Gap is not consistent. REPEAT **LL6** . DO NOT leave this step until a consistent air gap is obtained.

LL7 CHECK FOR WIRING INTERMITTENTS

NOTE: If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for Circuits 521 (T/O) and 522 (T/BK).

Is resolution obtained?

Yes	No
Concern is most likely resolved. A drive test is recommended to VERIFY speed sensor output is OK during customer driving conditions.	GO to **LL8** .

LL8 CHECK IF ALL STEPS HAVE BEEN COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: If the above is not complete, chances are that replacement of this or any other system component without specific direction will not, in most circumstances, resolve the concern and will consequently result in customer dissatisfaction.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE speed sensor. GO to **LL9** for drive test. If no resolution, REPLACE anti-lock brake control module. GO to **LL9** for drive test.	GO to last diagnostic step completed and CONTINUE.

tomsn048@gmail.com

LL9 SPEED SENSOR OUTPUT DRIVE TEST

- Reinstall all components and remove Rotunda Breakout Box 014-00322 or equivalent.
- Clear all codes.
- Key OFF.
- Key ON.
- Drive vehicle and perform the following:
  - Complete at least one hard left and one hard right turn.
  - Travel over a stretch of rough road at normal vehicle speed.
  - Perform one hard acceleration from a stop.
- Retrieve code(s).

Is Code System Pass set?

Yes	No
STOP. Repair is complete.	Code being repaired still exists. GO to **LL8** . Different code is set (other than C1158, C1258 or C1233). GO to appropriate pinpoint test. Code being repaired still exists and anti-lock brake control module has been replaced. GO to **LL10** .

LL10 POSSIBLE CONDITIONS NOT CHECKED

At this point the following have been verified or are true if the above steps are complete:

- Sensor strength is OK.
- Tone ring is intact with no damaged teeth and is correctly seated against the rotor hub.
- Air gap is within allowable limits and is consistent as the wheel rotates.
- Wiring between speed sensor and anti-lock brake control module is intact.
- The anti-lock brake control module has been replaced.
- The speed sensor has been replaced.
- The following are time consuming and should be performed only after all previous options have been exhausted.
- Verify Circuits 521 (T/O) and 522 (T/BK) are twisted throughout the wire loom. If the wires are not twisted, the anti-lock brake control module may be sensitive to any outside interference.
- Excessive axle vibration, especially over rough road can cause this issue. Verify front axle is not excessively noisy or otherwise performing abnormally.

NOTE: Blips or fallout indicate intermittent issue.

Does signal rise consistently and evenly?

Yes	No
STOP. Repair is complete.	GO to **LL8** .

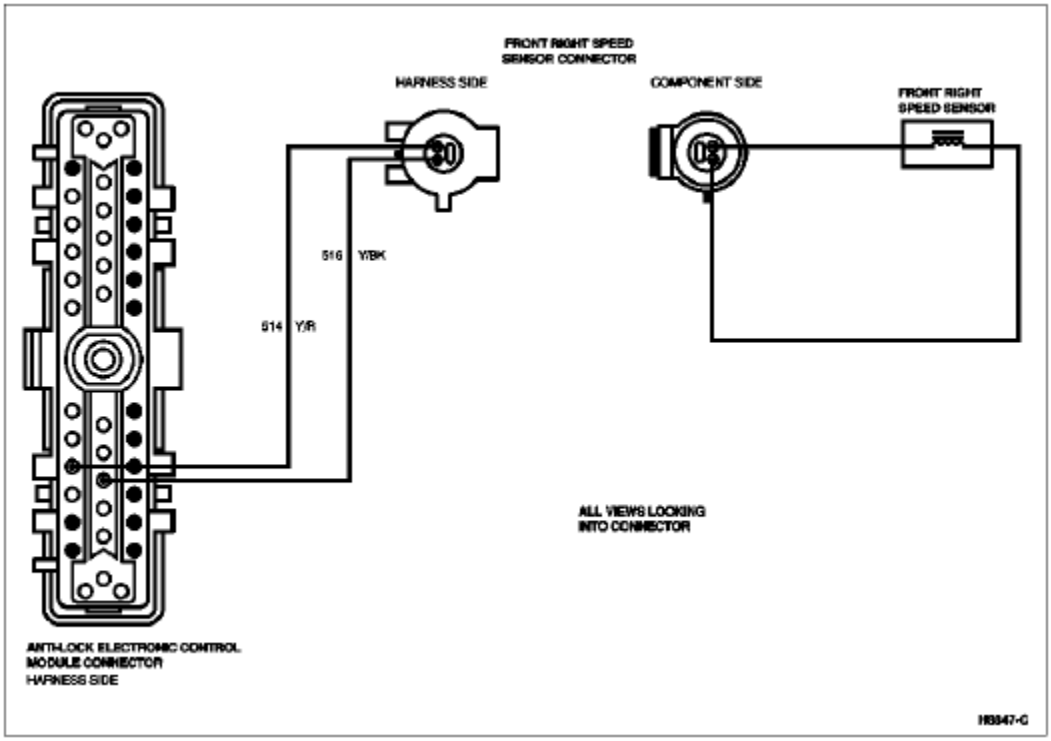
tomsn048@gmail.com

PINPOINT TEST M: RF WHEEL SPEED SENSOR INPUT CIRCUIT FAILURE (STATIC) (CODE C1145)

Possible Code(s)

C1145 — Electrically shorted or open front right speed sensor circuit or coil.

Affected Circuit(s)/Electrical Component(s)



Description

Code C1145 is generated by the anti-lock electronic control module's detection of an open or shorted wheel speed sensor coil or an open or shorted condition in Circuits 514 (Y/T) or 516 (Y/BK) between the wheel speed sensor and the anti-lock brake control module. If this fault is detected during the anti-lock electronic control module's self-check after key ON, the ABS warning lamp will come on immediately. This is generally an indication of a constant wiring or component fault. If the ABS warning lamp proves out normally and comes on later when the vehicle is driven, this is generally an indication of an intermittent wiring or component fault.

Possible Contributing Component/Vehicle Wiring Concerns

- Poor connection at front right wheel sensor
- Terminal damage or backout in anti-lock brake control module connector Pins 36 or 23
- Terminal damage or backout in two-pin sensor connector
- Open or shorted front right speed sensor coil
- Open or shorted Circuit 514 (Y/R) or 516 (Y/BK)

tomsn048@gmail.com

- Improper front right wheel speed sensor cable routing leading to above
- Defective front right wheel speed sensor electrical test circuit in anti-lock brake control module

M1 DIAGNOSTIC TROUBLE CODE C1145: CHECK FRONT RIGHT SPEED SENSOR ELECTRICAL FAULT

- Ignition OFF.
- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.
- Measure resistance between Pins 36 and 23.

Is reading between 1.0-1.4 k Ohms?

Yes	No
GO to **M7** .	GO to **M2** .

M2 CHECK RESISTANCE AT FRONT RIGHT WHEEL SPEED SENSOR

- Disconnect right front speed sensor connector.
- Measure resistance between the two Pins on the speed sensor component connector.

Is reading between 1.0-1.4 k Ohms?

Yes	No
Speed sensor checks good. GO to **M3** .	REPLACE speed sensor. GO to **M10** .

M3 CHECK CIRCUIT 514 (Y/R) CONTINUITY

- Measure resistance between Pin 36 on the Rotunda Breakout Box 014-00322 or equivalent and wheel speed sensor harness connector pin for Circuit 514 (Y/R).

Is there continuity (zero or near zero ohms)?

Yes	No
Circuit 514 (Y/R) checks OK. GO to **M4** .	REPAIR open or high resistance on Circuit 514 (Y/R). GO to **M10** .

M4 CHECK CIRCUIT 516 (Y/BK) CONTINUITY

- Measure resistance between Pin 23 on the Rotunda Breakout Box 014-00322 or equivalent and wheel speed sensor harness connector pin for Circuit 516 (Y/BK).

Is there continuity (zero or near zero ohms)?

tomsn048@gmail.com

Yes	No
Circuit 516 (Y/BK) checks OK. GO to **M5** .	REPAIR open or high resistance on Circuit 516 (Y/BK). GO to **M10** .

M5 CHECK CIRCUIT 514 (Y/R) SHORT TO GROUND

- Measure resistance between Pins 1 and 36 on the Rotunda Breakout Box 014-00322 or equivalent.

Is there continuity (zero or near zero ohms)?

Yes	No
REPAIR short to ground on Circuit 514 (Y/R). GO to **M10** .	Circuit 514 (Y/R) checks OK. GO to **M6** .

M6 CHECK CIRCUIT 516 (Y/BK) SHORT TO GROUND

- Measure resistance between Pins 1 and 23 on the Rotunda Breakout Box 014-00322 or equivalent.

Is there continuity (zero or near zero ohms)?

Yes	No
REPAIR short to ground on Circuit 516 (Y/BK). GO to **M10** .	Circuit 516 (Y/BK) checks OK. GO to **M7** .

M7 CHECK FOR SHORT TO CAN

- Measure resistance between spindle near sensor can and either coil circuit at sensor connector.

Is resistance less than 10 ohms?

Yes	No
REPLACE speed sensor. CORRECT any obvious routing issues. GO to **M10** .	GO to **M8** .

M8 CHECK FOR WIRING INTERMITTENTS

NOTE: If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on the pinpoint test mini-schematic.

Is resolution obtained?

tomsn048@gmail.com

Yes	No
GO to **M10** for system verification.	Wiring system has been verified as intact. GO to **M9** .

M9 CHECK IF ALL STEPS HAVE BEEN COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: If the above is not complete, chances are that replacement of this or any other system component without specific direction will not, in most circumstances, resolve the concern and will consequently result in customer dissatisfaction.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE speed sensor. GO to **M10** for system verification. If no resolution, REPLACE anti-lock brake control module. GO to **M10** for system verification.	GO to last diagnostic step completed and CONTINUE.

M10 CHECK FOR CODE REPEATABILITY

- Remove Rotunda Breakout Box 014-00322 or equivalent and reinstall all components.
- Clear all codes.
- Key OFF.
- Key ON.
- Retrieve code(s).

Is Code System Pass set?

Yes	No
STOP. Concern has been corrected.	Code being repaired still exists. Concern has NOT been corrected. RETURN to last diagnostic step completed and PROCEED. Different code is set. GO to appropriate pinpoint test. Code being repaired still exists and Test M8 is completed. **NOTE: The anti-lock system is disabled with the Rotunda Breakout Box 014-00322 or equivalent installed.** INSTALL Rotunda Breakout Box 014-00322 or equivalent with Overlay. REPEAT Test Steps

tomsn048@gmail.com

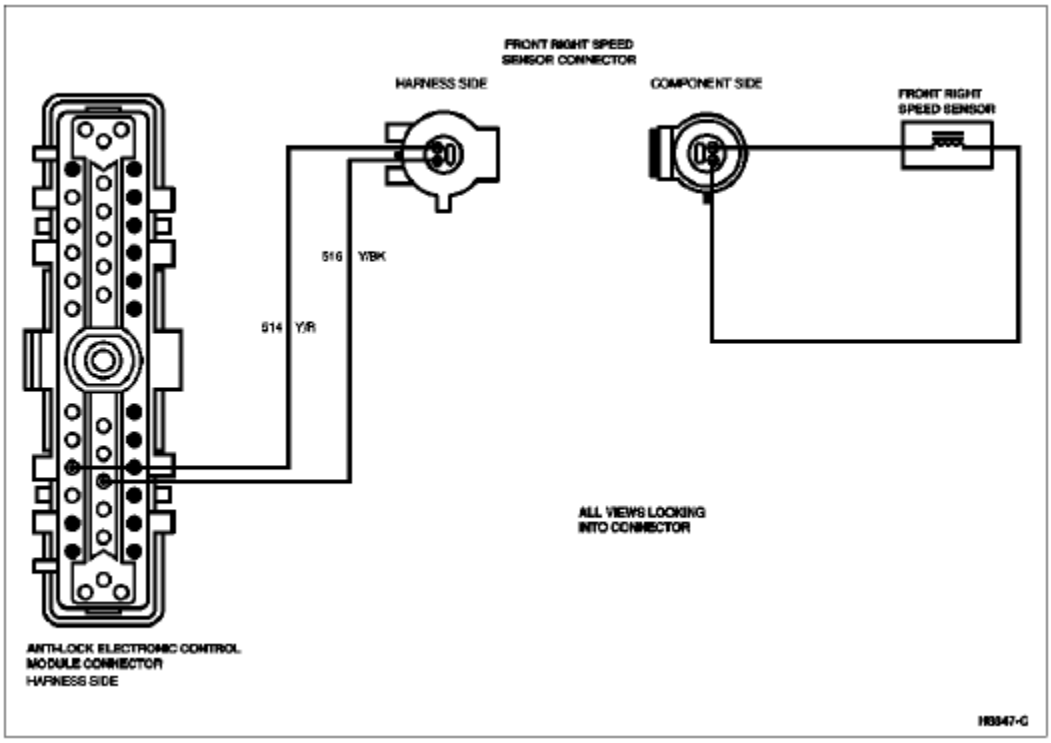
	M3 -M6 while driving vehicle. LOOK for any change in indicated continuity (turning on the DVOM beeper will help). INSPECT Circuits 514 (Y/R) and 516 (Y/BK) along their entire length from the speed sensor connector to the anti-lock brake control module harness connector for chafing or any other damage that could lead to any open or shorted condition. REPAIR as required.

PINPOINT TEST MM: RF WHEEL SPEED SENSOR COHERENCY FAULT (DYNAMIC) (CODES C1148, C1259 and C1234)

Possible Code(s)

C1148, C1259 or C1234

Affected Circuit(s)/Electrical Component(s)



Description

Codes C1148, C1259 and C1234 are generated by the anti-lock electronic control module's detection of a missing, erratic, or otherwise improper wheel speed signal from the right front wheel speed sensor. The codes are set for specific faults at various vehicle speeds that are as follows:

tomsn048@gmail.com

Code C1148: Anti-lock brake control module detects that the front right wheel speed information is erratic.

Code C1259: Anti-lock brake control module detects that the front right wheel speed information does not match the left front and rear axle wheel speed information.

Code C1234: Anti-lock brake control module detects that the front right wheel speed signal has dropped out when it was previously there. This code is not dependent upon vehicle speed.

Codes C1148, C1259 and C1234 CANNOT be set with the vehicle stationary. The vehicle should be driven when attempting to duplicate the concern. If Codes C1148, C1259 or C1234 are set, then the ABS warning lamp will come on and will remain on until the vehicle is shut off. However, if the condition is corrected, the ABS warning lamp will be turned off by the anti-lock brake control module and the system will again be operational.

Possible Contributing Component/Vehicle Wiring Concerns

- Damaged/missing tone ring teeth or missing tone ring
- Air gap too small or too large
- Excessive axle vibration
- Weak speed sensor
- Loose speed sensor
- INTERMITTENT short or open in Circuit 514 (Y/R) or 516 (Y/BK)

NOTE: If above codes are stored with C1155, check for intermittent short to ground or open. If above codes only are stored, the concern is output related and it is not necessary to check for intermittent open/short conditions.

- Disturbances caused by ignition or Radio Frequency Interference (RFI)
- Defective trigger circuit in anti-lock brake control module

MM1 DIAGNOSTIC TROUBLE CODES C1148, C1259 or C1234: INSPECT SPEED SENSOR MOUNTING/TONE RING

- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.
- Raise vehicle on hoist.
- Inspect the right front tone ring for damaged or missing teeth. Rotate wheel to ensure all teeth are checked.
- Inspect the speed sensor mounting in the wheel end for looseness.

CAUTION: Examine the ring carefully with good light. Failure to catch issues with the tone ring will lead to unnecessary component replacement and wasted diagnostic time.

Is tone ring damage or speed sensor looseness found?

Yes	No
Tone ring is damaged or missing. REPLACE tone ring. GO to **MM5** to CHECK for proper speed sensor output.	GO to **MM2** .

tomsn048@gmail.com

Speed sensor is loose. TIGHTEN speed sensor bolt to specifications. GO to **MM5** to CHECK for proper speed sensor output.	

MM2 CHECK FRONT RIGHT SPEED SENSOR OUTPUT AT ANTI-LOCK ELECTRONIC CONTROL MODULE

- Lower vehicle so that wheels are just far enough off the ground to permit all wheels to turn.
- Remove right front wheel. Knock back the disc brake caliper so that the wheel can move as freely as possible. Remount the wheel.
- 4x2s ONLY, spin front right wheel and maintain a constant speed of 60 rpm (1 re volution per second).
- 4x4s ONLY, place in 4x4 low mode. Key ON and allow wheels to spin and stabilize at engine idle speed.

NOTE: Perform the following measurements with Rotunda 105-R0053 Digital/Analog Volt-Ohmmeter or equivalent. If not using Rotunda 105-R0053 or Fluke Frequency Meter, higher wheel speed may be required in order for the frequency meter to function correctly.

- Set the Rotunda Digital/Analog Volt-Ohmmeter 105-R0053 or equivalent, to the frequency counter (Hz) setting. Measure and record the frequency between Pins 36 and 23 on the Rotunda Breakout Box 014-00322 or equivalent.
- Change the meter to the A/C mV setting. Measure and record the voltage output between Pins 36 and 23 on the Rotunda Breakout Box 014-00322 or equivalent.
- Determine the sensor output in mV/Hz:
- Output — A/C Voltage/Frequency

NOTE: Measurements of BOTH the frequency and the voltage output must be taken. The actual speed the wheels are turning is not important — the result of voltage output divided by the frequency will not change with wheel speed. However, it is crucial that both the frequency measurement and the voltage measurement be taken at the SAME wheel speed.

Is the sensor output greater than 5.0 mV/Hz (4x2), 5.8 mV/Hz (4x4)?

Yes	No
Output at anti-lock brake control module indicates that the air gap and speed sensor strength are OK. GO to **MM7**.	Speed sensor output at anti-lock brake control module is insufficient. GO to **MM3**.

MM3 CHECK FRONT RIGHT SPEED SENSOR OUTPUT AT SPEED SENSOR

- Disconnect the sensor connector at the RH radiator support.
- 4x2s ONLY, spin front right wheel and maintain a constant speed of 60 rpm (1 revolution per second).
- 4x4s ONLY, place in 4x4 low mode. Start engine and allow wheels to spin and stabilize at engine idle speed.
- Set the meter to the frequency counter (Hz) setting. Measure and record the frequency between the two pins of the speed sensor component connector.
- Change the meter to the A/C mV setting. Measure and record the voltage output between the two pins of the speed sensor component connector.

tomsn048@gmail.com

- Determine the speed sensor output in mV/Hz:
- Output — A/C Voltage/Frequency

NOTE: Measurements of BOTH the frequency and the voltage output must be taken. The actual speed the wheels are turning is not important — the result of voltage output divided by the frequency will not change with wheel speed. However, it is crucial that both the frequency measurement and the voltage measurement be taken at the SAME wheel speed.

Is the speed sensor output greater than 5.0 mV/Hz (4x2), 5.8 mV/Hz (4x4)?

Yes	No
Output indicates that air gap and sensor strength are OK at the speed sensor. GO to **MM7** .	GO to **MM4** .

MM4 CHECK SPEED SENSOR/TONE RING AIR GAP

- Remove the speed sensor from the wheel end.
- Inspect mounting boss and speed sensor mounting plate for any metal flash or debris. Clean as necessary.
- Remount speed sensor securely.
- Measure the air gap between the speed sensor and tone ring teeth. Repeat in at least two more wheel positions to ensure that gap does not vary as the wheel is turned.

NOTE: Feeler gauges can be mounted to a welding rod and inserted between the vanes of the front disc brake hub and rotor to measure air gap precisely.

Is the gap consistent and less than 1.78mm (0.070 inch)?

Yes	No
REPLACE speed sensor. GO to **MM5** .	Gap is greater than 1.78mm (0.070 inch). Air gap is too large. REPLACE tone ring. GO to **MM5** . Gap is not consistent. Tone ring is not pressed on straight or axle end play is too great. GO to **MM6** .

MM5 RECHECK FRONT RIGHT SENSOR OUTPUT

- 4x2s ONLY, spin front right wheel and maintain a constant speed of 60 rpm (1 revolution per second).
- 4x4s ONLY, place in 4x4 low mode. Start engine and allow wheels to spin and stabilize at engine idle speed.
- Set the meter to the frequency counter (Hz) setting. Measure and record the frequency between the two pins of the speed sensor component connector.
- Change the meter to the A/C mV setting. Measure and record the voltage output between the two pins of the speed sensor component connector.
- Determine the speed sensor output in mV/Hz:
- Output — A/C Voltage/Frequency

tomsn048@gmail.com

NOTE: Measurements of BOTH the frequency and the voltage output must be taken. The actual speed the wheels are turning is not important — the result of voltage output divided by the frequency will not change with wheel speed. However, it is crucial that both the frequency measurement and the voltage measurement be taken at the SAME wheel speed.

Is the sensor output greater than 5.8 mV/Hz (4x4)?

Yes	No
Output is now OK. Concern is most likely resolved. A drive test is recommended to VERIFY speed sensor output is OK for customer driving conditions.	VERIFY tone ring is pressed straight and fully onto the rotor hub. CORRECT as needed. REPEAT **MM5** . If no resolution, REPLACE speed sensor. DO NOT leave this test until output is OK.

MM6 RESOLVE INCONSISTENT AIR GAP CONCERN

- Remove the front disc brake hub and rotor and inspect the tone ring/hub mounting surface. Verify the tone ring is pressed straight and fully onto the hub. Correct before proceeding.
- Reinstall the front disc brake hub and rotor.
- Verify wheel end play is within allowable limits (refer to Section 04-01A or Section 04-01B). Correct as necessary.
- Measure the air gap between the speed sensor and tone ring teeth. Repeat in at least two more wheel positions to ensure that gap does not vary as the wheel is turned.

NOTE: Feeler gauges can be mounted to a welding rod and inserted between the vanes of the front disc brake hub and rotor to measure air gap precisely.

Is the gap consistent and less than 1.78mm (0.070 inch)?

Yes	No
GO to **MM5** to RECHECK speed sensor output.	Gap is greater than 1.78mm (0.070 inch). Air gap is too large. GO to **MM4** to resolve large air gap concern. Gap is not consistent. REPEAT **MM6** . DO NOT leave this step until a consistent air gap is obtained.

MM7 CHECK FOR WIRING INTERMITTENTS

NOTE: If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedures and perform for Circuits 514 (Y/R) and 516 (Y/BK).

Is resolution obtained?

Yes	No
Concern is most likely resolved. A drive test is	

tomsn048@gmail.com

recommended to VERIFY speed sensor output is OK during customer driving conditions.	GO to **MM8** .

MM8 CHECK IF ALL STEPS HAVE BEEN COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: If the above is not complete, chances are that replacement of this or any other system component without specific direction will not, in most circumstances, resolve the concern and will consequently result in customer dissatisfaction.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE speed sensor. GO to **MM9** for drive test. If no resolution, REPLACE anti-lock brake control module. GO to **MM9** for drive test.	GO to last diagnostic step completed and CONTINUE.

MM9 SPEED SENSOR OUTPUT DRIVE TEST

- Reinstall all components and remove Rotunda Breakout Box 014-00322 or equivalent.
- Clear all codes.
- Key OFF.
- Key ON.
- Drive vehicles and perform the following:
  - Complete at least one hard left and one hard right turn.
  - Travel over stretch of rough road at normal vehicle speed.
  - Perform one hard acceleration from a stop.
- Retrieve code(s).

Is Code System Pass set?

Yes	No
STOP. Repair is complete.	Code being repaired still exists. GO to **MM8** . Different code is set (other than C1148, C1259 or C1234). GO to appropriate pinpoint test. Code being repaired still exists and anti-lock brake control module has been replaced. GO to **MM10** .

MM10 POSSIBLE CONDITIONS NOT CHECKED

At this point the following have been verified or are true if the above steps are complete:

tomsn048@gmail.com

- Speed sensor strength is OK.
- Tone ring is intact with no damaged teeth and is correctly seated against the rotor hub.
- Air gap is within allowable limits and is consistent as the wheel rotates.
- Wiring between sensor and anti-lock brake control module is intact.
- The anti-lock brake control module has been replaced.
- The speed sensor has been replaced.
- The following are time consuming and should be performed only after all previous options have been exhausted.
- Verify Circuits 514 (Y/R) and 516 (Y/BK) are twisted throughout the wire loom. If the wires are not twisted, the anti-lock brake control module may be sensitive to any outside interference.
- Excessive axle vibration, especially over rough road can cause this issue. Verify front axle is not excessively noisy or otherwise performing abnormally.

NOTE: Blips or fallout indicate intermittent issue.

Does signal rise consistently and evenly?

Yes	No
STOP. Repair is complete.	GO to **MM8** .

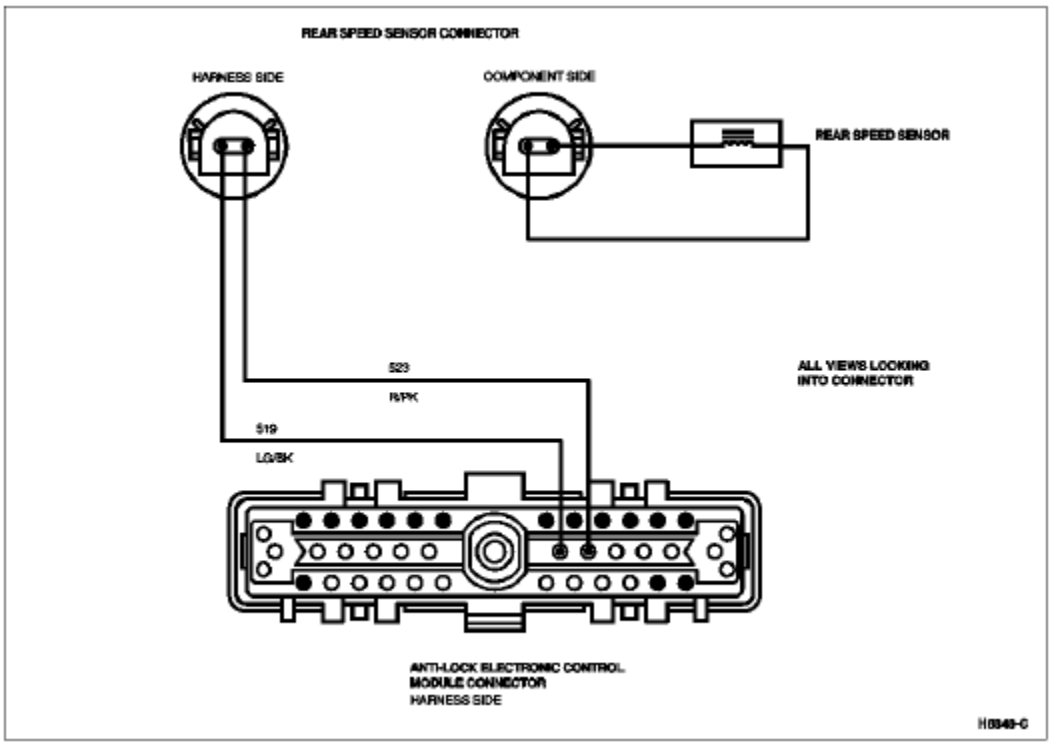
PINPOINT TEST N: REAR AXLE SPEED SENSOR INPUT CIRCUIT FAILURE (STATIC) (CODE C1230)

Possible Code(s)

C1230 — Electrically shorted or open rear axle speed sensor circuit or coil.

Affected Circuit(s)/Electrical Component(s)

tomsn048@gmail.com



Description

Code C1230 is generated by the anti-lock electronic control module's detection of an open or shorted rear axle speed sensor coil or an open or shorted condition in Circuits 523 (R/PK) or 519 (LG/BK) between the wheel speed sensor and the anti-lock brake control module. If this fault is detected during the anti-lock electronic control module's self-check after key ON, the ABS warning lamp will come on immediately. This is generally an indication of a constant wiring or component fault. If the ABS warning lamp proves out normally and comes on later when the vehicle is driven, this is generally an indication of an intermittent wiring or component fault.

Possible Contributing Component/Vehicle Wiring Concerns

- Poor connection at rear axle speed sensor
- Terminal damage or backout in anti-lock brake control module connector Pins 21 or 22
- Terminal damage or backout in two-pin sensor connector
- Open or shorted rear axle speed sensor coil
- Open or shorted Circuit 523 (R/PK) or 519 (LG/BK)
- Improper rear axle speed sensor cable routing leading to above
- Defective rear axle speed sensor electrical test circuit in anti-lock brake control module

N1 DIAGNOSTIC TROUBLE CODE C1230: CHECK REAR AXLE SPEED SENSOR ELECTRICAL FAULT

- Ignition OFF.
- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.

tomsn048@gmail.com

- Measure resistance between Pins 22 and 21.

Is reading between 800 and 1400 ohms?

Yes	No
GO to N7 .	GO to N2 .

N2 CHECK RESISTANCE AT REAR AXLE SPEED SENSOR

- Disconnect rear axle speed sensor connector.
- Measure resistance between the two pins on the speed sensor.

Is reading between 800 and 1400 ohms?

Yes	No
Speed sensor checks good. GO to N3 .	REPLACE speed sensor. GO to N11 .

N3 CHECK CIRCUIT 523 (R/PK) CONTINUITY

- Measure resistance between Pin 22 on the Rotunda Breakout Box 014-00322 or equivalent and wheel speed sensor harness connector pin for Circuit 523 (R/PK).

Is there continuity (zero or near zero ohms)?

Yes	No
Circuit 523 (R/PK) checks OK. GO to N4 .	REPAIR open or high resistance on Circuit 523 (R/PK). GO to N11 .

N4 CHECK CIRCUIT 519 (LG/BK) CONTINUITY

- Measure resistance between Pin 21 on the Rotunda Breakout Box 014-00322 or equivalent and wheel speed sensor harness connector pin for Circuit 519 (LG/BK).

Is there continuity (zero or near zero ohms)?

Yes	No
Circuit 519 (LG/BK) checks OK. GO to N5 .	REPAIR open or high resistance on Circuit 519 (LG/BK). GO to N11 .

N5 CHECK CIRCUIT 523 (R/PK) SHORT TO GROUND

- Measure resistance between Pins 1 and 22 on the Rotunda Breakout Box 014-00322 or equivalent.

Are there less than 10 ohms measured?

tomsn048@gmail.com

Yes	No
REPAIR short to ground on Circuit 523 (R/PK). GO to **N11** .	Circuit 523 (R/PK) checks OK. GO to **N6** .

N6 CHECK CIRCUIT 519 (LG/BK) SHORT TO GROUND

- Measure resistance between Pins 1 and 21 on the Rotunda Breakout Box 014-00322 or equivalent.

Is there continuity (zero or near zero ohms)?

Yes	No
REPAIR short to ground on Circuit 519 (LG/BK). GO to **N11** .	Circuit 519 (LG/BK) checks OK. GO to **N8** .

N7 CHECK COIL CIRCUIT COMPONENT CONNECTOR RESISTANCE

- Remove speed sensor from rear axle housing.
- Measure resistance between speed sensor can and either coil circuit at component connector.

Is resistance less than 10 ohms?

Yes	No
Internal short in speed sensor detected. REPLACE speed sensor. GO to **N11** .	GO to **N8** .

N8 CHECK SPEED SENSOR CABLE ROUTING FOR DAMAGE

- Inspect the rear axle speed sensor cable from the rear axle housing to the frame for chafing or other wire damage.

Is damage found?

Yes	No
REPAIR damage. CORRECT any obvious routing issues. GO to **N11** .	GO to **N9** .

N9 CHECK FOR WIRING INTERMITTENTS

NOTE: If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on the pinpoint test mini-schematic.

tomsn048@gmail.com

Is resolution obtained?

Yes	No
GO to **N11** for system verification.	Wiring system has been verified as intact. GO to **N10**.

N10 CHECK IF ALL STEPS HAVE BEEN COMPLETED

CAUTION: If the above is not complete, chances are that replacement of this or any other system component without specific direction will not, in most circumstances, resolve the concern and will consequently result in customer dissatisfaction.

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE sensor. GO to **N11** for system verification. If no resolution, REPLACE anti-lock brake control module. GO to **N11** for system verification.	GO to last diagnostic step completed and CONTINUE.

N11 CHECK FOR CODE REPEATABILITY

- Remove breakout box and reinstall all components.
- Clear all codes.
- Key OFF.
- Key ON.
- Retrieve code.

Is Code System Pass set?

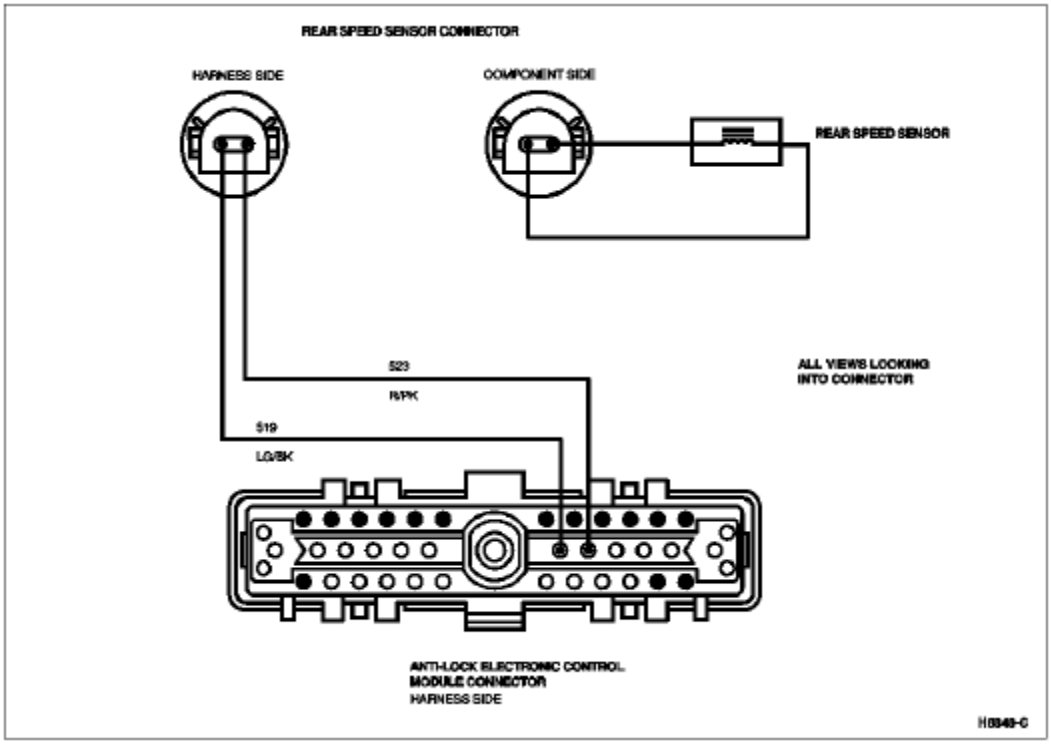
Yes	No
STOP. Concern has been corrected.	Code being repaired still exists. Concern has NOT been corrected. RETURN to last diagnostic step completed and PROCEED. Different code is set. GO to appropriate pinpoint test. Code being repaired still exists and Test N9 is completed. **NOTE: The anti-lock system is disabled with the Rotunda Breakout Box 014-00322 or equivalent installed.** INSTALL breakout box with overlay. REPEAT

tomsn048@gmail.com

	Test Steps **N3** -N6 while driving vehicle. LOOK for any change in indicated continuity (turning on the DVOM beeper will help). INSPECT Circuits 523 (R/PK) and 519 (LG/BK) along their entire length from the speed sensor connector to the anti-lock brake control module harness connector for chafing or any other damage that could lead to an open or shorted condition. REPAIR as required.

PINPOINT TEST NN: REAR AXLE WHEEL SPEED SENSOR COHERENCY FAULT (DYNAMIC) (CODES C1229, C1260 and C1237)

Affected Circuit(s)/Electrical Component(s)



Description

Codes C1229, C1260, and C1237 are generated by the anti-lock electronic control module's detection of a missing, erratic, or otherwise improper wheel speed signal from the rear axle wheel speed sensor. The codes are set for specific faults at various vehicle speeds that are as follows:

Code C1229: Anti-lock brake control module detects that the rear axle wheel speed information is erratic. This code is only set at vehicle speeds greater than 40 km/h (25 mph).

tomsn048@gmail.com

Code C1260: Anti-lock brake control module detects that the rear axle wheel speed information does not match the left front and right front wheel speed information.

Code 1237: Anti-lock brake control module detects that the rear axle wheel speed signal has dropped out when it was previously there. This code is not dependent upon vehicle speed.

Codes C1229, C1260 and C1237 CANNOT be set with the vehicle stationary. The vehicle should be driven when attempting to duplicate the concern. If Codes C1229, C1260 or C1237 are set, then the ABS warning lamp will come on and will remain on until the vehicle is shut off. However, if the condition is corrected, the ABS warning lamp will be turned off by the anti-lock brake control module and the system will again be operational.

Possible Contributing Component/Vehicle Wiring Concerns

- Damaged/missing tone ring teeth or missing tone ring
- Air gap too small or too large
- Excessive axle vibration
- Weak sensor
- Loose sensor
- INTERMITTENT short or open in Circuit 523 (R/PK) or 519 (LG/BK)

NOTE: If above codes are stored with C1155, check for intermittent short to ground or open. If above codes only are stored, the concern is output related and it is not necessary to check for intermittent open/short conditions.

- Disturbances caused by ignition or Radio Frequency Interference (RFI)
- Defective trigger circuit in anti-lock brake control module

NN1 DIAGNOSTIC TROUBLE CODES C1229, C1260 or C1237: INSPECT SPEED SENSOR MOUNTING/TONE RING

- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.
- Raise vehicle on hoist.
- Inspect the rear axle tone ring for damaged or missing teeth. Rotate ring to ensure all teeth are checked.
- Inspect the speed sensor for debris on the rear axle housing mounting boss or on speed sensor mounting flange. Clean as necessary.
- Reinstall speed sensor and tighten to specification.

CAUTION: Examine the ring carefully with good light. Failure to catch issues with the tone ring will lead to unnecessary component replacement and wasted diagnostic time.

Is tone ring intact or debris found at speed sensor mounting?

Yes	No
Debris is found. REMOVE debris and GO to NN6 .	Tone ring is not intact. REPLACE tone ring. GO to NN6 to DRIVE TEST vehicle. GO to NN2 .

tomsn048@gmail.com

NN2 CHECK REAR AXLE SPEED SENSOR OUTPUT AT ANTI-LOCK ELECTRONIC CONTROL MODULE

- Lower vehicle so that wheels are just far enough off the ground to permit all wheels to turn.
- 4x4s ONLY, verify transfer case is in the 4x2 mode.
- Start engine and allow rear wheels to spin and stabilize at engine idle speed.

NOTE: Perform the following measurements with Rotunda 105-R0053 Digital/Analog Volt-Ohmmeter or equivalent. If not using Rotunda 105-R0053 or Fluke Frequency Meter, higher wheel speed may be required in order for the frequency meter to function correctly.

- Set the Rotunda Digital/Analog Volt-Ohmmeter 105-R0053 or equivalent, to the frequency counter (Hz) setting. Measure and record the frequency between Pins 21 and 22 on the Rotunda Breakout Box 014-00322 or equivalent.
- Change the meter to the A/C mV setting. Measure and record the voltage output between Pins 21 and 22 on the Rotunda Breakout Box 014-00322 or equivalent.
- Determine the speed sensor output in mV/Hz:
- Output — A/C Voltage/Frequency

NOTE: Measurements of BOTH the frequency and the voltage output must be taken. The actual speed the wheels are turning is not important — the result of voltage output divided by the frequency will not change with wheel speed. However, it is crucial that both the frequency measurement and the voltage measurement be taken at the SAME wheel speed.

Is the sensor output greater than 6.0 mV/Hz?

Yes	No
Output at anti-lock brake control module indicates that the air gap and sensor strength are OK. GO to **NN4** .	Sensor output at ECU is insufficient. GO to **NN3** .

NN3 CHECK REAR AXLE SENSOR OUTPUT AT SPEED SENSOR

- Disconnect the speed sensor connector at the rear axle housing.
- If vehicle is not running, key ON and allow rear wheels to spin and stabilize at engine idle speed.
- Set the Rotunda Digital/Analog Volt-Ohmmeter 105-R0053 or equivalent, to the frequency counter (Hz) setting. Measure and record the frequency between the two pins of the speed sensor component connector.
- Change the meter to the A/C mV setting. Measure and record the voltage output between the two pins of the speed sensor.
- Determine the speed sensor output in mV/Hz:
- Output — A/C Voltage/Frequency

NOTE: Measurements of BOTH the frequency and the voltage output must be taken. The actual speed the wheels are turning is not important — the result of voltage output divided by the frequency will not change with wheel speed. However, it is crucial that both the frequency measurement and the voltage measurement be taken at the SAME wheel speed.

tomsn048@gmail.com

Is the sensor output greater than 6.0 mV/Hz?

Yes	No
Output indicates that air gap and speed sensor strength are OK at the sensor. GO to **NN4** .	REPLACE sensor. REPEAT **NN3** to RECHECK sensor output.

NN4 CHECK FOR WIRING INTERMITTENTS

NOTE: If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for Circuits 523 (R/PK) and 519 (LG/BK).

Is resolution obtained?

Yes	No
Concern is most likely resolved. A drive test is recommended to VERIFY speed sensor output is OK during customer driving conditions.	GO to **NN5** .

NN5 CHECK IF ALL STEPS HAVE BEEN COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: If the above is not complete, chances are that replacement of this or any other system component without specific direction will not, in most circumstances, resolve the concern and will consequently result in customer dissatisfaction.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE speed sensor. GO to **NN6** for drive test. If no resolution, REPLACE anti-lock brake control module. GO to **NN6** for drive test.	GO to last diagnostic step completed and CONTINUE.

NN6 SENSOR OUTPUT DRIVE TEST

- Reinstall all components and remove Rotunda Breakout Box 014-00322 or equivalent.
- Clear all codes.
- Key OFF.
- Key ON.
- Drive vehicle and perform the following:
  - Complete at least one hard left and one hard right turn.
  - Travel over a stretch of rough road at normal vehicle speed.

tomsn048@gmail.com

- Perform one hard acceleration from a stop.
- Retrieve code(s).

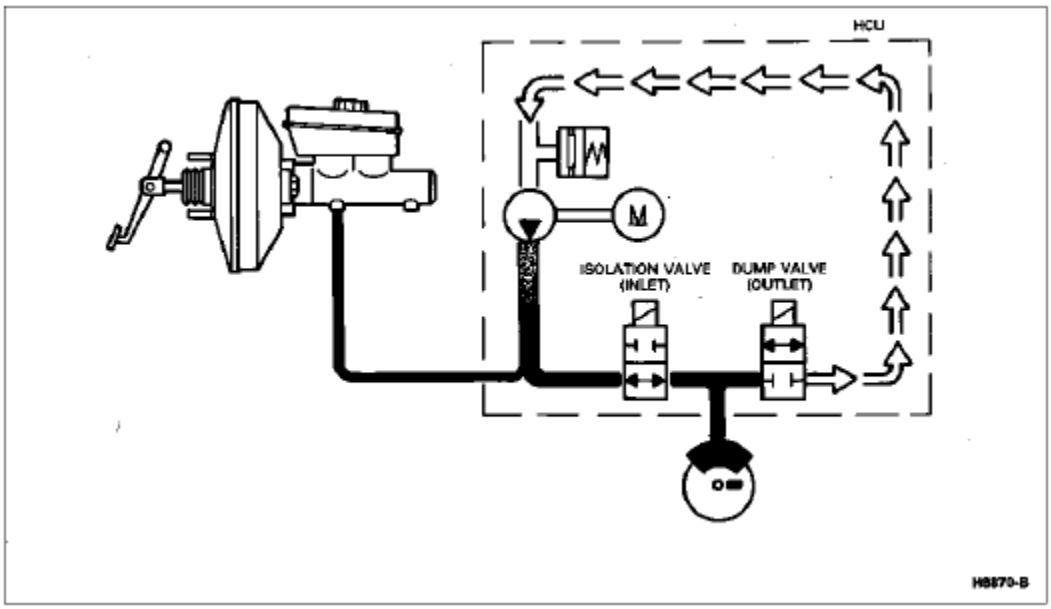
Is Code System Pass set?

Yes	No
STOP. Repair is complete.	Code being repaired still exists. GO to **NN5** . Different code is set (other than C1229, C1260 or C1237). GO to appropriate pinpoint test. Code being repaired still exists and anti-lock brake control module has been replaced. The following are time consuming and should be performed only after all previous options have been exhausted. Air gap between sensor and rear axle tone ring may be too large. VERIFY Circuits 523 (R/PK) and 519 (LG/BK) are twisted throughout the wire loom. If the wires are not twisted, the anti-lock brake control module may be sensitive to any outside interference. Excessive axle vibration, especially over rough road can cause this issue. VERIFY rear axle is not excessively noisy or otherwise performing abnormally. REPAIR as required.

PINPOINT TEST P: LF VALVE PAIR FUNCTION TEST

Affected Circuit(s)/Electrical Component(s)

tomsn048@gmail.com



Possible Contributing Component/Vehicle Wiring Concerns

- Pinched or closed brake line or hose
- Worn or clogged front left outlet valve

P1 CHECK BRAKE LINES/HOSES

- Visually inspect brake lines from valve block to front left wheel.

Are they damaged?

Yes	No
REPLACE/REPAIR brake lines.	GO to **P2** .

P2 CHECK FRONT LEFT OUTLET VALVE

- Key OFF.
- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.
- Jumper Pins 19, 26, 40, and 1 together on the Rotunda Breakout Box 014-00322 or equivalent.
- Raise vehicle so front left wheel is just off the ground.
- Press hard on the brake pedal and have an assistant try to turn the LH front wheel.

  NOTE: This condition is similar to the master cylinder bypass condition. It is important that the brake pedal be quickly and forcefully applied to rule out master cylinder bypass as the cause if a hydraulic leak is detected. Typically, master cylinder bypass only occurs at low line pressures.

Does the wheel turn or the brake pedal drop slowly?

tomsn048@gmail.com

Yes	No
REPLACE HCU. BLEED brake system. Refer to Section 06-06 .	GO to **P3** .

P3 CHECK FRONT LEFT OUTLET VALVE OPERATION

CAUTION: Do not leave ignition on for more than 30 seconds with the jumper installed.

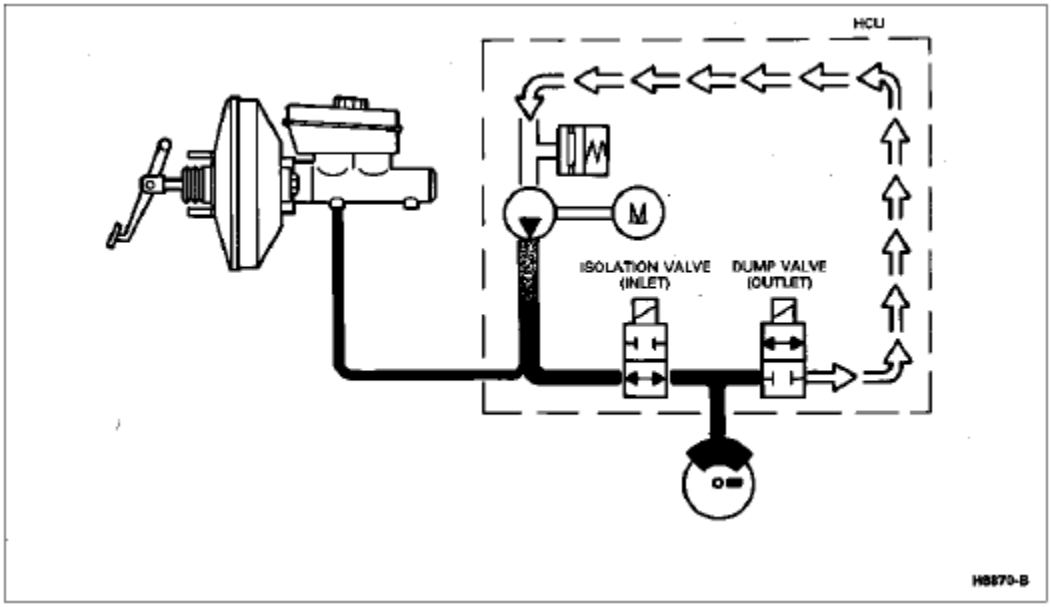
- Apply brake pedal force, turn ignition on and have assistant try to turn LH front wheel.

Does wheel turn now?

Yes	No
Valve is OK.	REPLACE HCU. BLEED brake system. REFER to Section 06-06 .

PINPOINT TEST Q: RF VALVE PAIR FUNCTION TEST

Affected Circuit(s)/Electrical Component(s)



Possible Contributing Component/Vehicle Wiring Concerns

- Pinched or closed brake line or hose
- Worn or clogged front right outlet valve

tomsn048@gmail.com

Q1 CHECK BRAKE LINES/HOSES

- Visually inspect brake lines from valve block to right front wheel.

Are lines damaged?

Yes	No
REPAIR/REPLACE lines.	GO to **Q2** .

Q2 CHECK FRONT RIGHT OUTLET VALVE

- Key OFF.
- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.
- Jumper Pins 15, 19, 34, and 1 together on the Rotunda Breakout Box 014-00322 or equivalent.
- Raise vehicle so front right wheel is just off the ground.
- Press hard on the brake pedal and have an assistant try to turn the RH front wheel.

NOTE: This condition is similar to the master cylinder bypass condition. It is important that the brake pedal be quickly and forcefully applied to rule out master cylinder bypass as the cause if a hydraulic leak is detected. Typically, master cylinder bypass only occurs at low line pressures.

Does wheel turn or the pedal drop slowly?

Yes	No
REPLACE HCU. BLEED brake system. Refer to Section 06-06 .	GO to **Q3** .

Q3 CHECK FRONT RIGHT OUTLET VALVE OPERATION

CAUTION: Do not leave ignition on for more than 30 seconds with the jumper installed.

- Apply brake pedal force, turn ignition ON and have assistant try to turn wheel.

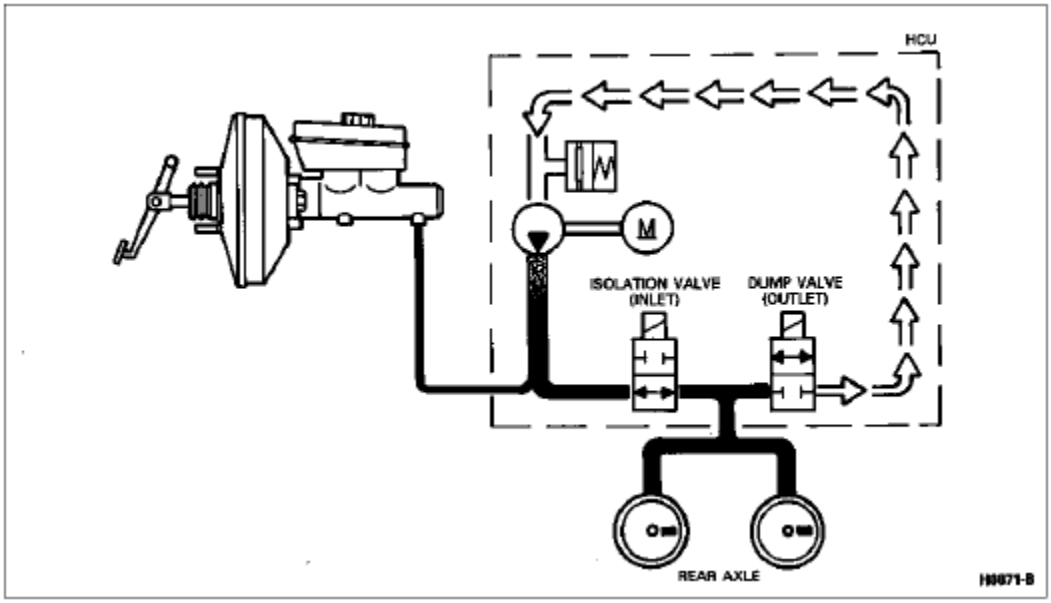
Does wheel turn now?

Yes	No
Valve is OK.	REPLACE HCU. BLEED brake system. REFER to Section 06-06 .

PINPOINT TEST R: REAR AXLE VALVE PAIR FUNCTION TEST

Affected Circuit(s)/Electrical Component(s)

tomsn048@gmail.com



Possible Contributing Component/Vehicle Wiring Concerns

- Pinched or closed brake line or hose
- Worn or clogged rear axle outlet valve

R1 CHECK BRAKE LINES

- Visually inspect brake lines from valve block to rear wheel.

Are lines damaged?

Yes	No
REPAIR/REPLACE lines.	GO to **R2** .

R2 CHECK REAR AXLE OUTLET VALVE

- Key OFF.
- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.
- Jumper Pins 19, 27, 33, and 1 together on the Rotunda Breakout Box 014-00322 or equivalent.
- Raise vehicle so rear wheels are just off the ground.
- Press hard on the brake pedal and have an assistant try to turn a rear wheel.

  NOTE: This condition is similar to the master cylinder bypass condition. It is important that the pedal be quickly and forcefully applied to rule out master cylinder bypass as the cause if a hydraulic leak is detected. Typically, master cylinder bypass only occurs at low line pressures.

tomsn048@gmail.com

Does the wheel turn or the brake pedal drop slowly?

Yes	No
REPLACE HCU. BLEED brake system. Refer to Section 06-06 .	GO to **R3** .

R3 CHECK REAR AXLE OUTLET VALVE OPERATION

CAUTION: Do not leave ignition on for more than 30 seconds with the jumper installed.

- Apply brake pedal force, turn ignition on and have assistant try to turn wheel.

Does wheel turn now?

Yes	No
Valve is OK.	REPLACE HCU. BLEED brake system. REFER to Section 06-06 .

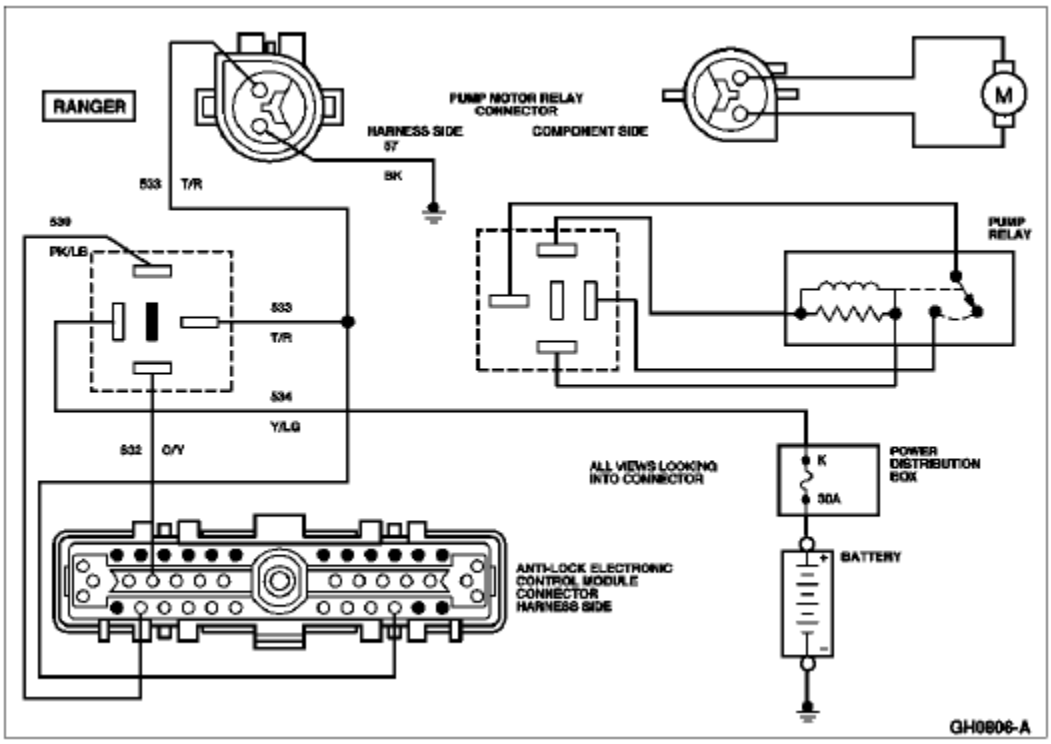
PINPOINT TEST S: ABS HYDRAULIC PUMP MOTOR CIRCUIT OPEN (CODE C1096)

Possible Code(s)

C1096 — Open or intermittent connection to pump motor relay, damaged relay coil or contacts, damaged pump motor.

Affected Circuit(s)/Electrical Component(s)

tomsn048@gmail.com



Description

Code C1096 is generated by the anti-lock brake control module.

Possible Contributing Component/Vehicle Wiring Concerns

- Damaged pump motor.
- Terminal backout in anti-lock brake control module harness connector Pins 29 and 37
- Open or shorted pump motor relay coil
- Open contacts in pump motor relay
- Terminal backout in pump motor 2-way, Pins 1 or 2

S1 VISUAL INSPECTION AND EQUIPMENT HOOK-UP

- Make sure the battery is OK. Refer to Section 14-01 .
- Inspect anti-lock brake control module pins, 30 amp pump motor feed fuse, battery and ground connections, relay connections and pump motor connections.
- Remove anti-lock brake control module, install Rotunda Breakout Box 014-00322 or equivalent and Overlay. Verify ground.
- Jumper Pins 1 and 19 together.
- Key ON (energize system relay).
- Jumper Pins 1 and 29 together (energize pump motor relay).

Is pump motor running?

tomsn048@gmail.com

Yes	No
GO to S7 .	GO to S2 .

S2 VOLTAGE CHECK 1 AND 2

- Disconnect 2-way connector.
- Using battery positive lead connect B+ to Pin 2 (533) and ground to Pin 1 (57) on HCU side of 2-way connector.

Does pump motor run?

Yes	No
GO to S3 .	REPLACE HCU. GO to S9 .

S3 CHECK PIN 1 GROUND

- Check for continuity between Pin 1 on the harness side connector and a known good chassis ground.

Is there continuity?

Yes	No
GO to S4 .	REPAIR open in Circuit 57 (BK). GO to S9 .

S4 CONTINUITY CHECK, CIRCUIT 533 (T/R)

- Key OFF.
- Disconnect pump motor relay.
- Check continuity on Circuit 533 (T/R) to Pin 2.

Is there continuity?

Yes	No
GO to S5 .	REPAIR open in Circuit 533 (T/R). GO to S9 .

S5 CONTINUITY CHECK, PUMP MOTOR RELAY TO ABS POWER RELAY

- Remove ABS power relay.
- Check continuity between pump motor relay Circuit 532 (O/Y) and ABS power relay Circuit 532 (O/Y).

Is there continuity?

Yes	No
GO to S6 .	REPAIR Circuit 532 (O/Y). GO to S9 .

tomsn048@gmail.com

S6 CONTINUITY CHECK, PUMP MOTOR RELAY CIRCUIT 534 (Y/LG)

- Disconnect battery negative cable.
- Check continuity from pump motor relay Circuit 534 (Y/LG) to battery (+) connection point.
- Reconnect battery negative cable when finished.

NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

Is there continuity?

Yes	No
GO to S7.	REPAIR open in Circuit 534 (Y/LG) or REPLACE 30A fuse. GO to S9.

S7 CONTINUITY CHECK, PUMP MOTOR RELAY CIRCUIT 539 (PK/LB)

- Check continuity from pump motor relay Circuit 539 (PK/LB) to Pin 29 on the Rotunda Breakout Box 014-00322 or equivalent.

Is there continuity?

Yes	No
REPLACE pump motor relay. GO to S9.	REPAIR short to ground in Circuit 539 (PK/LB). GO to S9.

S8 CHECK IF ALL STEPS HAVE BEEN COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: If the above is not complete, chances are that replacement of this or any other system component without specific direction will not, in most circumstances, resolve the concern and will consequently result in customer dissatisfaction.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE ECU. GO to S9.	GO to last diagnostic step completed and CONTINUE.

S9 CHECK FOR CODE REPEATABILITY

tomsn048@gmail.com

- Clear all codes.
- Key OFF.
- Key ON.
- Retrieve code(s).

Is Code System Pass set?

Yes	No
STOP. Concern has been corrected.	Code C1096 still exists. Concern has NOT been corrected. RETURN to the last diagnostic step completed and PROCEED. Different code is set. GO to appropriate pinpoint test. Code C1096 still exists and Step S8 is complete. GO to **S10** .

S10 VERIFY INTEGRITY OF VEHICLE WIRING

NOTE: If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on the pinpoint test mini-schematic.

Is resolution achieved?

Yes	No
GO to **S9** for system OK verification.	GO to **S8** .

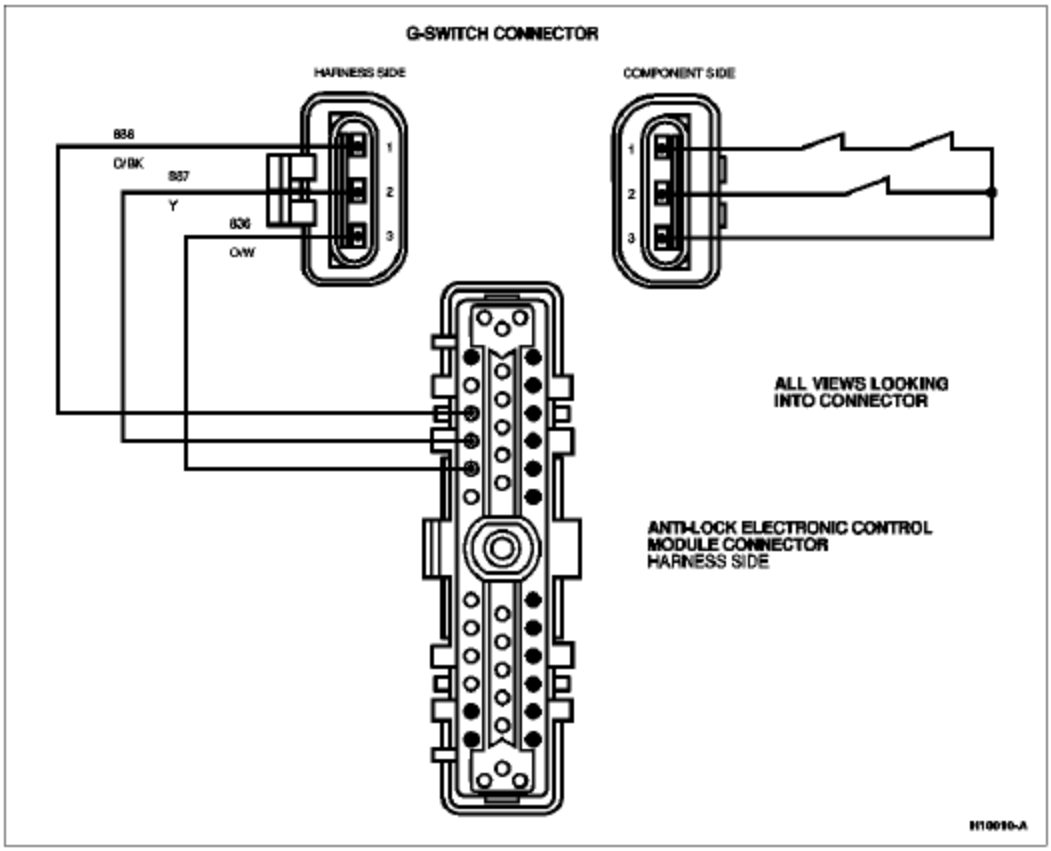
PINPOINT TEST T: ABS ACCELERATION SWITCH CIRCUIT FAILURE (CODE C1102)

Possible Code(s)

C1102 — Intermittent or open connection between anti-lock brake control module and G-switch, damaged G-switch or circuit in anti-lock brake control module.

Affected Circuit(s)/Electrical Component(s)

tomsn048@gmail.com



Description

Code C1102 is generated by the anti-lock electronic control module's detection of a circuit failure between the anti-lock brake control module and the G-switch and by a failed G-switch or internal anti-lock brake control module damage.

Possible Contributing Component/Vehicle Wiring Concerns

- Terminal backout in anti-lock brake control module wiring harness connector Pins 30, 31 and 32.
- Worn or damaged G-switch.
- Worn or damaged anti-lock brake control module.
- G-switch terminal backout, Pins 1, 2 and 3.
- Short to ground in Circuits 836 (O/W), 886 (O/BK) and 887 (Y).
- Module initialized on 4x4 vehicle then installed on 4x2 vehicle.

NOTE: The ECU can be reinitialized with the New Generation Star (NGS) Tester.

T1 SWITCH CHECK, DEFAULT G-SWITCH POSITION

- Disconnect G-switch harness connector.
- Remove the G-switch from the vehicle.
- Inspect harness connector and G-switch connector cavity for water or terminal corrosion.

tomsn048@gmail.com

- Place the G-switch on a level surface.
- Measure the resistance between G-switch Pin 1 (Circuit 886) and Pin 3 (Circuit 836).
- Measure the resistance between G-switch Pin 2 (Circuit 887) and Pin 3 (Circuit 836).

Are both resistances measured less than 5 ohms?

Yes	No
GO to **T2** .	All switches should be closed. REPLACE G-switch. GO to **T11** .

T2 SWITCH CHECK, G-SWITCH RAISED 38.0MM

- Raise the front of the G-switch 38.0mm (1.5 in.). The arrow on the connector points toward the front.
- Measure the resistance between G-switch Pin 1 (Circuit 886) and Pin 3 (Circuit 836).

Is the resistance greater than 5 ohms?

Yes	No
GO to **T3** .	REPLACE G-switch. GO to **T11** .

T3 SWITCH CHECK, G-SWITCH RAISED 25.4MM

- Raise the rear of the G-switch 25.4mm (1.0 in.).
- Measure the resistance between G-switch Pin 2 (Circuit 887) and Pin 3 (Circuit 836).

Is the resistance greater than 5 ohms?

Yes	No
G-switch is OK. GO to **T4** .	REPLACE sensor. GO to **T11** .

T4 CONTINUITY CHECK, CIRCUIT 836 (O/W) BETWEEN ANTI-LOCK ELECTRONIC CONTROL MODULE AND G-SWITCH HARNESS CONNECTOR

- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.
- Measure the resistance between Pin 32 on the Rotunda Breakout Box 014-00322 or equivalent and G-switch harness connector Pin 3 (Circuit 836).

Is the resistance greater than 5 ohms?

Yes	No
REPAIR Circuit 836 (O/W) between anti-lock brake control module and G-switch. GO to **T11** .	GO to **T5** .

T5 SHORT TO GROUND CHECK, CIRCUIT 836 (O/W) BETWEEN ANTI-LOCK

tomsn048@gmail.com

ELECTRONIC CONTROL MODULE AND G-SWITCH HARNESS CONNECTOR

- Measure the resistance between Pin 32 and Pin 1 or 14 on the Rotunda Breakout Box 014-00322 or equivalent.

Is the resistance greater than 5 ohms?

Yes	No
GO to **T6** .	REPAIR short to ground in Circuit 836 (O/W) between anti-lock brake control module and acceleration sensor. GO to **T11** .

T6 CONTINUITY CHECK, CIRCUIT 886 (O/BK) BETWEEN ANTI-LOCK ELECTRONIC CONTROL MODULE AND G-SWITCH HARNESS CONNECTOR

- Measure the resistance between Pin 30 on the Rotunda Breakout Box 014-00322 or equivalent and G-switch harness connector Pin 1 (Circuit 886).

Is the resistance greater than 5 ohms?

Yes	No
REPAIR Circuit 886 (O/BK) between anti-lock brake control module and acceleration sensor. GO to **T11** .	GO to **T7** .

T7 SHORT TO GROUND CHECK, CIRCUIT 886 (O/BK) BETWEEN ANTI-LOCK ELECTRONIC CONTROL MODULE AND G-SWITCH HARNESS CONNECTOR

- Measure the resistance between Pin 30 and Pin 1 or 14 on the Rotunda Breakout Box 014-00322 or equivalent.

Is the resistance greater than 5 ohms?

Yes	No
GO to **T8** .	REPAIR short to ground in Circuit 886 (O/BK) between anti-lock brake control module and acceleration G-switch. GO to **T11** .

T8 CONTINUITY CHECK, CIRCUIT 887 (Y) BETWEEN ANTI-LOCK ELECTRONIC CONTROL MODULE AND G-SWITCH HARNESS CONNECTOR

- Measure the resistance between Pin 31 on the Rotunda Breakout Box 014-00322 or equivalent and G-switch harness connector Pin 2 (Circuit 887).

Is the resistance greater than 5 ohms?

Yes	No

tomsn048@gmail.com

REPAIR Circuit 887 (Y) between anti-lock brake control module and acceleration G-switch. GO to **T11** .	GO to **T9** .

T9 SHORT TO GROUND CHECK, CIRCUIT 887 (Y) BETWEEN ANTI-LOCK ELECTRONIC CONTROL MODULE AND G-SWITCH HARNESS CONNECTOR

- Measure the resistance between Pin 31 and Pin 1 or 14 on the Rotunda Breakout Box 014-00322 or equivalent .

Is the resistance greater than 5 ohms?

Yes	No
GO to **T11** .	REPAIR short to ground in Circuit 887 (Y) between anti-lock brake control module and G-switch. GO to **T11** .

T10 VERIFY ALL STEPS HAVE BEEN COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

  CAUTION: If the above is not complete, chances are that replacement of this or any component without specific direction will not, in most circumstances, resolve the concern and will consequently result in customer dissatisfaction.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE G-switch. GO to **T11** . If no resolution, REPLACE anti-lock brake control module. GO to **T11** .	GO to last diagnostic step completed and CONTINUE.

T11 CHECK FOR CODE REPEATABILITY

- Remove Rotunda Breakout Box 014-00322 or equivalent and reinstall all components.
- Clear all codes.
- Key OFF.
- Key ON.
- Retrieve code(s).

Is Code System Pass set?

Yes	No
	Code C1102 still exists. Concern has NOT been corrected. RETURN to last diagnostic step

tomsn048@gmail.com

STOP. Concern has been corrected.	completed and PROCEED. Different code is set. GO to appropriate pinpoint test. Code C1102 still exists and Step T9 is complete. GO to **T12** .

T12 VERIFY INTEGRITY OF VEHICLE WIRING

NOTE: If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on the pinpoint test mini-schematic.

Is resolution achieved?

Yes	No
GO to **T11** for system OK verification.	Go to **T10** .

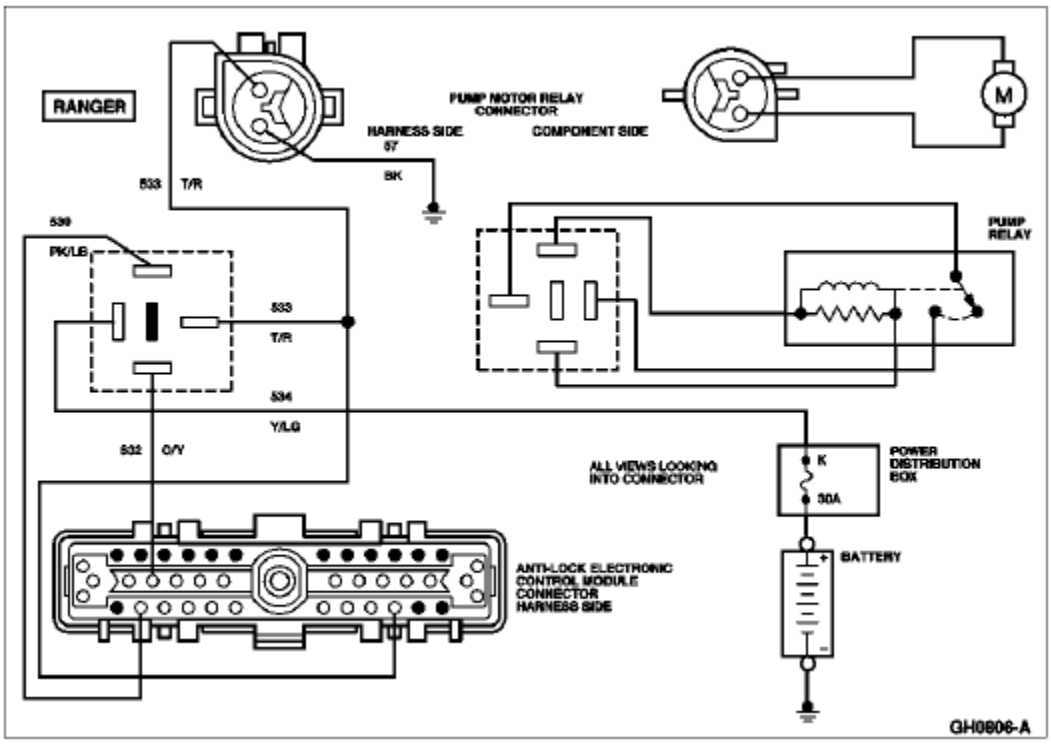
PINPOINT TEST U: ABS HYDRAULIC PUMP MOTOR CIRCUIT FAILURE (CODE C1095)

Possible Code(s)

C1095 — Pump motor running but not triggered by ECU.

Affected Circuit(s)/Electrical Component(s)

tomsn048@gmail.com



Description

Code C1095 is generated by the anti-lock brake control module when the pump motor is running but is not triggered.

Possible Contributing Component/Vehicle Wiring Concerns

- Damaged trigger circuit in anti-lock brake control module
- Welded relay contacts
- Ground short on Circuit 539 (PK/LB)

U1 PUMP MOTOR CHECK, KEY OFF

- Make sure the battery is OK. Refer to Section 14-01 .
- Key OFF.

Is the pump motor running?

Yes	No
REPLACE pump motor relay. GO to **U4** .	GO to **U2** .

U2 CHECK CIRCUIT 539 (PK/LB)

tomsn048@gmail.com

- Remove anti-lock brake control module, install Rotunda Breakout Box 014-00322 or equivalent and Overlay. Verify Pin 1 is ground.
- Key ON.
- Jumper Pins 1 and 19 to energize main relay.
- Verify that contacts are not sticking or welded.

Is pump motor running?

Yes	No
REPAIR short to ground in Circuit 539 (PK/LB). GO to **U4** .	GO to **U4** .

U3 CHECK IF ALL STEPS HAVE BEEN COMPLETED

- This step requires that a valid diagnostic trouble code has been obtained, ALL prior diagnostic steps have been completed, and the affected wiring integrity has been verified.

CAUTION: If the above is not complete, chances are that replacement of this or any other system component without specific direction will not, in most circumstances, resolve the concern and will consequently result in customer dissatisfaction.

Have all prior diagnostic steps been completed as described above?

Yes	No
REPLACE anti-lock brake control module. GO to **U4** .	GO to last diagnostic step completed and CONTINUE.

U4 CHECK FOR CODE REPEATABILITY

- Clear all codes.
- Key OFF.
- Key ON.
- Retrieve code(s).

Is Code System Pass set?

Yes	No
STOP. Concern has been corrected.	Code C1095 still exists. Concern has NOT been corrected. RETURN to the last diagnostic step completed and PROCEED. Different code is set. GO to appropriate pinpoint test. Code C1095 still exists and Step U2 is complete. GO to **U5** .

tomsn048@gmail.com

U5 VERIFY INTEGRITY OF VEHICLE WIRING

NOTE: If the above steps have been completed, the MOST LIKELY cause of the concern is wiring related.

- Refer to Pinpoint Test ID , Intermittent Diagnosis Procedure and perform for ALL affected circuits as shown on the pinpoint test mini-schematic.

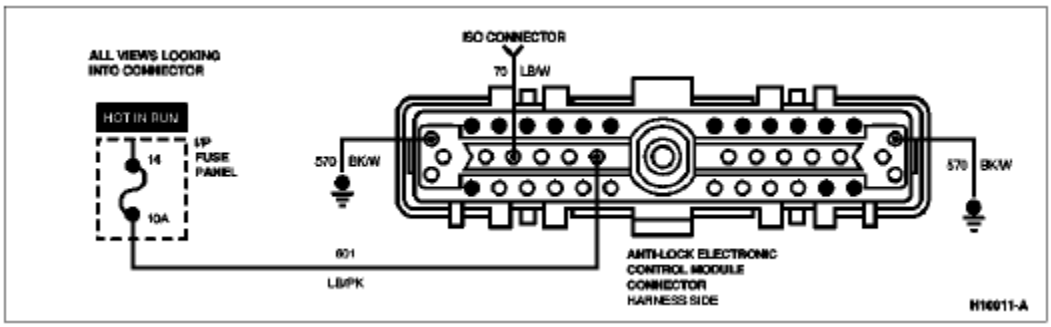
Is resolution achieved?

Yes	No
GO to **U4** for system OK verification.	GO to **U3** .

PINPOINT TEST V: NO COMMUNICATION

Hard Light — No Code

Affected Circuit(s)/Electrical Components:



Description

If no vehicle battery voltage is available to the anti-lock brake control module, or the voltage available is less than 9.5 volts, the anti-lock brake control module cannot initialize. As a result, the system relay cannot be energized and the ABS warning light remains on. No diagnostics are possible; therefore, no codes can be read.

Possible Contributing Base Brake Component/Vehicle Wiring Concerns

- Worn or damaged ignition switch
- Open ignition feed circuit to anti-lock brake control module
- Low battery voltage (less than 8V)
- Blown ignition fuse
- Open system ground
- Poor ground connection Circuit 570 (BK/W)
- B+ short on Circuit 70 (LB/W)
- Ground short on Circuit 601 (LB/PK) (fuse 14 blown).

tomsn048@gmail.com

V1 INSTALL ROTUNDA BREAKOUT BOX 014-00322 OR EQUIVALENT

- Install Rotunda Breakout Box 014-00322 or equivalent and Overlay.
- Open power distribution box and locate ignition fuse 14 (10A).
- Check fuse for continuity.
- Verify both fuse terminals in the power network box are clean and secure.

Is there continuity and are terminals clean and secure?

Yes	No
REINSTALL fuse. GO to **V2** .	REPLACE fuse or SERVICE terminal as appropriate. GO to **PC3** .

V2 CHECK FOR B+ SHORT ON CIRCUIT 70 (LB/W)

- Key OFF.
- Measure voltage between Pins 1 and 16 at breakout box.

Is B+ present?

Yes	No
GO to **V3** .	REPAIR B+ short on Circuit 70 (LB/W). GO to **PC3** .

V3 VERIFY ECU GROUND

- Key OFF.
- Inspect ground eyelet at left radiator support for excessive dirt, corrosion, or looseness. Clean and tighten as necessary.
- Check for continuity between Pin 1 and the ground eyelet at left radiator support.
- Check for continuity between Pin 14 and the ground stud at left radiator support.

Is there continuity at both pins?

Yes	No
GO to **V4** .	REPAIR open circuit in ground between anti-lock brake control module harness connector and ground eyelet. GO to **PC3** .

V4 VERIFY DIAGNOSTIC LINE

- Key OFF.
- Measure resistance between NGS Tester Connector pin for Circuit 70 (LB/W) and Pin 16 on breakout

tomsn048@gmail.com

box.

Is resistance measured less than 10 ohms?

Yes	No
GO to **V5** .	REPAIR or REPLACE open or high resistance issue in Circuit 70 (LB/W). GO to **PC3** .

V5 VERIFY DIAGNOSTIC GROUND

- Key OFF.
- Measure resistance between NGS Tester Connector pin for Circuit 57 (BK) and known good chassis ground.

Is resistance measured less than 10 ohms?

Yes	No
GO to **V6** .	REPAIR or REPLACE as necessary. GO to **PC3** .

V6 VERIFY PROPER VOLTAGE AT ANTI-LOCK ELECTRONIC CONTROL MODULE HARNESS CONNECTOR

- Key ON.
- Measure voltage between Pins 20 and 1.

Is there at least 9.5 volts?

Yes	No
REPLACE anti-lock brake control module. GO to **PC3** .	There is voltage greater than 0 volts but less than 9.5 volts. Anti-lock brake control module cannot initialize due to insufficient voltage. Problem is NOT in ABS system. REFER to Section 14-00 . There is 0 volts. REPAIR open circuit between fuse 14 and anti-lock brake control module harness connector in 601 (LB/PK). GO to **PC3** .

tomsn048@gmail.com

Hydraulic Control Unit (HCU)

Removal

1. Remove the battery (10655) and battery tray (10732). Refer to Section 14-01 .
2. Raise and support the vehicle on a hoist.
3. From beneath the LH front fender apron (16055), remove the anti-lock hydraulic control unit bracket nut.
4. Lower the vehicle.
5. Disconnect the two anti-lock HCU electrical connectors.
6. **NOTE: To prevent contamination and brake fluid leakage after hydraulic tubes are disconnected, plug each tube and port.**

   Disconnect the five HCU hydraulic connectors.
7. Remove the HCU bracket-to-inner fender screw and stud and remove HCU.

Installation

To install, reverse the removal procedure.

Tighten the anti-lock HCU bracket-to-inner fender screw and stud to 11-13 Nm (91-122 lb-in).

Tighten the anti-lock HCU bracket nut to 11-13 Nm (91-122 lb-in).

Tighten the hydraulic brake tube to the HCU outlet port adapter nuts to 18-27 Nm (14-19 lb-ft).

Tighten the hydraulic brake tube to HCU inlet port nuts to 14-21 Nm (11-15 lb-ft).

Bleed the brake system. Refer to Section 06-06 .

tomsn048@gmail.com

tomsn048@gmail.com

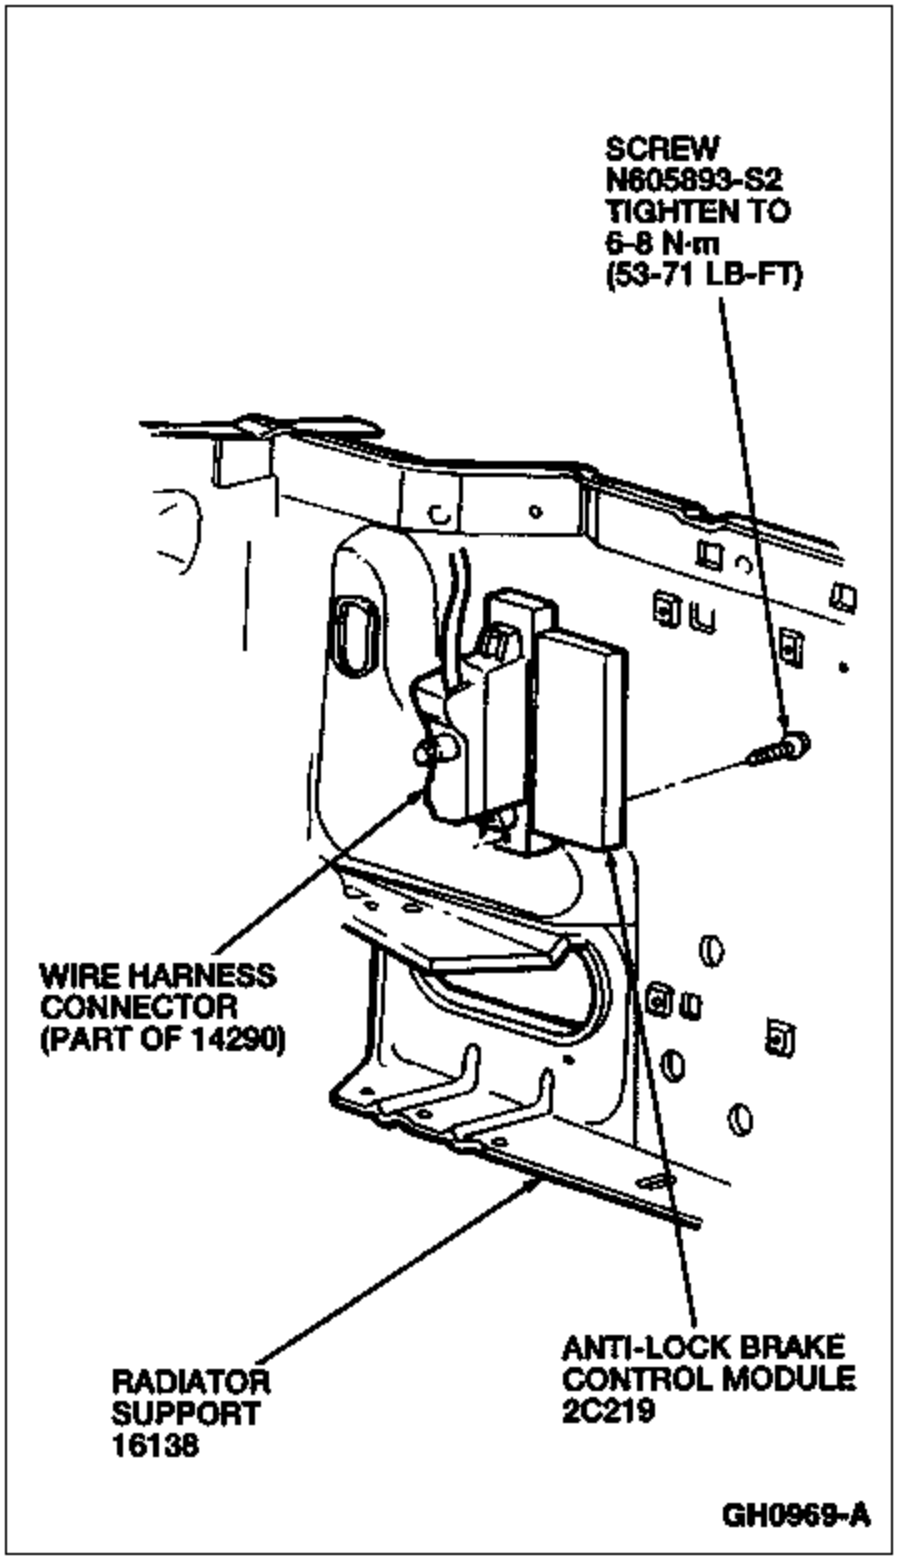
Control Module, Anti-Lock Brake, Ranger

Removal

1. Disconnect the battery cables and remove the battery.

2. Locate the anti-lock brake control module electrical connector in front and to the right of the battery tray (10732). Disconnect the connector.

tomsn048@gmail.com



3. Remove the anti-lock brake control module-to-radiator support screw.

4. Slide the anti-lock brake control module to release the retaining tab and remove the module from the vehicle.

tomsn048@gmail.com

Installation

To install, reverse the removal procedure. Tighten the module-to-radiator support screw to 6-8 Nm (53-71 lb-in).

tomsn048@gmail.com

Relay, Anti-Lock Brake

Removal and Installation

The anti-lock brake relays are located in a relay box attached to the LH inner fender, behind the battery. The ABS power relay uses five terminal sockets and the pump motor relay uses four. The relay box must be removed from the LH inner fender to remove the relays. The relays are pulled from and pressed into their respective sockets.

tomsn048@gmail.com

Brake Sensors

Front

Removal

1. From under the vehicle, disconnect the speed sensor assembly two-pin connector from wiring harness.
2. Separate the speed sensor cable from brake hose clips.
3. Remove the speed sensor retaining bolt from front spindle and slide sensor out of mounting hole.

Installation

For installation, follow removal procedures in reverse order. Tighten retaining bolt to 8-10 Nm (68-92 lb-in).

tomsn048@gmail.com

Sensor Indicator, Anti-Lock Brake

Front

Removal and Installation

For removal and installation of the front speed sensor indicator (4x4 only), refer to Section 05-03A . Replace the rotor. Refer to Section 06-03 (4x2).

Rear

Removal and Installation

For removal and installation of the rear speed sensor indicator, refer to Section 05-02A or Section 05-02B .

tomsn048@gmail.com

Brake Master Cylinder Reservoir Checking and Filling

Brake fluid level should not be more than 4mm (0.16 inch) below the MAX line on the side of the brake master cylinder reservoir (2K478). If brake fluid is low, the red BRAKE indicator will illuminate. To add brake fluid, clean and remove reservoir cap and pour clean brake fluid into the brake master cylinder reservoir. Fill to specification mentioned above. Use Ford High Performance DOT 3 Brake Fluid C6AZ-19542-AA or equivalent DOT 3 fluid meeting Ford specification ESA-M6C25-A, DOT3. If brake fluid has to be added often, check all hydraulic connections for leaks.

Transmission Description

The 4R44E automatic transmissions are electronically controlled four-speed units.

The 4R44E transmission is used with the 2.3L and 3.0L engine applications.

These transmissions feature a four element torque converter with a torque converter clutch (TCC). The geartrain includes:

- Three compound planetary gearsets
- Three bands
- Three multi-plate clutches
- Two one-way clutches

The hydraulic functions are directed by electronic solenoids to control:

- Engagement feel
- Shift feel
- Shift scheduling
- Modulated TCC applications
- Timing of the 3-2 T.D. and K.D. shifts
- Engine braking (with O/D canceled) utilizing the coast clutch
- Manual 1st timing

Transmission Range Operation

The 4R44E transmission range selector lever has six positions: P, R, N, D, 2, 1. The driver selects the required gear position by moving the selector lever to the various positions. Interlocking cables and linkages connect the selector lever to the transmission. This allows the selector lever to move internal linkages and the manual control valve, which signals the driver demand.

Park

No powerflow is transferred through the transmission in PARK. The manual lever shaft, which is connected to a park rod, presses the parking pawl into the park gear on the output shaft. This locks the output shaft and prevents the vehicle from rolling. However, for safety reasons, the parking brake should be applied whenever the vehicle is parked.

While the engine can be started in either P or N position, the ignition key can only be removed in PARK.

Reverse

Reverse gear allows the vehicle to be operated in a rearward direction, at a reduced gear ratio. When overdrive has been cancelled, engine braking is provided in the R position with the coast clutch applied.

Neutral

As in PARK, there is no power transferred through the transmission. However, the final drive is not locked by the parking pawl, so the wheels are free to rotate. The vehicle may be started in the N position, but the ignition key cannot be removed.

Overdrive

In the (D) position, the transmission will upshift or downshift 1-2-3-4 automatically.

When overdrive has been canceled by turning the transmission control switch on, the transmission will not upshift to 4th gear. Engine braking is provided in 1st, 2nd, 3rd and reverse gears with the coast clutch applied.

2nd Position

Selection of the 2 position provides a 2nd gear hold position from a manual upshift or downshift. When the 2 position is selected from a stop, the transmission will start in second gear. This allows for maximum traction on slippery surfaces. Engine braking is provided in the 2 position when the transmission control switch (TCS) is on or off.

1st Position

The 1 position provides a 1st gear hold after an automatic or manual downshift. The transmission is prevented from downshifting above a specific speed (approximately 48 km/h [30 mph]) to protect the powertrain from overspeeding. Engine braking is provided in the 1 position when the transmission control switch (TCS) is on or off.

tomsn048@gmail.com

tomsn048@gmail.com

Transmission Shift Patterns

Upshifts

Transmission upshifting is controlled by the powertrain control module (PCM). The PCM receives inputs from various engine or vehicle sensors and driver demands to control shift scheduling, shift feel and torque converter clutch operation.

Downshifts

Under certain conditions the transmission will downshift automatically to a lower gear range (without moving the range selector lever). There are three categories of automatic downshifts: Coastdown, Torque Demand and Forced or Kickdown shifts.

Coastdown

The coastdown downshift occurs as the name indicates, when the vehicle is coasting down to a stop.

Torque Demand

The torque demand downshift occurs (automatically) during part throttle acceleration when the demand for torque is greater than the engine can provide at that gear ratio. The transmission will also disengage the torque converter clutch to provide added acceleration, if applied.

Kickdown

For maximum acceleration, the drive can force a downshift by pressing the accelerator pedal to the floor. A forced downshift into a lower gear (3rd, 2nd or 1st) is possible below calibrated speeds. For all shift speeds, specifications are subject to variations due to tire size, engine and transmission calibration requirements.

tomsn048@gmail.com

tomsn048@gmail.com

Transmission Control Switch and Lamp Operation

The transmission control switch (TCS) is a driver-controlled momentary contact switch mounted on the end of the transmission range selector lever. When the TCS is activated, 4th gear operation (overdrive) is canceled, coast clutch is applied, and engine braking is provided in 1st, 2nd, 3rd and reverse gears.

The transmission control indicator lamp (TCIL) is located on the transmission range selector lever in the Aerostar and on the instrument panel in the Ranger. The TCIL indicates that the transmission control switch (TCS) has been depressed and 4th gear has been cancelled. The TCIL will flash if the powertrain control module (PCM) detects a concern in certain transmission related sensors or solenoids.

tomsn048@gmail.com

Main Components and Functions

Torque Converter

The 4R44E uses a four element torque converter. The converter contains the standard internal components (turbine, impeller, and stator) for transfer of power and multiplication of torque. It also utilizes a disc type torque converter clutch (TCC) for maximum fuel economy.

The operation of the main torque converter components is as follows:

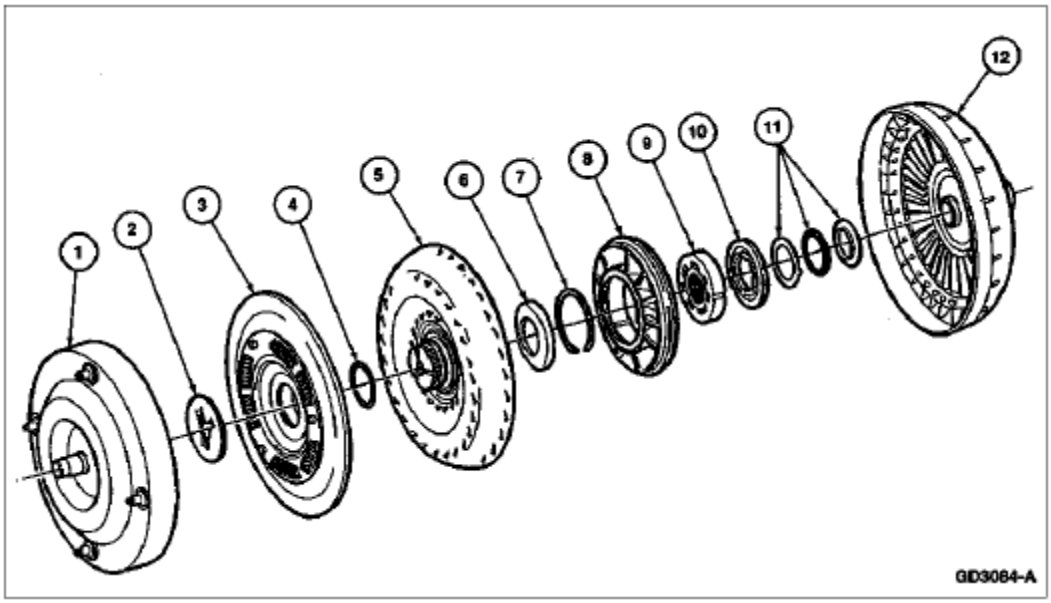
- The converter cover and impeller are connected to the engine crankshaft. Rotation of the cover and impeller by the engine crankshaft sets the fluid in motion.
- The turbine reacts to the fluid motion from the impeller, transferring rotation to the geartrain by way of the turbine shaft.
- The stator redirects the fluid going back to the impeller, from the turbine. By directing fluid back to the impeller in the same direction as engine rotation, the stator multiplies engine torque.

When applied, the TCC provides a mechanical link between the converter turbine and the engine, allowing for a direct mechanical power transfer from the engine to the transmission. The converter clutch pressure plate is applied and released by fluid pressure, which is controlled by the powertrain control module (PCM). The PCM controls the torque converter clutch using a pulse-width modulated TCC solenoid.

Torque Converter Clutch (TCC) Damper

The torque converter clutch damper assembly functions only when the torque converter clutch is applied.

Torque Converter Assembly



tomsn048@gmail.com

Item	Part Number	Description
1	—	Cover (Part of 7902)
2	—	Thrust Washer (Part of 7902)
3	—	Converter Damper Plate (Part of 7902)
4	—	O-Ring (Part of 7902)
5	—	Turbine Assembly (Part of 7902)
6	—	Thrust Washer (Part of 7902)
7	—	Snap Ring (Part of 7902)
8	—	Reactor (Part of 7902)
9	—	One-Way Clutch Assembly (Part of 7902)
10	—	Thrust Washer (Part of 7902)
11	—	Thrust Bearing (Part of 7902)
12	—	Impeller Assembly (Part of 7902)

Impeller and Cover

The impeller sets the fluid in motion and directs it to the turbine. The impeller is welded to the converter cover.

Turbine

The turbine is the driven member of the converter. It is driven by fluid from the impeller and transfers the hydraulic power to the transmission. When the converter lockup clutch is engaged, the power is transferred mechanically.

Reactor

The reactor is equipped with heavily curved vanes and its center hub has an one-way clutch which prevents the stator from rotating opposite to the engine rotation. The reactor reverses the fluid and returns it to the impeller in the direction of impeller rotation. The one-way clutch prevents the force of this fluid from turning the stator against the impeller and turbine.

The reactor one-way clutch is built into the reactor (stator) and prevents it from rotating opposite to engine rotation.

Torque Converter Clutch

The clutch is joined to the turbine by means of the externally splined hub of the turbine and also internally splines within its own assembly.

When engaged the clutch friction plate bears against the inside of the converter cover, thereby producing a direct mechanical connection between the pump housing and the turbine.

Geartrain

Power is transmitted from the torque converter to the planetary gearsets through the input shaft.

tomsn048@gmail.com

By holding and driving certain numbers of the gearsets, four forward ratios and one reverse ratio are obtained and transmitted to the output shaft and differential.

The ratios from the planetary gearsets are:

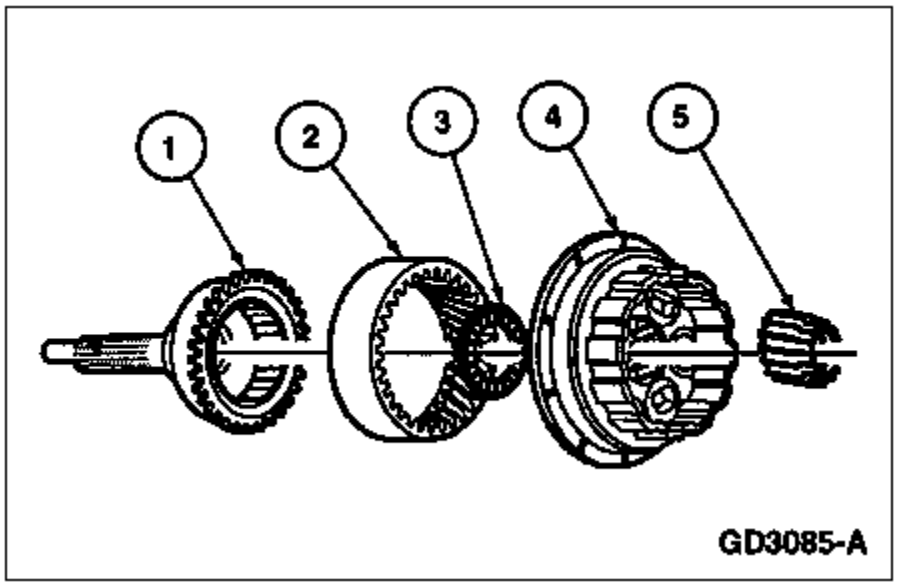
- 2.474:1 in 1st (Low)
- 1.474:1 in 2nd (Intermediate)
- 1.000:1 in 3rd (Drive)
- .75:1 in 4th (Overdrive)
- 2.1:1 in Reverse

Planetary Gearset — Overdrive

The planetary gear overdrive carrier is driven by the input shaft. The planetary gearset overdrive carrier drives the center shaft via the overdrive one-way clutch in 1st, 2nd and 3rd gears.

In overdrive, the overdrive sun gear is held, causing the pinion gear to rotate around the overdrive sun gear. The pinion gears in turn drive the overdrive ring gear resulting in an overdrive output ratio of 0.75:1.

The overdrive planetary gearset is also internally splined to the coast clutch for engine braking.



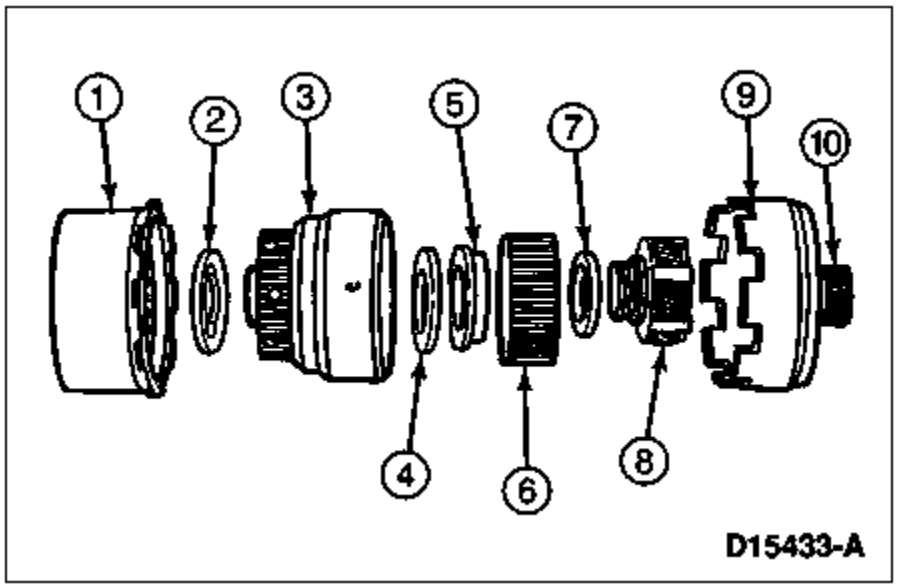
Item	Part Number	Description
1	7A658	Center Shaft Assembly
2	7653	Overdrive Ring Gear
3	7L495	No. 2 Overdrive Planetary Thrust Bearing
4	7B446	Overdrive Planetary Gear Carrier Assembly
5	7D063	Overdrive Sun Gear Assembly

Planetary Gearset — Forward

The forward planetary gearset is splined to the output shaft.

tomsn048@gmail.com

The forward planetary gearset is driven by the forward ring gear when the forward clutch is applied. The forward planetary gearset pinions drive the forward sun gear. The forward sun gear is splined to the input shell.



Item	Part Number	Description
1	7D044	Intermediate Brake and Direct Clutch Drum Assembly
2	7C096	No. 5 Forward Clutch Cylinder Thrust Bearing
3	7A360	Forward Clutch Cylinder Assembly
4	7D234	No. 6A Forward Ring Gear Hub Thrust Bearing
5	7D090	No. 6B Forward Clutch Thrust Washer
6	7D392	Forward Ring Gear
7	7F374	No. 7 Forward Planetary Thrust Bearing Assembly
8	7A398	Forward Planetary Assembly
9	7D064	Input Shell
10	7D063	Forward Sun Gear Assembly

Input Shaft

The input shaft is supported by two bushings in the stator support. End positioning of the input shaft is controlled by the splines in the converter turbine and the overdrive planetary carrier.

Output Shaft

The output shaft is supported by two bushings in the case and by the slip yoke bushing in the extension housing. End positioning is controlled by the parking pawl gear and snap ring or shoulder and by the reverse ring gear hub and snap ring.

Planetary Gearset — Low/Reverse

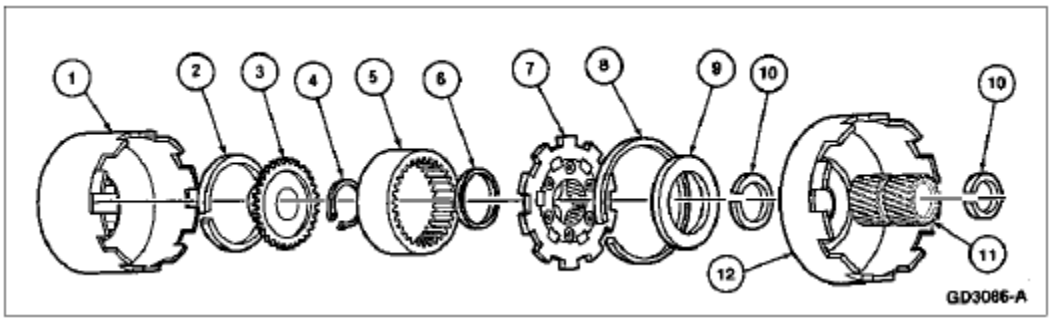
tomsn048@gmail.com

The low/reverse planetary gearset is connected to the low/reverse brake drum by lugs from the low/reverse brake drum to the lugs of the low/reverse planetary gearset.

The low/reverse planetary gearset is driven by the forward sun gear which is splined to the input shell.

The splines of the forward sun gear drive the pinions in the low/reverse planetary gearset. The pinions of the low/reverse planetary gearset drive the output shaft ring gear and output shaft hub which is splined to the output shaft.

The low/reverse planetary gearset is held via the low one-way clutch in the low/reverse brake drum assembly, when the low/reverse band is applied.



Item	Part Number	Description

6	7M153	No. 9 Reverse Planetary Carrier Thrust Bearing
7	7D006	Reverse Planetary Gearset
8	W702037-S300	Retaining Ring
9	7A166	No. 8 Reverse Planetary Carrier Thrust Bearing
10	E860121-S	Retaining Ring (2 Req'd)
11	7D063	Forward Sun Gear Assembly
12	7D064	Input Shell

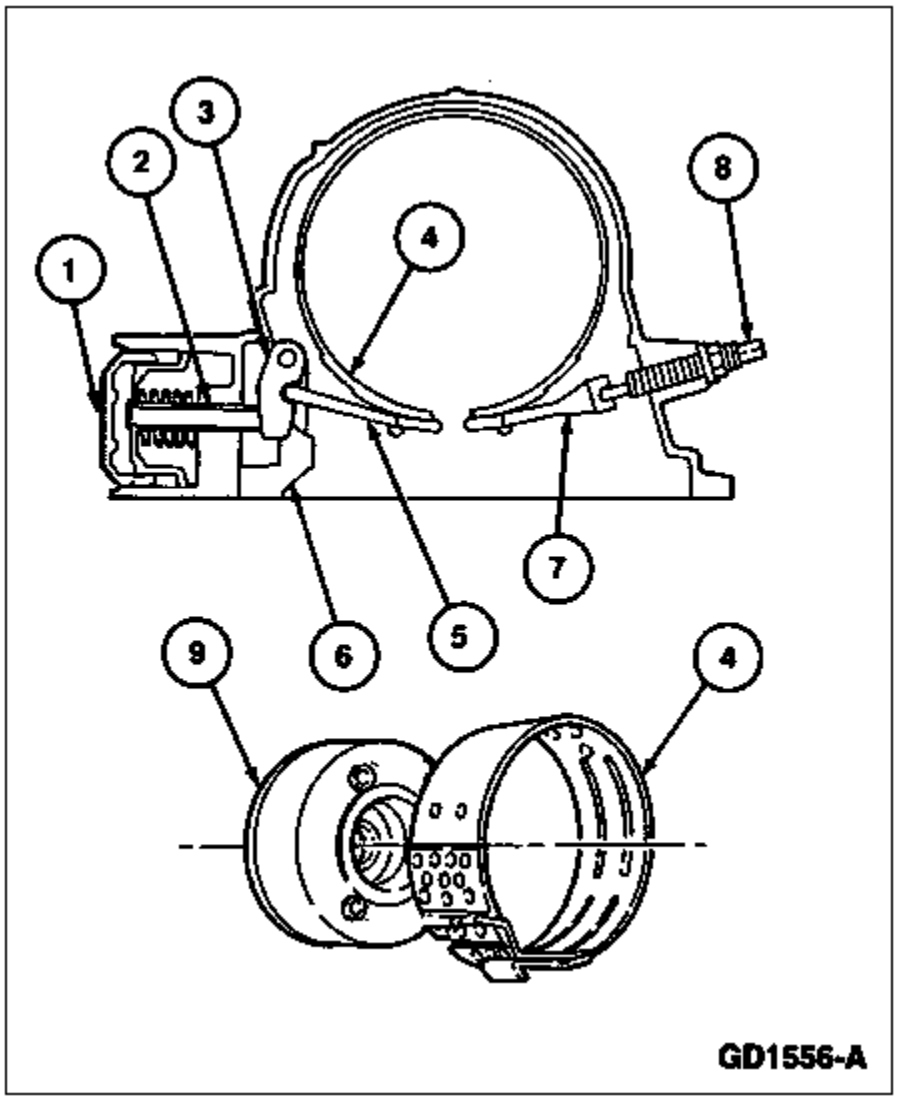
Apply Components

Bands — Overdrive

Hydraulic pressure is applied to the front side of the overdrive servo. This pressure causes the servo to stroke and apply force to the band, causing the overdrive brake and coast clutch drum to be held.

The overdrive band holds the overdrive brake and coast clutch drum to the case in 4th gear. This causes the overdrive sun gear to be held stationary through the coast clutch adapter and the overdrive brake and coast clutch drum.

tomsn048@gmail.com



Item	Part Number	Description
1	7L493	Overdrive Servo Cover Assembly
2	7D021	Overdrive Servo Piston and Rod Assembly
3	7330	Overdrive Band Servo Lever
4	7D034	Overdrive Band Assembly
5	7D029	Overdrive Band Apply Strut
6	7A653	Overdrive Band Lever to Case Bracket
7	7D430	Overdrive Band Anchor Strut
8	7C492	Overdrive Band Adjuster/Lock Screw
9	7L669	Overdrive Brake and Coast Clutch Drum Assembly

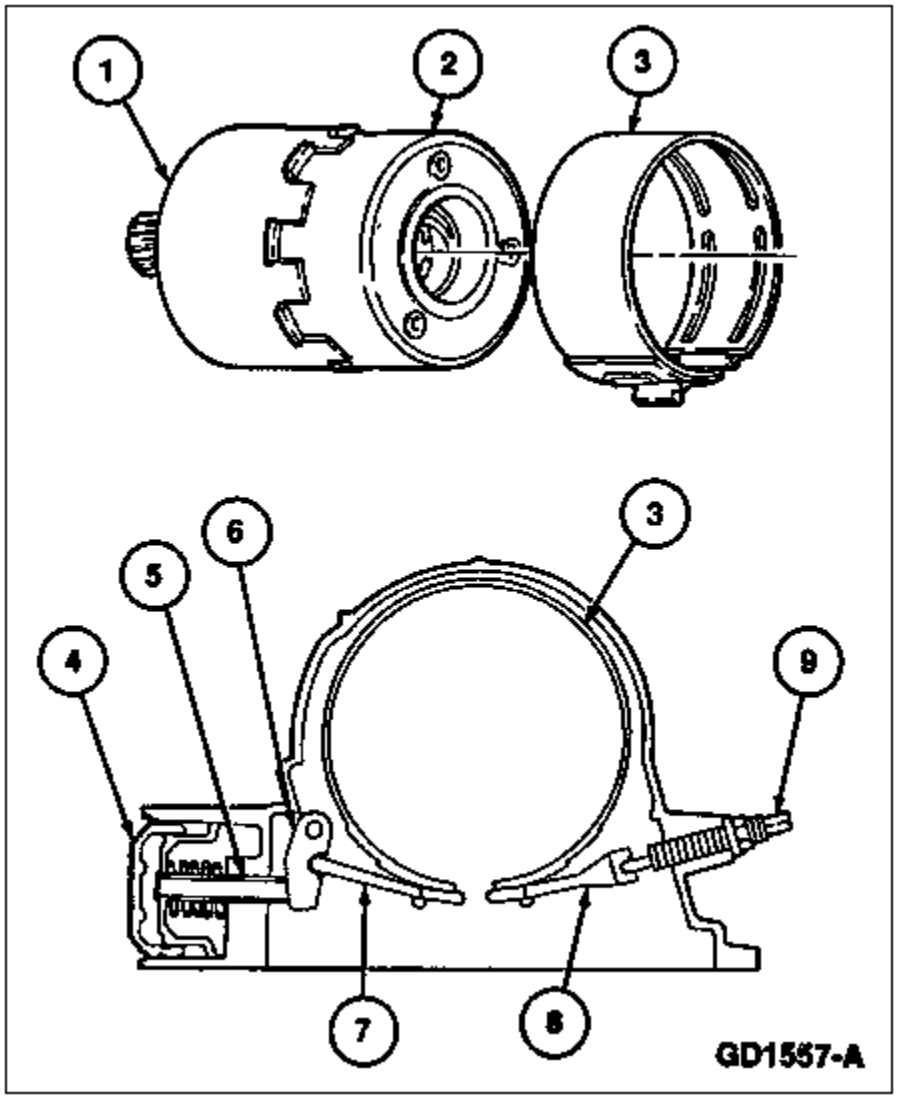
Bands — Intermediate

Hydraulic pressure is applied to the front side of the intermediate servo. This pressure causes the servo to stroke and apply force to the intermediate band, causing the intermediate brake and direct clutch drum to be

tomsn048@gmail.com

held.

The intermediate band holds the intermediate brake and direct clutch drum to the case in 2nd gear. This causes the input shell and the forward sun gear to be held stationary.



Item	Part Number	Description
1	7D064	Input Shell
2	7D044	Intermediate Brake and Coast Clutch Drum Assembly
3	7D034	Intermediate Band Assembly
4	7L493	Intermediate Servo Cover Assembly
5	7D021	Intermediate Servo Piston and Rod Assembly
6	7330	Intermediate Band Servo Lever
7	7D029	Intermediate Band Apply Strut
8	7D430	Intermediate Band Anchor Strut

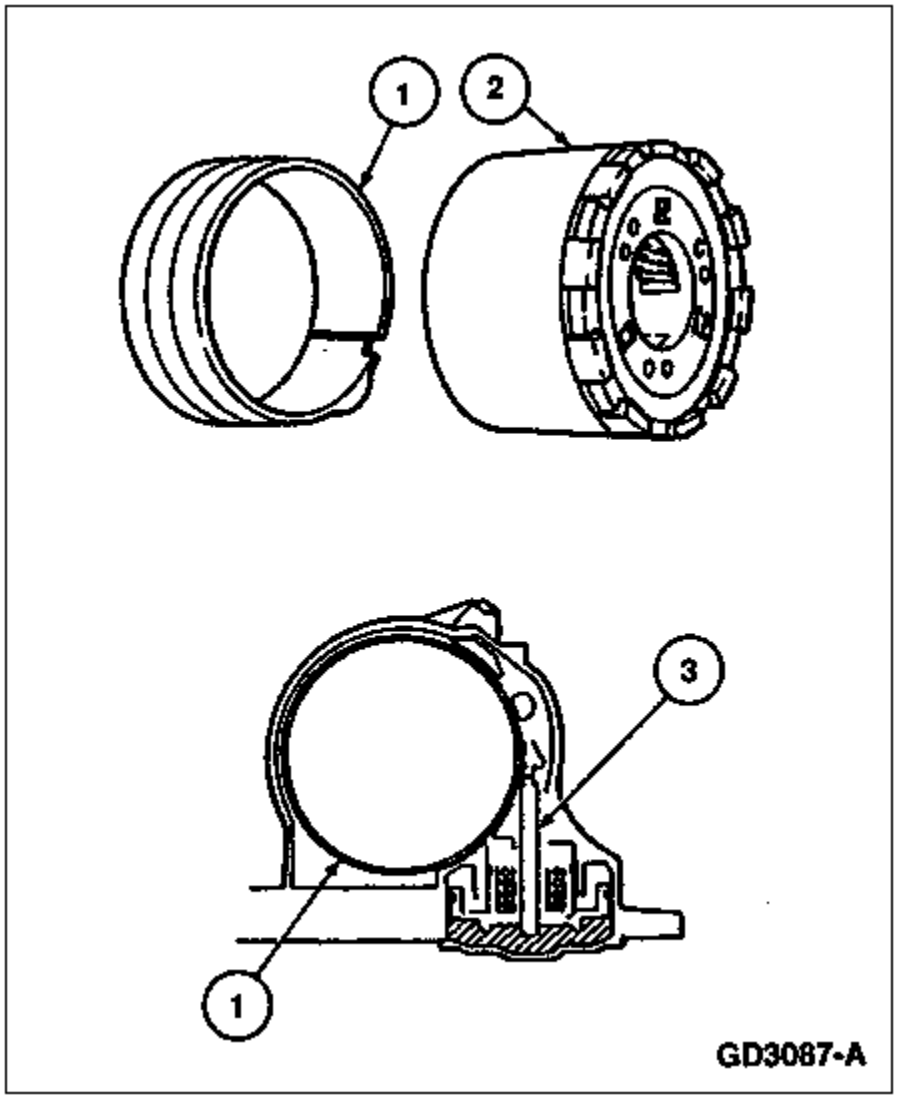
tomsn048@gmail.com

9	7C492	Intermediate Band Adjuster/Lock Screw

Bands — Low/Reverse

Hydraulic pressure is applied to the front side of the reverse servo. This pressure causes the servo to stroke and apply force to the reverse band, causing the reverse brake drum to be held.

The reverse band holds the reverse brake drum to the case in manual 1st and reverse gears. This causes the reverse planetary assembly to be held stationary.

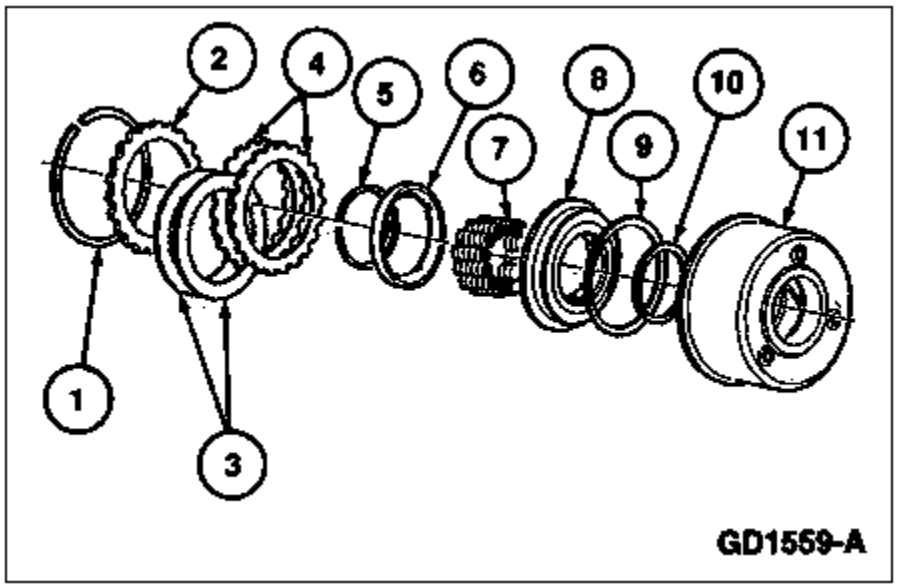


Item	Part Number	Description
1	7D095	Low/Reverse Band Assembly
2	7C498	Low/Reverse Brake Drum Assembly
3	7D189	Low/Reverse Servo Piston Assembly

Clutches — Coast

tomsn048@gmail.com

The coast clutch is a multi-disc clutch made up of steel and friction plates. The coast clutch is applied with hydraulic pressure and disengaged by return springs and exhaust of the hydraulic pressure. It is housed in the overdrive brake and coast clutch drum. The coast clutch is applied when the transmission control switch (TCS) is on and hydraulically applied in 2 and 1 positions. When the coast clutch is applied, it holds the planetary gear overdrive carrier and disengages the overdrive one-way clutch preventing overrunning. This uses engine compression to help slow the vehicle and provide engine braking.



Item	Part Number	Description
1	E860126-S/129-S	Retaining Ring (Select Fit)
2	7B066	Coast Clutch Pressure Plate
3	7B164	Coast Clutch Internal Plate — Friction (2 Req'd)
4	7B442	Coast Clutch External Plate — Steel (2 Req'd)
5	E860125-S	Retaining Ring
6	7A527	Coast Clutch Piston Spring Retainer
7	7A480	Coast Clutch Piston Spring (20 Req'd)
8	7A258	Coast Clutch Piston
9	7A548	Coast Clutch Piston Outer Seal Ring
10	7D404	Coast Clutch Piston Inner Seal Ring
11	7L669	Overdrive Brake and Coast Clutch Drum Assembly

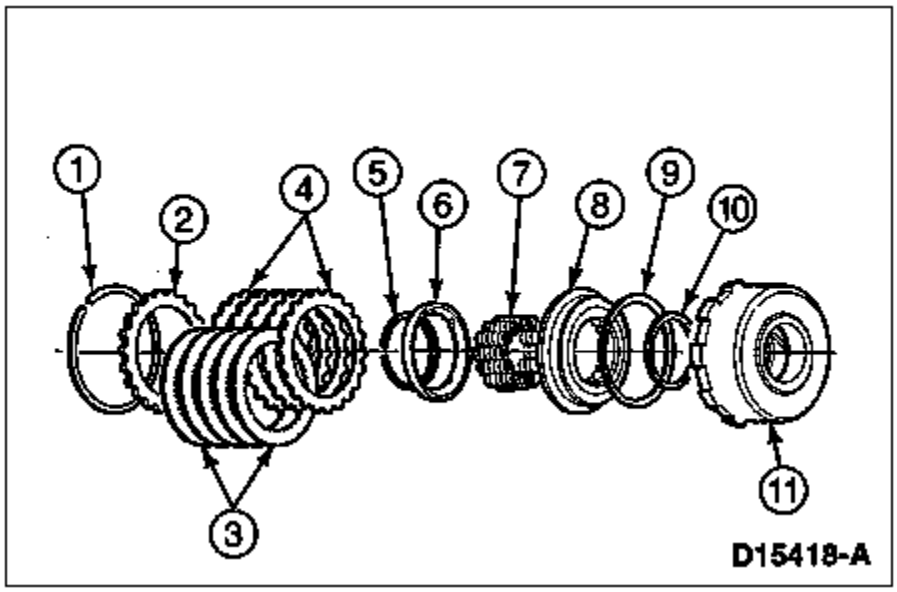
Clutches — Direct

The direct clutch is a multi-disc clutch made up of steel and friction plates. The direct clutch is applied with hydraulic pressure and disengaged by return springs and exhaust of the hydraulic pressure. It is housed in the intermediate brake and direct clutch drum. The intermediate brake and direct clutch drum provides two functions. In drive, the direct clutch is applied and coupled to the forward clutch in 3rd and 4th gears. This drives the input shell and forward sun gear at a ratio of 1:1.

In reverse, the direct clutch is applied and coupled to the forward clutch and input shell. Since the forward

tomsn048@gmail.com

sun gear is splined to the input shell, this causes the forward sun gear to drive the pinions of the reverse planetary assembly that is being held by the reverse band in reverse rotation. This in turn drives the output shaft ring gear and hub at a ratio of 2.1:1.



Item	Part Number	Description
1	E860126-S/129-S	Retaining Ring (Select Fit)
2	7B066	Direct Clutch Pressure Plate
3	7B164	Direct Clutch Internal Plate — Friction (4 Req'd)

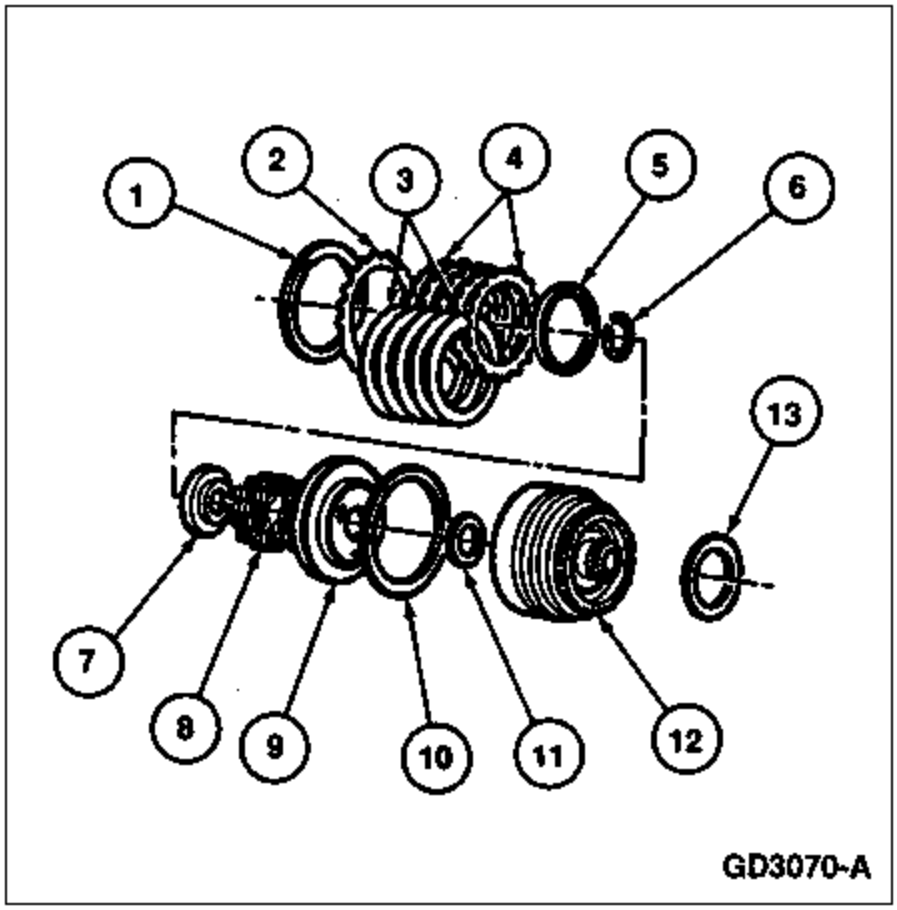
5	E860125-S	Retaining Ring
6	7A527	Direct Clutch Piston Springs Retainer (8 Tabs)
7	7A480	Direct Clutch Piston Spring (20 Req'd)
8	7A258	Direct Clutch Piston
9	7A548	Direct Clutch Piston Outer Seal Ring
10	7D404	Direct Clutch Piston Inner Seal Ring
11	7D044	Intermediate Brake and Direct Clutch Drum Assembly

Clutches — Forward

The forward clutch is a multi-disc clutch made up of steel and friction plates. The forward clutch is applied with hydraulic pressure and disengaged by return springs and exhaust of the hydraulic pressure. The forward clutch is applied in all forward gears and driven by the center shaft. The forward clutch also holds and drives the forward ring gear and hub when hydraulically applied.

tomsn048@gmail.com



Item	Part Number	Description
1	E860115-S/118-S	Retaining Ring (Select Fit)
2	7B066	Forward Clutch Pressure Plate
3	7B164	Forward Clutch Internal Plate — Friction

11	7A548	Forward Clutch Piston Inner Seal Ring
12	7A360	Forward Clutch Cylinder Assembly
13	7M153	No. 5 Forward Clutch Cylinder Thrust Bearing

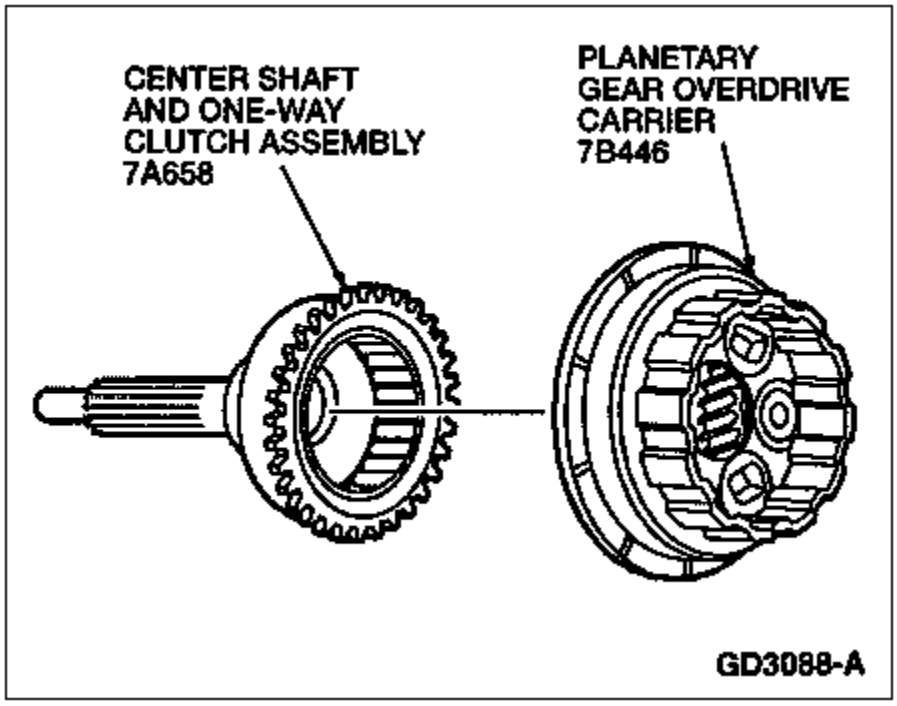
One-Way Clutches — Overdrive

The overdrive one-way clutch is a sprag-type one-way clutch that is pressed into the overdrive center shaft.

tomsn048@gmail.com

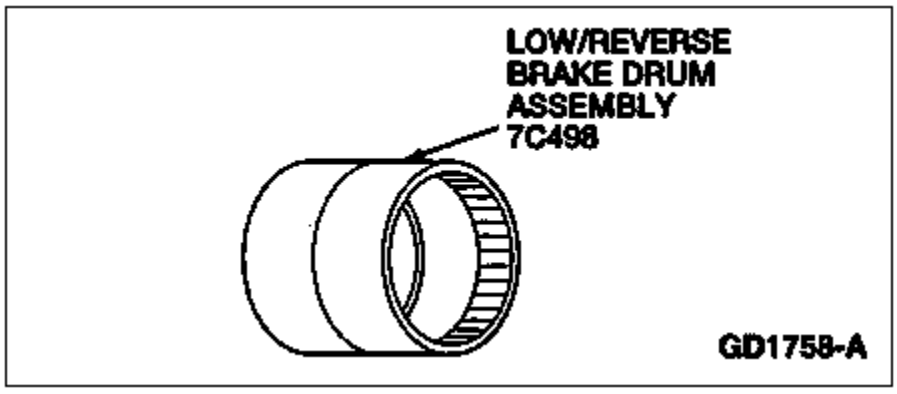
The overdrive one-way clutch is driven by the inner race of the overdrive planetary gear carrier. The overdrive one-way clutch holds and drives the outer race of the center shaft in 1st, 2nd, 3rd and reverse gears.

The overdrive one-way clutch overruns during all coast operations and is always overrunning in 4th gear.



One-Way Clutches — Low

The 2.3L and 3.0L use a spring and roller one-way clutch. The low one-way clutch holds the low/reverse brake drum and reverse planetary assembly to the case in 1st gear only and overruns in all other gears.



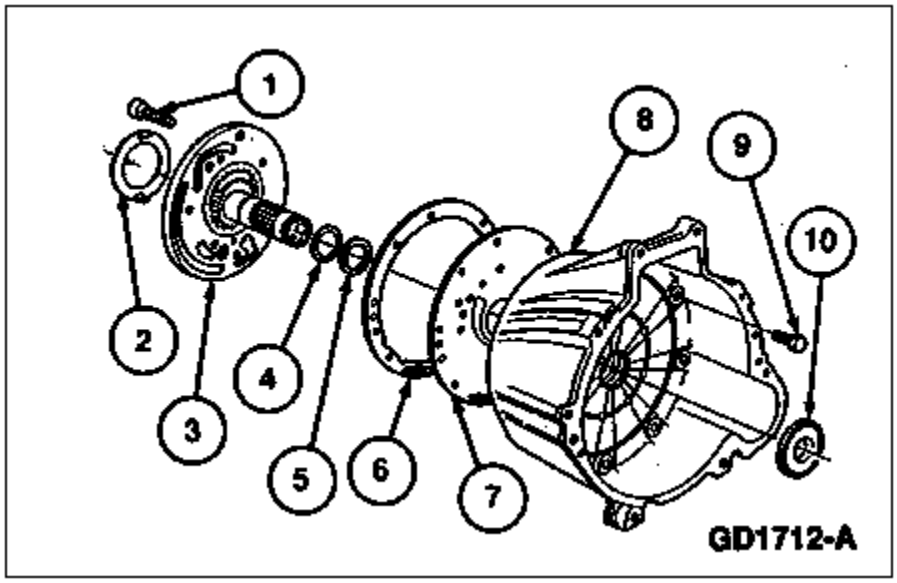
Hydraulic System

Pump

The fluid pump provides the fluid pressure required to charge the torque converter, main control assembly, transmission cooling system, lubrication system and apply devices.

tomsn048@gmail.com

The 4R44E has a positive displacement gear and crescent-type pump which is shaft-driven by the torque converter cover.



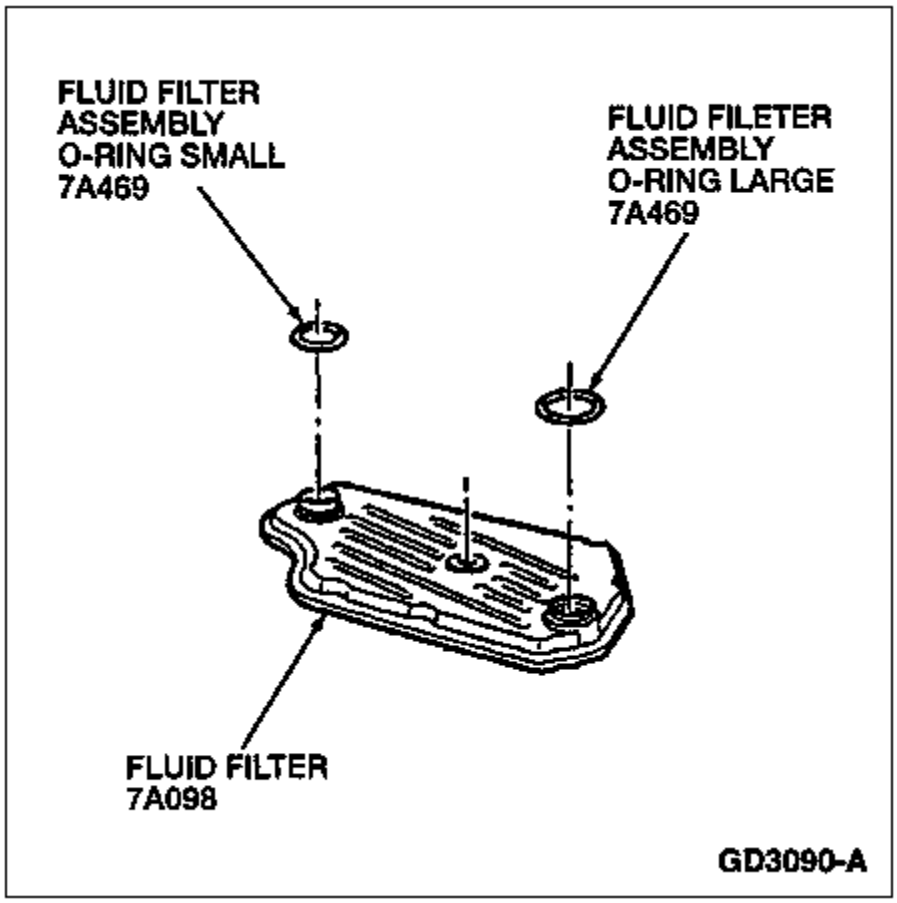
Item	Part Number	Description
1	W701429-S309M	Fluid Pump-to-Converter Housing Screws (6 Req'd)
2	7D014	No. 1 Fluid Pump Input Thrust Washer (Nylon)
3	7A103	Fluid Pump Support and Gear Assembly
4	W701431-S300	Fluid Pump Shaft-to-Inner Gear O-Ring
5	7L323	Fluid Pump Support Seal Ring
6	7A136	Fluid Pump Gasket
7	7B472	Fluid Pump Adapter Plate
8	7976	Converter Housing Assembly
9	E804595-S200 (8 Req'd)	Converter Housing-to-Case Screw and Seal Assembly
10	7A248	Converter Hub-to-Converter Housing Seal Assembly

Filter

All fluid drawn from the pan passes through the fluid filter. The fluid filter and its accompanying seals are part of the fluid path to the fluid pump.

The fluid filter also has a bypass section. This allows the fluid which is vented at the main regulator valve to be recirculated to the pump without passing through the filtering element.

tomsn048@gmail.com



Main Control

The main control assembly and related components are part of the pressure side of the 4R44E hydraulic system. The main control assembly consists of the solenoids, the valve body assembly and the separator plate.

All valves inside the main control assembly are anodized aluminum. They cannot be sanded, filed or dressed in any way that may damage the valve surface. If the valves have any scratches, burrs or nicks that prevent free movement, the main control assembly must be replaced.

tomsn048@gmail.com

Transmission Electronic Control System

Electronic System Description

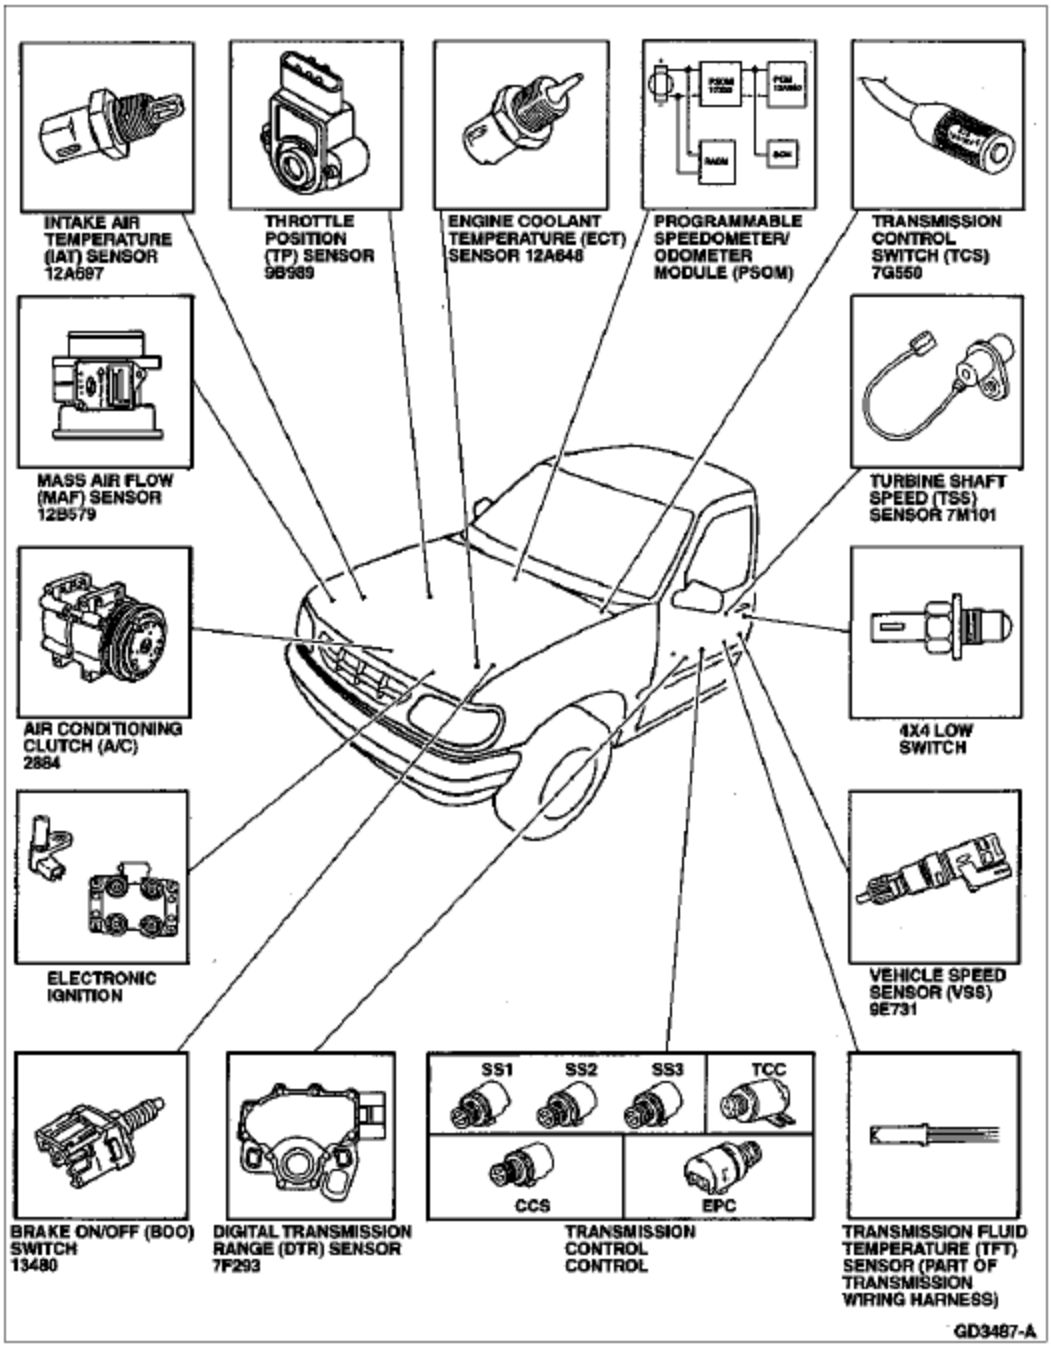
Shift scheduling, timing and feel (line pressure), as well as torque converter clutch (TCC) operation in the 4R44E are controlled electronically by the powertrain control module (PCM).

Input signals from various engine sensors give the PCM information about the engine's operating state. Other inputs are based on driver demands, such as the accelerator pedal position, which is monitored by the PCM using the throttle position (TP) sensor. Inputs are also supplied by the transmission itself. The turbine shaft speed (TSS) sensor and the transmission fluid temperature (TFT) sensor supply information to the PCM.

Using these input signals, the PCM can determine when the time and conditions are right for a shift or TCC application. The PCM controls six solenoids: three ON/OFF solenoids for upshifts and downshifts, one for pulse-width modulated control of the torque converter clutch, one for electronic line pressure control, and one ON/OFF solenoid for coast clutch application.

Component Locator

tomsn048@gmail.com



Powertrain Control Module (PCM) 12A650:

Description:
The powertrain control module (PCM) controls various engine functions and provides control of the 4R44E transmissions.
The PCM responds to inputs and operates solenoids for electro-hydraulic control of line pressure, shift scheduling, torque converter clutch (TCC) scheduling and coast clutch control for coast braking.
The PCM has the ability to:

tomsn048@gmail.com

- Monitor its input and output devices for the presence of faults.
- Store diagnostic trouble codes (DTCs) related to detected faults.
- Alert the driver for some detected faults by turning on the malfunctioning indicator lamp (MIL) in the instrument cluster.
- Display information when a service technician connects diagnostic equipment.

Diagnostic Trouble Codes:

P0603, P0605.

Air Conditioning (A/C) Clutch 2884:

Description:

An electro-magnetic air conditioning (A/C) clutch is energized when the clutch cycling pressure switch closes. The switch is located on the suction accumulator-drier. The closing of the switch completes the circuit to the clutch and draws it into engagement with the compressor driveshaft.

When engaged, the A/C clutch is an input to the PCM to adjust electronic pressure control (EPC) pressure for the additional load on the engine. It is also used to adjust TCC modulation when the A/C clutch is engaged.

Symptoms:

Failed ON — EPC pressure slightly low with A/C off.
Failed OFF — EPC pressure slightly high with A/C on. If erratic A/C operation occurs, the customer may feel improper TCC apply and release.

Diagnostic Trouble Codes:

P1460.

Brake On/Off (BOO) Switch 13480:

Description:

The brake on/off (BOO) switch is connected to the brake pedal. When the brake pedal is pressed, the BOO switch has closed contacts allowing a voltage signal to the PCM.

The PCM may release TCC when the brakes are applied.

Symptoms:

Failed ON — converter clutch will not engage at less than 1/3 throttle.
Failed OFF or not connected — converter clutch will not disengage when brake is applied.

Diagnostic Trouble Codes:

P1703.

Engine Coolant Temperature (ECT) Sensor 12A648:

tomsn048@gmail.com

Description:
The engine coolant temperature (ECT) sensor detects the temperature of engine coolant and supplies the information to the PCM.
The ECT sensor is threaded into the heater outlet fitting or cooling passage on the engine. For automatic transmission applications, the ECT is used to control TCC solenoid operation. For engine control applications, the ECT signal is used to modify ignition timing, exhaust gas recirculation (EGR) flow, and air-to-fuel ratio as a function of engine coolant temperature. On electronic instrument cluster applications, the ECT output is used to control a coolant temperature indicator.
Symptoms:
Torque converter clutch solenoid will always be "off," resulting in reduced fuel economy.
Diagnostic Trouble Codes:
P0117, P0118, P1116, P1117.

Electronic Ignition (EI) System:

Description:
The electronic ignition (EI) system has a crankshaft position (CKP) sensor and ignition coil packs. The CKP sensor sends crankshaft position information to the PCM. The rpm signal in the transmission strategy is then used for torque converter clutch control, EPC and shift scheduling.
Symptoms:
Engine malfunction, no torque converter clutch engagement.
Diagnostic Trouble Codes:
P0300-P0306, P0320, P0340, P1351-P1364.

4x4 Low (4x4L) Switch:

Description:
The low range switch is located on the transfer case cover. It provides an indication of when the 4x4 transfer case gear system is in the low range.
NOTE: Not all 4x4L switch concerns will set a DTC. Refer to Diagnosis by Symptom or pinpoint tests if shifts are delayed in 4x4L or shift early in normal mode.
Transmission Function:
Modifies shift schedule for 4x4L transfer case gear ratio.
Symptoms:
Failed on — Early shift schedule in 4x2 and 4x4H. Failed off — Shifts delayed in 4x4L. If the 4x4 low indicator light fuse is blown, the transmission will shift according to 4x4 low shift schedule regardless of transfer case position.
Diagnostic Trouble Codes:
P1781, P1729.

tomsn048@gmail.com

Intake Air Temperature (IAT) Sensor 12A697:

Description:
The intake air temperature (IAT) sensor is used to determine the EPC pressure. It also provides the electronic fuel injection system with mixture (fuel and air) temperature information. The IAT is used both as a density corrector for airflow calculation and to proportion the cold enrichment fuel flow. This sensor is similar in construction to the engine coolant temperature (ECT) sensor, except it is packaged to improve sensor response time.
Symptoms:
Incorrect EPC pressure either high or low resulting in either harsh or soft shifts.
Diagnostic Trouble Codes:
P0112, P0113, P0114.

Mass Air Flow (MAF) Sensor 12B579:

Description:
The mass air flow (MAF) sensor directly measures the mass of the air flowing into the engine. The sensor output is a DC (analog) signal ranging from about 0.5 volts to 5.0 volts used by the processor to calculate the injector pulse width for stoichiometry. For transmission strategies, this sensor is used for EPC pressure control, shift, and torque converter clutch scheduling.
Symptoms:
Incorrect shift schedule, high/low EPC pressure. Incorrect torque converter engagement scheduling and symptoms similar to a throttle position (TP) sensor malfunction. Soft or firm shift based on EPC/line pressure. Soft shifts may be caused by a restricted air inlet.
Diagnostic Trouble Codes:
P0102, P0103, P1100, P1101.

Transmission Control Switch (TCS) 7G550:

Description:
The transmission control switch (TCS) is a momentary contact switch. When the driver presses the button of the TCS, a signal is sent to the PCM. At the same time, the PCM also causes the transmission control indicator lamp (TCIL) in the instrument panel to turn on or off.
When the TCS is initially pressed, the PCM disables transmission operation in D position/4th gear. At the same time, coast braking in 2nd gear and 3rd gear occurs because the coast clutch is applied.
When the button of the TCS is pressed again, the PCM enables 4th gear operation, releases the coast clutch and turns off the TCIL.
Symptoms:

tomsn048@gmail.com

If the TCS fails with open contacts, no disabling of 4th gear and enabling of coast braking in 2nd and 3rd gear in D position is possible.
Diagnostic Trouble Codes:
P1780.

Transmission Control Indicator Lamp (TCIL):

Description:
The transmission control indicator lamp (TCIL) is located in the instrument panel for Ranger and on the end of the shift lever for Aerostar. It is labeled O/D OFF. The transmission control switch (TCS) and the PCM control the on/off operation of the TCIL.
When the driver initially presses the button of the TCS, the TCIL turns on to indicate that transmission operation in 4th gear is disabled. When the driver presses the TCS again, the TCIL turns off. The TCIL will flash if the EPC solenoid is shorted or a monitored sensor has failed.
Symptoms:
If the TCIL fails on or off, the driver may have an incorrect indication of transmission operation or monitored sensor malfunction.
Diagnostic Trouble Code:
N/A.

Throttle Position (TP) Sensor 9B989:

Description:
The throttle position (TP) sensor is a potentiometer mounted on the throttle body. The TP sensor detects the position of the throttle plate and sends this information to the processor assembly as varying voltage signal.
The PCM uses the monitored voltage level of the TP sensor for control of EPC pressure, torque converter clutch operation and shift scheduling.
If a malfunction occurs in the TP sensor circuit, the processor will recognize that the TP sensor signal is out of specification. The processor will then operate the transmission in a high capacity mode to prevent transmission damage.
Symptoms:
Harsh engagements, firm shift feel, abnormal shift schedule, torque converter clutch does not engage, or torque converter clutch cycling.
Diagnostic Trouble Codes:
P0121-P0123, P1120, P1121, P1124, P1125.

Programmable Speedometer/Odometer Module (PSOM):

tomsn048@gmail.com

The programmable speedometer/odometer module (PSOM) receives input from the rear brake anti-lock sensor, which is mounted on the rear axle differential housing. The PSOM processes this input signal information and relays it to the powertrain control module and the speed control module. This signal tells the powertrain control module the vehicle speed in miles per hour (mph). The PSOM is also used as an input in determining shift scheduling and electronic pressure control.
Symptoms:
Harsh engagements, firm shift feel, abnormal shift schedule, unexpected downshifts may occur at closed throttle. Torque converter clutch will not engage, elevated EPC pressures.
NOTE: EPC shorted to ground or failed low may result in a false VSS code. Diagnose EPC concerns first. Then recheck VSS input and PSOM.
Diagnostic Trouble Codes:
P0500, P1500, P1501.

Vehicle Speed Sensor (VSS) 9E731:

Description:
The vehicle speed sensor (VSS) is a magnetic pickup that sends a signal to the processor assembly. This VSS signal tells the processor assembly the vehicle speed.
The PCM uses this information to control shift scheduling and EPC pressure.
Symptoms:
Harsh engagements, firm shift feel, abnormal shift schedule, unexpected downshifts may occur at closed throttle. Torque converter clutch will not engage, elevated EPC pressures.
NOTE: EPC shorted to ground or failed low may result in a false VSS code. Diagnose EPC concerns first. Then recheck VSS.
Diagnostic Trouble Codes:
P0500, P1500, P1501.

Transmission Fluid Temperature (TFT) Sensor:

Description:
The transmission fluid temperature (TFT) sensor is located on the transmission main control body wiring harness assembly. It is a temperature-sensitive device called a thermistor. The resistance value of the TFT will vary with temperature change. The processor monitors the voltage across the TFT to determine the temperature of the transmission fluid.
The processor assembly uses this initial signal to determine whether a cold start shift schedule is necessary. The cold start shift schedule allows quicker shifts when the transmission fluid temperature is cold. The processor also inhibits torque converter clutch operation at low transmission fluid temperatures and corrects EPC pressures for temperature.
Symptoms:
Torque converter clutch engagement and stabilized shift schedules happen too soon after a cold start.

tomsn048@gmail.com

Harsh or soft shifts.
Diagnostic Trouble Codes:
P0712, P0713, P1711, P1783.

Digital Transmission Range (DTR) Sensor 7F293:

Description:
The digital transmission range (DTR) sensor is located on the outside of the transmission at the manual lever. The DTR sensor completes the start circuit in Park and Neutral, the back-up lamp circuit in Reverse and the neutral sense circuit (4x4 only) in Neutral. The DTR sensor also sends a digital output signal to the powertrain control module (PCM) indicating the position of the manual lever (P, R, N, D, 2, 1).
Symptoms:
Engagement concerns, wrong gear, no shifts, increase in EPC pressure.
Diagnostic Trouble Codes:
P0705, P0708, P1705, P1704.

Turbine Shaft Speed (TSS) Sensor 7M101:

Description:
A turbine shaft speed (TSS) sensor is a magnetic pickup that sends a signal to the processor assembly that indicates transmission turbine shaft input speed.
The TSS sensor provides torque converter turbine speed information for torque converter clutch control strategy. Also used in determining static EPC pressure settings.
Symptoms:
Increased engine rpm on engagements, harsh shifts (converter engaged), delayed shifts with hard apply (slip/bump feel).
Diagnostic Trouble Codes:
P0715.

Electronic Pressure Control (EPC) Solenoid 7H144:

Description:
The electronic pressure control (EPC) solenoid is a variable force style (VFS) solenoid. The VFS type solenoid is an electro-hydraulic actuator combining a solenoid and a regulating valve. It supplies EPC which regulates transmission line pressure and line modulator pressure. This is done by producing resisting forces to the main regulator and line modulator circuits. These two pressures control clutch application pressures.

tomsn048@gmail.com

Symptoms:
Maximum EPC pressure, harsh shifts and engagements, **may set a false VSS code.** Zero EPC pressure — no 2nd and 4th gear, slips in 1st and 3rd with high input torque.
Diagnostic Trouble Codes:
P1746*, P1747*.
*Output circuit check, generated only by electrical conditions.

Torque Converter Clutch (TCC) Solenoid 7F037:

Description:
The torque converter clutch (TCC) solenoid is used in the transmission control system to control the application, modulation, and release of the torque converter clutch.
Symptoms:
Failed ON — engine runs rough/vehicle shudder, engine stalls in Drive at low idle speeds (1st, 2nd, 3rd, or 4th gear). Failed OFF — torque converter never engages.
Diagnostic Trouble Codes:
P0743*, P1744**.
*Output circuit check, generated only by electrical conditions.
**May also be generated by a non-electrical transmission hardware condition.

Coast Clutch Solenoid (CCS) 7G484:

Description: The coast clutch solenoid (CCS) is an on/off solenoid.
The PCM uses the coast clutch solenoid to control the apply and release of the coast clutch.
Symptoms:
If the coast clutch solenoid fails ON, coast braking occurs in all gears (except in 4th gear).
If the coast clutch solenoid fails OFF, no effect will be apparent.
Diagnostic Trouble Codes:
P1754*.

Shift Solenoid Assemblies (SS1, SS2, SS3) (7G484):

Description:
Three on/off solenoids are used for electronically controlled shift scheduling. The three solenoids are located on the main control assembly. The solenoids are two-way, normally open style.

tomsn048@gmail.com

Solenoids SS1, SS2, and SS3 provide gear selection of 1st through 4th by controlling the pressure of the three shift valves.
SS1 Symptoms:
Improper gear selection depending on failure mode and manual lever position. Failed ON — 1st and 2nd. Failed OFF — 2nd, 3rd and 4th gears only.
Diagnostic Trouble Codes:
P0750*, P0751**, P0731**, P0732**, P0733**, P0734**.
SS2 Symptoms:
Improper gear selection depending on failure mode and manual lever position. Failed ON — 2nd gear only. Failed OFF — 1st, 3rd and 4th gears only.
Diagnostic Trouble Codes:
P0755*, P0756**, P0731**, P0732**, P0733**, P0734**.
SS3 Symptoms:
Improper gear selection depending on failure mode and manual lever position. Failed ON — No engine braking, 4th gear and incorrect gear ratios. Failed OFF — 1st, 2nd, 3rd only.
Diagnostic Trouble Codes:
P0760*, P0761**, P0733**, P0734**.
*Output circuit check, generated only by electrical conditions.
**May also be generated by a non-electrical transmission hardware condition.

SHIFT SOLENOID OPERATION CHART — 4R44E

Transmission Range Selector Lever Position	Powertrain Control Module (PCM) Gear Commanded	4R44E Solenoid States				
		Engine Braking	SS1	SS2	SS3	CCS
P/N	P/N	No	On	Off	Off	Off
R	R	Yes [1]	On	Off	Off	O/W [1]

tomsn048@gmail.com

tomsn048@gmail.com

Diagnostic Strategy

Troubleshooting an electronically controlled automatic transmission is simplified by using the proven method of diagnosis. One of the most important things to remember is that there is a definite procedure to follow.

NOTE: Do not take any short cuts or assume that critical checks or adjustments have already been made.

Follow the procedures as written to avoid missing critical components or steps.

To properly diagnose a concern the technician should have the following publications available:

- Service Manual
- Transmission Reference Manual
- Powertrain Control/Emissions Diagnosis (PC/ED) Manual
- OASIS Messages
- Technical Service Bulletins (TSBs)
- Electrical/Vacuum Troubleshooting Manual (EVTM)

These publications provide the information required when diagnosing transmission concerns.

Using the Diagnostic Flow Chart as a guide, follow the steps as indicated.

Preliminary Inspection

- Know and understand the customer's concern.
- Verify the concern by operating the vehicle.
- Check the fluid level and condition.
- Check for non-factory add-on items.
- Check shift linkages for proper adjustment.
- Check TSBs and OASIS messages for the concern.

Diagnostics

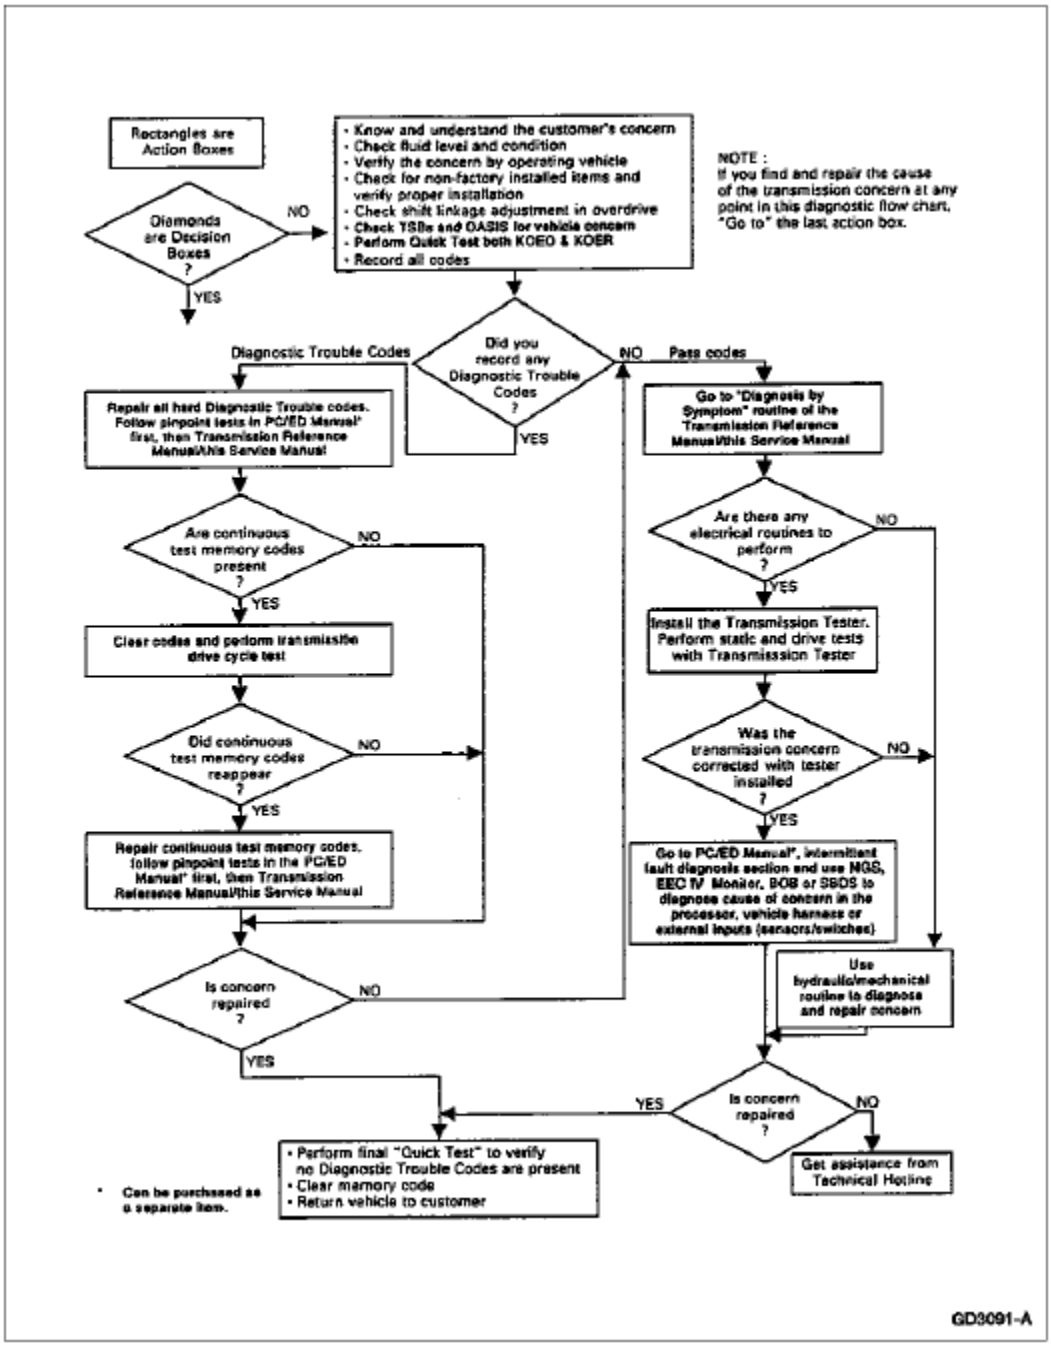
- Perform On-Board Diagnostic Procedures, key on engine off (KOEO), key on engine running (KOER).
- Record all diagnostic trouble codes (DTCs).
- Repair all non-transmission codes first.
- Repair all transmission codes second.
- Erase all continuous codes and attempt to repeat them.
- Repair all continuous codes.
- If only pass codes, proceed to Diagnosis By Symptom Charts for further information and diagnosis.

By following the diagnostic sequence the service technician will be able to diagnose and repair the concern the first time.

tomsn048@gmail.com

tomsn048@gmail.com

Diagnostic Flow Chart



tomsn048@gmail.com

tomsn048@gmail.com

Preliminary Inspection

The following items must be checked before proceeding.

Know and Understand the Concern

This section provides information which must be used in determining the actual cause of customer concerns and performing the appropriate service procedures.

Verification of Condition

The following procedures must be used when verifying customer concerns for the transmission.

Required Equipment

Required equipment to diagnose the 4R44E transmission consists of:

- Rotunda Transmission Tester 007-00130, part of Rotunda Transmission Tester Kit, or equivalent.
- Rotunda New Generation STAR (NGS) Tester 007-00500 or equivalent.
- Rotunda EEC-V 104-pin Breakout Box 014-00950 or equivalent.
- Rotunda 73 Digital Multimeter 105-R0051 or equivalent.
- Rotunda Transmission Range (TR) Sensor Cable "E" 007-00111 or equivalent.
- Digital TR Sensor Overlay 007-00131, used with Rotunda Transmission Range (TR) Cable "E" 007-00111.
- Rotunda 4R44E/4R55E Overlay/Cable 007-00106, part of Transmission Tester Kit.

Determine Customer Concern

NOTE: If noise/vibration, check for dependencies: rpm, vehicle speed, shift, gear, range, or temperature.

NOTE: Some transmission conditions may cause engine concerns. The torque converter clutch not disengaging will stall the engine.

Determine customer concerns relative to vehicle usage and dependent driving conditions. Pay attention to the following items:

- Hot or cold vehicle operating temperature
- Hot or cold ambient temperatures
- Type of terrain
- Vehicle loaded/unloaded
- City/highway driving
- Upshift
- Downshift
- Coasting
- Engagement

tomsn048@gmail.com

- Noise/vibration

Check Fluid Level and Condition

Fluid Level Check

NOTE: If the vehicle has been operating for an extended period at high speeds in city traffic during hot weather or pulling a trailer, the vehicle should be turned off for about 30 minutes to allow the oil to cool before checking.

Under normal circumstances, check the transmission fluid level during normal maintenance, it does not require a change. For severe duty only, change the fluid at 80,450 km (50,000 miles), since the vehicle does not use up transmission fluid. If the transmission is not working properly, or if there is some sign of fluid leakage, the fluid level should be checked.

It is preferable to check the transmission fluid level at normal operating temperature after approximately 32 km (20 miles) of driving. The fluid level can be checked without driving the vehicle if the outside temperature is above 10℃ (50℉).

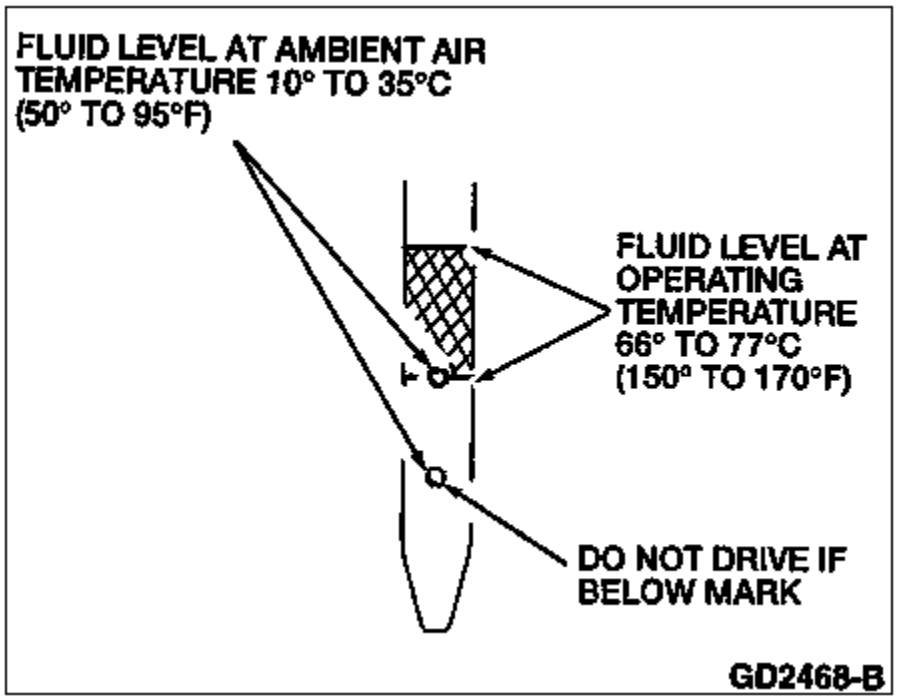
With the vehicle on a level surface, start the engine and move the transmission range selector lever through all of the gear ranges, allowing sufficient time for each position to engage. Securely engage the transmission range selector lever in the Park position, fully set the parking brake control (2780) and leave the engine running.

Wipe off the fluid level indicator cap, pull thefluid level indicator (7A020) out and wipe the indicator end clean. Insert the fluid level indicator back into the oil filler tube (7A228) and make sure it is fully seated. Pull the fluid level indicator out and read the fluid level.

CAUTION: The vehicle should not be driven if the fluid level is below the bottom hole on the fluid level indicator and outside temperature is above 10°C (50℉).

When checking fluid at normal operating temperature, the fluid level should be within the crosshatched area on the fluid level indicator. When the vehicle has not been driven, and outside temperature is above 10°C (50℉), the fluid level should be between the holes in the fluid level indicator.

tomsn048@gmail.com



High or Low Fluid Level

CAUTION: If the fluid level is high, damage to the vehicle may occur. Excess fluid must be removed.

A fluid level that is too high may cause the fluid to become aerated due to the churning action of the rotating parts of the transmission. Aerated fluid will cause erratic line pressure, which may result in harsh/soft shifts or engagements, damage to the clutch materials, improper torque converter operation, and fluid coming out of the vent. Refer to Fluid Change — Drain/Refill in this section.

A fluid level that is too low will affect transmission operation, causing slipping, slow engagements, or damage to internal hardware. Low levels may also indicate that a leak is present in the fluid system. If the fluid level is low, add fluid using the procedures shown in Adding Fluid in this section.

Adding Fluid

CAUTION: Use of any fluid other than specified could result in transmission malfunction or failure.

Before adding any fluid, be sure that the correct type is used. MERCON V® XT-5-QM is stamped on the container.

Add fluid in 0.25L (1/2 pint) increments through the filler tube to bring the level to the correct area on the dipstick. If an overfill occurs, excess fluid must be removed.

Fluid Change — Drain/Refill

Normal maintenance and lubrication does not necessitate periodic automatic transmission fluid changes. For severe duty applications, change the fluid at 80,450 km (50,000 miles).

To remove excess fluid, disconnect the cooler feed line at the cooler. Attach a rubber hose to the line and

tomsn048@gmail.com

insert the other end into a drain pan. Crank the engine for a short period of time (do not allow the engine to start) to remove a quantity of transmission fluid. Reattach the cooler line to the cooler. Start the engine. Move the transmission range selector lever through all gear ranges. Recheck the fluid for the proper level. Continue to add or subtract fluid until the proper level is reached. If a major service (e.g., clutch, band, bearing, etc.) is required, the unit will have to be removed. At this time, the torque converter (7902), transmission cooler, and cooler lines must be flushed to remove any contaminates. Refer to the Converter and Fluid Cooler Cleaning and Inspection procedure.

When used under severe duty conditions the transmission fluid filter/screen assembly should be replaced at 80,450 km (50,000 miles). The transmission fluid should be drained from the transmission and torque converter and refilled with MERCON V® XT-5-QM or equivalent MERCON® approved fluid as specified to the proper level.

When filling a dry transmission and torque converter, refer to Specifications for capacity. Check the fluid level as outlined.

Procedures for Drain and Refill

- Normal Maintenance
  - Not required with normal use.
- Severe Duty Maintenance
  - Change fluid at 80,450 km (50,000 miles) intervals using MERCON 5® XT-5-QM or equivalent.

CAUTION: Use only MERCON V® XT-5-QM transmission fluid. Use of any other fluids may result in a transmission malfunction or failure.

Maintenance Procedure

1. Loosen, then remove, the transmission fluid pan attaching screws to drain the fluid.
2. Remove and discard old pan gasket.
3. Thoroughly clean the pan and the transmission case pan rail surface.
4. Install new pan gasket onto pan and install pan to case with screws. Tighten screws to 13-15 Nm (115-133 lb-in).
5. Add 2.8 liters (3 quarts) of MERCON V® XT-5-QM or equivalent MERCON® approved fluid to transmission through the fill tube.
6. Start the engine. Move transmission range selector lever through all gear ranges, checking for engagements.
7. Check and adjust transmission fluid in 0.25 liter (1/2 pint) increments to proper level (cross-hatched area of fluid level indicator at normal operating temperature).

Major Service/Overhaul

1. Loosen, then remove, the transmission fluid pan attaching bolts to drain fluid.
2. Remove and discard old pan gasket.
3. Perform required internal repair and cleaning as required.

tomsn048@gmail.com

4. Thoroughly flush torque converter, cooler lines and transmission in-tank radiator cooler and auxiliary cooler (if equipped).

5. Replace fluid filter and seal assembly.

6. Install cleaned pan and new pan gasket with screws. Tighten screws to 13-15 Nm (115-133 lb-in).

7. Add 3.7 liters (4 quarts) of MERCON V® XT-5-QM or equivalent MERCON® approved fluid to the transmission through the fill tube.

8. Start engine. Move the transmission range selector lever through all gear ranges, checking for engagements.

9. Check and adjust the transmission fluid level in 0.25 liter (1/2 pint) increments to the proper level (cross-hatched area of the fluid level indicator at normal operating temperature).

Fluid Condition Check

1. Check the fluid level. Refer to the Fluid Level Check for proper procedure.

2. Observe color and odor of the fluid. It should be red, not brown or black. Odor may indicate an overheating condition, clutch disc or band failure.

3. Use an absorbent white facial tissue and wipe the fluid level indicator. Examine the stain for evidence of solid particles and for engine coolant signs (gum or varnish on fluid level indicator) .

   If particles are present in the fluid or there is evidence of engine coolant or water, the transmission fluid pan (7A194) must be removed for further inspection.

   If fluid contamination or transmission failure is confirmed by further evidence of coolant or excessive particles in the transmission fluid pan, the transmission must be disassembled and completely cleaned and serviced. This includes cleaning and flushing the torque converter and transmission cooling system.

   During disassembly and assembly, all overhaul checks and adjustments of clearances and end play must be made.

   After the transmission has been serviced, all diagnostic tests and adjustments listed in the Diagnosis By Symptom Charts must be completed to make sure that the problem has been corrected.

Road Testing Vehicle

The Shift Point Road Test and Torque Converter Clutch Operation Test provide diagnostic information on transmission shift controls and torque converter operation.

Shift Point Road Test

This test verifies that the shift control system is operating properly.

1. Bring engine and transmission up to normal operating temperature.
2. Operate vehicle with transmission selector in (D) range.
3. Apply minimum throttle and observe speeds at which upshift occurs and torque converter engages. Refer to the following Shift Speeds chart. (Also refer to Automatic Transmission Specifications Issue

tomsn048@gmail.com

FPS-12180-97.)

4. Stop the vehicle. Depress transmission control switch (TCS) to activate D range. Repeat Step 3. Transmission will make all upshifts except 3-4 and torque converter clutch apply should occur above 46 km/h (27 mph).
5. Press accelerator pedal to floor, wide open throttle (WOT). Transmission should shift from third to second, or third to first, depending on vehicle speed, and torque converter clutch should release.
6. With vehicle speed above 48 km/h (30 mph), move transmission range selector lever from D range to 1 range (LOW) and release accelerator pedal. Transmission should immediately downshift to second gear. When vehicle speed drops below 32 km/h (20 mph), transmission should downshift into first gear.
7. If transmission fails to upshift/downshift or torque converter clutch does not apply/release, refer to Diagnosis By Symptom Index for possible causes.

SHIFT SPEEDS — KM/H (MPH) [1]

Throttle Position	Range	Shift	KM/H (MPH) Range [1]
Closed Throttle	(D)	3-2	19-32 (12-20)
	(D)	2-1	10-23 (6-14)
Minimum Throttle	(D)	1-2	14-27 (9-17)
	(D)	2-3	26-43 (16-27)
	(D)	3-4	64-85 (40-53)
Part Throttle	(D)	1-2	29-47 (18-29)
	(D)	2-3	50-71 (31-44)
	(D)	3-4	89-116 (55-72)
	(D)	4-3	68-100 (43-62)
	(D)	3-2	40-61 (25-38)
Wide Open Throttle	(D)	1-2	53-72 (33-45)
	(D)	2-3	98-127 (61-79)
	(D)	3-2	93-119 (58-74)
	(D)	3-1, 2-1	47-66 (29-41)
Manual Pull-In	1	2-1	40-62 (25-38)

[1] Shift Speed Ranges are approximate for all applications. For specific applications (Engine, Axle Ratio and Application) refer to the Automatic Transmission Specification Issue FPS-12180-97.

Torque Converter Diagnosis

Prior to torque converter replacement all diagnostic procedures must be followed. This is to prevent the unnecessary replacement of good torque converters. Only after a complete diagnostic evaluation can the decision be made to replace the torque converter.

Begin with the normal diagnostic procedures as follows:

1. Preliminary inspection.
2. Know and understand the customer's concern.
3. Verify the concern.

tomsn048@gmail.com

- Perform the Torque Converter Clutch Operation Test. Refer to the procedure in this section.

4. Perform diagnostic procedures.

    - Run on-board diagnostics. Refer to the procedure in this section.
        - Repair all non-transmission related DTCs first.
        - Repair all transmission DTCs.
        - Rerun on-board diagnostic to verify repair.
    - Perform Line Pressure Test . Refer to the procedure in this section.
    - Perform Stall Speed Test . Refer to the procedure in this section.
    - Diagnosis By Symptom Routines . Refer to the procedure in this section.
        - Use the index to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed, diagnose and repair as required, before replacing the torque converter.

Torque Converter Operation Test

This test verifies that the torque converter clutch control system and the torque converter are operating properly.

1. Connect tachometer to engine.
2. Bring engine to normal operating temperature by driving vehicle at highway speeds for approximately 15 minutes in (D) range.
3. After normal operating temperature is reached, maintain constant vehicle speed of about 80 km/h (50 mph). Release throttle for about two seconds then reapply throttle to previous setting.
4. Engine rpm should increase when throttle is released and decrease in about five seconds (converter engagement) after throttle is reapplied. If this does not occur, refer to Torque Converter Clutch Operation Concerns in the Diagnosis By Symptom Index .

Visual Inspection

This inspection will identify malfunctions to the vehicle operating system that may affect diagnosis.

- Vehicle modification
- Electronic add-on items
    - Air conditioning
    - Generator (alternator)
    - Engine turbo
    - Cellular telephone
    - Cruise control
    - CB radio
    - Linear booster
    - Backup alarm signal
    - Computer
- Leaks — Refer to Leakage Inspection in this section.
- Proper linkage adjustments — Refer to Section 07-05 in this service manual.

These items, if not installed properly, will affect powertrain control module or transmission function. Pay particular attention to add-on wiring splices in the powertrain control module harness or transmission wiring harness, abnormal tire size, or axle ratio changes.

tomsn048@gmail.com

After a road test, with the vehicle warm and before disturbing any connectors, perform the Quick Test using Rotunda New Generation STAR (NGS) Tester 007-00500 or equivalent. Refer to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the automatic transmission.

Check TSBs and OASIS

Refer to all Technical Service Bulletins and OASIS messages which pertain to the transmission concern and follow the procedures as outlined.

Perform On-Board Diagnostics

After a road test, with the vehicle warm and before disturbing any connectors, perform Quick Test using Rotunda New Generation STAR (NGS) Tester 007-00500 or equivalent. Refer to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the automatic transmission.

---

tomsn048@gmail.com

Diagnostics

Diagnosing electronically controlled automatic transmissions is simplified using the following procedures. It is important to remember that there is a definite procedure to follow. Do not take short cuts or assume that critical checks or adjustments have already been made. Follow the procedures as written to avoid missing critical components or steps. By following the diagnostic sequence, the service technician will be able to diagnose and repair the concern the first time.

On-Board Diagnostics With NGS

NOTE: For detailed instructions and other diagnostic methods using the NGS, refer to the Powertrain Control/Emissions Diagnosis Manual or NGS instruction guide.

NOTE: If using a generic scan tool, refer to the Powertrain Control/Emissions Diagnosis Manual for instructions on performing OBD procedures.

The Quick Tests are in the Powertrain Control/Emissions Diagnosis Manual (PC/ED). These tests can be used to diagnose the powertrain control module (PCM) (12A650), sensors and actuators of the 4R44E transmission.

The following is a guide for using the On-Board Diagnostic (OBD) Quick Tests and the New Generation STAR (NGS) Tester.

Quick Test 1.0 — Visual Inspection

Perform the Visual Check and Vehicle Preparation procedures as outlined in the Powertrain Control/Emissions Diagnosis Manual.

Inspect the following:

- Air cleaner and inlet ducting.
- All engine vacuum hoses for damage, such as leaks, cracks, blockage, proper routing, etc.
- Powertrain control module (PCM) system wiring harnesses for proper connections, bent or broken pins, corrosion, loose wires, proper routing, etc.
- Sensors, actuators and powertrain control module (PCM) for physical damage.
- Engine coolant for proper level.
- Transmission fluid for proper level and condition.
- Any non-factory installed items wired into the transmission or PCM harnesses.

Perform all necessary servicing before continuing with Quick Tests.

Quick Test 2.0 — Set Up

Connect Rotunda New Generation STAR Tester 007-00500 or equivalent to Data Link Connector (refer to vehicle owner manual for connector location).

The following are steps to run OBD II procedures.

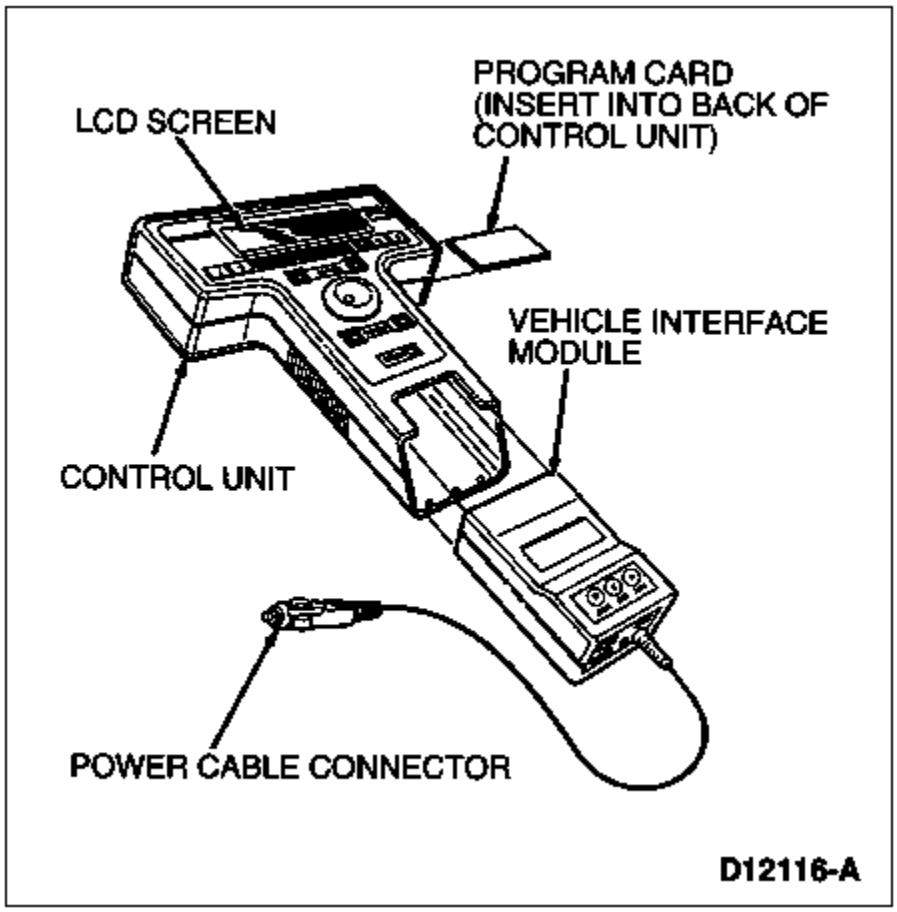
tomsn048@gmail.com

Vehicle and Tester Preparation

Prepare the vehicle as follows:

- Transmission range selector lever in PARK.
- Engine to operating temperature.
- Apply parking brake.
- Block wheels.
- Turn off all electrical loads including A/C and defroster. (If A/C is ON, DTC P1460 will set.)

Prepare the NGS as follows:



- Key OFF.
- Verify that the proper program card is inserted in the NGS.
- Connect J1962/16-way DCL cable adapter to the NGS.
- Connect NGS DCL cable adapter securely into the vehicle's DCL connector.
- Connect the NGS power supply cable to the vehicle battery power supply through cigarette lighter or at the battery with alligator clip adapter.
- Key ON or start vehicle if necessary.
- The NGS is now ready to communicate with the PCM.

Quick Test 3.0 — Key On, Engine Off (KOEO)

tomsn048@gmail.com

CAUTION: Do not replace parts based on a code, perform Pinpoint Tests first.

- The key on engine off (KOEO) test provides "hard" diagnostic trouble codes (DTCs) present at the time of testing.
- Always service the "hard" DTCs first.

Performing KOEO

- Perform visual inspection and vehicle preparation as required.
- Select "Vehicle and Engine Selection" menu.
- Select year, engine, model with the appropriate qualifier if needed, for example, transmission or 49 state/Cal.
- Select "Diagnostic Data Link" menu.
- Select "Diagnostic Test Mode" menu.
- Select "KOEO On-Demand Self Test."
- Follow operating instructions from the NGS menu screen.
- Record all DTCs displayed.
- Service non-transmission DTCs first as they can directly affect the operation of the transmission. Road test the vehicle and repeat Quick Test to verify the repair.

Quick Test 4.0 — Continuous Memory Codes

Continuous DTCs are concerns which were detected during normal vehicle operation. These codes are retained for 40 warm-up cycles.

- The cause of some continuous DTCs may have been eliminated if KOEO and/or KOER DTCs were serviced. Always retest and service any DTCs that still remain.
- If DTCs are present, go to the On-Board Diagnostic Trouble Code Description Chart in this section for service information. Erase DTC, perform the Transmission Drive Cycle Test and repeat all Quick Test procedures after completing service on the DTCs.
- If the Continuous tests passes and a concern is still present, refer to the Diagnosis By Symptom Charts , OASIS and TSBs for concern diagnosis.

Performing Continuous DTC Tests

- Select "Vehicle and Engine Selection" menu
- Select year, engine, model with the appropriate qualifier if needed, for example, transmission or 49 state/Cal.
- Select "Diagnostic Data Link" menu.
- Select "Diagnostic Test Mode" menu.
- Select "Retrieve Continuous Codes."
- Follow operating instructions from the NGS menu screen.
- Record all DTCs displayed.
- Perform Transmission Drive Cycle Test.
- Rerun Continuous DTC Test. If DTCs have returned, service as required. Road test and rerun all DTC test procedures.

Quick Test 5.0 — Key On, Engine Running (KOER)

This test provides "hard" DTCs only.

tomsn048@gmail.com

- Follow the menu screen instructions as they appear.
- If a DTC appears after the key on engine running (KOER) test, a malfunction is present. Refer to the DTC Code Chart for service information.

Performing KOER

- Perform visual inspection and vehicle preparation as required.
- Select "Vehicle and Engine Selection" menu.
- Select year, engine, model with the appropriate qualifier if needed, for example, transmission or 49 state/Cal.
- Select "Diagnostic Data Link" menu.
- Select "Diagnostic Test Mode" menu.
- Select "KOER On-Demand Self Test."
- Follow operating instructions from the NGS menu screen (example: turn key on, etc.) and perform brake on/off (BOO) and cycle the transmission control switch (TCS) on and off, if equipped, rotate steering wheel.
- Record all DTCs displayed.
- Service all non-transmission DTCs first as they can directly affect the operation of the transmission. Road test the vehicle and repeat Quick Test to verify the repair.

Special Test Modes

The following Special Test Modes may be used or required during diagnostics.

Output Test Mode

The diagnostic test mode aids is servicing output actuators associated with the PCM system. It allows the technician to energize and de-energize most of the system output actuators on command.

Performing Output Test Mode

Enter Output Test Mode with ignition key ON and the engine OFF.

- Perform visual inspection and vehicle preparation as required.
- Select "Vehicle and Engine Selection" menu.
- Select year, engine, model with the appropriate qualifier if needed, for example, transmission or 49 state/Cal.
- Select "Diagnostic Data Link" menu.
- Select "Diagnostic Test Mode" menu.
- Enter "Active Tests."
- Enter "Output Control."
- Follow operating instructions from the NGS menu screen.

PCM Reset Mode

The PCM reset mode provides a means for the NGS to command the powertrain control module to clear all DTCs. When resetting the PCM, a DTC P1000 will be set in the PCM until all OBD II system or components have been monitored during the OBDII Drive Cycle. When a PCM reset is performed the following occurs:

- DTCs cleared.

tomsn048@gmail.com

- Freeze Frame Data cleared.
- Oxygen Sensor Test Data cleared.
- Status of the OBD II System Monitors reset.
- DTC P1000 set.

Performing PCM Reset

- Perform visual inspection and vehicle preparation as required.
- Select "Vehicle and Engine Selection" menu.
- Select year, engine, model with the appropriate qualifier if needed, for example, transmission or 49 state/Cal.
- Select "Generic OBD II Functions" menu.
- Select "Clearing ALL Codes."
- Follow operating instructions from the NGS menu screen.
- Perform OBD II Drive Cycle — Clear DTC P1000.

Clearing DTC P1000

In some localities it may become a legal requirement to pass an Inspection/Maintenance (I/M) test of the OBD II system. If the vehicle's powertrain system or its battery has just been serviced, the OBD II system is reset to a not ready for I/M testing condition. To prepare the vehicle for the test and to clear the DTC No. P1000, an OBD II Drive Cycle must be performed.

OBD II Drive Cycle

The following steps must be run in the order shown. If Steps 2, 3, or 4 are interrupted, repeat the step before proceeding. Any safe driving mode is acceptable between steps.

Always drive vehicle in a safe manner according to traffic conditions and obey all traffic laws.

1. Start engine and drive vehicle in typical city stop-and-go traffic for at least 10 minutes after it has reached normal operating temperature.

2. Idle vehicle for at least 45 seconds, then accelerate at part throttle to near 72 km/h (45 mph).

3. Cruise and maintain a select speed in the range of 48-64 km/h (30 to 40 mph) on a level road with throttle held steady for at least one minute.

4. Drive to accumulate at least four minutes in the range of 32-72 km/h (20 to 45 mph). If stop-and-go conditions occur, the accumulated time must be within the 32-72 km/h (20 to 45 mph) range. No wide open throttle (WOT) conditions should be encountered.

5. Decelerate and idle for at least 10 seconds.

6. Accelerate to approach 88 km/h (55 mph) at 1/2 throttle (elapsed time is about 10 seconds).

7. Cruise and maintain select speed in the range of 64-104 km/h (40 to 65 mph) on a level road with throttle held steady for at least one minute and 20 seconds.

8. OBDII Drive Cycle has been completed.

tomsn048@gmail.com

Other NGS Features

For further information on other diagnostic testing features using the NGS or generic scan tool, refer to the Powertrain Control/Emissions Diagnosis Manual. Other diagnostic methods include the following:

- Parameter Identification (PID) Access Mode, used to monitor sensor and actuators.
- Freeze Frame Data Access Mode, used to view emissions related data values from specific PIDs.
- Oxygen Sensor Monitor Mode, used to monitor the O2 sensor.

Transmission Drive Cycle Test

NOTE: The Transmission Drive Cycle Test must be followed exactly. Malfunctions must occur four times consecutively for codes P0731, P0732, P0733 and P0734 to be set, and five times consecutively for continuous code P0743.

NOTE: When performing the Transmission Drive Cycle Test, refer to the Solenoid Application Chart for proper solenoid operation.

After performing the Quick Test, use the Transmission Drive Cycle Test for checking continuous codes.

1. Record and then erase Quick Test codes.
2. Warm engine to normal operating temperature.
3. Make sure transmission fluid level is correct.
4. With transmission in (D), moderately accelerate from stop to 80 km/h (50 mph). This allows the transmission to shift into fourth gear. Hold speed and throttle opening steady for a minimum of 15 seconds.
5. With transmission in fourth gear and maintaining steady speed and throttle opening, lightly apply and release brake pedal (2455) (to operate stoplamps). Then hold speed and throttle steady for an additional five seconds (minimum).
6. Brake to a stop and remain stopped for a minimum of 20 seconds.
7. Repeat Steps 4 through 6 at least five times.
8. Perform Quick Test and record continuous codes.
    - If DTCs are present, go to the On-Board Diagnostic Trouble Code Description Chart in this section for service information. Service all non-transmission DTCs first as they can directly affect the operation of the transmission. Repeat the Quick Test and Road Test to verify the correction. Erase DTCs, perform Drive Cycle and repeat the Quick Test after completing service on the DTCs.
    - If the continuous test passes and a concern is still present, refer to the Diagnosis By Symptom Charts , OASIS and TSBs for concern diagnostics.

tomsn048@gmail.com

tomsn048@gmail.com

After On-Board Diagnostics

NOTE: The vehicle wiring harness, powertrain control module (PCM) (12A650) and non-transmission sensors may affect transmission operations. Service these concerns first.

After the On-Board Diagnostics procedures are completed, service all DTCs.

Begin with non-transmission related DTCs, then service any transmission related DTCs. Refer to the On-Board Diagnostic Trouble Code Description Chart for information on condition and symptoms. This chart will be helpful in referring to the proper manual(s) and to aid in diagnosing internal transmission concerns and external non-transmission inputs. The Pinpoint Tests are used in diagnosing electrical concerns of the transmission. Make sure that the vehicle wiring harness and the powertrain control module are diagnosed as well. The Powertrain Control/Emissions Diagnosis Manual will aid in diagnosing non-transmission electronic components.

tomsn048@gmail.com

Before Pinpoint Tests

NOTE: Prior to entering Pinpoint Tests, refer to TSBs and OASIS messages for 4R44E concerns.

NOTE: Prior to entering Pinpoint Tests, the vehicle harness must be checked for continuity and shorts, and the powertrain control module (PCM) must be checked for any concerns. Refer to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the PCM concerns.

NOTE: If any non-transmission service codes appear, service those codes first. They could affect the electrical operation of the transmission. Record and erase codes from continuous memory after repairs have been performed. After servicing any fault codes in the Quick Test, the Quick Test should be repeated.

NOTE: Check the EEC-V system wiring harness for proper connection, bent or broken pins, corrosion, loose wires, proper routing, proper seals and their condition. Check the powertrain control module (PCM) (12A650), sensors, and actuators for physical damage.

If codes appear while performing the Self Test, refer to the On-Board Diagnostic Trouble Code Description Chart for the appropriate service procedure.

tomsn048@gmail.com

On-Board Diagnostic Trouble Code Description Chart

ON-BOARD DIAGNOSTIC TROUBLE CODE DESCRIPTION CHART

****May also be generated by some other non-electric transmission hardware system.**					
***Output circuit check, generated only by electrical symptoms.**					
Four-Digit DTC	**Component**	**Description**	**Condition**	**Symptom**	**Action**
P0112	IAT	IAT indicates 125°C (254°F) (grounded).	Voltage drop across IAT exceeds scale set for temperature 125°C (254°F).	Incorrect EPC pressure. Either high or low which will result in harsh or soft shifts.	Refer to PCED [1]
P0113	IAT	IAT indicates -40°C (-40°F) (open circuit).	Voltage drop across IAT exceeds scale set for temperature -40°C (-40°F).	Incorrect EPC pressure. Either high or low which will result in harsh or soft shifts.	Refer to PCED [1]
P0114	IAT	IAT out of on-board diagnostic range.	IAT temperature higher or lower than expected during KOEO and KOER.	Rerun on-board diagnostic at normal operating temperature.	Refer to PCED [1]
P1116	ECT	ECT out of on-board diagnostic range.	ECT temperature higher or lower than expected during KOEO and KOER.	Rerun on-board diagnostic at normal operating temperature.	Refer to PCED [1]
P0117	ECT	ECT indicates 125°C (254°F).	Voltage drop across ECT exceeds scale set for temperature 125°C (254°F) (grounded).	Torque converter clutch will always be off, resulting in reduced fuel economy.	Refer to PCED [1]
P0118	ECT	ECT indicates -40°C (-40°F).	Voltage drop across ECT exceeds scale set for temperature -40°C (-40°F) (open circuit).	Torque converter clutch will always be off, resulting in reduced fuel economy.	Refer to PCED [1]
P1124	TP	TP voltage high/low for on-board diagnostic.	TP was not in the correct position for on-board diagnostic.	Rerun at appropriate throttle position per application.	Refer to PCED [1]
P0121, P0122, P0123,	TP	TP concern.	PCM has detected an error. This error may cause a	Harsh engagements, firm shift feel, abnormal shift schedule, torque	Refer to PCED [1]

tomsn048@gmail.com

P1120, P1121, P1125, P1124			transmission concern.	converter clutch does not engage. Torque converter clutch cycling.	
P0102, P0103, P1100, P1101	MAF	MAF concerns.	MAF system has a malfunction which may cause a transmission concern.	High/low EPC pressure, incorrect shift schedule. Incorrect torque converter clutch engagement scheduling. Symptoms similar to a TP failure.	Refer to PCED [1]
P0300-P0306, P0320, P0340, P1351-P1364	EI	EI concerns.	EI system has a malfunction which may cause a transmission concern.	Harsh engagements and shifts, late WOT shifts, no torque converter clutch engagement.	Refer to PCED [1]
P0500, P1500, P1501	VSS	Insufficient VSS input.	PCM detected a loss of vehicle speed signal during operation.	Torque converter clutch engages, shift engagement/ disengagement (hunting) on grades.	Refer to PCED [1]
P1705	DTR	DTR not in PARK or NEUTRAL.	On-board diagnostic not run in PARK.	Rerun on-board diagnostic in PARK.	Refer to Pinpoint Test D.
P1704	DTR	DTR sensor failure in transition state.	DTR sensor misaligned or failed electrically.	Increase in EPC pressure.	Refer to Pinpoint Test D.
P1703	BOO	Brake not actuated during on-board diagnostic KOER.	Brake not cycled during KOER.	Failed ON or not connected — torque converter clutch will not engage at less than 1/3 throttle. Failed OFF or not connected — torque converter clutch will not disengage when brake is applied.	Refer to PCED [1]
P1703	BOO	BOO switch circuit failed.	Brake ON circuit failure during KOEO.	Failed ON or not connected — torque converter clutch will not engage at less than 1/3 throttle. Failed OFF or not connected — torque converter clutch will not disengage when brake is applied.	Refer to PCED [1]
P1460	A/C	A/C clutch cycling pressure switch error.	A/C or Defrost ON condition may result from A/C clutch being ON during on-board diagnostic.	DTC set during on-board diagnostic — rerun with A/C OFF. Failed ON — EPC pressure slightly low with A/C OFF.	Refer to PCED [1]
P0731**	SS1, SS2, SS3 or	1st gear error.	No 1st gear.	Improper gear selection depending on failure or	Refer to Solenoid

tomsn048@gmail.com

	internal parts			mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material).	On/Off Charts. Refer to Pinpoint Test A.
P0732**	SS1, SS2, SS3 or internal parts	2nd gear error.	No 2nd gear.	Improper gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material).	Refer to Solenoid On/Off Charts. Refer to Pinpoint Test A.
P0733**	SS1, SS2, SS3 or internal parts	3rd gear error.	No 3rd gear.	Improper gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material).	Refer to Solenoid On/Off Charts. Refer to Pinpoint Test A.
P0734**	SS1, SS2, SS3 or internal parts	4th gear error.	No 4th gear.	Improper gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material).	Refer to Solenoid On/Off Charts. Refer to Pinpoint Test A.
P0750*	SS1	SS1 solenoid circuit failure.	SS1 circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Improper gear selection depending on condition mode and manual lever position. See Solenoid On/Off charts.	Refer to Pinpoint Test A.
P0755*	SS2	SS2 solenoid circuit failure.	SS2 circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Improper gear selection depending on condition mode and manual lever position. See Solenoid On/Off charts.	Refer to Pinpoint Test A.
—	TCIL	TCIL circuit failure.	TCIL circuit open or shorted.	Failed ON — Overdrive cancel mode always ON. NO flashing TCIL for EPC failure or sensor. Failed OFF — Overdrive cancel mode	Refer to PCED [1]

tomsn048@gmail.com

				never indicated. NO flashing TCIL for EPC sensor failure.	
P1747*	EPC	EPC solenoid circuit failure, shorted circuit.	Voltage through EPC solenoid is checked. An error will be noted if tolerance is exceeded.	Short Circuit — Causes minimum EPC pressure (minimum capacity) and limits engine torque (alternate firm). Zero EPC — no 2nd and 4th gear. Slips in 1st and 3rd with high torque input.	Refer to Pinpoint Test E.
P1744**	TCC	TCC slippage detected.	The PCM picked up an excessive amount of TCC slippage during normal vehicle operation.	TCC slippage/erratic or no torque converter clutch operation. Flash TCIL.	Refer to Diagnosis by Symptom Index.
P1780	TCS	TCS not changing states.	TCS not cycled during self test. TCS circuit open or shorted.	No (D) cancel when switch is cycled during KOER.	Rerun on-board diagnostic and cycle switch. Refer to PCED [1]
P1711	TFT	TFT out of on-board diagnostic range.	Transmission not at operating temperature during on-board diagnostic.	DTC set — Vehicle cold or overheated.	Warm or cool vehicle to normal operating temperature. Refer to Pinpoint Test B.
P0713	TFT	-40°C (-40°F) indicated TFT sensor circuit open.	Voltage drop across TFT sensor exceeds scale set for temperature -40°C (-40°F)	Firm shift feel.	Refer to Pinpoint Test B.
P0712	TFT	157°C (315°F) indicated TFT sensor circuit grounded.	Voltage drop across TFT sensor exceeds scale set for temperature of 157°C (315°F)	Firm shift feel.	Refer to Pinpoint Test B.
P0715	TSS	Insufficient input from Turbine Shaft Speed Sensor.	PCM detected a loss of TSS signal during operation.	Harsh shifts, abnormal shift schedule, no torque converter clutch activation.	Refer to Pinpoint Test F.
P0743*	TCC	TCC solenoid circuit failure during on-board diagnostic.	TCC solenoid circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM drive failure during on-board diagnostic.	Short circuit — Engine stalls in second (OD, 2 range) at low idle speeds with brake applied. Open circuit — Torque converter clutch never engages.	Refer to Pinpoint Test C.
P1783	TFT	Transmission	Transmission fluid	Increase in EPC	Refer to

tomsn048@gmail.com

		overtemp condition indicated.	temperature exceeded 127°C (270°F).	pressure.	Pinpoint Test B.
P0705	DTR	DTR circuit failure.	DTR sensor, circuit or PCM shorted or grounded.	Increase in EPC pressure.	Refer to Pinpoint Test D.
P0708	DTR	DTR circuit above maximum voltage — open.	DTR sensor, circuit or PCM indicates open.	Increase in EPC pressure.	Refer to Pinpoint Test D.
P0751 **	SS1	Shift solenoid No. 1 functional failure (California only).	Mechanical or hydraulic failure of the shift solenoid.	Improper gear selection depending on failure mode and manual lever position.	Refer to Solenoid On/Off Charts. Refer to Pinpoint Test A.
P0756 **	SS2	Shift solenoid No. 2 functional failure (California only).	Mechanical or hydraulic failure of the shift solenoid.	Improper gear selection depending on failure mode and manual lever position.	Refer to Solenoid On/Off Chart. Refer to Pinpoint Test A.
P1781	4x4L	4x4 low switch failure.	Switch closed or shorted during KOEO.	Early or delayed shifts.	Refer to Section 07-07A.
P1729	4x4L	4x4 low switch failure.	Circuit open/shorted.	Early or delayed shifts.	Refer to Section 07-07A.
P0761**	SS3	Shift solenoid No. 3 functional failure (California).	Mechanical or hydraulic failure of the shift solenoid.	Improper gear selection depending on failure mode and manual lever position.	Refer to Solenoid On/Off Charts. Refer to Pinpoint Test A.
P0760*	SS3	SS3 solenoid circuit failure.	SS3 circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Improper gear selection depending on condition mode and manual lever position. See Solenoid On/Off chart.	Refer to Pinpoint Test A.
P1754*	CCS	CCS solenoid circuit failure.	CCS circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Failed on — no coast braking except in 4th gear. Delayed 3-2 shifts. Failed off — coast braking 2nd, 3rd. Firm 3-2 and 4-3 shifts.	Refer to Pinpoint Test G.
P1746 *	EPC	EPC solenoid circuit open.	Voltage through EPC solenoid is checked. Error is	Open Circuit — Causes maximum EPC pressure, harsh	Refer to Pinpoint Test E.

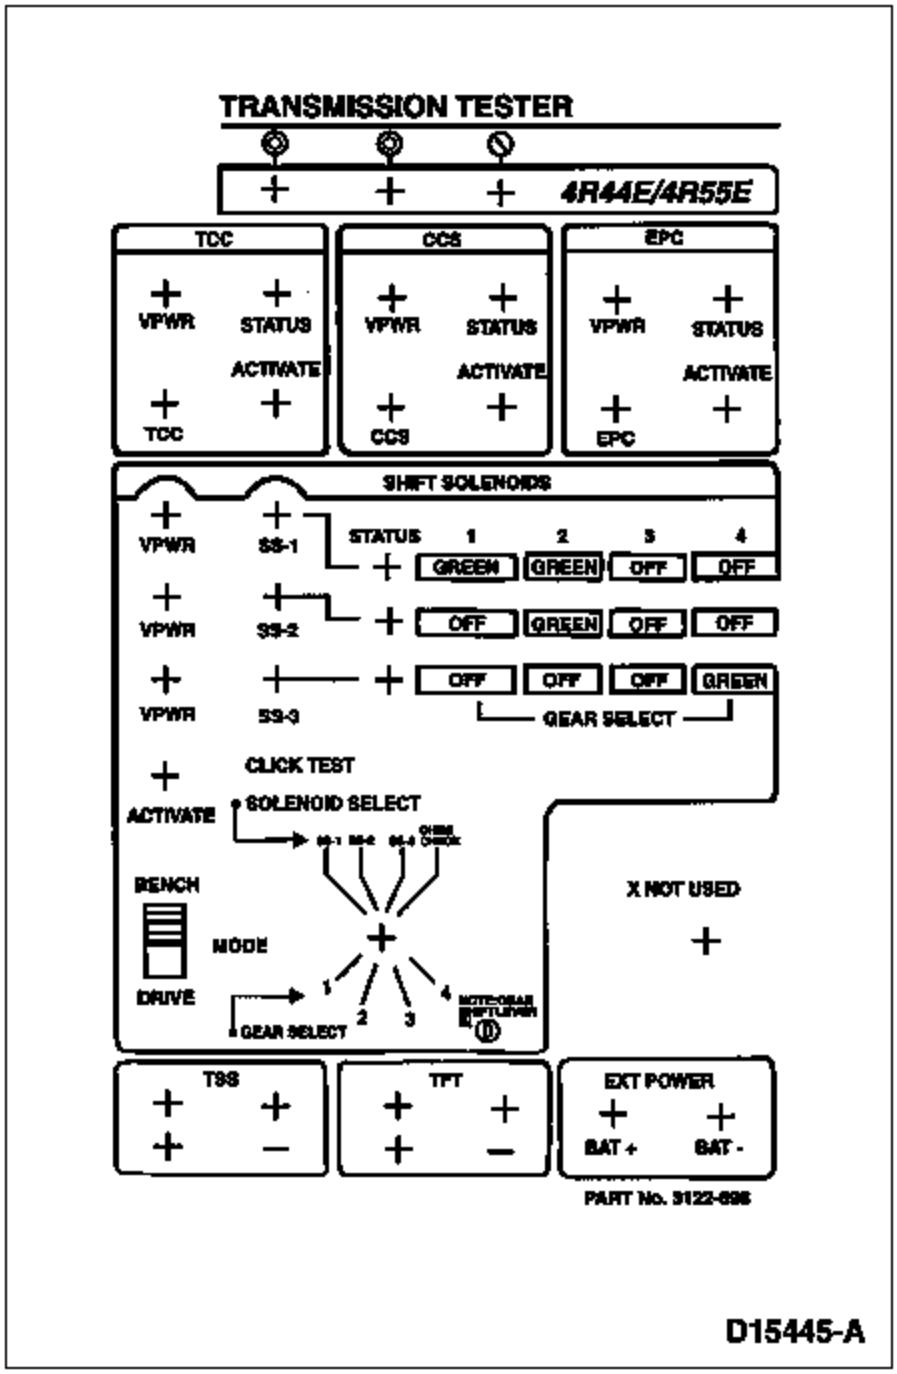
Rotunda Transmission Tester

Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) with Rotunda 4R44E/4R55E Overlay/Cable 007-00106 in Transmission Tester Kit, Rotunda Transmission Range (TR) Sensor Cable "E" 007-00111 with Digital TR Sensor Overlay 007-00131 or equivalent to diagnose electronically controlled transmissions (7003). The following instructions outline the set up and use of this tester in the Pinpoint Tests for the 4R44E.

Transmission Tester

tomsn048@gmail.com



Overlays and Adapters

1. **Overlay and Cable Correctly Installed LEDs:** Only LEDs with the (O) symbol will light when the overlay and cable are correctly matched.

2. **Status LEDs:** LED OFF when not activated by tester (solenoid not activated, open circuit or signal line short to ground).

    - LED green when activated by tester and current draw is correct.

tomsn048@gmail.com

- LED red when activated by tester and current draw is excessive (short at VPWR).
- All LEDs light orange during On-Board Diagnostics.

3. **Solenoid Activate Buttons:** Energize respective solenoids during click testing and activate selected circuits during DRIVE mode testing.

4. **Tester Mode Switch:** Selects operating mode, either BENCH or DRIVE.

5. **Solenoid Select/Gear Select Switch:** Has three functions:

   - BENCH MODE: acts as shift solenoid selector for click testing.
   - DRIVE MODE: acts as forward gear selector in place of vehicle's powertrain control module (PCM) (12A650) controlled shifting. Hydraulic safety mechanisms and overrides are built into the transmission.
   - OHMS CHECK: allows technician to measure ohms and to check for presence of diode on specific solenoids.

Tester Jacks

1. **VPWR Pin Jacks (red):** Vehicle Power (VPWR) test points for solenoid circuits.

2. **Solenoid Signal Line Pin Jacks (black):** Signal line test points for solenoid circuits.

3. **BAT + (red) and BAT - (black) Pin Jacks:** Battery reference points when measuring circuits for shorts.

4. **TFT Pin Jacks:** Test points for transmission fluid temperature sensor.

5. **TSS Jack:** Test points for TSS sensor.

LEDs and Controls

- LED turns **RED** when solenoid activates and **OFF** when solenoid deactivates.
- LED turns **GREEN** if an activated solenoid/harness is shorted.
- LED remains **OFF** if an activated solenoid/harness is shorted to ground or no continuity.

Instructions

The Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) with Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in Transmission Tester Kit or equivalent allows a technician to operate the electrical portion of the transmission independent of the vehicle electronics to determine transmission concerns. The Transmission Tester usage is divided in six steps:

- Preliminary Testing and Diagnosis
- Installing the Transmission Tester
- Static Testing — Engine Off
- Dynamic Testing — Vehicle Running
- DTR Testing
- Removing Transmission Tester and Clearing DTCs

Preliminary Inspections

tomsn048@gmail.com

1. Know and understand the customer's concern.

2. Verify the customer's concern:

    - Upshift
    - Downshift
    - Coasting
    - Engagement

If concern involves noise or vibration, does it relate to any of the following?

- Rpm
- Vehicle speed
- Shift
- Gear
- Range
- Temperature

3. Vehicle must be at normal operating temperature.

4. Check transmission fluid level and condition.

5. Check the following items:

    - Vehicle modifications
    - Electronic add-on items
    - Leaks
    - Linkage adjustments

6. Check TSBs and OASIS for related information.

7. Perform complete On-Board Diagnostics (OBD) for both KOEO and KOER.

8. Record all DTCs.

9. Repair all non-transmission DTCs.

Installation Procedures

Installing Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) with Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in Transmission Tester Kit or equivalent at the transmission connector allows separation of the vehicle electronics from transmission electronics. Disconnecting normal vehicle electronics will cause firm shifts and defaults transmission to maximum line pressure.

During tester usage, additional DTCs may be set. Therefore, it is important that all codes are erased after service has been made. To verify elimination of all codes, rerun On-Board Diagnostics.

The following manuals will assist in diagnosis of electronically controlled transmissions:

- Powertrain Control/Emissions Diagnosis Manual.
- Transmission Reference Manual.

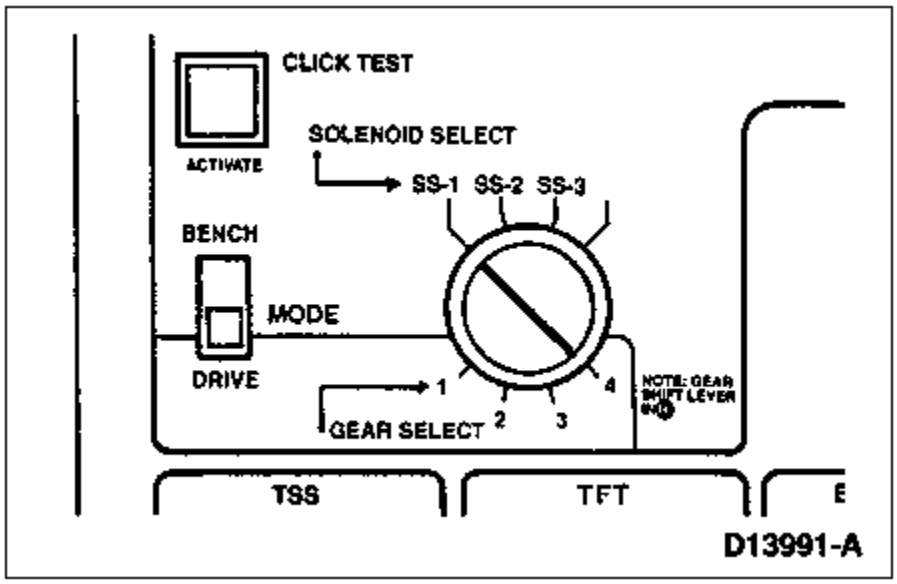
tomsn048@gmail.com

1. **CAUTION: Do not attempt to pry off connectors with a screwdriver. This will damage the connector and could result in transmission concerns.**

   Disconnect vehicle wiring harness at transmission connector.

2. Install appropriate overlay onto tester.

3. Turn tester solenoid select switch to the OHMS CHECK position.



4. **CAUTION: Route all cables away from heat sources.**

   Connect appropriate interface cable to transmission tester and then to the appropriate transmission connectors.

5. **CAUTION: Route gauge line away from heat sources.**

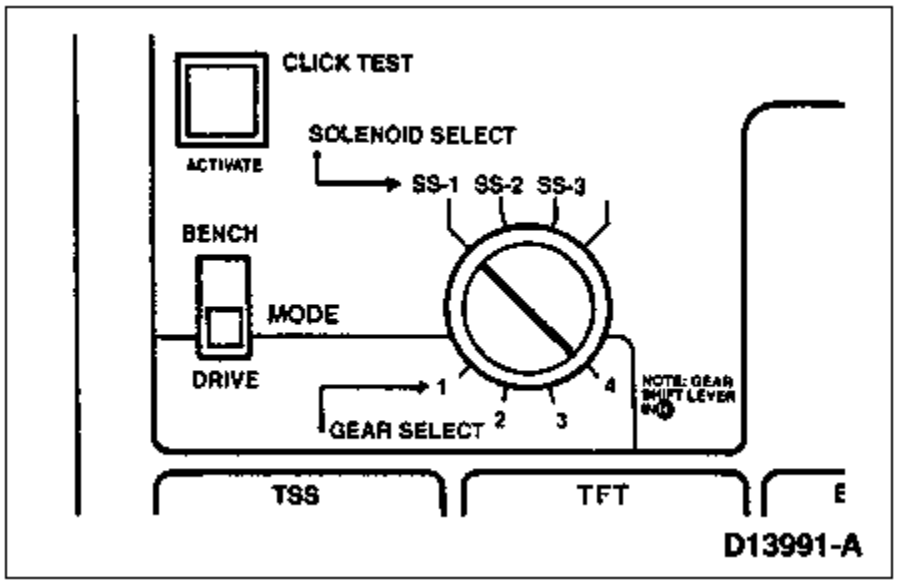
   Install a line pressure gauge into line pressure tap on transmission.

Static Testing — Engine Off

Static testing procedures allow for shop testing of the transmission in the vehicle or on the bench. Completion of these tests prove out transmission electronics.

- Refer to appropriate Pinpoint Test based on DTCs displayed.
- Use a digital volt-ohmmeter and the transmission tester to perform the Pinpoint Tests as indicated, based on the DTCs which were displayed.
- Perform repairs as indicated by the Pinpoint Tests. Always erase all codes, retest and road test vehicle after a repair.

tomsn048@gmail.com



Resistance/Continuity Tests — EPC Solenoid

1. Set ohmmeter to 100-200 ohm range.
2. Connect COM lead to the EPC jack.
3. Connect ohmmeter POS lead to the VPWR jack.
4. Record resistance.
5. Refer to the chart for values.

If out of specification, refer to Pinpoint Test E in this section.

Solenoid	Resistance (Ohms)
S1	22-48
S2	22-48
S3	22-48
CCS	22-48
TCC	8.9-16.0
EPC	3.1-5.7

Resistance/Continuity Tests — Solenoids (SS1, SS2, SS3, TCC, CCS)

1. Set ohmmeter to 100-200 ohm range.
2. Connect ohmmeter COM lead to the appropriate solenoid (shift solenoid 1 [SS1], shift solenoid 2 [SS2], shift solenoid 3 [SS3], torque converter solenoid [TCC], coast clutch solenoid [CCS]) jack.
3. Connect ohmmeter POS lead to the appropriate VPWR jack for the solenoid being tested.

tomsn048@gmail.com

4. Record resistance.
5. Refer to the chart for values.

If out of specification, refer to Pinpoint Test A (SS1, SS2, SS3); Pinpoint Test C (TCC), Pinpoint Test G (CCS).

Resistance/Continuity Tests — Transmission Fluid Temperature (TFT) Sensor

1. Set ohmmeter to 1000 ohm (k) scale.
2. Connect ohmmeter COM lead to TFT jack.
3. Connect ohmmeter POS lead to + TFT jack.
4. Record resistance. Resistance will vary with temperature.
5. Refer to the following chart.

If out of specification, refer to Pinpoint Test B in this section.

Temperature		Resistance
℃	℉	(Ohms)
-40 - -20	-40 - -4	967k-248k
-19 - -1	-3 - 31	248k-100k
0-20	32-68	100k-37k
21-40	69-104	37k-16k
41-70	105-158	16k-5k
71-90	159-194	5k-2.7k
91-110	195-230	2.7k-1.5k
110-130	231-266	1.5k-0.8k
131-150	267-302	0.8k-0.54k

Resistance/Continuity Tests — Turbine Shaft Speed (TSS) Sensor

1. Set Rotunda 73 Digital Multimeter 105-R0051 or equivalent to 200 ohms.
2. Connect multimeter COM lead to TSS jack.
3. Connect multimeter POS lead to (-) TSS jack.
4. Record resistance.

   Range:

   - TSS 64-120 ohms
5. If resistance is out of range, refer to Pinpoint Test F in this section.

tomsn048@gmail.com

Solenoid Voltage Test

1. Slide MODE switch to BENCH position.
2. Set voltmeter to 20-volt DC range.
3. Determine solenoid to be tested and connect voltmeter leads as follows:
    - If testing SS1, SS2, or SS3 solenoid, turn the SOLENOID SELECT dial to SS1, SS2, or SS3 before hooking up leads.

    - Connect negative lead to solenoid jack.
    - Connect positive lead to VPWR jack.
4. Press solenoid activate/deactivate button and check voltage.

The LED should light, the voltage should change, and an audible click may be heard. See LED and Controls for reading LED status.

5. Observe and record values.

Dynamic Testing — Engine On

Preliminary Set Up

1. Slide MODE switch to DRIVE position.
2. Turn GEAR SELECT dial to 1.
3. Place vehicle in PARK with parking brake on.
4. Start engine.

EPC Solenoid

tomsn048@gmail.com

CAUTION: Do not attempt to hold the electronic pressure control switch depressed (minimum line pressure) and stall the transmission (holding the vehicle with the brake while depressing the throttle with the transmission in gear). Transmission damage will result.

1. Observe line pressure. Record value. Line pressure should go to maximum. If not, refer to the Diagnosis By Symptom Index for diagnostic information or Pinpoint Test E concerning electronic pressure control solenoid.

2. Depress electronic pressure control switch. Record value. Line pressure should drop to a minimum value Record value. If not, refer to the Diagnosis by Symptom Index or Pinpoint Test E for the electronic pressure control solenoid.

Transmission Engagements

1. Verify that MODE switch is in DRIVE position.

2. Turn GEAR SELECT dial to 1.

3. Start engine.

4. Shift vehicle from PARK to REVERSE.

   - Did vehicle shift into REVERSE?
   - Was engagement firm?

5. Depress EPC switch. Line pressure should drop to idle pressure.

   While holding EPC switch down, shift vehicle from PARK to REVERSE.

   - Did vehicle shift into REVERSE?
   - Was engagement smooth?
   - Shift vehicle from REVERSE to PRK.
   - Release EPC switch. Line pressure should rise to MAX pressure.

6. Shift vehicle from PARK to DRIVE.

   - Did vehicle shift into DRIVE?
   - Was engagement firm?

7. Shift vehicle from DRIVE to PARK.

8. Depress EPC switch. Pressure should drop to idle pressure.

9. While holing EPC switch down, shift vehicle from PARK to DRIVE.

   - Did the vehicle shift from PARK to DRIVE?
   - Was the engagement smooth?

10. Release EPC Switch.

Upshifts/Downshits

tomsn048@gmail.com

NOTE: Upshifts and downshifts will be firm during this procedure. Pressure gauges may be removed. These tests should be performed on the road. If performed on the hoist, shift feel during engagement may not be possible.

LED will turn green when solenoids are activated and turn off when deactivated. Refer to the appropriate overlay for the proper status shift sequence of the shift solenoids during upshifts and downshifts.

1. Move transmission range selector lever into (D) and accelerate to 24 km/h (15 mph). By moving transmission range selector lever, shift to second gear.

    - Did vehicle upshift to second gear?
    - Did appropriate shift solenoids activate/deactivate?

2. Accelerate to 40 km/h (25 mph) and select third gear by turning GEAR SELECT dial to 3.

    - Did vehicle upshift to third gear?
    - Did appropriate shift solenoids activate/deactivate?

3. Accelerate to 56-72 km/h (35/45 mph) and select fourth gear by turning GEAR SELECT dial to 3.

    - Did vehicle upshift to fourth gear?
    - Did appropriate shift solenoids activate/deactivate?

4. Reverse the order to downshift.

    - Did vehicle downshift from fourth to third, third to second, and second to first?

Torque Converter Clutch (TCC) Engagement

CAUTION: Do not depress torque converter clutch solenoid switch with transmission in gear and the vehicle at a stop. Damage to torque converter clutch may result.

NOTE: This test should be performed on the road. If performed on a hoist, torque converter clutch engagement feel may not be possible.

1. Accelerate and shift vehicle up into third gear. Hold speed steady and depress the torque converter clutch solenoid switch.

    - Did the torque converter engage?
    - Did the engine rpm drop?
    - Did torque converter clutch solenoid activate?
    - Did TCC solenoid deactivate when switch was reused?

Coast Clutch Engagement

NOTE: This test should be performed on the road. If performed on the hoist, coast clutch engagement feel may not be possible.

1. Accelerate and shift vehicle into third gear. Depress the coast clutch solenoid switch and immediately

tomsn048@gmail.com

back off the throttle.

- Did the coast clutch engage? Did engine braking occur?
- Did the coast clutch solenoid activate?

2. Release the CCS switch.

- Did the CCS solenoid deactivate?

Turbine Shaft Speed (TSS) Sensor

NOTE: This test may be performed on the hoist or on the road.

1. Set voltmeter to 20 volts AC.
2. Connect voltmeter positive lead to +TSS.
3. Connect voltmeter negative lead to -TSS.
4. Slowly accelerate vehicle and monitor voltmeter.

- Did voltage increase with vehicle speed?

If testing of the DTR sensor is required, go to the following procedure. If testing of the DTR sensor is not required, go to the disconnecting the tester procedure in this section.

Digital Transmission Range (DTR) Sensor Testing

Introduction

The Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit), TR Testing Cable "E" 007-00111 and Digital TR Sensor Overlay 007-00131 or equivalent allows a technician to test the DTR sensor independent of vehicle electronics. DTR sensor testing is divided into four steps:

1. Preliminary diagnosis and testing.
2. Installing the Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit), TR Testing cable "E" (007-00111) and Digital TR Overlay or equivalent.
3. Testing the digital transmission range (DTR) sensor.
4. Testing the park/neutral, backup and optional circuits.

Preliminary Testing and Diagnosis

Before any diagnostic testing is done on a vehicle some preliminary checks must be performed. Be sure to write down any findings, especially any DTCs, for future reference.

1. Know and understand customer's concern.
2. Verify that DTR sensor is properly adjusted in NEUTRAL.

tomsn048@gmail.com

3. Verify customer concern:

    - Upshift
    - Downshift
    - Coasting
    - Engagement

If concern involves noise or vibration, does it relate to any of the following?

- Rpm
- Vehicle speed
- Shift
- Gear
- Range
- Temperature

4. Vehicle must be at normal operating temperature.

5. Check transmission fluid level and condition.

6. Check for the following items:

    - Vehicle modifications
    - Electronic add-on items
    - Leaks
    - Linkage adjustments

7. Check TSBs and OASIS for related information.

8. Perform complete On-Board Diagnostics (OBD) for both KOEO and KOER.

9. Record all DTCs.

10. Repair all non-transmission DTCs.

Installation Procedures

Installing the Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and TR Testing Cable "E" 007-00111 and Digital TR Sensor Overlay 007-00131 at the transmission connector allows separation of the DTR sensor electronics from the vehicle electronics.

Testing may cause additional fault codes to be set. Therefore, it is important that all DTCs are erased whenever repairs are made. To verify elimination of all codes, rerun OBD test.

The following manuals will assist in diagnosis of electronically controlled transmissions:

- Powertrain Control/Emission Diagnosis (PC/ED) Manual
- Transmission Reference Manual

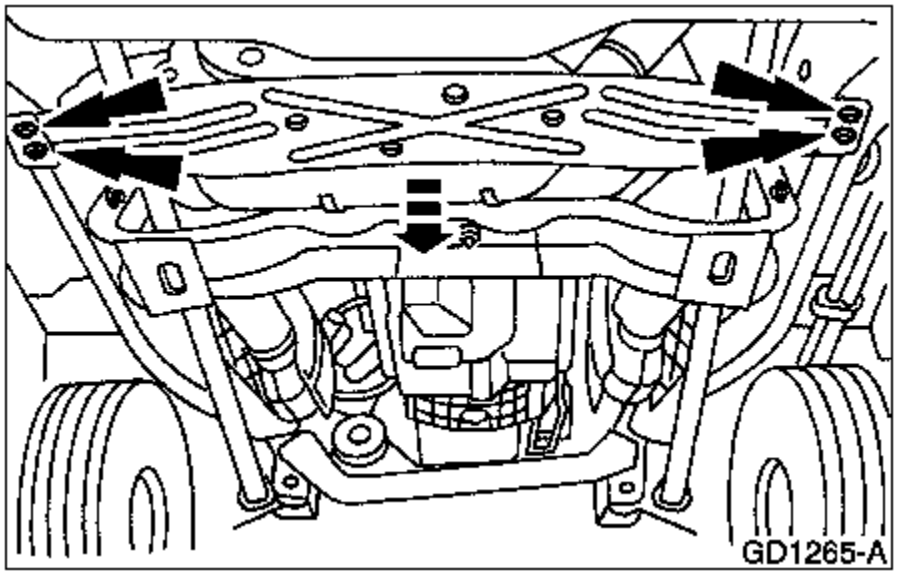
1. For proper DTR sensor diagnosis, follow Pinpoint Test D .

2. Disconnect vehicle harness at transmission DTR sensor.

tomsn048@gmail.com

3. Set the two-way switch in the down position. (This switch will stay in the same position for all DTR sensor testing.)

4. Attach the Digital TR Sensor Overlay 007-00131 to the transmission tester.

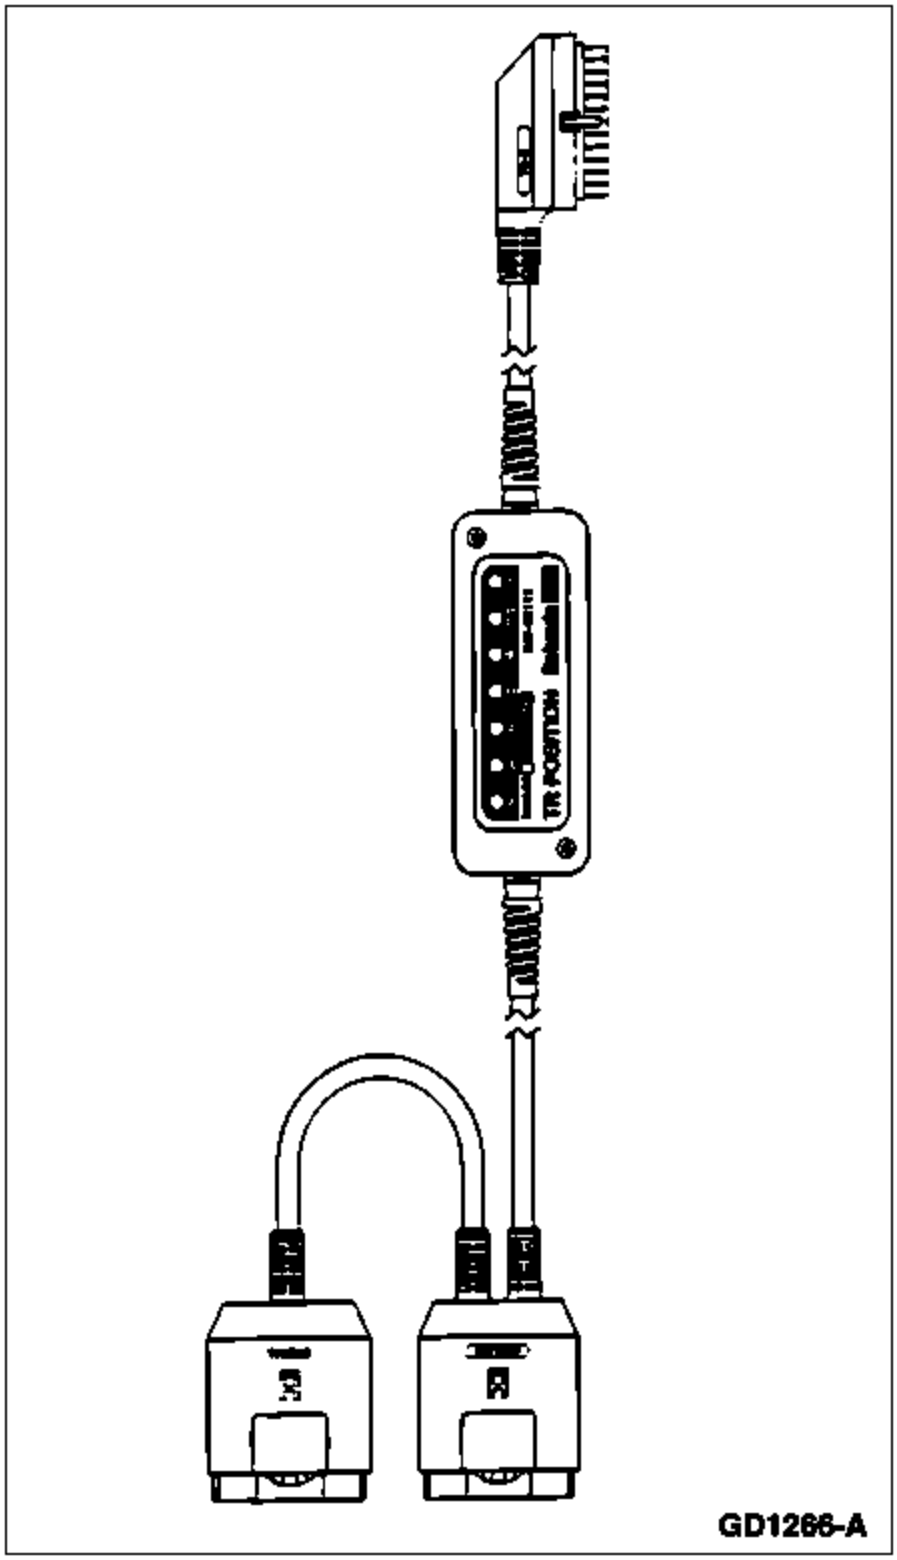


Affixing the overlay will immobilize the two-way switch (set in Step 2) so it cannot be accidentally moved to an incorrect setting during testing.

5. Select and connect interface cable "E" 007-00111 to the tester and then black connector (digital) to DTR sensor.

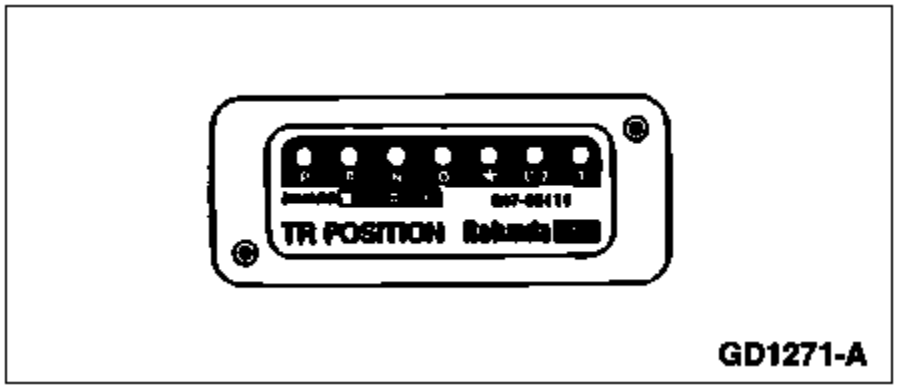
Transmission	Model Year	Cable
4R44E	1997	E

tomsn048@gmail.com



6. Set analog/digital switch on TR-E cable to digital.

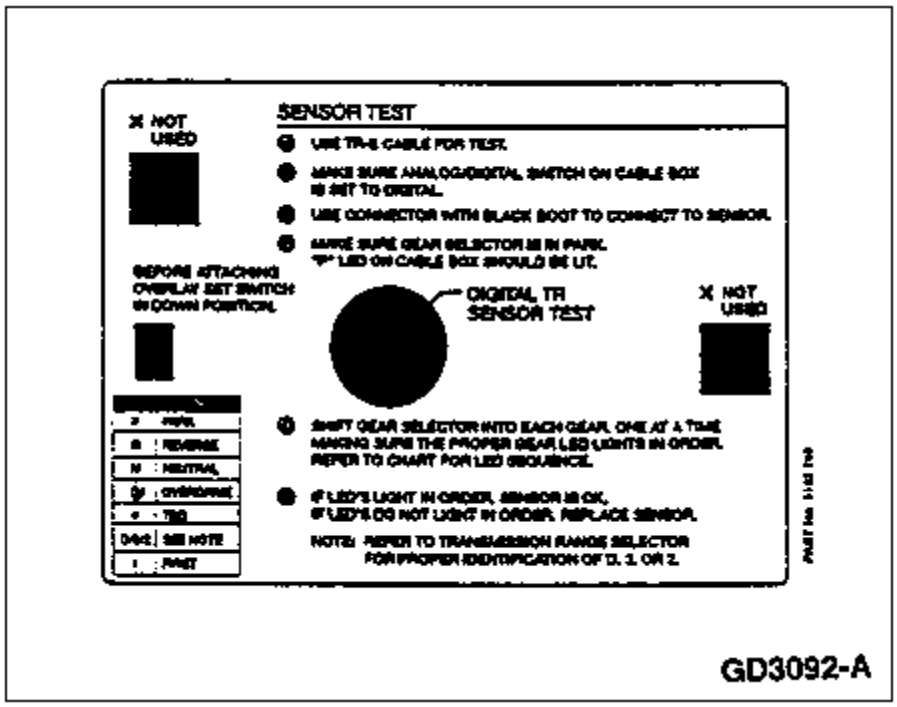
tomsn048@gmail.com



CAUTION: Route all cables away from heat sources to prevent damage to cables during testing.

Use the transmission tester extender cable when running tests with the transmission on the vehicle.

7. Turn large dial to DIGITAL TR SENSOR TEST.



8. Plug transmission tester power cable into cigar lighter socket.

All LEDs should light for a short period and then turn off. This is the Tester's internal circuit check.

CAUTION: For resistance checks, be sure that the tester selector switch is set to the TR SENSOR TEST position or damage to the ohmmeter may result.

Sensor Test

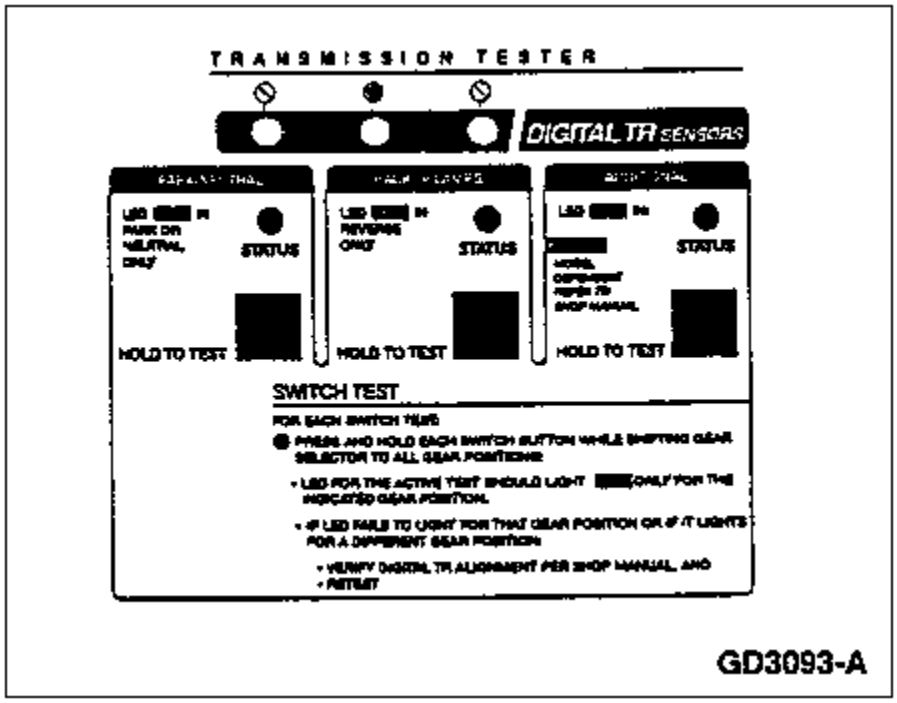
tomsn048@gmail.com

CAUTION: Be sure that the DIGITAL 12 pin sensor cable connector (black) is used. If the wrong connection is made or the slide switch is in the wrong position, the LEDs on the TR cable will give false or no response during testing. This will cause the replacement of good parts.

1. Place transmission range selector lever into PARK.
2. Ensure that the "E" cable ANALOG/DIGITAL switch is set to DIGITAL.
3. Move the transmission range selector lever through all ranges.
4. Monitor the LEDs, located on the "E" cable, in each gear position. The LED should illuminate RED for the appropriate range selected.
5. If the LED for the applicable gear range position fails to illuminate RED or if it lights for a position other than the gear selected:
    - Verify test cable connections at sensor and tester.
    - Verify transmission shift linkage for proper adjustment.
    - Verify DTR sensor for proper adjustment.
    - Retest.
6. If the sensor still fails to illuminate the LED RED for the selected gear range or indicates incorrect gear position, replace it.

Switch Tests — Park/Neutral, Backup Lamp and Optional Circuits

NOTE: LED lights red when circuit is closed.



tomsn048@gmail.com

LED turns off when circuit is open.

1. Press and hold each test button while moving the transmission range selector lever to each gear position.

2. Monitor each STATUS LED:

   The LED in the appropriate gear position being testing should light red.

   If the LED for the applicable gear position fails to light red, or if it lights for a position other than the gear selected:

   - Verify DTR alignment. Refer to the assembly procedure in this section.
   - Retest.

3. If the DTR sensor fails, replace it.

   After testing is finished, follow the Disconnecting The Tester procedure in this section.

Disconnecting The Tester

1. **CAUTION: Do not attempt to pry off connectors with a screwdriver. This will damage the connector and could result in a transmission concern.**

   Disconnect transmission tester from the DTR sensor connector.

2. Reinstall vehicle wiring harness. Verify connection by pulling up on the harness.

3. Reinstall all heat shields that were previously removed.

4. Disconnect transmission tester power lead from vehicle.

5. Erase all DTCs using the procedures in the Powertrain Control/Emissions Diagnosis Manual.

6. Rerun On-Board Diagnostic Tests to receive a pass code.

7. Verify that the customer concern has been eliminated.

Pinpoint Tests

PINPOINT TEST A: SHIFT SOLENOIDS

Solenoid Operation Chart

The following chart shows normal solenoid operation for given operating modes.

SOLENOID OPERATION CHART — 4R44E

Transmission Range Selector Lever Position	Powertrain Control Module (PCM) Gear Commanded	4R44E Solenoid States				
		Engine Braking	SS1	SS2	SS3	CCS
P/N	P/N	No	On	Off	Off	Off
R	R	Yes [1]	On	Off	Off	O/W [1]
(D)(Overdrive)	1 2 3 4	No No No No	On On Off Off	Off On Off Off	Off Off Off On	Off Off Off Off
(D) [1]	1	Yes	On	Off	Off	On
	2 3	Yes Yes	On Off	On Off	Off Off	On On
Manual 2	2	Yes	On	On	Off	On
Manual 1	1	Yes	On	Off	Off	On

[1] O/W = TCS "ON"

Shift Solenoid Failure Mode Charts

NOTE: 2nd and 4th gear in O/D position can only be obtained with sufficient EPC pressure (i.e., no short in EPC circuit can be present).

Shift Solenoid Failure "Always Off"

Shift Solenoid failed in the OFF mode due to PCM and/or vehicle wiring concerns; solenoid electrically or mechanically stuck in the OFF mode.

SS1 Always OFF:	Transmission Range Selector Lever Position		
	OD	2	1

tomsn048@gmail.com

PCM Gear Commanded	Actual Gear Obtained		
1	3	—	2
2	2	2	2 [1]
3	3	—	—
4	4	—	—

[1] When a manual pull-in occurs above a calibrated speed, the transmission will downshift from the higher gear until the vehicle speed drops below this calibrated speed.

SS2 Always OFF:	Transmission Range Selector Lever Position		
	OD	2	1
PCM Gear Commanded	Actual Gear Obtained		
1	1	—	1
2	1	2	1
3	3	—	—
4	4	—	—

SS3 Always OFF:	Transmission Range Selector Lever Position		
	OD	2	1
PCM Gear Commanded	Actual Gear Obtained		
1	1	—	1
2	2	2	2 [1]
3	3	—	—
4	3	—	—

[1] When a manual pull-in occurs above a calibrated speed, the transmission will downshift from the higher gear until the vehicle speed drops below this calibrated speed.

Shift Solenoid Failure "Always On"

Failed ON due to powertrain control module (PCM) (12A650) and/or vehicle wiring concerns; solenoid electrically or mechanically stuck ON.

SS1 Always ON:	Transmission Range Selector Lever Position		
	OD	2	1
PCM Gear Commanded	Actual Gear Obtained		
1	1	—	1
2	2	2	2 [1]
3	1	—	—
4	Ratio 1.86	—	—

[1] When a manual pull-in occurs above a calibrated speed, the transmission will downshift from the higher gear until the vehicle speed drops below this calibrated speed.

tomsn048@gmail.com

SS2 Always ON:	Transmission Range Selector Lever Position		
	OD	2	1
PCM Gear Commanded	Actual Gear Obtained		
1	2	—	2
2	2	2	2
3	2	—	—
4	2	—	—

SS3 Always ON:	Transmission Range Selector Lever Position		
	OD	2	1
PCM Gear Commanded	Actual Gear Obtained		
1	Ratio 1.86	—	Ratio 1.86
2	Ratio 1.11	Ratio 1.11	Ratio 1.11 [1]
3	4	—	—
4	4	—	—

[1] When a manual pull-in occurs above a calibrated speed, the transmission will downshift from the higher gear until the vehicle speed drops below this calibrated speed.

NOTE: 2nd and 4th gear in O/D position can only be obtained with sufficient EPC pressure (i.e., no short in EPC circuit can be present).

A1 ELECTRONIC DIAGNOSTICS

- Check to make sure transmission harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding.
- Connect New Generation STAR (NGS) Tester 007-00500 or equivalent.
- Perform KOEO test until continuous DTCs have been displayed.
- Enter output test mode (OTM). Refer to On-Board Diagnostics with NGS as outlined.
- Select the mode "ALL ON".
- Push START to turn outputs "ON".
- Push STOP to turn outputs "OFF".

Does vehicle enter OTM?

Yes	No
REMAIN in OTM. GO to **A2** .	PRESS START. If vehicle does not enter OTM, REFER to Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the automatic transmission.

tomsn048@gmail.com

A2 CHECK ELECTRICAL SIGNAL OPERATION

CAUTION: Do not pry up on connector, depress release button, then pull up on the connector.

NOTE: Refer to the schematic and chart preceding this pinpoint test.

- Disconnect transmission connector.
- Using a mirror, inspect both ends of connector for damaged or pushed out pins, corrosion, loose wires, and missing or damaged seals.
- Connect Rotunda 73 Digital Multimeter 105-R0051 or equivalent positive lead to VPWR and negative test lead to the solenoid circuit of the transmission vehicle harness connector.
- Place multimeter on 20-volt scale.
- While observing multimeter, press "start" and "stop" to cycle solenoid output ON and OFF.

Does the suspect solenoid output voltage change at least 0.5 volts?

Yes	No
GO to **A5**	GO to **A3** .

A3 CHECK CONTINUITY OF SOLENOID SIGNAL AND VPWR HARNESS CIRCUITS

NOTE: Refer to the schematic and chart preceding this pinpoint test.

- Key OFF.
- Ensure harness transmission connector is disconnected.
- Disconnect powertrain control module (PCM), inspect for damage or pushed out pins, corrosion, or loose wires.
- Install Rotunda Breakout Box 014-00950 or equivalent, leave PCM disconnected.
- Measure resistance between PCM test Pins 1, 27, 53 at the breakout box and the appropriate signal pin at transmission harness connector.
- Measure resistance between PCM test Pins 71/97 at the breakout box and the appropriate signal pins at the transmission harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
GO to **A4** .	SERVICE open circuits. REMOVE breakout box. RECONNECT all components. REPEAT Quick Test.

A4 CHECK SOLENOID HARNESS FOR SHORTS TO POWER AND GROUND

NOTE: Refer to the schematic and chart preceding this pinpoint test.

- Ensure Rotunda Breakout Box 014-00950 or equivalent is installed and powertrain control module disconnected.

tomsn048@gmail.com

- Ensure transmission harness connector is disconnected.
- Measure resistance between PCM signal test Pins 1, 27, 53 and the test Pins 71/97 at the breakout box.
- Measure resistance between PCM test Pins 1, 27, 53 and PCM test Pins 91 and test Pins 77, 103 at the breakout box and chassis ground.

Is each resistance greater than 10,000 ohms?

Yes	No
GO to **A5** .	SERVICE short circuit. REMOVE breakout box. RECONNECT all components. REPEAT Quick Test.

A5 TRANSMISSION FUNCTIONAL TEST

CAUTION: Do not pry connector. Pull transmission harness connector.

- Ensure that the vehicle harness is disconnected at transmission.
- Install tester to Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) with Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in Transmission Tester Kit or equivalent.
- Use tests outlined in the Transmission Tester manual.
- Perform Solenoid Function Test.
- LED will turn green when solenoid activates and turn off when deactivated.
- LED will turn red if an activated solenoid/harness is shorted to BAT+ .
- LED will remain off if an activated solenoid/harness is shorted to ground or no continuity (open circuit).

Do the solenoids (LED) activate? (LED green)

Yes	No
GO to **A6** .	GO to **A7** .

A6 TRANSMISSION DRIVE TEST

- Reconnect PCM.
- Perform the Drive Test outlined in the Transmission Tester Manual.

Does the vehicle upshift when commanded by the tester?

Yes	No
REPLACE PCM. ERASE all codes and PERFORM the Transmission Drive Cycle Test as outlined in this manual. RERUN Quick Test. If the codes are still present, REFER to the Diagnosis By Symptom Routines .	GO to **A7** .

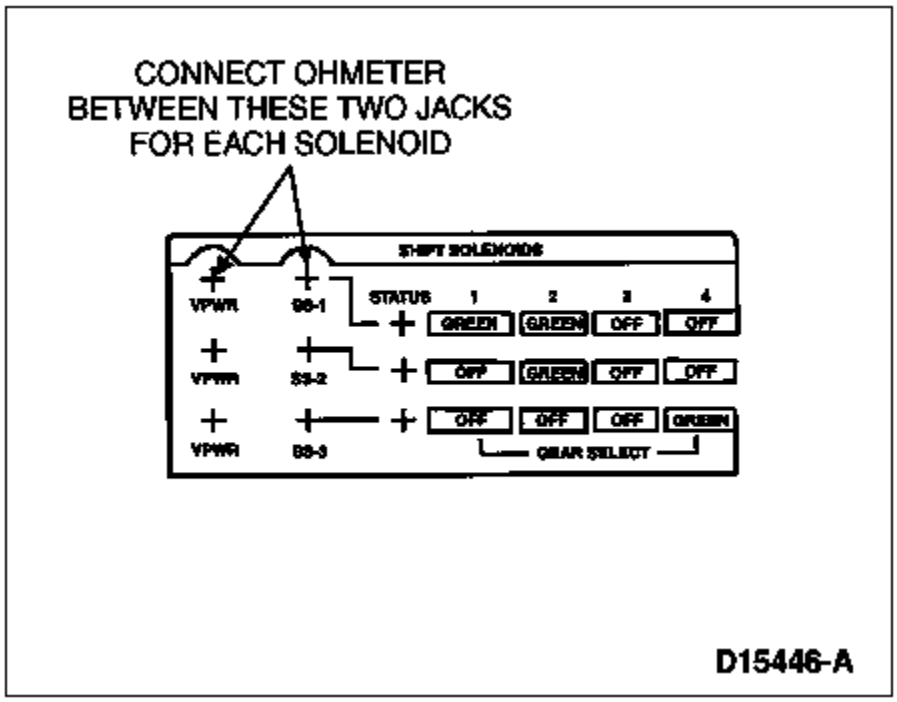
tomsn048@gmail.com

A7 CHECK RESISTANCE OF SOLENOID/HARNESS

NOTE: Refer to transmission tester for terminal locations.

- Set MODE switch to **BENCH** position.
- Rotate GEAR SELECTOR switch to **OHMS CHECK** position.
- Connect ohmmeter negative lead to SS1 jack and positive lead to VPWR jack on tester. This is to test SS1.
- Record resistance. Should be between 22-48 ohms.
- Connect ohmmeter negative lead to SS2 jack and positive lead to VPWR jack on tester. This is to test SS2.
- Record resistance. Should be between 22-48 ohms.
- Connect ohmmeter negative lead to SS3 jack and positive lead to VPWR jack on tester. This is to test SS3.
- Record resistance. Should be between 22-48 ohms.

Are all shift solenoid resistances within specifications?

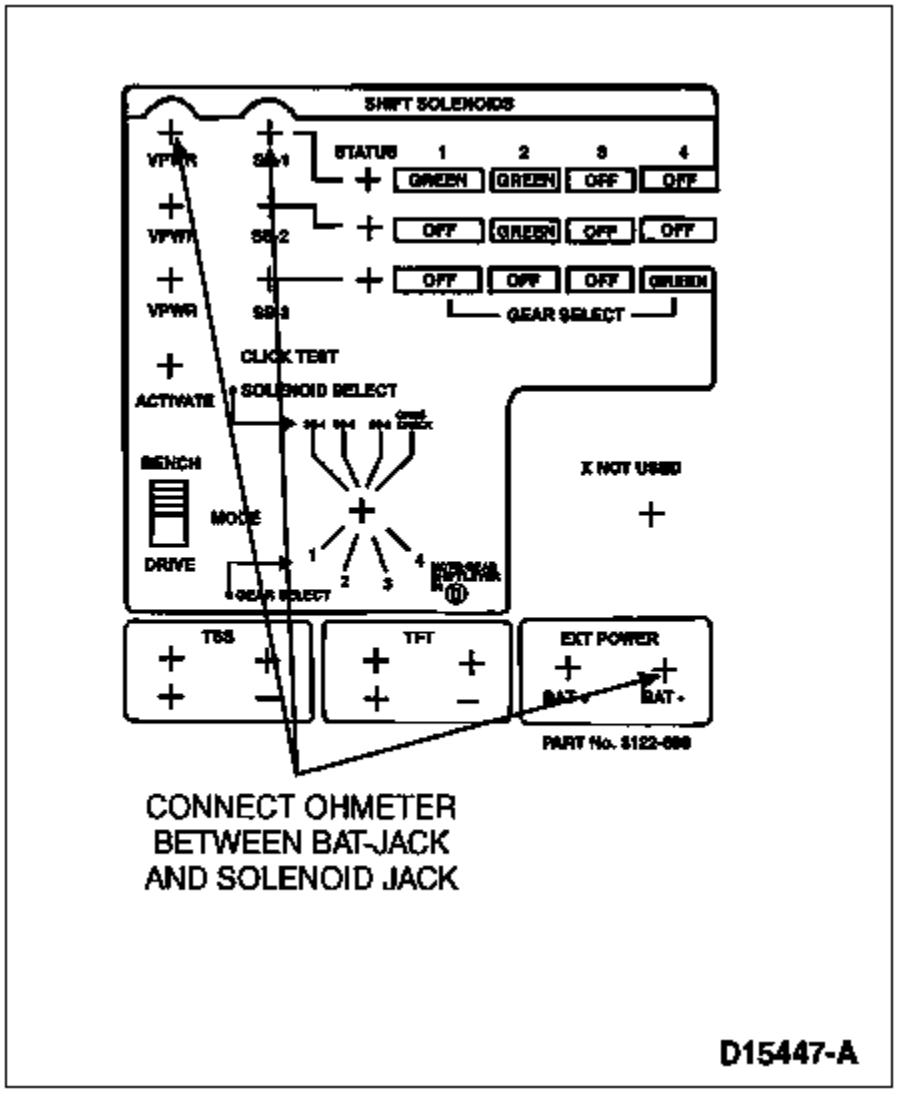


Yes	No
GO to **A8** .	**NOTE: Out of specifications may be caused by internal harness or solenoid concerns.** GO to **A9** .

A8 CHECK SOLENOID/HARNESS FOR SHORT TO GROUND

tomsn048@gmail.com

- Check for continuity between BAT- (engine ground) and appropriate jack with an ohmmeter or other low current tester (less than 200 milliamps).



Solenoid	Tester Jack
SS1	SS1 VPWR
SS2	SS2 VPWR
SS3	SS3 VPWR

- Connection should show infinite resistance (no continuity).

Is there continuity?

Yes	No

tomsn048@gmail.com

GO to **A9** .	GO to the Shift Concerns in the Diagnosis By Symptom Index .

A9 INTERNAL ELECTRONIC DIAGNOSTICS

- Drain transmission fluid.
- Remove transmission fluid pan.
- Check that internal harness connector is fully engaged on shift solenoid assemblies.
- Check that internal harness connector terminals are fully seated in connector.
- Inspect connectors for damage.
- Inspect wires for insulation damage.

Were checks done and was everything OK?

Yes	No
GO to **A10** .	SERVICE as required.

A10 CHECK INTERNAL HARNESS (CONTINUITY)

CAUTION: Do not probe into connector terminals.

- Disconnect internal harness from solenoid assemblies.
- For SS1, connect positive lead from ohmmeter to tester jack SS1 and negative lead at appropriate signal wire of SS1 wire connector.
- Record resistance. Should be less than 0.5 ohms.
- For SS2, connect positive lead from ohmmeter to tester jack SS2 and negative lead at appropriate signal wire of the SS2 connector.
- Record resistance. Should be less than 0.5 ohms.
- For SS3, connect positive lead from ohmmeter to test jack SS3 and negative lead at appropriate signal wire of the SS3 wire connector.
- Record resistance. Should be less than 0.5 ohms.
- For SS1, SS2, and SS3 VPWR, connect positive lead from an ohmmeter to appropriate solenoid VPWR and negative lead to appropriate VPWR wire for SS1, SS2, or SS3.
- Record resistance. Should be less than 0.5 ohms.

Wire Colors					
SS1		SS2		SS3	
Signal	PWR	Signal	PWR	Signal	PWR
Gray	White	Brown	White	Yellow	White

Is resistance less than 0.5 ohms?

Yes	No
GO to **A11** .	REPLACE internal harness. GO to **A12** .

tomsn048@gmail.com

A11 CHECK INTERNAL HARNESS (SHORTS TO GND)

- Check for continuity between BAT- (engine ground) and appropriate wire with ohmmeter or other low current tester (less than 200 milliamps).

Wire Colors					
SS1		SS2		SS3	
Signal	PWR	Signal	PWR	Signal	PWR
Gray	White	Brown	White	Yellow	White

- Connection should show infinite resistance (no continuity).

Is there continuity?

Yes	No
REPLACE internal harness. GO to **A12** .	GO to **A12** .

A12 CHECK SOLENOID RESISTANCE AT SOLENOID

- Check solenoid resistance by connecting ohmmeter at solenoid terminals.
- Measure and record resistance for each solenoid (SS1, SS2, SS3).

Is resistance between 22-48 ohms?

Yes	No
GO to **A13** .	REPLACE shift solenoid.

A13 CHECK SOLENOID FOR SHORT TO GROUND

- Check for continuity between engine ground and appropriate shift solenoid terminal with ohmmeter or other low current tester (less than 200 milliamps).

Solenoid	Terminal
SS1	+/-
SS2	+/-
SS3	+/-

- Connection should show infinite resistance (no continuity).

Is there continuity?

Yes	No
REPLACE shift solenoid.	REFER to the Diagnosis By Symptom Routines .

tomsn048@gmail.com

PINPOINT TEST B: TRANSMISSION FLUID TEMPERATURE (TFT) SENSOR

B1 4R44E ELECTRICAL DIAGNOSIS

- Make sure transmission harness connector is fully seated and terminals are fully engaged in connector and in good condition before proceeding.

Have items been checked?

Yes	No
GO to **B2** .	PERFORM checks. ERASE codes. REPEAT Quick Test.

B2 CHECK ELECTRICAL SIGNAL OPERATION

CAUTION: Do not pry up on connector. Depress release button, then pull up on the vehicle harness.

NOTE: Refer to the schematic and chart preceding this pinpoint test.

- Key OFF.
- Disconnect transmission connector.
- Using a mirror, inspect both ends of the connector for damaged or pushed out pins, corrosion, or loose wires and missing or damaged seals.
- Connect Rotunda 73 Digital Multimeter 105-R0051 or equivalent positive test lead to TFT circuit and negative test lead to Signal Return (SIG RTN) circuit of transmission vehicle harness connector.
- Place multimeter on 20-volt scale.
- Turn key ON, engine OFF.

Is voltage between 4.75 and 5.25 volts?

Yes	No
GO to **B5** .	GO to **B3** .

B3 CHECK CONTINUITY OF TFT AND SIG RTN CIRCUITS

NOTE: Refer to the schematic and chart preceding this pinpoint test.

- Key OFF.
- Ensure that the vehicle harness is disconnected at the transmission connector.
- Disconnect powertrain control module (PCM). Inspect for damaged or pushed out pins, corrosion or loose wires.
- Install Rotunda Breakout Box 014-00950 or equivalent. Leave PCM disconnected.

tomsn048@gmail.com

- Measure resistance between PCM test Pin 37 at the breakout box and the appropriate signal pin at transmission harness connector.
- Measure resistance between PCM test Pin 91 at the breakout box and the appropriate signal pins at the transmission harness connector.

Are both resistances less than 5.0 ohms?

Yes	No
GO to **B4** .	SERVICE open circuit(s). REMOVE breakout box. RECONNECT all components. ERASE all codes. REPEAT Quick Tests.

B4 CHECK TFT CIRCUIT FOR SHORT TO VPWR AND GROUND

NOTE: Refer to the schematic and chart preceding this pinpoint test.

- Key OFF.
- Ensure transmission harness connector is disconnected.
- Disconnect powertrain control module. Inspect for damaged or pushed out pins, corrosion or loose wires.
- Install Rotunda Breakout Box 014-00950 or equivalent. Leave powertrain control module disconnected.
- Measure resistance between PCM test signal Pin 37 and the test Pins 71/97 at the breakout box.
- Measure resistance between TFT test pin 37 and chassis ground, Pins 51, 76, 77, 103 and 91.

Is the resistance greater than 10,000 ohms?

Yes	No
GO to **B5** .	SERVICE short circuit. REMOVE breakout box. RECONNECT all components. ERASE codes. REPEAT Quick Tests.

B5 CHECK RESISTANCE OF TFT SENSOR

CAUTION: Do not pry up on connector. Depress release button, then pull up on vehicle harness connector.

NOTE: Be sure tester solenoid select switch is in the OHMS CHECK position or damage to ohmmeter may result.

- Vehicle at normal operating temperature.
- Disconnect vehicle harness at transmission.
- Install Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) with Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in Transmission Tester Kit or equivalent to transmission connector.
- Set MODE switch to BENCH mode.
- Rotate solenoid select switch to OHMS CHECK mode.
- Connect ohmmeter negative lead to -TFT jack and positive lead to + TFT jack.

tomsn048@gmail.com

NOTE: While performing tests 1 and 2 observe resistances. Code P0713 is set if resistance value exceeds 869K ohms (OPEN circuit). Code P0712 is set if resistance value falls below 597 ohms (SHORT circuit).

- Perform tests 1 and 2.
- Test 1: Record resistance. Should be approximately in following ranges:

Transmission Fluid Temperature

℃	℉	Resistance (Ohms)
-40 - -20	-40 - -4	967k-248k
-19 - -1	-3 - 31	248k-100k
0-20	32-68	100k-37k
21-40	69-104	37k-16k
41-70	105-158	16k-5k
71-90	159-194	5k-2.7k
91-110	195-230	2.7k-1.5k
111-130	231-266	1.5k-0.8k
131-150	267-302	0.8k-0.54k

- Test 2: Check for intermittent short or open.
- If resistance was between 0.8k and 100k ohms, perform following test. If transmission is cold, run transmission to warm it. If transmission is warm, allow transmission to cool. Check TFT sensor resistance again. Compare resistance with initial resistance. Resistance should decrease if transmission was heated and should increase if transmission was allowed to cool. If correct change in resistance occurs, repeat On-Board Diagnostics.

Is resistance within range?

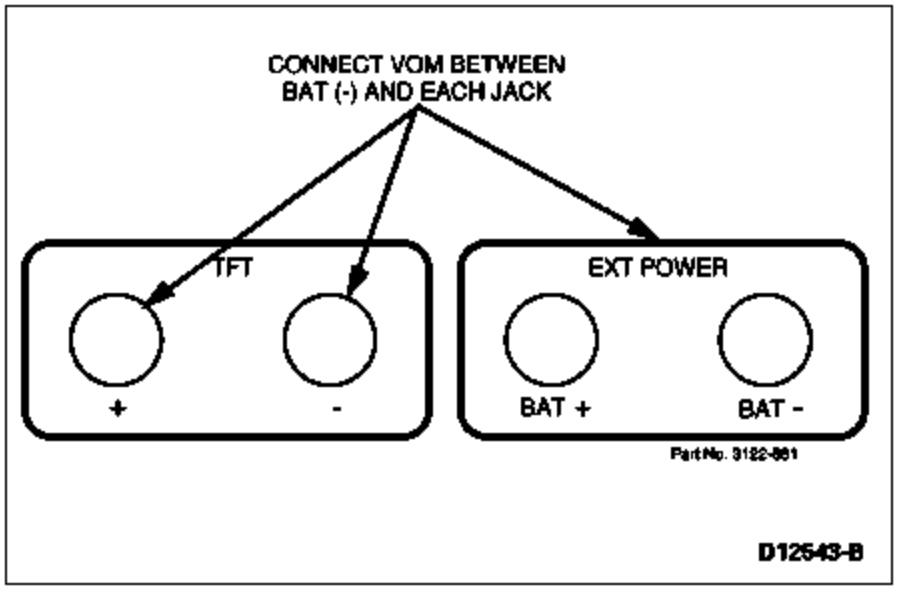
Yes	No
GO to **B6** .	REPLACE internal transmission wiring harness. CLEAR codes. RERUN Quick Test.

B6 CHECK TFT SENSOR/HARNESS FOR SHORT TO GROUND

- Check for continuity between BAT- (engine ground) and appropriate jack (-TFT and +TFT), appropriate wire with ohmmeter, or other low current tester (less than 200 milliamps).
- Connection should show infinite resistance (no continuity).

Is there continuity?

tomsn048@gmail.com



Yes	No
GO to **B7** .	REPLACE powertrain control module. CLEAR codes and RERUN Self Test.

B7 INTERNAL ELECTRONIC DIAGNOSTICS

- Drain transmission fluid.
- Remove transmission fluid pan.
- Check that internal harness connector is fully seated on TFT sensor.
- Check that internal harness connector terminals are fully engaged in connector.
- Inspect connector for damage.

Is everything in good condition?

Yes	No
REPEAT Quick Test. If codes are present and overtemp condition exists, CHECK fluid condition. CHECK overheat condition in the Diagnosis By Symptom Routine . SERVICE as required. REPEAT Quick Test.	SERVICE as required. REPLACE internal harness.

PINPOINT TEST C: TORQUE CONVERTER CLUTCH (TCC) SOLENOID

C1 ELECTRONIC DIAGNOSTICS

- Check to make sure transmission harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding.

tomsn048@gmail.com

- Connect New Generation STAR (NGS) Tester 007-00500 or equivalent.
- Perform KOEO test until continuous DTCs have been displayed.
- Enter output test mode (OTM). Refer to On-Board Diagnostics with NGS as outlined.
- Select the mode "ALL ON".
- Push START to turn outputs "ON".
- Push STOP to turn outputs "OFF".

Does vehicle enter OTM?

Yes	No
REMAIN in OTM. GO to C2.	PRESS START. If vehicle does not enter OTM, REFER to Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the automatic transmission.

C2 CHECK ELECTRICAL SIGNAL OPERATION

CAUTION: Do not pry up on connector. Depress release button, then pull up on the vehicle harness.

NOTE: Refer to the schematic and chart preceding this pinpoint test.

- Disconnect transmission connector.
- Using a mirror, inspect both ends of the connector for damaged or pushed out pins, corrosion, loose wires and missing or damaged seals.
- Connect Rotunda 73 Digital Multimeter 105-R0051 or equivalent positive test lead to VPWR circuit and negative test lead to solenoid circuit of transmission vehicle harness connector.
- Place multimeter on 20-volt scale.
- While observing multimeter, press "start" and "stop" to cycle solenoid ON and OFF.

Does the suspected solenoid output voltage change at least 0.5 volts?

Yes	No
GO to C5.	GO to C3.

C3 CHECK CONTINUITY OF SOLENOID SIGNAL AND VPWR HARNESS CIRCUITS

NOTE: Refer to the schematic and chart preceding this pinpoint test.

- Turn key OFF.
- Ensure transmission harness connector is disconnected.
- Disconnect powertrain control module (PCM). Inspect for damaged or pushed out pins, corrosion or loose wires.
- Install Rotunda Breakout Box 014-00950 or equivalent. Leave powertrain control module disconnected.
- Measure resistance between PCM test Pin 54 at the breakout box and the appropriate signal pin at transmission harness connector.
- Measure resistance between PCM test Pins 71/97 at the breakout box and the VPWR pin at the

tomsn048@gmail.com

transmission harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
GO to C4 .	SERVICE the open circuit(s). REMOVE the breakout box. RECONNECT all components. REPEAT Quick Test.

C4 CHECK SOLENOID/HARNESS FOR SHORTS TO POWER AND GROUND

NOTE: Refer to the schematic and chart preceding this pinpoint test.

- Ensure Rotunda Breakout Box 014-00950 or equivalent is installed and powertrain control module is disconnected.
- Ensure transmission vehicle harness connector is disconnected.
- Measure resistance between PCM signal test Pin 54 and the test Pins 71/97 at the breakout box.
- Measure resistance between PCM signal test Pin 54 and test Pins 51, 76, 77, 91 and 103 at the breakout box and chassis ground.

Is the resistance greater than 10,000 ohms?

Yes	No
GO to C5 .	SERVICE the short circuit(s). REMOVE the breakout box. RECONNECT all components. REPEAT Quick Test.

C5 TRANSMISSION FUNCTIONAL TEST

CAUTION: Do not pry connector. Pull on transmission harness connector.

- Disconnect vehicle harness at transmission.
- Install Rotunda Tester 007-00130 (part of Rotunda Transmission Tester Kit) with Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in Transmission Tester Kit to transmission connector.
- Use tests outlined in the Transmission Tester manual.
- Perform TCC Solenoid Function Test.
- LED will turn green when solenoid activates and turn off when deactivated.
- LED will turn red if an activated solenoid/harness is shorted to BAT+ .
- LED will remain off if an activated solenoid/harness is shorted to ground or no continuity (open circuit).

Does the TCC (LED green) activate when the tester switch is depressed?

Yes	No
GO to C6 .	GO to C7 .

tomsn048@gmail.com

C6 TRANSMISSION DRIVE TEST

- Reconnect PCM.
- Perform the Drive Test as outlined in Transmission Tester Manual.
- While in 3rd gear, depress the TCC switch.

Does the TCC activate (LED green)? Does the engine rpm drop?

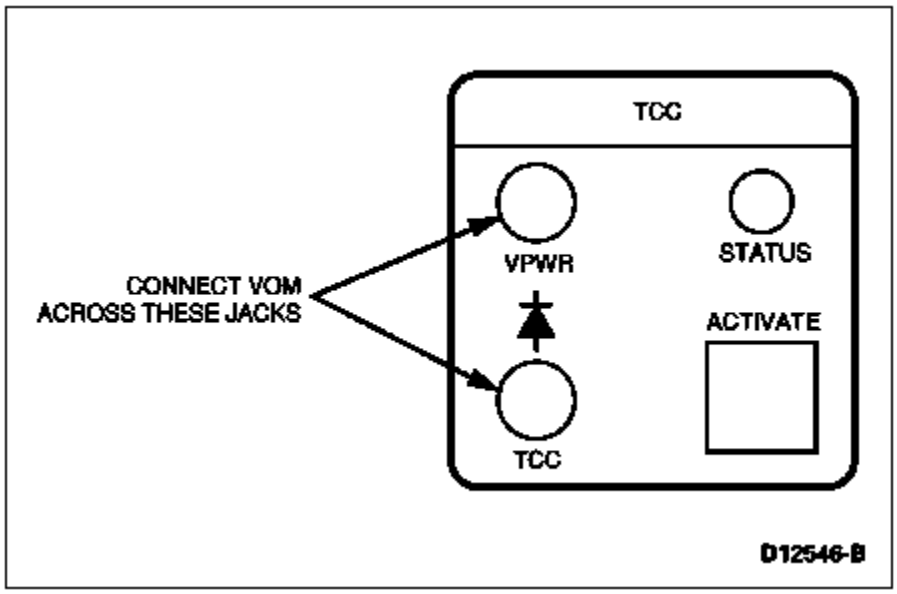
Yes	No
REPLACE PCM. ERASE all codes and PERFORM Transmission Drive Cycle Test and Torque Converter Engagement Test as outlined in this manual. RERUN Self Test. If codes are still present, REFER to the Diagnosis By Symptom Index — Torque Converter Concerns for continued diagnosis.	GO to **C7**.

C7 CHECK RESISTANCE OF SOLENOID/HARNESS

Refer to Transmission Tester for terminal locations.

- Set MODE switch to BENCH mode on tester.
- Rotate GEAR SELECTOR switch to OHMS CHECK position.
- Connect ohmmeter negative lead to TCC jack and positive lead to VPWR jack on tester. This is to test TCC.
- Record resistance. Should be between 8.9-16.0 ohms for TCC.

Is resistance within specifications?



Yes	No

tomsn048@gmail.com

GO to **C8** .	**NOTE: Internal harness or solenoid may be damaged.** GO to **C9** .

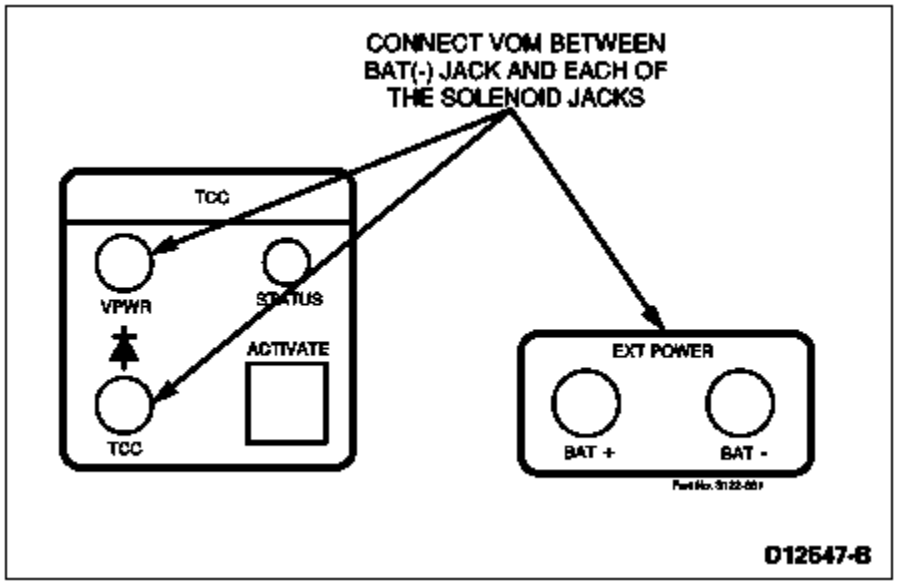
C8 CHECK SOLENOID/HARNESS FOR SHORT TO GROUND

- Check for continuity between BAT- (engine ground) and appropriate jack with ohmmeter or other low current tester (less than 200 milliamps).

Solenoid	Tester Jack
TCC	TCC VPWR

- Connection should show infinite resistance (no continuity).

Is there continuity?



Yes	No
GO to **C9** .	REFER to Diagnosis By Symptom Index in this manual to diagnose torque converter clutch concerns.

C9 INTERNAL ELECTRONIC DIAGNOSTICS

- Drain transmission fluid.
- Remove transmission fluid pan.
- Check that internal harness connector is fully seated on TCC solenoid.

tomsn048@gmail.com

- Check that internal harness connector terminals are fully engaged in connector.
- Inspect connector for damage.

Is connector in good condition and seated properly?

Yes	No
GO to **C10** .	SERVICE as required.

C10 CHECK INTERNAL HARNESS (CONTINUITY)

NOTE: Do not probe into connector terminals.

- Disconnect internal harness from solenoid (TCC wire connector).
- Connect positive lead from ohmmeter to tester TCC jack and negative lead at purple wire at TCC connector.
- Record resistance. Should be less than 0.5 ohms.
- Next, connect positive lead from ohmmeter to tester VPWR jack and negative lead at black wire of TCC connector.

Record resistance. Is resistance less than 0.5 ohms?

Yes	No
GO to **C11** .	REPLACE internal harness. GO to **C12** .

C11 CHECK INTERNAL HARNESS

- Check for continuity between BAT- (engine ground) and the appropriate wire with an ohmmeter or other low current tester (less than 200 milliamps).

Solenoid	Wire Color
TCC	Purple
VPWR	Black

- Connection should not show continuity (infinite).

Is there continuity?

Yes	No
REPLACE internal harness. GO to **C12** .	GO to **C12** .

C12 CHECK SOLENOID RESISTANCE

- Check solenoid resistance by connecting ohmmeter at terminals of TCC solenoid.
- Record resistance. Should be between 8.9-16.0 ohms for TCC.

tomsn048@gmail.com

Is resistance within specification?

Yes	No
GO to **C13** .	REPLACE TCC solenoid.

C13 CHECK SOLENOID FOR SHORT TO GROUND

- Check for continuity between BAT- (engine ground) and appropriate terminal with ohmmeter or other low current tester (less than 200 milliamps).

Solenoid	Terminal
TCC	+/-

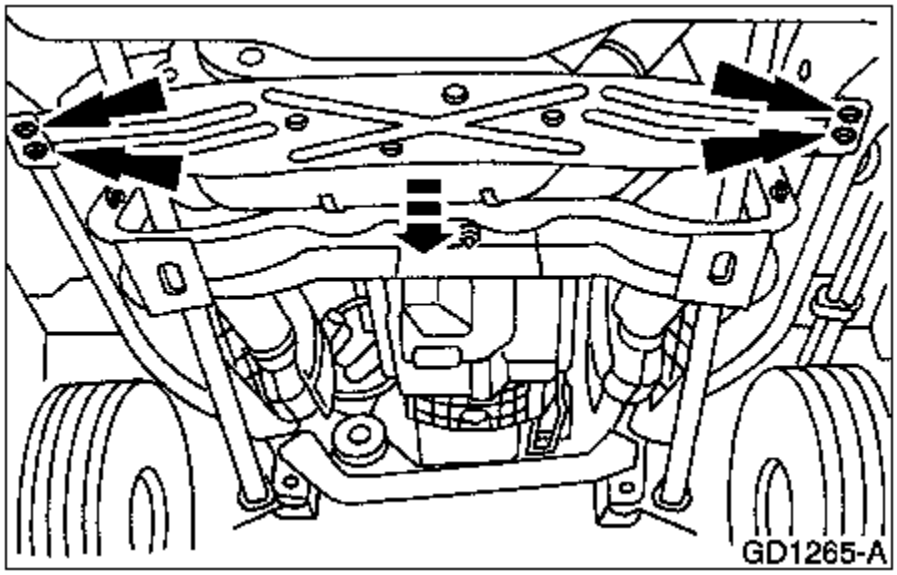
- Connection should show infinite resistance (no continuity).

Is there continuity?

Yes	No
REPLACE TCC solenoid.	REFER to Diagnosis By Symptom Index in this section for torque converter clutch concerns.

PINPOINT TEST D: DIGITAL TRANSMISSION RANGE (DTR) SENSOR

Digital TR Sensor Overlay



D1 VERIFY DIGITAL TRANSMISSION RANGE SENSOR ALIGNMENT

tomsn048@gmail.com

- Turn ignition switch OFF.
- Place transmission range selector lever in PARK.
- Check to make sure the DTR sensor harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding.
- Apply the parking brake.
- Place transmission range selector lever in OVERDRIVE.
- Verify the shift linkage is adjusted in the OVERDRIVE (O/D) position.
- Place transmission range selector lever in NEUTRAL.
- Verify that the Digital TR Sensor Alignment Tool (T97L-70010-A) fits in the appropriate slots.

Is the DTR sensor properly adjusted?

Yes	No
GO to **D2** .	ADJUST the DTR sensor as outlined under Assembly . PLACE transmission range selector lever into PARK and CLEAR DTCs. RERUN OBD tests.

D2 CHECK ELECTRICAL SIGNAL OPERATION

- Place transmission range selector lever in PARK.

CAUTION: Do not pry on connector. This will damage the connector and result in a transmission concern.

- Press button and pull out on DTR harness connector.
- Inspect both ends of the connector for damage or pushed out pins, corrosion, loose wires and missing or damaged seals.

Is there damage to the connector, pins or harness?

Yes	No
REPAIR as required. CLEAR DTCs and RERUN OBD tests.	If diagnosing a DTC, GO to **D3** . If diagnosing a starting concern, a backup lamp concern, or 4x4 low engagement concern, GO to **D8** .

D3 CHECK ELECTRICAL SYSTEM OPERATION (DTR AND PCM)

- Turn ignition switch OFF.
- Connect the New Generation STAR (NGS) tester.
- Reconnect DTR connector.
- Turn ignition switch ON.
- Select TR PIDs TR and TR_D on the NGS tester.
- Move transmission range selector lever into each gear and stop.
- Observe the PIDs, TR and TR_D, while wiggling harness and tapping on sensor.

tomsn048@gmail.com

- Compare the PIDs to the chart below:

Selector Position	TR	TR_D
Park	P/N	0000
Reverse	REV	1100
Neutral	NTRL	0110
Drive	O/D *	1111
Man 2	MAN2	1001
Man 1	MAN1	0011

* Will read DRIVE if O/D cancel switch is ON.

Do the PIDs TR and TR_D match the above chart, and does the TR_D PID remain steady when the harness is wiggled or when the sensor is tapped upon?

Yes	No
The problem is not in the DTR sensor system. REFER to Diagnosis by Symptom for further diagnosis.	GO to **D4**. **NOTE: If TR_D changes when wiggling harness or tapping on the sensor, problem may be intermittent.**

D4 CHECK DIGITAL TRANSMISSION RANGE SENSOR OPERATION

- Disconnect DTR Sensor Connector.
- Connect TR-E Cable (007-00111) to Transmission Tester (007-00130).
- Connect TR-E Cable (007-00111) to DTR Sensor.
- Place the DIGITAL TR Overlay (007-00131) onto transmission tester (007-00130).
- Perform SENSOR TEST as instructed on the DTR overlay.

Does the status lamp on the tester TR-E cable match the selected gear positions?

Yes	No
Concern is not in the DTR sensor, GO to **D5**.	REPLACE the DTR sensor and ADJUST as outlined. REFER to Assembly for procedures. CLEAR DTCs and RERUN OBD tests.

D5 CHECK PCM HARNESS CIRCUITS FOR OPENS

NOTE: Refer to schematic diagram and illustration preceding the Pinpoint Tests.

- Turn ignition switch OFF.
- Disconnect powertrain control module (PCM) connector. Inspect for damaged or pushed out pins, corrosion or loose wires.

CAUTION: Do not pry connector. This will damage the connector and result in a

tomsn048@gmail.com

transmission concern.

- Press button and pull out DTR connector.
- Install 104 Pin Breakout Box (014-00950).
- Measure resistance between PCM test pin 91 at the breakout box and signal return circuit pin at vehicle harness connector pin 2.
- Measure resistance between PCM test pin 3 at breakout box and TR1 circuit pin at vehicle harness connector pin 4.
- Measure resistance between PCM test pin 49 at breakout box and TR2 circuit pin at vehicle harness connector pin 5.
- Measure resistance between PCM test pin 50 at breakout box and TR4 circuit pin at vehicle harness connector pin 6.
- Measure resistance between PCM test pin 64 at breakout box and TR3A circuit pin at vehicle harness connector pin 3.

Are all resistances less than 5 ohms?

Yes	No
GO to **D6** .	REPAIR open circuit(s). RECONNECT all components. CLEAR DTCs. RERUN OBD tests.

D6 CHECK PCM HARNESS CIRCUITS FOR SHORT TO GROUND OR POWER

- Measure resistance between PCM test pin 91 and test pins 71/97 at breakout box.
- Measure resistance between PCM test pin 3 and power/ground test pins at breakout box.
- Measure resistance between PCM test pin 49 and power/ground test pins at breakout box.
- Measure resistance between PCM test pin 50 and power/ground test pins at breakout box.
- Measure resistance between PCM test pin 64 and power/ground test pins at breakout box.

Are all resistances greater than 10,000 ohms?

Yes	No
GO to **D7** .	REPAIR short circuit(s). RECONNECT all components. CLEAR DTCs. RERUN OBD tests.

D7 CHECK FOR SHORT BETWEEN TR/PCM INPUT SIGNAL CIRCUITS

- Measure resistance between test pin 3 and pins 49, 50 and 64 at the breakout box.
- Measure the resistance between test pin 49 and pins 3, 50 and 64 at the breakout box.
- Measure the resistance between test pin 50 and pins 3, 49 and 64 at the breakout box.
- Measure the resistance between test pin 64 and pins 3, 49 and 50 at the breakout box.

Are all resistances greater than 10,000 ohms?

Yes	No
REPLACE PCM. RECONNECT all components. CLEAR DTCs and RERUN OBD tests.	REPAIR shorts on circuits having less than 10,000 ohms between other TR/PCM input signal circuits. RECONNECT all components.

tomsn048@gmail.com

	CLEAR DTCs and RERUN OBD tests.

D8 CHECK THE NON PCM INTERNAL CIRCUITS OF SENSOR

- Connect TR-E Cable (007-00111) to Transmission Tester (007-00130).
- Connect TR-E Cable (007-00111) to DTR sensor.
- Place the DIGITAL TR Overlay (007-00131) onto transmission tester (007-00130).
- Perform SWITCH TEST as instructed on the DTR overlay.

Does the status lamp on the tester indicate RED for the correct gear position?

Yes	No
Concern is not in the DTR sensor. For START SYSTEM concerns, GO to Section 03-06 . For Backup Lamp concerns, GO to Section 17-01 . For Optional Circuits: 4x4 Low Neutral Sense; REFER to Powertrain Control/Emissions Diagnosis Manual and Workshop Manual Section 07-07A for diagnosis.	REPLACE DTR sensor and ADJUST as outlined. REFER to Assembly for procedures. CLEAR DTCs and RERUN OBD tests.

PINPOINT TEST E: ELECTRICAL PRESSURE CONTROL (EPC) SOLENOID

E1 ELECTRONIC DIAGNOSTICS

- Check to make sure transmission harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding.
- Connect New Generation STAR (NGS) Tester 007-00500 or equivalent.
- Perform KOEO test until continuous DTCs have been displayed.
- Enter output test mode (OTM). Refer to On-Board Diagnostics with NGS as outlined.
- Select the mode "ALL ON".
- Push START to turn outputs "ON".
- Push STOP to turn outputs "OFF".

Does vehicle enter OTM?

Yes	No
REMAIN in OTM. GO to **E2** .	PRESS START. If vehicle does not enter OTM, REFER to Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the automatic transmission.

E2 CHECK ELECTRICAL SIGNAL OPERATION

CAUTION: Do not pry on connector. Pull up on the connector harness.

tomsn048@gmail.com

NOTE: Refer to the schematic and chart preceding this pinpoint test.

- Disconnect transmission connector.
- Using a mirror, inspect both ends of connector for damage or pushed out pins, corrosion, loose wires, and missing or damaged seals.
- Connect a VOM positive lead to VPWR and the negative test lead to the solenoid circuit of the transmission vehicle harness connector.
- Place VOM on 20 volt scale.
- While observing VOM, press "start" and "stop" to cycle solenoid output ON and OFF.

Does the suspect solenoid output voltage change at least 0.5 volt?

Yes	No
GO to **E5** .	GO to **E3** .

E3 CHECK CONTINUITY OF SOLENOID SIGNAL AND VPWR HARNESS CIRCUITS

NOTE: Refer to the schematic and chart preceding this pinpoint test.

- Key OFF.
- Disconnect powertrain control module (PCM). Inspect for damaged or pushed out pins, corrosion, or loose wires.
- Install Rotunda Breakout Box 014-00950 or equivalent. Leave PCM disconnected.
- Measure resistance between PCM test Pin 81 at the breakout box and the appropriate signal pin at transmission harness connector.
- Measure resistance between PCM test Pins 71/97 at the breakout box and the appropriate signal pins at the transmission harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
GO to **E4** .	SERVICE all open circuit(s). REMOVE the breakout box. RECONNECT all components. ERASE codes and REPEAT OBD Tests.

E4 CHECK HARNESS FOR SHORT TO GROUND OR POWER

NOTE: Refer to the schematic and chart preceding this pinpoint test.

- Key OFF.
- Ensure Rotunda Breakout Box 014-00950 or equivalent is installed and powertrain control module is disconnected.
- Ensure transmission connector is disconnected.
- Measure resistance between PCM signal test Pin 81 and the test Pins 71/97 at the breakout box.
- Measure resistance between PCM test Pin 81 and test Pins 77, 103, 76 and 91 at the breakout box and chassis ground.

Is each resistance greater than 10,000 ohms?

tomsn048@gmail.com

Yes	No
GO to **E5** .	SERVICE all short circuit(s). REMOVE the breakout box. RECONNECT all components. ERASE codes and REPEAT OBD Tests.

E5 TRANSMISSION FUNCTIONAL TEST

- Ensure that the vehicle harness is disconnected at transmission connector.
- Reconnect PCM.
- Install line pressure gauge at line tap on case.
- Install Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) with Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in Transmission Tester Kit or equivalent to transmission connector.
- Set MODE switch to DRIVE mode.
- Rotate GEAR SELECTOR switch to 1ST GEAR position.
- Use tests outlined in the Transmission Tester manual.
- Perform EPC Functional Test.
- LED will turn green when solenoid activates and turn off when deactivated.
- LED will turn red if activated solenoid/harness is shorted to BAT+ .
- LED will remain off if activated solenoid/harness is shorted to ground or no continuity (open circuit).
- Does EPC (LED green) activate when EPC switch is depressed?
- Observe line pressure on gauge while depressing EPC switch (vehicle must be running).

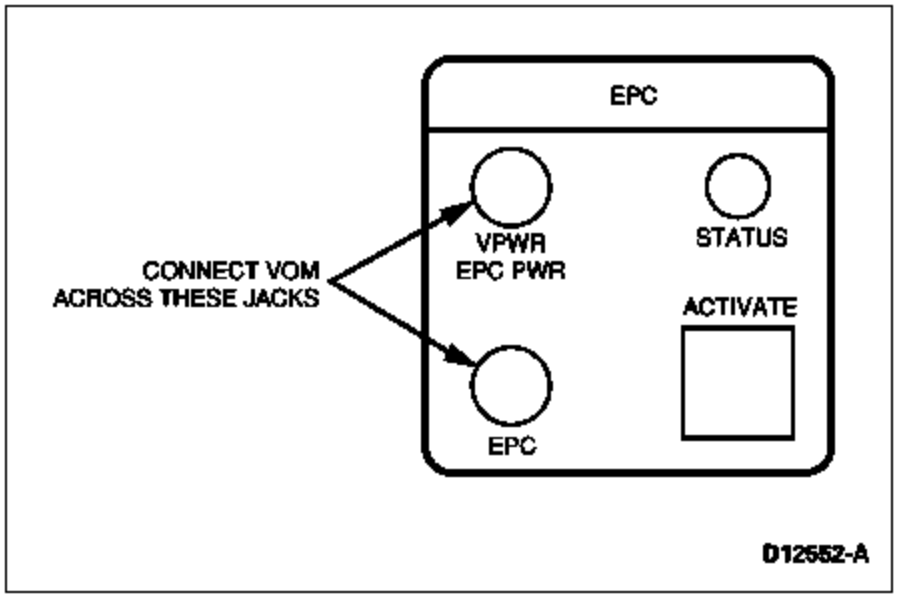
Does line pressure drop?

Yes	No
REPLACE powertrain control module, INSPECT power relay for damage, corrosion. SERVICE as required. REPEAT the OBD Tests.	GO to **E6** .

E6 CHECK RESISTANCE OF SOLENOID/HARNESS

- Set MODE switch to BENCH mode on tester.
- Rotate GEAR SELECTOR switch to OHMS CHECK position.
- Connect ohmmeter negative lead to EPC jack and positive lead to VPWR jack on tester. This is to test EPC solenoid and harness.

tomsn048@gmail.com



- Record resistance.

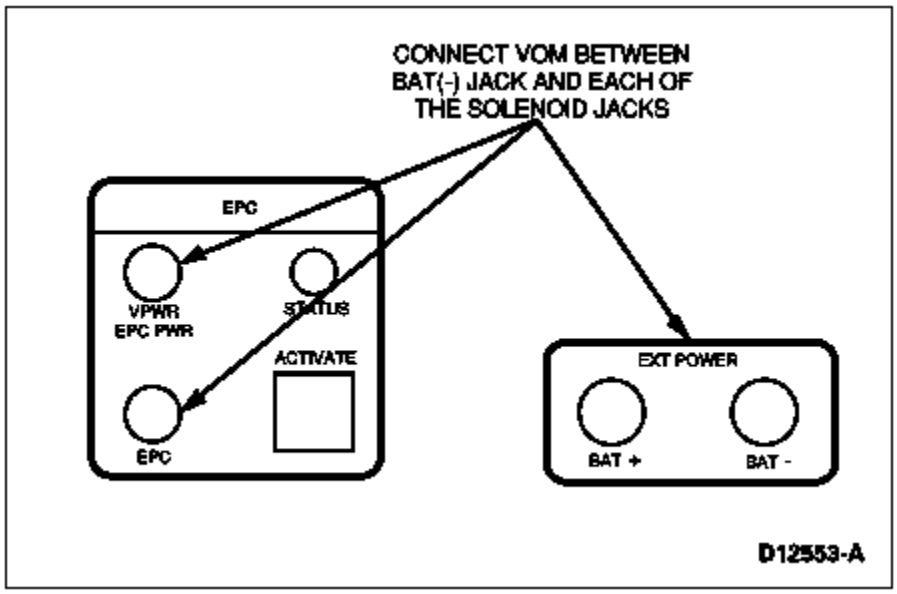
Is resistance between 3.10-5.7 ohms?

Yes	No
GO to **E7** .	**NOTE: Internal harness or solenoid may be damaged.** GO to **E8** .

E7 CHECK SOLENOID/HARNESS FOR SHORT TO GROUND

- Check for continuity between BAT- (engine ground) and appropriate jack with an ohmmeter or other low current tester (less than 200 milliamps).

tomsn048@gmail.com



Solenoid	Tester Jack
EPC	EPC VPWR

- Connection should show infinite resistance (no continuity).

Is there continuity?

Yes	No
GO to **E8** .	REFER to Hydraulic/Mechanical Diagnosis charts in Diagnosis By Symptom Index .

E8 INTERNAL ELECTRONIC DIAGNOSTICS

- Drain transmission fluid.
- Remove transmission fluid pan.
- Check that internal harness connector is fully engaged on EPC solenoid.
- Check that internal harness connector terminals are fully seated in connector.
- Inspect connector for damage.

Is everything engaged and in good condition?

Yes	No
GO to **E9** .	SERVICE as required.

E9 CHECK INTERNAL HARNESS (CONTINUITY)

tomsn048@gmail.com

- Disconnect internal harness from EPC solenoid assembly.
- Connect positive lead from an ohmmeter to tester EPC jack and negative lead at Blue wire at EPC connector.
- Record resistance. Should be less than 0.5 ohms.
- Next, connect positive lead from an ohmmeter to tester VPWR jack and negative lead at green wire at EPC connector.
- Record resistance.

Is resistance less than 0.5 ohms?

Yes	No
GO to **E10** .	REPLACE internal harness.

E10 CHECK INTERNAL HARNESS (SHORTS TO GND)

- Check for continuity between BAT- (engine ground) and appropriate wire with ohmmeter or other low current tester (less than 200 milliamps).

Solenoid	Wire Color
EPC	Blue - Green +

- Connection should show infinite resistance (no continuity).

Is there continuity?

Yes	No
REPLACE internal harness. GO to **E11** .	GO to **E11** .

E11 CHECK SOLENOID RESISTANCE

- Check solenoid resistance by connecting ohmmeter at EPC terminals of solenoid.
- Record resistance.

Is resistance between 3.10-5.7 ohms?

Yes	No
GO to **E12** .	REPLACE EPC solenoid.

E12 CHECK SOLENOID FOR SHORT TO GROUND

- Check for continuity between a good ground and each EPC terminal with ohmmeter or other low current tester (less than 200 milliamps).

Solenoid	Terminal

tomsn048@gmail.com

EPC	+/-

- Connection should show infinite resistance (no continuity).

Is there continuity?

Yes	No
REPLACE EPC solenoid.	REFER to Hydraulic/Mechanical Diagnosis Charts in Diagnosis By Symptom Index for diagnosis of pressure concerns.

PINPOINT TEST F: TURBINE SHAFT SPEED (TSS) SENSOR

F1 4R44E/4R55E ELECTRONIC DIAGNOSTICS

- Check that the transmission vehicle harness connector is fully seated, terminals are fully engaged in connector and in good condition.

Have the items above been checked?

Yes	No
GO to **F2** .	PERFORM the checks. ERASE codes. RERUN OBD Tests.

F2 CHECK CONTINUITY OF TSS HARNESS CIRCUITS

CAUTION: Do not pry on connector. Use connector release and button.

NOTE: Refer to the schematic and chart preceding this pinpoint test.

- Key OFF.
- Disconnect transmission harness connector.
- Disconnect powertrain control module (PCM). Inspect for damaged or pushed out pins, corrosion, or loose wires.
- Install Rotunda Breakout Box 014-00950 or equivalent, leave powertrain control module disconnected.
- Measure resistance between PCM test Pin 84 at the breakout box and the appropriate signal pin at the transmission harness connector.
- Measure resistance between PCM test Pin 91 at the breakout box and the appropriate signal pin at the transmission harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
	SERVICE open circuit(s). REMOVE breakout

tomsn048@gmail.com

GO to **F3** .	box. RECONNECT all components. ERASE codes. RERUN OBD Tests.

F3 CHECK TSS CIRCUITS FOR SHORT TO POWER AND GROUND

- Key OFF.
- Ensure that the vehicle harness is disconnected.
- Breakout box installed, powertrain control module disconnected.
- Measure resistance between PCM test Pins 84, 91 and test Pins 71/97 at the breakout box.
- Measure resistance between PCM signal test Pins 84, and test Pins 91, 71/97, 77, 76 and 103 at the breakout box and chassis ground.

Is the resistance greater than 10,000 ohms?

Yes	No
GO to **F4** .	SERVICE short circuit(s). REMOVE breakout box. RECONNECT all components. ERASE codes and RERUN OBD Tests.

F4 TRANSMISSION FUNCTIONAL TEST

- Ensure that the vehicle harness is disconnected at the transmission.
- Reconnect PCM.
- Install Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) with Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit or equivalent.
- Connect voltmeter positive lead to +TSS and negative lead to -TSS. Set voltmeter to AC.
- Perform Drive Cycle Test . Monitor voltmeter.

Does the voltage increase with an increase in vehicle speed?

Yes	No
REPLACE powertrain control module.	GO to **F5** .

F5 CHECK RESISTANCE OF SOLENOID/HARNESS

NOTE: Refer to 4R44E Transmission Tester for terminal locations.

- Rotate GEAR SELECTOR switch to OFF position.
- Connect ohmmeter negative lead to TSS- jack and positive lead to TSS+ jack on tester.
- Record resistance.
- Resistance should be between 64-120 ohms.

Is the TSS resistance within specifications?

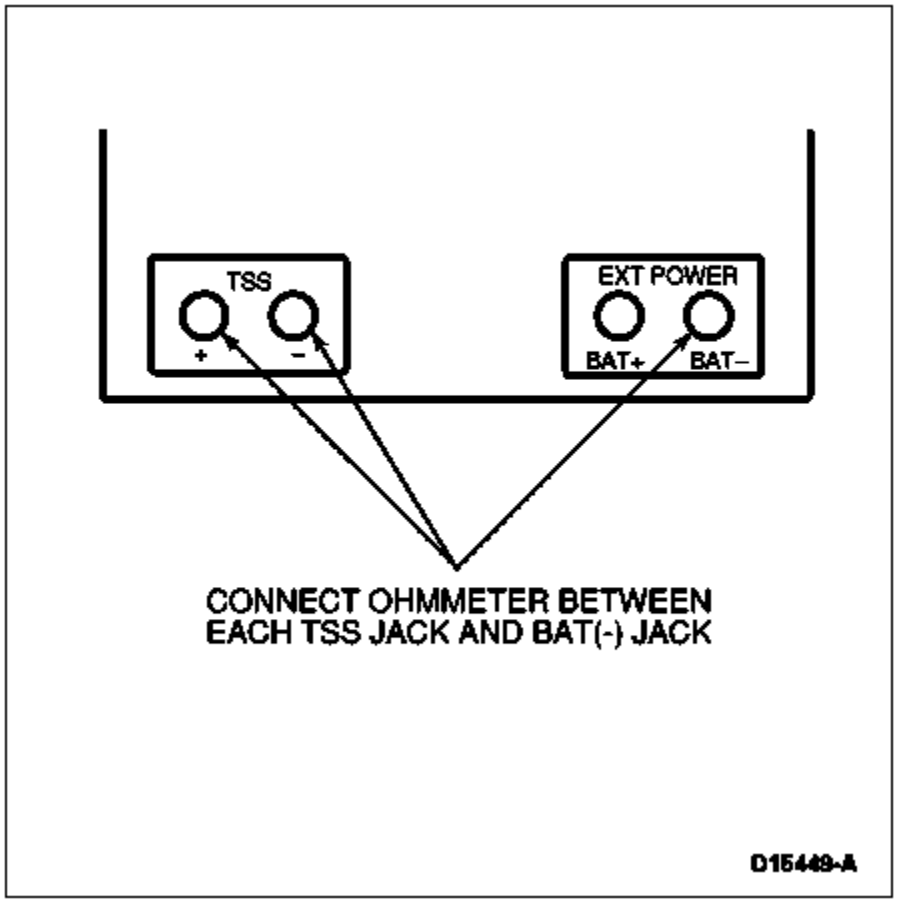
Yes	No

tomsn048@gmail.com

GO to **F6** .	**NOTE: Out of specification may be caused by internal harness or solenoid concerns.** GO to **F6** .

F6 CHECK SOLENOID/HARNESS FOR SHORT TO GROUND

- Check for continuity between BAT- (engine ground) and appropriate jack with an ohmmeter or other low current tester (less than 200 milliamps).



Solenoid	Tester Jack
TSS	TSS+ TSS-

- Connection should show infinite resistance (no continuity).

Is there continuity?

Yes	No
GO to Disassembly in this section for TSS	GO to Disassembly in this section for TSS

tomsn048@gmail.com

service and hardware diagnosis.	service and hardware diagnosis.

PINPOINT TEST G: COAST CLUTCH SOLENOID

G1 ELECTRONIC DIAGNOSTICS

- Check to make sure transmission harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding.
- Connect New Generation STAR (NGS) Tester 007-00500 or equivalent.
- Perform KOEO test until continuous DTCs have been displayed.
- Enter output test mode (OTM). Refer to On-Board Diagnostics with NGS as outlined.
- Select the mode "ALL ON".
- Push START to turn outputs "ON".
- Push STOP to turn outputs "OFF".

Does vehicle enter OTM?

Yes	No
REMAIN in OTM. GO to G2 .	PRESS START. If vehicle does not enter OTM, REFER to Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the automatic transmission.

G2 CHECK ELECTRICAL SIGNAL OPERATION

CAUTION: Do not pry on connector. Depress release button, then pull on harness.

NOTE: Refer to the schematic and chart preceding this pinpoint test.

- Disconnect transmission connector.
- Using a mirror, inspect both ends of connector for damaged or pushed out pins, corrosion, loose wires, and missing or damaged seals.
- Connect Rotunda 73 Digital Multimeter 105-R0051 or equivalent positive test lead to vehicle power (VPWR) circuit and negative test lead to the solenoid circuit of the transmission vehicle harness connector.
- Place multimeter on 20-volt scale.
- While observing volt-ohmmeter, press "start" and "stop" several times to cycle solenoid output on and off.

Does the suspected solenoid output voltage change at least 0.5 volts?

Yes	No
GO to G5	GO to G3 .

tomsn048@gmail.com

G3 CHECK CONTINUITY OF SOLENOID SIGNAL AND VEHICLE POWER HARNESS CIRCUITS

NOTE: Refer to the schematic and chart preceding this pinpoint test.

- Turn ignition switch off.
- Make sure transmission harness connector is disconnected.
- Disconnect powertrain control module. Inspect for damaged or pushed out pins, corrosion, or loose wires.
- Install Rotunda Breakout Box 014-00950 or equivalent, leave PCM disconnected.
- Measure resistance between PCM test Pin 28 at the breakout box and the appropriate signal pin at transmission harness connector.
- Measure resistance between PCM test Pins 71/97 at the breakout box and the appropriate signal pins at the transmission harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
GO to **G4** .	SERVICE open circuit(s). REMOVE breakout box. RECONNECT all components. REPEAT Quick Test.

G4 CHECK SOLENOID HARNESS FOR SHORTS TO POWER AND GROUND

NOTE: Refer to the schematic and chart preceding this pinpoint test.

- Key OFF.
- Breakout box installed, powertrain control module disconnected.
- Transmission harness connector disconnected.
- Measure resistance between PCM signal test Pin 28 and test Pins 71/97 at the breakout box.
- Measure resistance between PCM test Pins 28 and test Pins 77, 76, 91, 51 and 103 at the breakout box and chassis ground.

Is each resistance greater than 10,000 ohms?

Yes	No
GO to **G5** .	SERVICE short circuit. REMOVE breakout box. RECONNECT all components. RERUN Self Test.

G5 TRANSMISSION FUNCTIONAL TEST

- Reconnect PCM.
- Disconnect vehicle harness at transmission.
- Install Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) with Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit or equivalent at the transmission connector.

tomsn048@gmail.com

- Use tests outlined in the Transmission Tester manual.
- Perform the Solenoid Function Test.
- LED will turn green when solenoid activates and turn off when deactivated.
- LED will turn red if activated solenoid is shorted to BAT+ .
- LED will remain off if an activated solenoid is shorted to ground or no continuity.

Does the solenoid (LED) activate? (LED green)

Yes	No
GO to **G6** .	GO to **G7** .

G6 TRANSMISSION DRIVE TEST

- Perform the Drive Test as outlined in Transmission Tester Manual.
- **Does the CCS activate when commanded by the tester?**
- **Does engine braking occur?**

Does coast clutch engage?

Yes	No
REPLACE PCM. ERASE all codes and PERFORM the Transmission Drive Cycle as outlined in this section. RERUN Self Test. If symptom is still present, REFER to Diagnosis By Symptom Index to diagnose coast clutch concerns (no engine braking).	GO to **G7** .

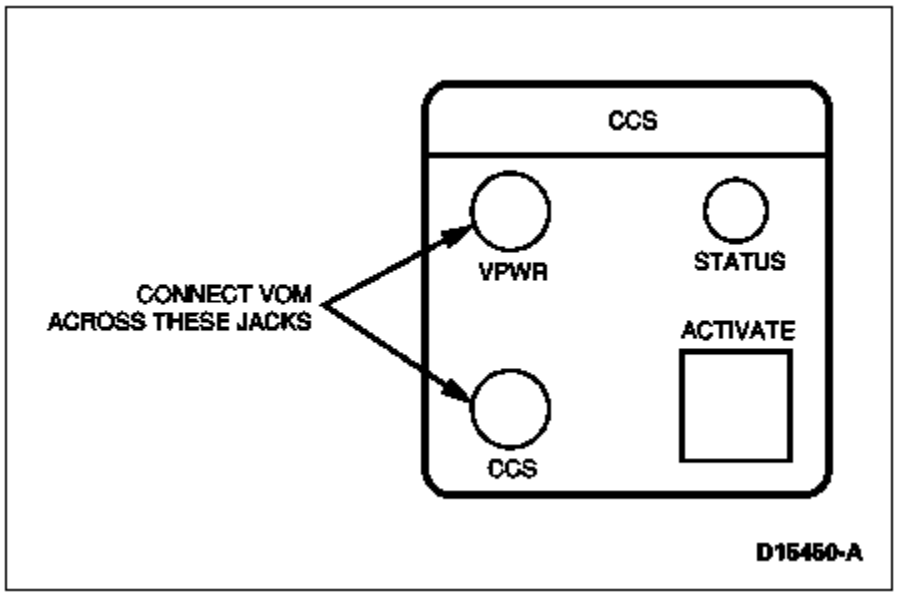
G7 CHECK RESISTANCE OF SOLENOID/HARNESS

NOTE: Refer to the 4R44E/4R55E Transmission Tester for terminal locations.

- BENCH/DRIVE switch in BENCH mode.
- Rotate GEAR SELECTOR switch to Ohm position.
- Connect ohmmeter negative lead to CSS jack and positive lead to VPWR jack on tester. This is to test CCS.
- Record resistance.
- Resistance should be between 22-48 ohms.

Is the coast clutch solenoid resistance within specification?

tomsn048@gmail.com



Yes	No
GO to G8 .	**NOTE: Out of specification may be caused by internal or solenoid concerns.** GO to G9 .

G8 CHECK SOLENOID/HARNESS FOR SHORT TO GROUND

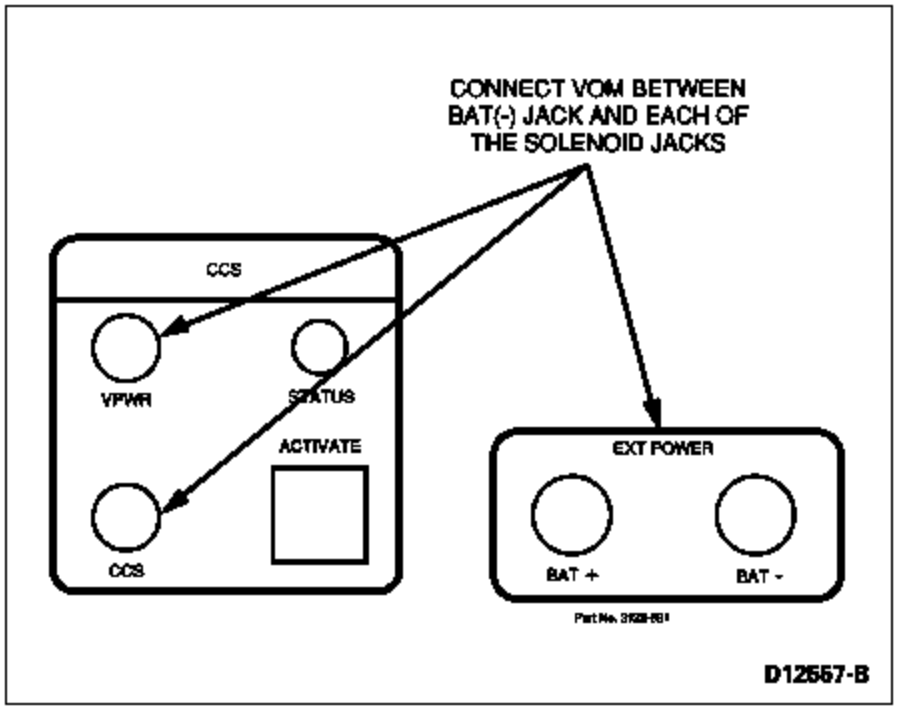
- Check for continuity between BAT- (engine ground) and appropriate jack with an ohmmeter or other low current tester (less than 200 milliamps).

Solenoid	Tester Jack
CCS	CCS VPWR

- Connection should show infinite resistance (no continuity).

Is there continuity?

tomsn048@gmail.com



Yes	No
GO to **G9** .	GO to Service Manual Diagnosis By Symptom Index charts for diagnosis of coast clutch concerns.

G9 4R44E INTERNAL ELECTRONIC DIAGNOSTICS

- Drain transmission fluid.
- Remove transmission pan.
- Check that the internal harness connector is fully engaged on the coast clutch solenoid assembly.
- Check that the internal harness connector terminals are fully seated in the connector.
- Inspect the connector for damage.

Were the checks done and was everything OK?

Yes	No
GO to **G10** .	SERVICE as required.

G10 CHECK INTERNAL 4R44E HARNESS (CONTINUITY)

- Disconnect the internal harness from the solenoid assembly.
- For CCS, connect the positive lead from an ohmmeter to the tester jack CCS and the negative lead at the orange wire of the CCS wire connector.
- For CCS VPWR, connect the positive lead from an ohmmeter to the tester jack CCS VPWR and the negative lead at the white wire of the CCS wire connector.
- Record resistance. Should be less than 0.5 ohms.

tomsn048@gmail.com

Are the resistances less than 0.5 ohms?

Yes	No
GO to **G11** .	REPLACE internal harness. GO to **G12** .

G11 CHECK INTERNAL HARNESS (SHORTS TO GND)

- Check for continuity between BAT- (engine ground) and appropriate wire with an ohmmeter or other low current tester (less than 200 milliamps).

Solenoid	Wire Color
CCS	Orange
VPWR	White

- Connection should show infinite resistance (no continuity).

Is there continuity?

Yes	No
REPLACE internal harness.	GO to **G12** .

G12 CHECK SOLENOID RESISTANCE AT SOLENOID

- Check solenoid resistance by connecting an ohmmeter at the terminals of the solenoid.
- Measure and record resistance for the solenoid. (CCS)
- Resistance should be between 22-48 ohms.

Is resistance between 22-48 ohms?

Yes	No
GO to **G13** .	REPLACE CCS solenoid.

G13 CHECK SOLENOID FOR SHORT TO GROUND

- Check for continuity between engine ground and appropriate solenoid terminal with ohmmeter or other low current tester (less than 200 milliamps).

Solenoid	Terminal
CCS	+/-

- Connection should show infinite resistance (no continuity).

Is there continuity?

Yes	No

tomsn048@gmail.com

REPLACE CCS solenoid.	REFER to service manual for Hydraulic/Mechanical Diagnosis Charts under Diagnosis By Symptom Index (no engine braking).

tomsn048@gmail.com

Special Testing Procedures

Engine Idle Speed Check

Refer to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the engine idle speed.

Line Pressure Test

CAUTION: The Transmission Tester must be removed and the vehicle harness installed when verifying these pressures.

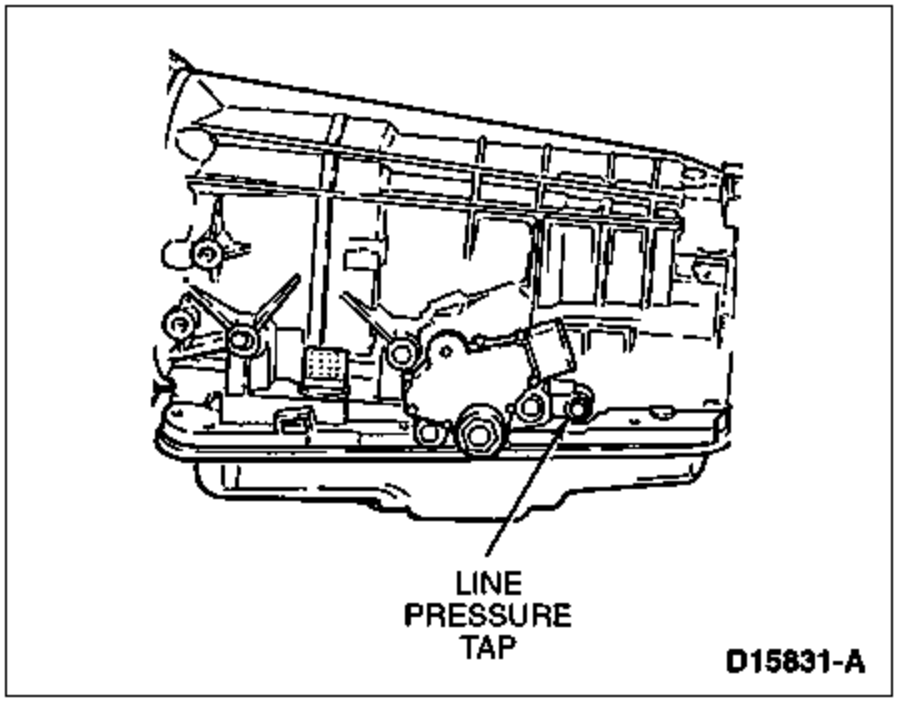
CAUTION: Perform Line Pressure Test prior to performing Stall Speed Test. If line pressure is low at stall, do not perform Stall Speed Test or further transmission damage will occur. Do not maintain wide open throttle in any gear range for more than five (5) seconds.

NOTE: Certain sensor failures may cause high EPC, FMEM (Failure Mode Effect Management) actions. Be sure that self test and electrical repairs have been performed, or test results may be incorrect.

This test verifies that the line pressure is within specifications.

1. Connect 0-2758 kPa (0-400 psi) pressure gauge to the line pressure tap.

tomsn048@gmail.com



2. Start engine and check line pressures. Refer to the following Line Pressure Specifications No. 401 chart to determine if line pressure is within specifications.

CAUTION: Do not install Transmission Tester when verifying these pressures.

NOTE: Vehicle harness must be installed at transmission connector to verify these pressures.

REFERENCE: LINE PRESSURE SPECIFICATIONS No. 401

Trans.	Transmission Model/Application	Range	Idle		WOT Stall	
			EPC	Line	EPC	Line
4R44E	2.3L Ranger	R	37-47	115-145	112-134	282-350
	4x2	N	21-31	77-107		
		(D), 2, 1	20-30	77-107	112-134	228-263
4R44E	3.0L Ranger	R	46-56	143-173	112-134	282-350
	4x2, 4x4	N	31-41	94-124		
		(D), 2, 1	20-30	71-101	112-134	228-263
4R44E	3.0L Aerostar	R	47-57	153-183	112-134	282-350
	4x2	N	20-30	73-103		
		(D), 2, 1	40-50	105-135	112-134	228-263

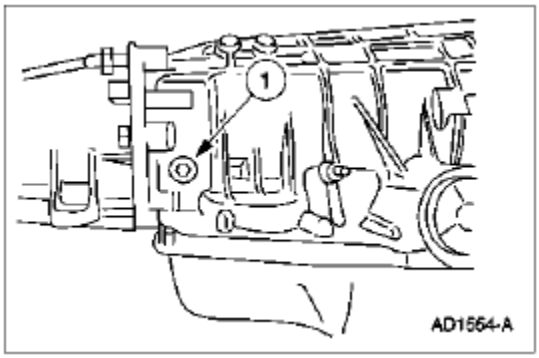
3. If line pressure is not within specifications, check EPC pressure.

4. Connect Pressure Gauge to EPC pressure tap.

tomsn048@gmail.com

5. Start engine and check EPC pressure. Refer to Reference: Line Pressure Chart in this section for specification.

6. If EPC pressure is not within specification, perform Pinpoint Test E to diagnose EPC operation. If EPC operation is OK, refer to Line Pressure Diagnosis Chart in this section for line pressure concern causes.



Item	Part Number	Description
1	—	Electronic Pressure Control (EPC)

LINE PRESSURE DIAGNOSIS CHART

Test Results	Possible Source
High at Idle — All Ranges	• Wiring Harnesses • EPC Boost Valve • EPC Solenoid • Main Regulator Valve
Low at Idle — All Ranges	• Low Fluid Level • Fluid Inlet Filter/Seal • Main Control Body • Cross Leaks • Gaskets • Pump • Separator Plate
Low — All Forward Ranges	• Forward Clutch • Main Control • O/D Servo
Low in Park Only	• Valve Body
Low in Reverse Only	• Separator Plate • Rear Servo Piston, Cover Seal • Reverse Clutch • O/D Servo • Valve Body • Forward Clutch
Low in Neutral Only	• Valve Body • O/D Servo

tomsn048@gmail.com

Low in Overdrive Only	• Forward Clutch • O/D Servo • Valve Body
Low in Drive Only (O/D Cancelled)	• Forward Clutch • O/D Servo • Valve Body
Low in 1st Position Only	• Forward Clutch • Valve Body
Low in 2nd Position Only	• Intermediate Servo • O/D Servo • Forward Clutch

Stall Speed Test

This test checks operation of the following items:

- Torque converter clutch
- Forward clutch
- Low one way clutch (OWC) assembly
- Engine performance

WARNING: APPLY THE PARKING BRAKE FIRMLY WHILE PERFORMING EACH STALL TEST.

CAUTION: Always perform Line Pressure Test procedures prior to performing the Stall Speed Test. If line pressure is low at stall, do not perform Stall Speed Test or further transmission damage will occur.

NOTE: The Stall Speed Test should be performed with the engine and transmission at normal operating temperatures.

1. Connect tachometer to the engine.
2. **CAUTION: After testing each of the following ranges (D), 2, 1, and R, move the transmission range selector lever to N (NEUTRAL) and run engine at 1000 rpm for about 15 seconds to allow the torque converter to cool before testing the next range.**

   CAUTION: Do not maintain wide open throttle in any range for more than five (5) seconds.

   CAUTION: If the engine rpm recorded by the tachometer exceeds maximum specified rpm, release the accelerator pedal immediately. Clutch or band slippage is indicated.

   NOTE: Prolonged use of this procedure may set Diagnostic Trouble Code P0712, P1783. After performing Stall Speed Test run OBD Test and clear DTCs from memory.

tomsn048@gmail.com

Press accelerator pedal to floor (WOT) in each range. Record rpm reached in each range. Stall speeds should be as follows:

Vehicle	Engine	Rpm
Ranger	2.3	2610-3035
Ranger	3.0	2870-3338
Aerostar	3.0	2762-3230

If stall speeds were too high, refer to the following Stall Speed Diagnosis Chart. If stall speeds were too low, first check the engine idle speed. If engine idle is OK, remove torque converter and check the torque converter clutch for slippage.

STALL SPEED DIAGNOSIS CHART

Transmission Range Selector Lever Position	Stall Speeds High	Stall Speeds Low
(D)Overdrive, D, and 1	Overdrive One-Way Clutch, Rear One-Way Clutch	—
D, 2 and 1	Forward Clutch, O/D One-Way Clutch	—
(D)Overdrive	Forward Clutch, O/D One-Way Clutch	—
(D)Overdrive, D, 2, 1 and R	General Pressure Concerns, Forward Clutch, O/D One-Way Clutch	Converter One-Way Clutch or Engine Performance
R Only	High/Reverse and High Clutch and Low and Reverse Band/Servo	—
2 Only	Intermediate Band/Servo	—
1 Only	Low/Reverse Band/Servo	—

Air Pressure Tests

A no drive condition can exist, even with correct transmission fluid pressure, because of inoperative clutches or bands. An erratic shift can be located through a series of checks by substituting air pressure for fluid pressure to determine the location of the malfunction.

When the transmission range selector lever is in a forward gear range ((D) , 2, 1), a no drive condition may be caused by an inoperative forward clutch, or an overrunning one-way clutch.

Failure to drive in R (REVERSE) could be caused by a malfunctioning reverse clutch, reverse servo, or band.

Follow the procedure to determine the location of the inoperative clutch or band by introducing air pressure into the various test plate passages.

Test Procedures

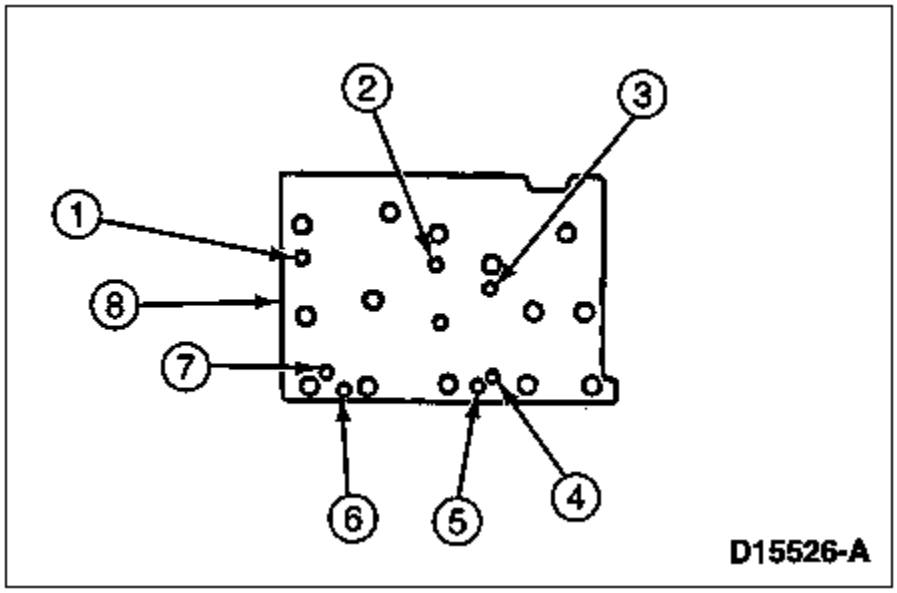
tomsn048@gmail.com

NOTE: Cover vent in test plate with a clean, lint-free shop towel to prevent spray when air is applied. Plugging vent hole during testing will result in inaccurate results.

NOTE: Use only dry regulated air pressure 276kPa (40 psi) max. A dull thud should be heard when the clutch or band applies. There should be no hissing sound when band or clutch applies.

1. Drain transmission fluid and remove transmission oil pan.
2. Remove filter and seal assembly and main control valve body.
3. Install 4R44E/4R55E Transmission Test Plate T95L-77000-AH and Transmission Test Plate Gasket T95L-77000-AH1.
4. **CAUTION: Do not apply air to test the vent.**

   Apply air pressure to appropriate clutch port (refer to diagram). A dull thud may be heard or movement felt when clutch is applied or released. If clutch seals or check balls are leaking a hissing sound may be heard.



Item	Part Number	Description
1	—	Coast Clutch Apply
2	—	Direct Clutch Apply
3	—	Forward Clutch Apply
4	—	Intermediate Servo Release
5	—	Intermediate Servo Apply
6	—	Overdrive Servo Release
7	—	Overdrive Servo Apply
8	T95L-77000-AH	4R44E/4R55E Transmission Test Plate

tomsn048@gmail.com

—	T95L-77000-AH1	Transmission Test Plate Gasket

Test Results

If test results find that the servos do not operate, disassemble, clean and inspect them to locate the source of the concern.

If air pressure applied to the clutch passages fails to operate a clutch, or operates another clutch simultaneously, disassemble and use air pressure to check the fluid passages in the center support and clutches to detect obstructions.

tomsn048@gmail.com

Leakage Inspection

CAUTION: Do not try to stop the fluid leak by increasing the torque beyond specifications. This may cause damage to the case threads.

Check the vehicle speed sensor (VSS) and the speedometer cable connection at the transmission. Replace rubber seal if necessary.

Leakage at the transmission fluid pan to case gasket often can be stopped by tightening the attaching bolts to 13-15 Nm (115-133 lb-ft). If necessary, replace the oil pan case gasket.

Check the fluid filler tube connection at the transmission case. If leakage is found here, install a new grommet.

Check fluid lines and fittings between the transmission and the cooler in the radiator tank for looseness, wear, or damage. If leakage cannot be stopped by tightening a fluid tube nut, replace the damaged parts. When fluid is found leaking between the case and cooler line fitting, check for missing or damaged O-ring, then tighten the fitting to maximum specification.

If the leak continues, replace cooler line fitting and tighten to specification. The same procedure should be followed for fluid leaks between the radiator cooler and the cooler line fittings in this section. Refer to Transmission Cooler Line Replacement for procedures.

Check the engine coolant in the radiator. If transmission fluid is present in the coolant, the cooler in the radiator is probably leaking.

The cooler can be further checked for leaks by disconnecting the lines for the cooler fittings and applying no more than 345 kPa (50 psi) air pressure to the fittings. Remove the radiator cap to relieve the pressure buildup at the exterior of the oil cooler tank. If the cooler is leaking and/or will not hold pressure, replace the cooler.

If leakage is found at the transmission range selector lever, replace the seal.

If leakage is found at the transmission internal harness connector, replace O-ring.

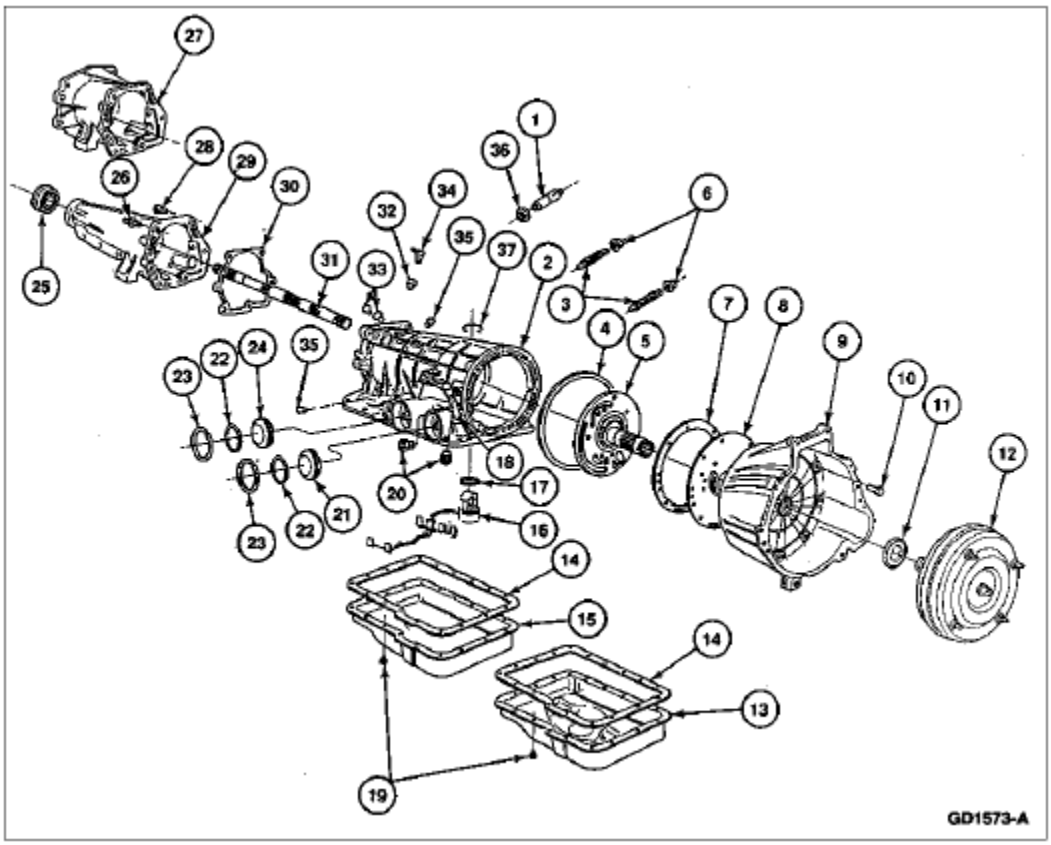
External Sealing

The 4R44E transmission has the following parts to prevent external fluid leakage:

- Gaskets
- Lip-type seals
- O-ring seals
- Seal rings
- Seal grommets
- Thread sealant

tomsn048@gmail.com

External Sealing



Item	Part Number	Description

35	E450102-S80	Plug — Pipe (Line and EPC Pressure) (Part of Case Assembly) (2 Req'd)
36	7B498	Seal Assembly (Main Control Lever) (Also in Case Assembly)
37	84280020	Spring (Retains 16-Pin Connector in Case)

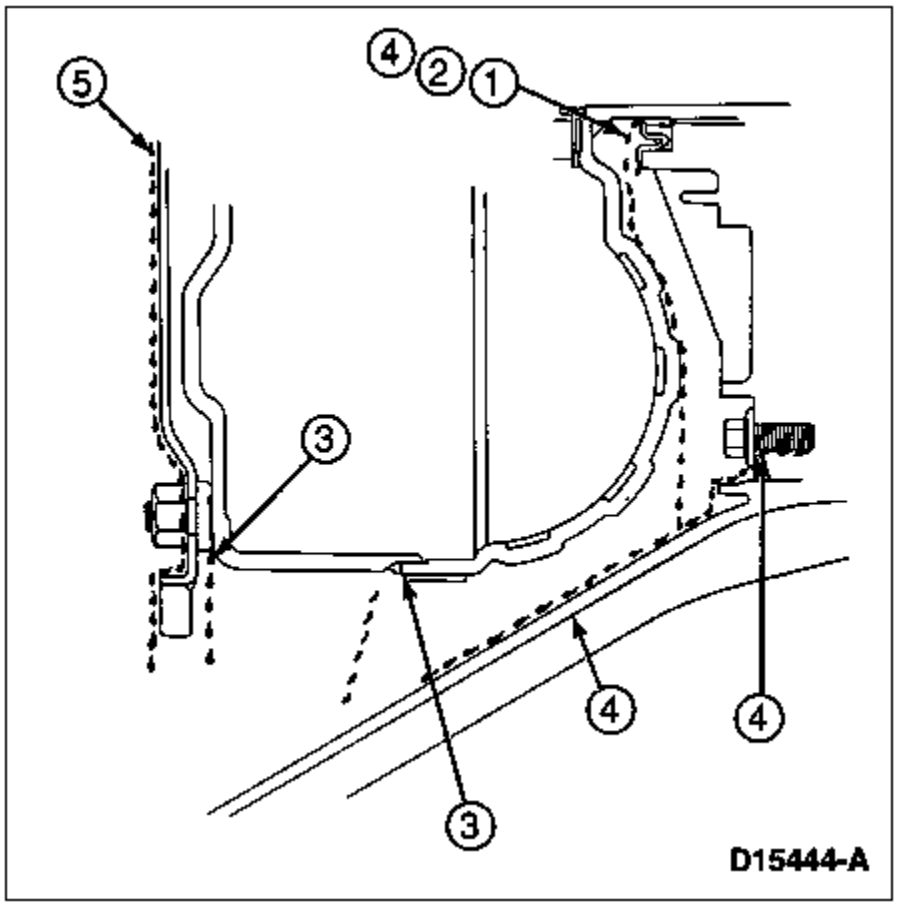
Fluid Leakage in Torque Converter Area

In diagnosing and correcting fluid leaks in the torque converter (7902) area, use the following procedures to locate the exact cause of the leakage. Leakage at the front of the transmission, as evidenced by fluid around the converter housing, may have several sources. By careful observation it is possible to pinpoint the source

tomsn048@gmail.com

of the leak before removing the transmission from the vehicle. The paths which the fluid can take to reach the bottom of the converter housing are as follows:

Torque Converter Area Leak Points



1. Fluid leaking by the torque converter impeller hub seal lip will tend to move along the converter impeller hub and onto the back of the impeller housing. Except in the case of a total seal failure, fluid leakage by the lip of the seal will be deposited on the inside of the converter housing only, near the outside diameter of the converter housing.

2. Fluid leakage by the outside diameter of the converter hub seal and the case will follow the same path which the leaks by the inside diameter of the seal follow.

3. Fluid leakage from the torque converter to the flywheel stud weld will appear at the outer diameter of the torque converter on the back face of the flywheel (6375), and in the converter housing only near theflywheel. If a converter-to-flywheel stud leak is suspected, remove torque converter and pressure check.

4. Fluid leakage from the pump will flow down the back of the converter housing. Leakage may be from loose or missing pump bolts, torn or damaged pump-to-case gasket and/or a worn pump bushing.

5. Engine oil leaks are sometimes improperly diagnosed as transmission pump seal leaks. The following areas of possible leakage should also be checked.

    a. Leakage at the valve cover may allow engine oil to flow over the converter housing or seep down between the converter housing and block, causing oil to be present in or at the bottom of

tomsn048@gmail.com

the converter housing.
b. Oil plug leaks will allow oil to flow down the rear face of the block to the converter housing.
c. Leakage at the crankshaft seal will work back to the flywheel, and then into the converter housing.

Leak Check Test

The following procedures should be used to determine the cause of the leakage before service is made.

1. Remove the fluid level indicator (7A020) and note the color of the fluid. Original factory fill fluid is dyed red to aid in determining if leakage is from the engine or transmission. Unless a considerable amount of makeup fluid has been added or the fluid has been changed, the red color should assist in pinpointing the leak.

2. Remove the converter housing access cover. Clean off any fluid from the top and bottom of the converter housing, front of the transmission case, and rear face of the engine and pan. Clean the converter area by washing with suitable nonflammable solvent, and blow dry with compressed air.

3. Wash out converter housing and the front of the flywheel. The converter housing may be washed out using clean solvent and a squirt-type fluid can. Blow dry all washed areas with compressed air.

4. Start and run the engine until the transmission reaches its normal operating temperature. Observe the back of the block and top of the converter housing for evidence of fluid leakage. Raise the vehicle on a hoist and position suitable safety stands under vehicle. Run the engine at fast idle, then at engine idle, occasionally shifting to the drive and reverse ranges to increase pressure within the transmission. Observe the front of the flywheel, back of the block (in as far as possible), and inside the converter housing and front of the transmission case. Run the engine until fluid leakage is evident and the probable source of leakage can be determined.

Leak Check Test With Black Light

Fluid soluble aniline or fluorescent dyes premixed at the rate of 2.5ml (1/2 teaspoon) of dye powder to 0.24L (1/2 pint) of automatic transmission fluid have proven helpful in locating the source of fluid leakage. Such dyes may be used to determine whether an engine fluid or transmission fluid leak is present, or if the fluid in the transmission fluid cooler hose leaks into the engine coolant system. An ultraviolet light must be used to detect the fluorescent dye solution.

tomsn048@gmail.com

tomsn048@gmail.com

Transmission Fluid Cooler

The following procedures will assist in diagnosing the transmission cooling system. Refer to Section 07-02 for specific transmission cooling system diagnosis and testing procedures.

Transmission Fluid Cooler Flow Test

NOTE: The transmission linkage/cable adjustment, fluid level, and line pressure must be within specification before performing this test.

1. Remove fluid level indicator (7A020) from fluid filler tube.
2. Place funnel in fluid filler tube.
3. Raise vehicle on hoist and position suitable safety stands under vehicle.
4. Remove cooler return line (rear fitting) from fitting on transmission case. Refer to removal and installation of the transmission fluid cooler line in Section 07-02 .
5. Connect one end of a hose to the cooler return line and route the other end of the hose to a point where it can be inserted into the funnel at the fluid filler tube.
6. Remove safety stands and lower vehicle. Insert end of hose into funnel.
7. Start engine and run at idle with transmission in neutral range.
8. When fluid flowing from hose is all liquid, an adequate amount of fluid should be observed (approximately 1 liter [1 quart] delivered in 30 seconds). If adequate flow is observed, test is completed.
9. If the flow is not adequate, stop engine. Disconnect hose from cooler return line and connect it to converter out line fitting (front fitting) on transmission case.
10. Repeat Steps 7 and 8. If flow is now adequate, refer to Section 07-02 for diagnosis of transmission fluid cooler (7A095). If flow is not adequate, service pump and/or converter assembly, and main control.

Transmission Fluid Cooler — Backflush/Cleaning

CAUTION: Whenever a transmission has been disassembled to replace worn or damaged parts or because the valve body sticks from foreign material, the transmission fluid cooler must be cleaned using the Rotunda Torque Converter/Fluid Cooler Cleaner 014-00028 or equivalent. Under no circumstances should torque converters be cleaned by hand agitation with solvent.

When internal wear or damage has occurred in the transmission, metal particles, clutch plate material, or band material may have been carried into the transmission cooler. These contaminants are a major cause of reoccurring transmission concerns and must be removed from the system before the transmission is put back into service.

tomsn048@gmail.com

1. Conduct backflushing with a Rotunda Torque Converter/Transmission Fluid Cooler Cleaner 014-00028 or equivalent. Test the equipment to make sure that a vigorous fluid flow is present before proceeding. Replace the system filter if flow is weak or contaminated.

2. To aid in attaching the cleaner to the transmission steel cooler lines, connect two additional rubber hoses to the transmission end of the steel transmission cooler lines as described.

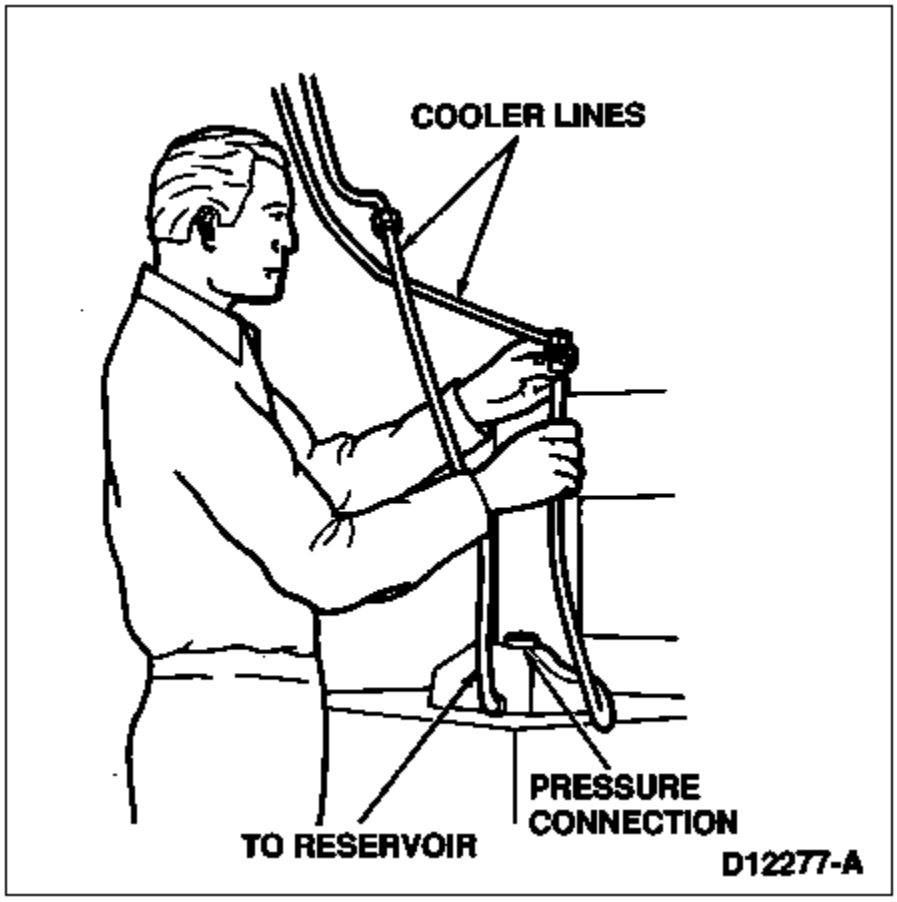
    - Connect the cleaner tank pressure line to the steel transmission cooler return line (longest line).
    - Connect a tank return hose to the steel transmission cooler pressure line (shorter line). Place the outlet end of this hose in the solvent tank reservoir.

3. Turn on solvent pump and allow the solvent to circulate a minimum of 5 minutes (cycling switch on and off will help dislodge contaminants in cooler system).

4. Switch off the solvent pump and disconnect the solvent pressure hose from the transmission cooler return line.

5. Use compressed air to blow out the cooler(s) and lines (blow air into the transmission cooler return line) until all solvent is removed.

6. Remove the rubber return hose from the remaining steel cooler line.



tomsn048@gmail.com

Transmission Fluid Cooler Tube Replacement

When fluid leakage is found at the transmission fluid cooler, the transmission fluid cooler must be replaced. Refer to Section 03-03 .

When transmission fluid cooler steel lines must be replaced, each replacement line must be fabricated from the same size inside diameter and length steel line as the original line.

Using the old line as a guide, bend the new line as required. Add the necessary fittings, and install the line.

After the fittings have been tightened, check and add fluid as necessary. Check for fluid leaks.

tomsn048@gmail.com

Diagnosis by Symptom

The Diagnosis by Symptom Index gives the technician diagnostic information, direction and suggests possible components, using a symptom as a starting point.

The Diagnosis by Symptom Index is divided into two categories: Electrical Routines, indicated by 200 series numbers, and Hydraulic/Mechanical Routines, indicated by 300 series numbers. The Electrical Routines list the possible electrical components that could cause or contribute to the symptom described. The Hydraulic/Mechanical Routines list the possible hydraulic or mechanical components that could cause or contribute to the symptom described.

Diagnosis by Symptom Chart — Directions

1. Using the Diagnosis by Symptom Index, select the Symptom/Concern that best describes the condition.

2. Turn to the Routine indicated in the Diagnosis by Symptom Index.

3. Always begin diagnosis of a symptom by using the following:

    a. Preliminary inspections
    b. Verification of condition
    c. Check the fluid level
    d. Perform other test procedures as directed

4. Then begin with the Electrical Routine, if indicated. Follow the reference or action required statements. Always perform the On-Board Diagnostic Tests as required. Never skip steps. Service as required. If the concern is still present after electrical diagnosis then proceed to the Hydraulic/Mechanical Routine listed.

CAUTION: Not all concerns and conditions with electrical components will set a Diagnostic Trouble Code (DTC). Be aware that the components listed may still be the cause. Verify proper function of those components prior to proceeding to the Hydraulic/Mechanical Routine listed.

5. The Hydraulic/Mechanical Routines list possible hydraulic or mechanical components that could cause the concern. These components are listed in the removal sequence and by most likely concern. All components listed must be inspected to ensure proper repair.

tomsn048@gmail.com

Diagnostic Routines

Engagement Concerns: No Forward Only

Possible Component	Reference/Action
201 — ELECTRICAL ROUTINE	
No Electrical Concerns	
301 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
• Improper level	• Adjust to proper level.
Shift Linkage (Internal/External)	
• Transmission shift cable and bracket damaged or misadjusted. TR sensor out of adjustment	• Inspect for damage. Readjust as required. Service all damaged components. After servicing linkage, readjust DTR sensor.
Improper Pressures	
• Improper band/clutch application pressure, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low, check the following possible components: main control, filter/seal, pump assembly.
Filter and Seal Assembly	
• Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gaskets damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• Forward modulator valve/EPC boost valve (207), forward engagement control valve (209), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Pump Assembly	
• Pump damaged, leaking	• Inspect for damage. Service or replace as required.
• Screws out of torque specification	• Tighten screws to specification.
Center Support Assembly	
• Forward clutch support seal rings leaking	• Perform air pressure check. If OK, go to forward clutch assembly. Service as required.
Forward Clutch Assembly	
• Forward clutch assembly burnt/damaged/leaking. Check ball in cylinder/leaking piston seal rings	• Perform air pressure check. Service as required.
Rear One-Way Clutch Assembly	

tomsn048@gmail.com

• Rear one-way clutch damaged, worn	• Replace rear one-way clutch and case.

Engagement Concerns: No Reverse Only

202 — ELECTRICAL ROUTINE	
No Electrical Concerns	
302 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
• Improper level	• Adjust to proper level.
Shift Linkages (Internal/External)	
• Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Service all damaged components. After servicing linkages, readjust DTR sensor.
Improper Pressures	
• Improper band/clutch application pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low, check the following possible components: reverse clutch.
Filter and Seal Assembly	
• Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• 1-2 shift valve (203), 2-3 shift valve (204), reverse modulator valve (205), spring damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Pump Assembly	
• Screws out of torque specification • Pump damaged, leaking	• Tighten screws to specifications. • Inspect for damage. Service as required.
Direct/Reverse Clutch/Reverse Band	
• Reverse clutch assembly burnt/worn/leaking check ball in clutch piston/leaking piston seal rings, cover gasket damaged	• Perform air pressure test. • Inspect for damage. Service as required.
• Direct/reverse servo piston seal cut/leaking	• Check and replace piston seal. Check and replace low/reverse band.

Engagement Concerns: Harsh Reverse Only

tomsn048@gmail.com

Possible Component	Reference/Action
203 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harness, PCM, TP, VSS, RPM, EPC, SS1 (off)	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit to perform transmission static and dynamic tests. Perform the following Pinpoint Tests: A, E. Service as required. Clear codes, road test and rerun on-board diagnostics.
303 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures • Improper band/clutch application pressures, line pressure high	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high, check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• EPC, SS1, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Reverse modulator valves (205), pressure boost valve/main regulator valve (208), check ball B, springs, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong components used in rebuild	• Verify that proper components were used.
Direct/Reverse Clutch Assembly • Assembly • Seals damaged, missing • Center support hub/seal ring damaged • Check ball damaged • Friction elements damaged or missing	• Air check clutch assembly as outlined in this manual. • Inspect direct clutch assembly for damage. Service as required.

[1] Can be purchased as a separate item.

Engagement Concerns: Harsh Forward Only

Possible Component	Reference/Action
204 — ELECTRICAL ROUTINE	
Powertrain Control System	

tomsn048@gmail.com

• Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harness, PCM, TP, RPM, VSS, EPC	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit to perform transmission static and dynamic tests. Perform the following Pinpoint Test: E. Service as required. Clear codes, road test and rerun on-board diagnostics.
304 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures • Improper band/clutch application pressures, line pressure high	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Reverse modulator valves (205), forward modulator valve/EPC boost valve (207), forward engagement control valve (209), spring, damaged, missing, misassembled, stuck bore damage	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Forward Clutch Assembly	
• Assembly	• Air check clutch assembly as outlined in this manual.
• Plates burnt, missing; check ball missing, damaged; hub damaged	• Inspect for damage. Service as required.

[1] Can be purchased as a separate item.

Engagement Concerns: Delay/Soft Reverse

Possible Component	Reference/Action
205 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harness, PCM, TP, RPM, VSS, EPC	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit to perform transmission static and dynamic tests. Perform the following Pinpoint Test: E. Service as required. Clear codes, road test and rerun on-board diagnostics.

tomsn048@gmail.com

305 — HYDRAULIC/MECHANICAL ROUTINE	
Engine Driveline	
• Looseness in the driveshaft, U-joints or engine mounts	• Service as required.
• Contamination blockage in cooler lines, in-tank radiator or auxiliary transmission oil cooler	• Perform transmission fluid cooler flow check.
Fluid	
• Improper level	• Adjust to proper level.
• Fluid contaminated	• Inspect fluid for contamination. If contaminated, locate source of contamination. If burnt, inspect mechanical band, clutches. Service as required.
Shift Linkages (Internal/External)	
• Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Service all damaged components. After servicing linkages, readjust DTR sensor.
Improper Pressures	
• Improper band/clutch application pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low, check the following possible components: main control.
Filter and Seal Assembly	
• Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Reverse modulator valves (205), forward modulator valve/EPC boost valve (207), forward engagement control valve (209), spring damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Overdrive One-Way Clutch Assembly	
• One-way clutch damaged	• Determine cause of condition. Service as required.
Center Support Assembly	
• Direct/reverse clutch center support seal rings/ring grooves worn/damaged	• Determine cause of condition. Service as required.

tomsn048@gmail.com

Reverse Clutch Drum • Rear reverse clutch drum bushing, one-way clutch damaged	• Air pressure test. Determine cause of condition. Visually inspect seal rings and pistons. Service as required.
Reverse Clutch Assembly	
• Assembly	• Perform air pressure check.
• Reverse clutch piston seals cut/worn	• Inspect for damage. Service as required.
• Reverse servo piston damaged/worn	• Inspect for damage. Service as required.
Reverse Band Assembly	
• Reverse band out of adjustment or damaged	• Inspect and readjust per procedures.
• Reverse band servo piston and rod damaged	• Inspect for damage. Service as required.
• Servo band cover gasket damaged	• Inspect gasket and replace.

[1] Can be purchased as a separate item.

Engagement Concerns: Delayed/Soft Forward

Possible Component	Reference/Action
206 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harness, PCM, TP, RPM, VSS, EPC	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit to perform transmission static and dynamic tests. Perform the following Pinpoint Test: E. Service as required. Clear codes, road test and rerun on-board diagnostics.
306 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid • Improper level	• Adjust to proper level.
Shift Linkages (Internal/External) • Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Service all damaged components. After servicing linkages, readjust DTR sensor.
Improper Pressures • Improper band/clutch application pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low, check the following possible components: main control.
Filter and Seal Assembly • Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.

tomsn048@gmail.com

Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Forward modulator valve/EPC boost valve (207), forward engagement control valve (209), valve, spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Extension housing lube orifice plugged, missing • Wrong component used in rebuild	• Inspect for damage. Service as required. • Verify that proper components were used.
Overdrive One-Way Clutch Assembly • Overdrive one-way clutch damaged	• Replace as required.
Forward Clutch Assembly	
• Forward clutch piston check ball not seating/leaking	• Replace forward clutch piston. Service transmission as required.
• Forward hub seal rings damaged • Forward clutch piston seals cut/worn	• Inspect for damage. Service as required. • Replace seal and service as required.
Rear One-Way Clutch • Rear one-way clutch damaged/worn	• Determine cause of condition. Service as required.

[1] Can be purchased as a separate item.

Engagement Concerns: No Forward And No Reverse

Possible Component	Reference/Action
207A — ELECTRICAL ROUTINE	
No Electrical Concerns	
307A — HYDRAULIC/MECHANICAL ROUTINE	
Fluid • Improper level	• Adjust to proper level.
Improper Pressures • Improper band/clutch application pressures, line pressure low, EPC	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible

tomsn048@gmail.com

pressure low	components: main control.
Filter and Seal Assembly • Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• EPC blow-off valve, spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Pump Assembly	
• Screws out of torque specification	• Tighten screws to specification.
• Pump gears damaged, cracked	• Inspect for damage. If damaged, replace pump.
Overdrive One-Way Clutch Assembly • Overdrive one-way clutch damaged	• Inspect for damage. Service as required.

Engagement Concerns: No Forward In (D) Position And No Reverse

Possible Component	Reference/Action
207B — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harness, PCM, TP, RPM, VSS, EPC	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit to perform transmission static and dynamic tests. Perform the following Pinpoint Test: E. Service as required. Clear codes, road test and rerun on-board diagnostics.
307B — HYDRAULIC/MECHANICAL ROUTINE	
Fluid • Improper level	• Adjust to proper level.

tomsn048@gmail.com

Improper Pressures • Improper band/clutch application pressures, line pressure low, EPC pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible components: main control, pump assembly.
Filter and Seal Assembly • Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Forward modulator valve/EPC boost valve (207), pressure boost valve (208), EPC blow off valve, spring, damaged, missing, misassembled, stuck bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Pump Assembly	
• Screws out of torque specification	• Tighten screws to specification.
• Gears damaged, cracked	• Inspect for damage. If damaged, replace pump.
Overdrive One-Way Clutch Assembly • Overdrive one-way clutch damaged	• Determine cause of condition. Service as required.
Mechanical • Mechanical damage	• Check splines on turbine input shaft and overdrive carrier, overdrive one-way clutch, center shaft, forward clutch, forward carrier and output shaft.

[1] Can be purchased as a separate item.

Engagement Concerns: Harsh Forward And Reverse

Possible Component	Reference/Action
208 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harness, internal transmission wiring harness, PCM, EPC, TSS, TFT, VSS, DTR, TCC, TP	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130, Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit, Transmission Range (TR) Sensor Cable "E" (007-00111)

tomsn048@gmail.com

and MAF NOTE: Refer to FMEM — Routine 265 for additional information.	and Digital TR Sensor Overlay (007-00131) or equivalents to perform transmission static and dynamic tests. Perform the following Pinpoint Tests: B, C, D, E, F. Service as required, clear codes, road test and rerun on-board diagnostics.
308 — HYDRAULIC/MECHANICAL ROUTINE	
Engine/Driveline	
• Loose in the driveshaft, U-joints or engine mounts	• Service as required.
• Engine idle speed too high	• Check engine idle speed. Refer to the Powertrain Control/Emissions Diagnosis Manual [a] .
Fluid	
• Improper level	• Adjust to proper level.
Improper Pressures	
• Improper band/clutch application pressures, line pressure high	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high, check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• TCC, EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Forward modulator valve/EPC boost valve (207), pressure boost valve/main regulator or valve (208), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.

[1] Can be purchased as a separate item.

Engagement Concerns: Delayed Soft Forward And Reverse

Possible Component	Reference/Action
209 — ELECTRICAL ROUTINE	
No Electrical Concerns	
309 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
• Improper level	• Adjust to proper level.

tomsn048@gmail.com

• Fluid contaminated	• Inspect fluid for contamination. If contaminated, locate source of contamination. If burnt, inspect mechanical band, clutches. Service as required.
Improper Pressures • Improper band/clutch application pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low, check the following possible components: main control, pump assembly.
Filter and Seal Assembly • Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• Forward modulator valve/EPC boost valve (207), pressure boost valve/main regulator valve (208), EPC blow-off valve, spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Pump Assembly	
• Screws out of torque specification	• Tighten screws to specification.
• Inner gears damaged, cracked	• Inspect for damage. Service as required.

Shift Concerns: Some Or All Shifts Missing

Possible Component	Reference/Action
210 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harness, PCM, TP, RPM, DTR, VSS, SS1, SS2, SS3, TCS, TSS, EPC (no 4th or 2nd when EPC is low)	• Perform shift point test. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit), Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit, Transmission Range (TR) Sensor Cable "E" (007-00111) and Digital TR Sensor Overlay (007-00131) or equivalents to perform transmission static and dynamic tests. Perform the following Pinpoint Tests: A, D, E, F. Service as required. Clear codes, road test and rerun on-board diagnostics.
310 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
• Improper level	• Adjust to proper level.
• Fluid contaminated	• Inspect fluid for contamination. If contaminated, locate

tomsn048@gmail.com

	source of contamination. If burnt, inspect mechanical band, clutches. Service as required.
Shift Linkages (Internal/External)	
• Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Service all damaged components. After servicing linkages, readjust DTR sensor.
Improper Pressures	
• Improper band/clutch application pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low, check the following possible components: main control, pump, EPC solenoid.
Filter and Seal Assembly	
• Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• SS1, SS2, SS3, EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Forward modulator valve/EPC boost valve (207), pressure boost valve/main regulator valve (208), extension housing lube orifice, check ball C damaged, spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong components used in rebuild	• Verify that proper components were used.
Overdrive Band	
• Not adjusted properly	• Readjust to proper specification.
• Piston seals damaged	• Inspect for damage. Service as required.
Intermediate Band	
• Not adjusted properly	• Readjust to proper specification.
• Servo, piston and seals damaged	• Inspect for damage. Service as required.
For diagnosis related to a specific shift, refer to Reference/Action.	• To diagnose specific No Shift, refer to the appropriate shift routine. **No Shift** 1-2, **Routine** 220/320 **No Shift** 2-3, **Routine** 221/321 **No Shift** 3-4, **Routine** 222/322

[1] Can be purchased as a separate item.

tomsn048@gmail.com

Shift Concerns: Timing — Early/Late (Some/All)

Possible Component	Reference/Action
211 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harness, PCM, TP, TFT, EPC, VSS, SS1, SS2, SS3, RPM	• Perform shift point test. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit to perform transmission static and dynamic tests. Perform the following Pinpoint Tests: A, B, E. Service as required, clear codes, road test and rerun on-board diagnostics.
Other Electrical Concerns • No power to PCM, Keep Alive Memory erased from PCM	• Inspect EEC power relay. Service as required. • Restore memory by performing drive cycle test.
311 — HYDRAULIC/MECHANICAL ROUTINE	
Power/Engine Performance • Poor vehicle performance	• Refer to Routine No. 253A, 253B, 353A, 353B.
Other • Tire size change • Axle ratio change • Speedometer gear change	• Refer to the specifications decal on door panel and verify that vehicle has original equipment. Changes in tire size or axle ratio will affect shift timing.
Improper Pressures • Improper band/clutch application pressures, line pressure low (late shifts)	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low, check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• SS1, SS2, SS3, EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Wrong component used in rebuild	• Verify that proper components were used.
For diagnosis related to a specific shift or if all above are OK, refer to Reference/Action.	• To diagnose specific shift-timing concern, refer to the appropriate shift routine. **Soft/Slipping Shift** 1-2, **Routine** 226/326 **Soft/Slipping Shift** 2-3, **Routine** 227/327 **Soft/Slipping Shift** 3-4, **Routine** 228/328 **Soft/Slipping Shift** 4-3, **Routine** 229/329

[1] Can be purchased as a separate item.

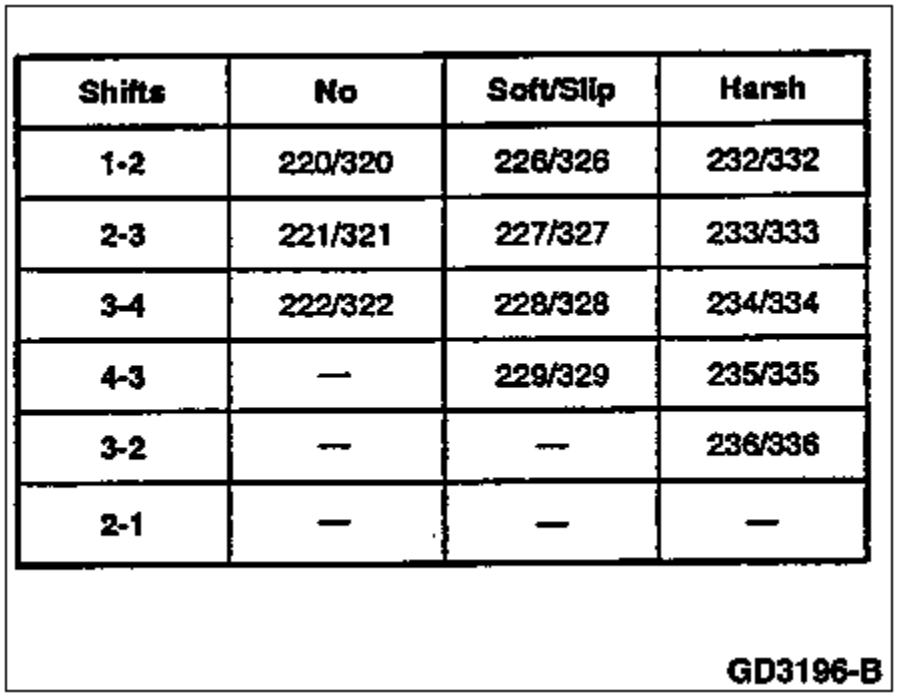
tomsn048@gmail.com

Shift Concerns: Timing — Erratic Hunting (Some/All)

Possible Component	Reference/Action
212 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harness, internal transmission wiring harness, PCM, TP, RPM, EPC, TFT, SS1, SS2, SS3, DTR, TCC, CCS	• Perform shift point and TCC tests. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1]. Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit), Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit and Transmission Range (TR) Sensor Adapter or equivalents to perform transmission static and dynamic tests. Perform the following Pinpoint Tests: A, B, C, D, E, G. Service as required. Clear codes, road test and rerun on-board diagnostics.
312 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
• Improper level • Fluid contaminated	• Adjust to proper level. • Inspect fluid for contamination. If contaminated, locate source of contamination. If burnt, inspect mechanical band, clutches. Service as required.
Filter and Seal Assembly • Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• SS1, SS2, SS3, EPC, CCS, solenoid stuck, damaged, O-ring damaged or out of bore • Wrong component used in rebuild	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required. • Verify that proper components were used.
Torque Converter Clutch Assembly	• Refer to converter cycling routine No. 342.
Further Diagnosis	
• For further diagnosis for timing issues, refer to Reference/Action.	• For specific shift diagnosis, refer to the following application chart.

[1] Can be purchased as a separate item.

tomsn048@gmail.com



Shifts	No	Soft/Slip	Harsh
1-2	220/320	226/326	232/332
2-3	221/321	227/327	233/333
3-4	222/322	228/328	234/334
4-3	—	229/329	235/335
3-2	—	—	236/336
2-1	—	—	—

GD3196-B

Shift Concerns: Feel — Soft/Slipping (Some/All)

Possible Component	Reference/Action
213 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harness, PCM, TP, RPM, EPC, TFT, MAF • Engine — restricted air inlet	• Perform shift point test. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit to perform transmission static and dynamic tests. Perform the following Pinpoint Tests: B, E. Service as required. Clear codes, road test and rerun on-board diagnostics.
313 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
• Improper level • Fluid contaminated	• Adjust to proper level. • Inspect fluid for contamination. If contaminated, locate source of contamination. If burnt, inspect mechanical band, clutches. Service as required.
Improper Pressures • Improper band/clutch application pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low check the following possible components: main control, filter/seal, pump assembly.
Filter and Seal Assembly	

tomsn048@gmail.com

• Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Pressure boost valve/main regulator valve (208), EPC blow-off valve, extension housing lube orifice, check ball C missing, valve spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Pump Assembly • Screws out of torque specification	• Tighten screws to specification.
Overdrive Band	
• Not adjusted properly	• Readjust to proper specification.
• Piston seals damaged	• Inspect for damage. Service as required.
Intermediate Band	
• Not adjusted properly	• Readjust to proper specification.
• Servo, piston and seals damaged	• Inspect for damage. Service as required.
For diagnosis related to a specific shift see Reference/Action.	• To diagnose a specific shift concern, refer to the appropriate shift routine. **Soft/Slipping Shift** 1-2, **Routine** 226/326 **Soft/Slipping Shift** 2-3, **Routine** 227/327 **Soft/Slipping Shift** 3-4, **Routine** 228/328 **Soft/Slipping Shift** 4-3, **Routine** 229/329

[1] Can be purchased as a separate item.

Shift Concerns: Feel — Harsh (Some/All)

Possible Component	Reference/Action
214 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harness, internal transmission wiring harness, PCM, EPC, TFT, RPM, DTR, VSS, TP*, MAF*	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit), Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit and Transmission Range (TR) Sensor Adapter or equivalents to perform

tomsn048@gmail.com

* Also see Routine 265	transmission static and dynamic tests. Perform the following Pinpoint Tests: B, D, E. Service as required. Clear codes, road test and rerun on-board diagnostics.
314 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid • Improper level	• Adjust to proper level.
Improper Pressures • Improper band/clutch application pressures, line pressure high	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Forward modulator valve/EPC boost valve (207), pressure boost valve/main regulator valve (208), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Overdrive Band • Misadjusted (tight)	• Readjust to specification.
Intermediate Band • Misadjusted (tight)	• Readjust to specification.
For diagnosis related to a specific shift, refer to Reference/Action.	• For diagnosis of a specific harsh shift, refer to the appropriate shift routine. **Harsh Shift** 1-2, **Routine** 232/332 **Harsh Shift** 2-3, **Routine** 233/333 **Harsh Shift** 3-4, **Routine** 234/334 **Harsh Shift** 4-3, **Routine** 235/335 **Harsh Shift** 3-2, **Routine** 236/336

[1] Can be purchased as a separate item.

Shift Concerns: No 1st Gear In Drive, Engages In High-Gear

Possible Component	Reference/Action
215 — ELECTRICAL ROUTINE	
Powertrain Control System	

tomsn048@gmail.com

• Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, SS1, SS2, SS3, DTR, EPC	• Perform shift point and TCC tests. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit and Transmission Range (TR) Sensor Adapter or equivalents to perform transmission static and dynamic tests. Perform the following Pinpoint Tests: A, D, E. Service as required. Clear codes, road test and rerun on-board diagnostics.
315 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkages (Internal/External)	
• Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Service all damaged components. After servicing linkage, readjust DTR sensor.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• SS1, SS2, SS3, EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Wrong components used in rebuild	• Verify that proper components were used.
Mechanical	
• Clutches damaged	• Refer to disassembly and assembly of transmission in this section.
For diagnosis related to a specific gear, use transmission tester to determine gear	• Refer to the following routines: **Shift** 1-2, **Routine** 220/320 **Shift** 2-3, **Routine** 221/321 **Shift** 3-4, **Routine** 222/322

[1] Can be purchased as a separate item.

Shift Concerns: No Manual 1st Gear

Possible Component	Reference/Action
216 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, SS1	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit to perform transmission static and dynamic tests. Perform the following Pinpoint Test: A. Service as

tomsn048@gmail.com

	required. Clear codes, road test and rerun on-board diagnostics.
316 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures • Improper band/clutch application (no engine braking), pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• SS1, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Check ball A damaged	• Inspect for damage. Service as required.
Low/Reverse One-Way Clutch Assembly	
• Rear one-way clutch damaged	• Service as required.

[1] Can be purchased as a separate item.

Shift Concerns: No Manual 2nd Gear

Possible Component	Reference/Action
217 — ELECTRICAL ROUTINE	
No Electrical Concerns	
317 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures • Improper band/clutch application pressures, line pressure high/low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• Check ball A damaged • Wrong component used in rebuild	• Inspect for damage. Service as required. • Verify that proper components were used.
Intermediate Band	
• Intermediate band out of	• Adjust intermediate band.

tomsn048@gmail.com

adjustment	
• Damaged or worn intermediate servo piston, lever, strut or internal leaks	• Perform air pressure test.
• Polished, glazed intermediate band or drum	• Replace or service as required.

Shift Concerns: No 1-2 Shift (Automatic)

Possible Component	Reference/Action
220 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TP, VSS, SS1, SS2, EPC	• Perform shift point test. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit to perform transmission static and dynamic tests. Perform the following Pinpoint Tests: A, E. Service as required, clear codes, road test and rerun on-board diagnostics.
320 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage (Internal/External) • Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Service all damaged components. After servicing linkages, readjust DTR sensor.
Improper Pressures • Improper band/clutch application pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• SS1, SS2, EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• 1-2 shift valve (203), forward modulator valve/EPC boost valve (207), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.

tomsn048@gmail.com

Intermediate Band Assembly	
• Band adjustment incorrect	• Inspect and readjust as required.
• Seals, piston, cover damaged	• Inspect for damage. Service as required.
• Friction elements worn, missing, damaged, misassembled	• Inspect for damage. Service as required.
• Return spring damaged • Case bore damaged, leaking	• Inspect for damage. Service as required. • Inspect for damage. Service as required.

[1] Can be purchased as a separate item.

Shift Concerns: No 2-3 Shift (Automatic)

Possible Component	Reference/Action
221 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TP, VSS, SS1, SS2	• Perform shift point test. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit to perform transmission static and dynamic tests. Perform the following Pinpoint Test: A. Service as required, clear codes, road test and rerun on-board diagnostics.
321 — HYDRAULIC/MECHANICAL ROUTINE	
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• SS1, SS2, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• 1-2 shift valve (203), 2-3 shift valve (204), spring, damaged, missing, misassembled, stuck, bore damaged • Wrong components used in rebuild	• Inspect for damage, If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage. • Verify that proper components were used.
Center Support Assembly	
• Screws not tightened to specification	• Inspect, install new and retighten to specification.
• Seal rings damaged • Outside diameter of casebore or center	• Inspect for damage. Service as required. • Inspect for damage. Service as required.

tomsn048@gmail.com

support damaged or leaking	
Direct Clutch Assembly	
• Assembly	• Air check assembly as outlined in this manual.
• Seals, piston, cylinder damaged	• Inspect for damage. Service as required.
• Friction elements mission or damaged	• Inspect for damage. Service as required.
• Check ball missing, damaged	• Inspect for damage. Service as required.

[1] Can be purchased as a separate item.

Shift Concerns: No 3-4 Shift (Automatic)

Possible Component	Reference/Action
222 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TP, VSS, SS3, CCS, EPC, TCS	• Perform shift point test. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit to perform transmission static and dynamic tests. Perform the following Pinpoint Tests: A, E, G. Service as required, clear codes, road test and rerun on-board diagnostics.
322 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures • Improper band/clutch application pressures, line pressure high/low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• SS3, CCS, EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Forward modulator valve/EPC boost valve (207), pressure boost valve/main regulator valve (208), SS3 solenoid/3-4 shift valve (215), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong components used in	• Verify that proper components were used.

tomsn048@gmail.com

rebuild	
Overdrive Band Assembly	
• Band adjustment incorrect	• Inspect and readjust as required.
• Band friction plates burnt, missing	• Inspect for damage. Service as required.
• Cylinder damaged, leaking seals damaged	• Inspect for damage. Service as required.
• Piston cover seal, strut, lever damaged	• Inspect for damage. Service as required.
Overdrive Planetary Assembly	
• Damaged	• Inspect for damage. Service as required.

[1] Can be purchased as a separate item.

Shift Concerns: Soft/Slipping 1-2 Only (Automatic)

Shift Concerns: Harsh 3-2 Only (Automatic)

Possible Component	Reference/Action
236 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, SS3, TCC, EPC	• Perform shift point and TCC tests. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit to perform transmission static and dynamic tests. Perform the following Pinpoint Tests: A, C, E. Service as required. Clear codes, road test and rerun on-board diagnostics.
336 — HYDRAULIC/MECHANICAL ROUTINE	
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• TCC, EPC, SS3, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Torque converter clutch (200), forward modulator valve/EPC boost valve (207), pressure boost valve/main regulator valve (208), manual low valve (212), 3-2 torque demand valve (213), thermostat bypass valve/cooler limit valve (216), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
Direct Clutch Drum • Damaged	• Inspect for damage. Service as required.
Intermediate Band • Misadjusted	• Readjust band to proper specification.
Intermediate Servo Assembly • Piston, servo, spring, damage, wrong part used in rebuild	• Inspect for damage. Service as required.
Torque Converter Clutch Assembly	• Refer to routines 241/341.

[1] Can be purchased as a separate item.

Torque Converter Clutch Operation Concerns: No Clutch Apply

Possible Component	Reference/Action
240 — ELECTRICAL ROUTINE	
Powertrain Control System	

tomsn048@gmail.com

• Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, ECT, TSS, TCC NOTE: Also refer to Routine No. 265.	• Perform TCC tests. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit to perform transmission static and dynamic tests. Perform the following Pinpoint Tests: C, F. Service as required. Clear codes, road test and rerun on-board diagnostics.
340 — HYDRAULIC/MECHANICAL ROUTINE	
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• Converter clutch control valve (201), thermostat bypass valve/cooler limit valve (216), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• TCC solenoid and valve (200), stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Wrong component used in rebuild	• Verify that proper components were used.
Pump Assembly	
• Front pump seal worn or damaged	• Inspect for damage. Service as required.
• Screws out of torque specification	• Retorque screws to specification.
Torque Converter Clutch Assembly	
• Torque converter internal malfunction preventing lockup, piston application	• Remove transmission. Inspect for damage. Replace torque converter if required.

[1] Can be purchased as a separate item.

Torque Converter Clutch Operation Concerns: Clutch Always Applies/Stalls Vehicle

Possible Component	Reference/Action
241 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Low engine idle	• Verify engine idle speed is within specification.
• Electrical inputs/outputs, vehicle wiring harnesses,	• Perform TCC tests. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] Use Rotunda Transmission

tomsn048@gmail.com

internal transmission wiring harnesses, PCM, TCC	Tester 007-00130 (part of Rotunda Transmission Tester Kit), Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit and Transmission Range (TR) Sensor Adapter or equivalents to perform transmission static and dynamic tests. Perform the following Pinpoint Test C . Service as required. Clear codes, road test and rerun on-board diagnostics.
341 — HYDRAULIC/MECHANICAL ROUTINE	
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• TCC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• TCC solenoid and valve (200), TCC control valve (201), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control, If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and result in further main control or transmission damage.
• Wrong components used in rebuild	• Verify that proper components were used.
Torque Converter Clutch Assembly	
• Torque converter internal malfunction preventing lockup piston application	• Remove transmission. Inspect for damage. Replace torque converter if required.

[1] Can be purchased as a separate item.

Torque Converter Clutch Operation Concerns: Cycling/Shudder/Chatter

Possible Component	Reference/Action
242 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TCC, DTR, BOO, TP, RPM	• Perform TCC tests. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit), Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit and Transmission Range (TR) Sensor Cable "E" (007-00111) or equivalents to perform transmission static and dynamic tests. Perform the following Pinpoint Tests: C, D. Service as required. Clear codes, road test and rerun on-board diagnostics.
• Speed control equipped vehicles	• Evaluate with speed control off.
342 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	

tomsn048@gmail.com

• Fluid contaminated	• Inspect fluid for contamination. If contaminated, locate source of contamination. If burnt, inspect mechanical band, clutches. Service as required.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• TCC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• TCC solenoid and valve (200), converter clutch control valve (201), thermostat bypass valve/cooler limit valve (216), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
Pump Assembly	
• Screws out of torque specification	• Tighten screws to specification.
• Cross leaks	• Inspect for damage. Service as required.
• Front pump seal damage	• Inspect for damage. Service as required.
• Seal on inner pump gear damaged	• Inspect for damage. Service as required.
Torque Converter Clutch Assembly • End clearance (excessive), internal leakage, clutch material damage	• Perform end play check. Inspect and service as required.

[1] Can be purchased as a separate item.

Other Concerns: Shift Level Efforts High

Possible Component	Reference/Action
251 — ELECTRICAL ROUTINE	
No Electrical Concerns	
351 — HYDRAULIC/MECHANICAL ROUTINE	
Brake Shift Interlock • System, solenoid damaged	• Refer to brake section or steering column section in the service manual.
Shift Linkages (Internal/External) • Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Service all damaged components. After servicing linkages, readjust DTR sensor.
Case	

tomsn048@gmail.com

• Manual control outer lever damaged. Manual valve inner lever pin bent, damaged. Manual valve inner lever, spring rod damaged • Manual valve lever shaft retaining pin damaged	• Adjust linkage and install manual valve lever shaft retaining pin.

Other Concerns: External Leaks

Possible Component	Reference/Action
252 — ELECTRICAL ROUTINE	
No Electrical Concerns	
352 — HYDRAULIC/MECHANICAL ROUTINE	
Case • Case vent	• Check the vent for free breathing. Service as required.
Seals/Gaskets • Leakage at gaskets, seals, etc. Refer to leakage diagram for potential leak locations	• Remove all traces of lubricant on exposed surfaces of transmission. Check the vent for free breathing. Operate transmission at normal temperatures and perform fluid leakage check. Service as required.

Other Concerns: Poor Vehicle Performance

Possible Component	Reference/Action
253A — ELECTRICAL ROUTINE	
Powertrain Control System	
• Poor engine performance	• Check engine tune-up. Refer to Section 4A in the Powertrain Control/Emissions Diagnosis Manual [1] for diagnosis and testing of the automatic transmission.
• Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, SS3, TCC	• Perform shift point tests on O/D with the TCS off. Refer to shift point specification if out of specifications. Run on-board diagnostic and check for shift error codes. Perform shift point and TCC tests. Re-run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit), Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit and Transmission Range (TR) Sensor Cable "E" (007-00111) or equivalents to perform transmission static and dynamic tests. Perform the following Pinpoint Tests: A, C. Service as required. Clear codes, road test and rerun on-board diagnostics.
353A — HYDRAULIC/MECHANICAL ROUTINE	
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.

tomsn048@gmail.com

• Separator plate damaged	• Inspect for damage. Service as required.
• SS3, TCC solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• SS3 and 3-4 shift valve (215), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used
Torque Converter Clutch Assembly	
• Torque converter one-way clutch slipping	• Inspect one-way clutch. Replace torque converter.
• Incorrect TCC used in rebuild	• Inspect for correct TCC assembly. Replace as required.

[1] Can be purchased as a separate item.

Other Concerns: Poor Vehicle Performance/Wrong Gear Ratio In D, M2, M1

Possible Component	Reference/Action
253B — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, SS3 (on)	• Perform shift point and TCC tests. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1]. Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit), Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit and Transmission Range (TR) Sensor Cable "E" (007-00111) or equivalents to perform transmission static and dynamic tests. Perform the following Pinpoint Test: A. Service as required. Clear codes, road test and rerun on-board diagnostics.
353B — HYDRAULIC/MECHANICAL ROUTINE	
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• SS3, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• SS3 solenoid and valve (215), spring, damaged, missing,	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will

tomsn048@gmail.com

misassembled, stuck, bore damaged • Wrong component used in rebuild	remove the anodized finish and result in further main control or transmission damage. • Verify that proper components were used.

[1] Can be purchased as a separate item.

Other Concerns: Noise/Vibration — Forward Or Reverse

Possible Component	Reference/Action
254 — ELECTRICAL ROUTINE	
No Electrical Concerns	
354 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid • Improper level	• Adjust to proper level.
Shift Linkages (Internal/External) • Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Service all damaged components. After servicing linkages, readjust DTR sensor.
Improper Pressures • Improper band/clutch application pressures, line pressure high/low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible components: pump assembly.
Pump Assembly	
• Internal leakage, cavitation • Screws out of torque specification	• Inspect and service as required. • Tighten screws to specification.
Overdrive One-Way Clutch Assembly • One-way clutch damaged, worn, misassembled	• Service one-way clutch.
Rear One-Way Clutch Assembly • One-way clutch damaged, worn, misassembled	• Service one-way clutch.
Other • Transmission oil cooler lines, fill tube grounding	• Relocate transmission oil cooler lines or fill tube properly.
Gear • Gear noise	• Service planetary gear assemblies.
Torque Converter Clutch Assembly	• Refer to routines 242/342.

Other Concerns: Engine Will Not Crank

tomsn048@gmail.com

Possible Component	Reference/Action
255 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, DTR sensor	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] for diagnosis. Use Rotunda Transmission Tester 007-00130 and Transmission Range (TR) Sensor Cable "E" 007-00111 or equivalents to perform transmission static and dynamic tests. Perform the following Pinpoint Test: D. Service as required. Clear codes, road test and rerun on-board diagnostics.
355 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkages (Internal/External) • Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Service all damaged components. After servicing linkages, readjust DTR sensor.
Pump Assembly • Seized	• Refer to disassembly of transmission. Inspect for damage. Service or replace as required.
Flywheel • Damaged	• Inspect for damage. Service as required.

[1] Can be purchased as a separate item.

Other Concerns: No Park Range

Possible Component	Reference/Action
256 — ELECTRICAL ROUTINE	
No Electrical Concerns	
356 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkages (Internal/External) • Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Service all damaged components. After servicing linkages, readjust DTR sensor.
Park Mechanism	
• Park gear, parking pawl, parking pawl return spring, park or guide plate, parking pawl shaft, parking pawl actuating rod, manual lever, manual lever detent spring damaged, misassembled	• Inspect for damage. Service as required.
• Transfer case and linkages damaged	• Refer to service manual for transfer case and linkage diagnosis.
4x4 Applications • Transfer case and linkage damaged	• Refer to service manual for transfer case and linkage diagnosis.

tomsn048@gmail.com

Other Concerns: Transmission Overheating

Possible Component	Reference/Action
257 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TFT, TCC	• Perform shift point and TCC test. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit), Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit and Transmission Range (TR) Sensor Cable "E" (007-00111) or equivalents to perform transmission static and dynamic tests. Perform the following Pinpoint Tests: B, C. Service as required. Clear codes, road test and rerun on-board diagnostics.
357 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid • Improper level	• Adjust to proper level.
Improper Pressures • Improper band/clutch application pressures, line pressure high/low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible components: main control, TCC.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• TCC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Thermostat bypass valve/cooler limit valve (216), spring, damaged, missing misassembled, stuck, bore damaged • Wrong component used in rebuild	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage. • Verify that proper components were used.
Torque Converter Clutch Assembly	
• Seized torque converter one-way clutch • Excessive slip detected	• Refer to routines 240/340. • Inspect torque converter one-way clutch. • Replace torque converter as required. • Run on-board diagnostics.
Other • Restriction in transmission oil cooler or tubes	• Service transmission oil cooler or tubes.

[1] Can be purchased as a separate item.

tomsn048@gmail.com

Other Concerns: No Engine Braking In Manual 2 Position

Possible Component	Reference/Action
258 — ELECTRICAL ROUTINE	
No Electrical Concerns	
358 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures • Improper band/clutch application pressures, line pressure high/low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible components: main control, coast clutch assembly.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• Extension housing lube orifice, check ball A and C not seating or damaged, spring, damaged, missing misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong part used in rebuild	• Service as required.
Coast Clutch Assembly	
• Coast clutch damaged	• Replace as required.
• Seal ring damaged	• Inspect for damage. Service as required.
Intermediate Band	
• Intermediate band out of adjustment	• Adjust intermediate band.
• Intermediate servo leaking	• Perform air pressure test to determine if intermediate servo is leaking. Service as required.
• Glazed intermediate band	• Service or replace as required.

Other Concerns: No Engine Braking In Manual 1 Position

Possible Component	Reference/Action
259 — ELECTRICAL ROUTINE	
No Electrical Concerns	
359 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid • Improper level	• Adjust to proper level.
Shift Linkages (Internal/External) • Transmission shift cable and	• Inspect for damage. Readjust as required. Service all

tomsn048@gmail.com

bracket damaged or misadjusted. DTR sensor out of adjustment	damaged components. After servicing linkages, readjust DTR sensor.
Improper Pressures	
• Improper band/clutch application pressures, line pressure high/low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• Manual low valve (212), check ball E not seating properly, spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong part used in rebuild	• Inspect for correct part. Service as required.
Coast Clutch Assembly	
• Wrong part used in rebuild	• Inspect parts. Service as required.
• Overdrive clutch damaged • Seal rings damaged	• Replace as required.
Reverse Clutch/Band	
• Reverse servo or piston or gasket seal leaking	• Perform air pressure test. Check and replace piston seal as required.
• Reverse band burnt, worn or damaged	• Replace as required.
• Polished or glazed low reverse clutch band or drum	• Service or replace as required.
Rear One-Way Clutch Assembly	
• Rear one-way clutch damaged	• Replace as required.

Other Concerns: No Engine Braking With Overdrive Cancelled(In 2nd And 3rd)

Possible Component	Reference/Action
260 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, SS3 (also no 3rd gear), CCS	• Perform shift point tests. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester to perform transmission static and dynamic tests. Perform the following Pinpoint Tests: A, G. Service as required. Clear codes, road test and rerun on-board diagnostics. Also check for engine braking in manual 1 and manual 2. NOTE: No engine braking in O/D position with the TCS off, 1st

tomsn048@gmail.com

	gear is a normal function.
360 — HYDRAULIC/MECHANICAL ROUTINE	
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• SS3, CCS, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Service as required.
• Coast clutch solenoid and valve/converter clutch control valve (201), SS3 solenoid/3-4 shift solenoid (215), spring, damaged, missing misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Coast Clutch Assembly	
• Wrong part used in rebuild	• Verify that proper components were used.
• Overdrive clutch damaged	• Replace as required.
• Seal rings damaged	• Inspect for damage. Service as required.

[1] Can be purchased as a separate item.

Other Concerns: Fluid Venting/Foaming

Possible Component	Reference/Action
261 — ELECTRICAL ROUTINE	
No Electrical Concerns	
361 — HYDRAULIC/MECHANICAL ROUTINE	
• Vent blocked or damaged	• Check vent for damage or blockage. Service as required.
• Overfilled transmission	• Check level and adjust as required.
• Fluid contaminated (antifreeze, water)	• Check for contamination, locate source of contamination. Service as required.
• Overheating	• Refer to routines 257/357.
• Filter and seal assembly damaged or misassembled	• Inspect filter and seal assembly for damage. Service as required.

Other Concerns: Slips/Chatters In Manual 1 Position

Possible Component	Reference/Action
263 — ELECTRICAL ROUTINE	
No Electrical Concerns	
363 — HYDRAULIC/MECHANICAL ROUTINE	

tomsn048@gmail.com

Improper Pressures • Improper band/clutch application pressures, line pressure high/low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• Wrong components used in rebuild	• Verify that proper components were used.
• Dirty or sticking main control valve body	• Clean, service or replace main control valve body.
Rear One-Way Clutch Assembly • Low/reverse one-way clutch damaged	• Replace rear one-way clutch and case.

Other Concerns: Slips/Chatters In Manual 2 Position

Possible Component	Reference/Action
264 — ELECTRICAL ROUTINE	
No Electrical Concerns	
364 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures • Improper band/clutch application pressures, line pressure high/low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Service as required.
• Wrong components used in rebuild	• Verify that proper components were used.
• Dirty or sticking main control valve body	• Clean, service or replace main control valve body.
Intermediate Band	
• Intermediate band out of adjustment	• Adjust intermediate band.
• Damaged or worn intermediate servo piston,	• Perform air pressure test. Inspect for damage. Service as required.

tomsn048@gmail.com

lever, strut, or internal leaks • Polished, glazed low and intermediate band or drum	• Replace or service as required.

Other Concerns: FMEM — Harsh Engagements And Shifts

Possible Component	Reference/Action
265 — ELECTRICAL ROUTINE	
Powertrain Control System • Operating in FMEM strategy. Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, EPC, VSS, DTR, TCC, transmission overtemp (TFT), TP and MAF, shift error detected (shift solenoid, TSS, VSS and internal hardware)	• Run on-board diagnostics. Service as required. Clear codes, road test and rerun self test. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit), Rotunda 4R44E/4R55E Overlay/Cable 007-00106 included in the Transmission Tester Kit and Transmission Range (TR) Sensor Cable "E" (007-00111) or equivalent, perform Transmission Static and Dynamic Test. Perform the following Pinpoint Test B , C, D, E, F. Service as required, clear codes, road test and rerun on-board diagnostics.
365 — HYDRAULIC/MECHANICAL ROUTINE	
No Hydraulic/Mechanical Concerns	

[1] Can be purchased as a separate item.

Transmission Fluid Drain and Refill

Intervals for drain and refill, due to in-vehicle service or major service operation, are as follows:

- Normal Maintenance
  - Not required with normal use.
- Severe Duty Maintenance
  - Change fluid at 80,450 km (50,000 mile) intervals using MERCON 5® XT-5-QM or equivalent.

CAUTION: Use only MERCON V® XT-5-QM Service Fluid as the use of any other fluids may result in a transmission malfunction or failure.

Maintenance Procedure

1. Loosen, then remove the transmission fluid pan-to-case screws to drain the fluid.
2. Remove and discard old pan gasket.
3. Thoroughly clean the fluid pan and the transmission case fluid pan rail surface.
4. Install new pan gasket onto pan and install fluid pan to case with screws. Tighten screws to 13-15 Nm (115-133 lb-in).
5. Add 2.8 liters (3 quarts) of MERCON V® XT-5-QM or equivalent MERCON® approved fluid into fluid filler tube.
6. Start engine. Move transmission range selector lever through all gear ranges, checking for engagements.
7. Check and adjust transmission fluid in 0.25 liter (1/2 pint) increments to proper level (cross-hatched area of fluid level indicator at normal operating temperatures).

Major Service/Overhaul

1. Loosen, then remove the transmission fluid pan screws to drain fluid.
2. Remove and discard old pan gasket.
3. Perform required internal repair and cleaning as required.
4. Thoroughly flush torque converter, cooler lines and transmission in-tank radiator cooler and auxiliary cooler (if equipped).
5. Replace with new fluid filter and O-rings assembly.

tomsn048@gmail.com

6. Install cleaned fluid pan and new pan gasket with fluid pan-to-case screws. Tighten fluid pan-to-case screws to 13-15 Nm (115-133 lb-in).

7. Add 3.7 liters (4 quarts) of MERCON V® XT-5-QM or equivalent MERCON® approved fluid into fluid filler tube.

8. Start engine. Move the transmission range selector lever through all gear ranges, checking for engagements.

9. Check and adjust the transmission fluid level in 0.25 liter (1/2 pint) increments to the proper level (cross-hatched area of the fluid level indicator at normal operating temperatures).

tomsn048@gmail.com

Extension Housing Seal and Bushing

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Impact Slide Hammer	T50T-100-A
Extension Housing Bushing Remover	T77L-7697-E
Extension Housing Bushing Replacer	T77L-7697-F
Extension Housing Seal Replacer	T74P-77052-A

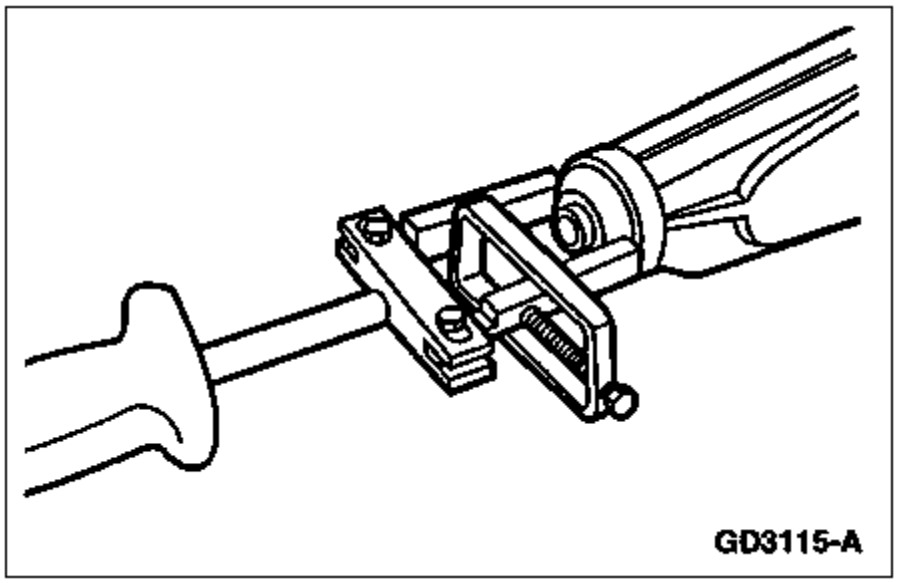
SPECIAL SERVICE TOOLS DESIRED

Tool Number	Description
Seal Remover	T94P-77001-BH

Removal

1. Raise vehicle on a hoist and position suitable safety stands under vehicle.
2. Remove rear driveshaft. Refer to Section 05-01 .
3. Remove output shaft and extension housing seal using Seal Remover T94P-77001-BH and Impact Slide Hammer T50T-100-A.

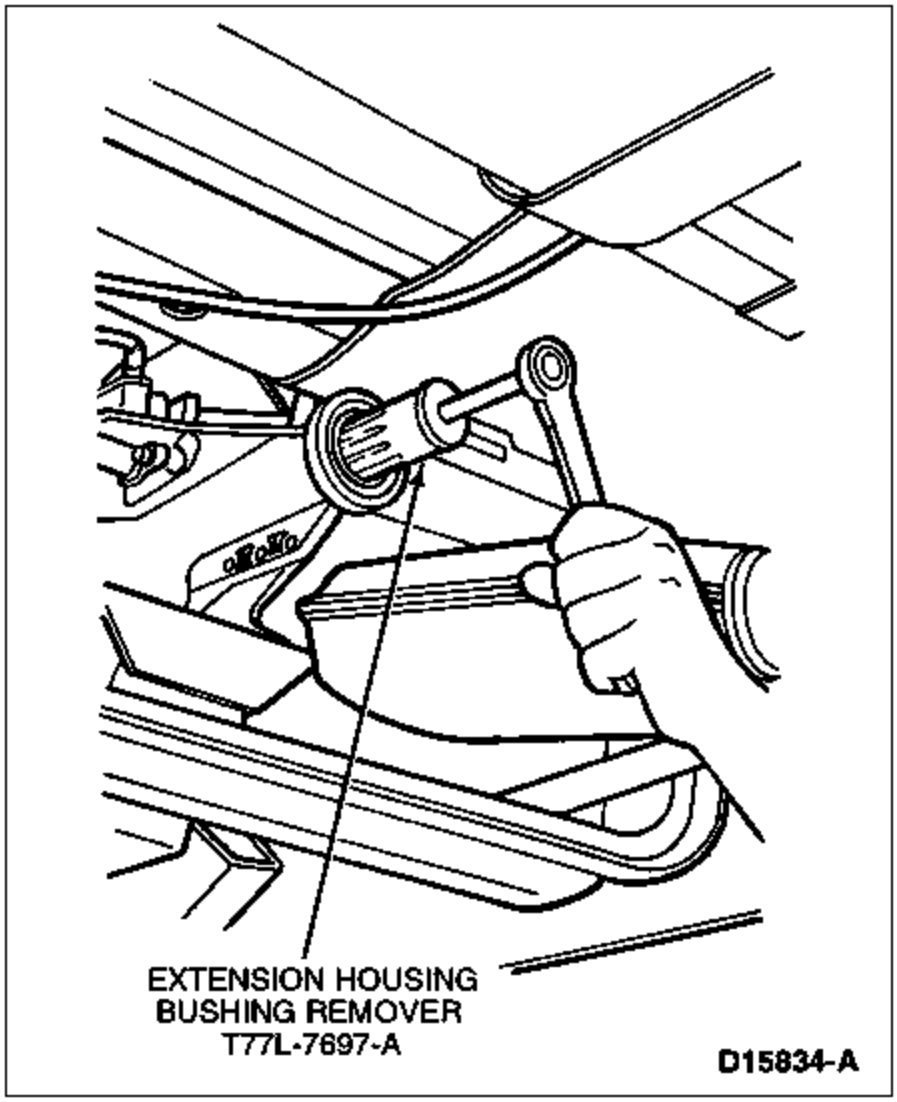
tomsn048@gmail.com



4. **CAUTION: Use the extension housing bushing remover carefully so that the seal area is not damaged.**

   Remove the bushing using Extension Housing Bushing Remover T77L-7697-E.

tomsn048@gmail.com



Installation

1. Inspect the counterbore of the extension housing for burrs. If necessary, remove burrs with an oil stone.

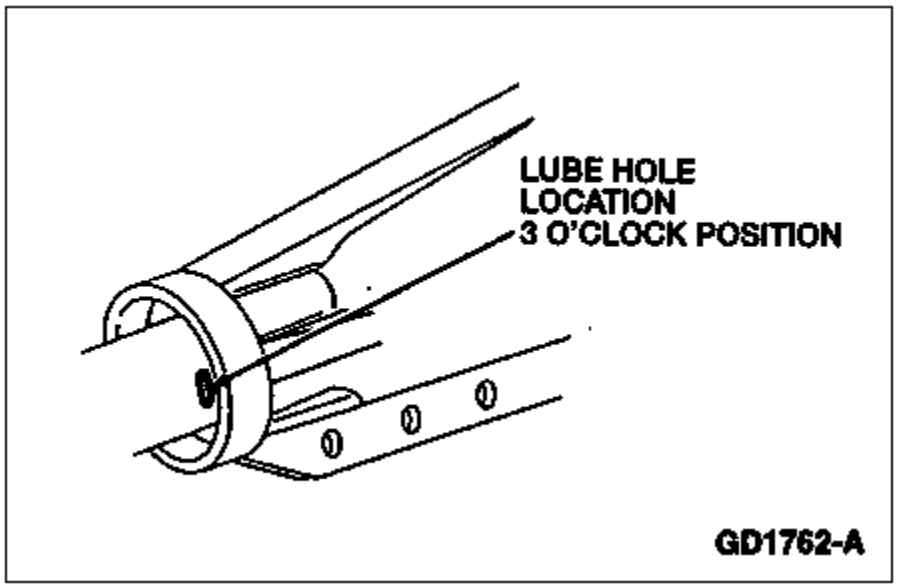
2. **CAUTION: The lube hole in the bushing must be aligned with the lube groove in the extension housing, located 90°(3 o'clock position) from top when viewed from rear.**

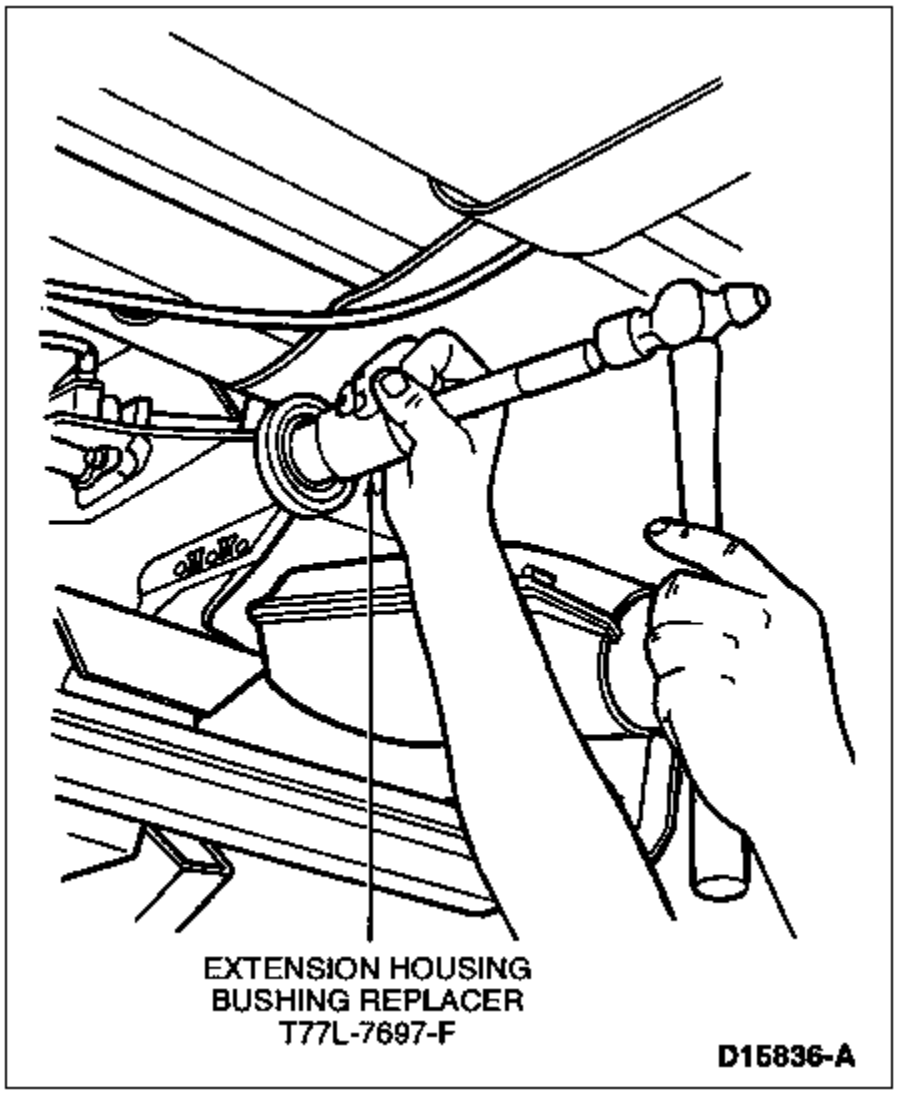
   CAUTION: Tool will bottom when bushing is in the proper position.

   NOTE: Install the extension housing bushing if it was removed.

   Install the extension housing bushing using Extension Housing Bushing Replacer T77L-7697-F.

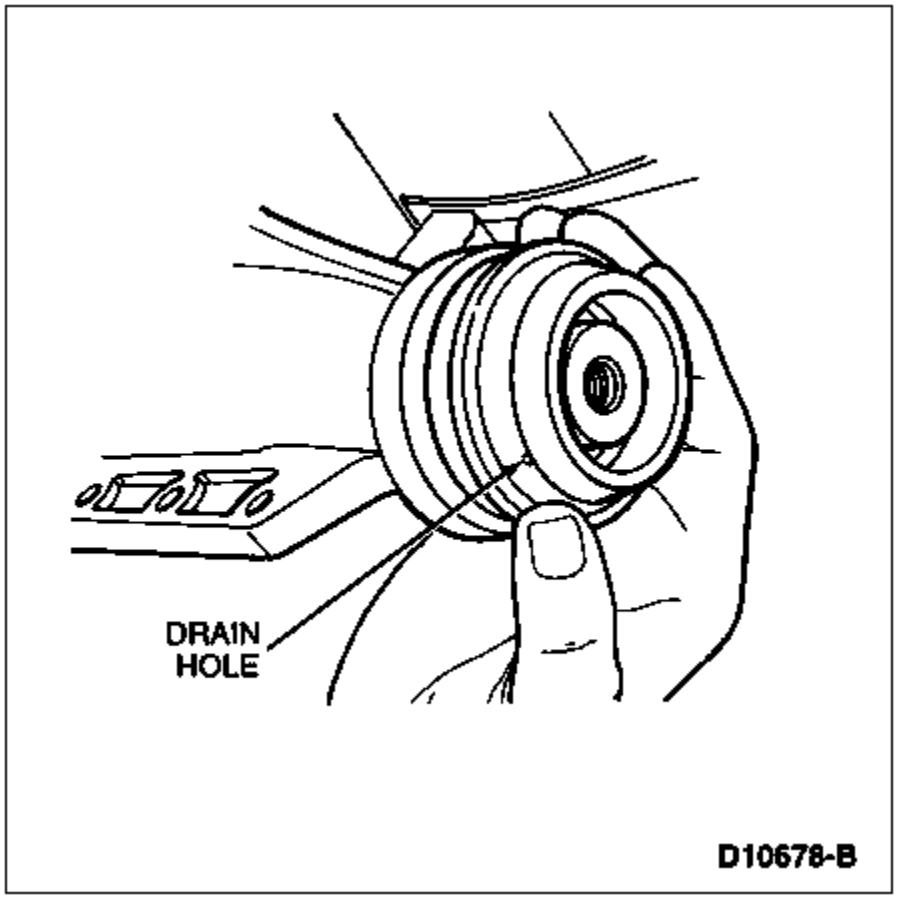
tomsn048@gmail.com





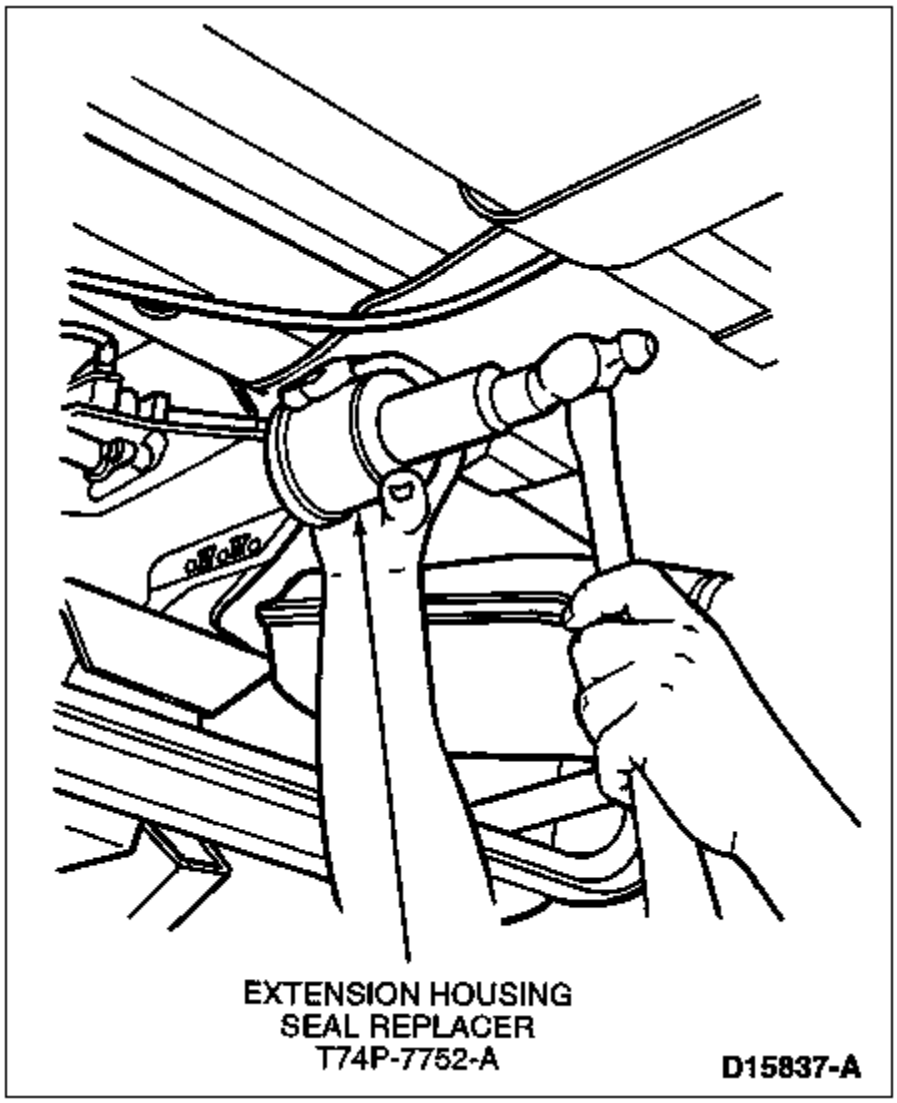
tomsn048@gmail.com

3. Position new output shaft and extension housing seal with drain hole positioned facing downward (6 o'clock position).



4. Seat seal using Extension Housing Seal Replacer T74P-77052-A.

tomsn048@gmail.com



5. Inspect driveshaft slip-yoke. Replace if damaged or worn.
6. Install driveshaft. Refer to Section 05-01 .
7. Remove safety stands and lower vehicle.
8. Fill the transmission to the proper level. Refer to Specifications at the end of this section.

tomsn048@gmail.com

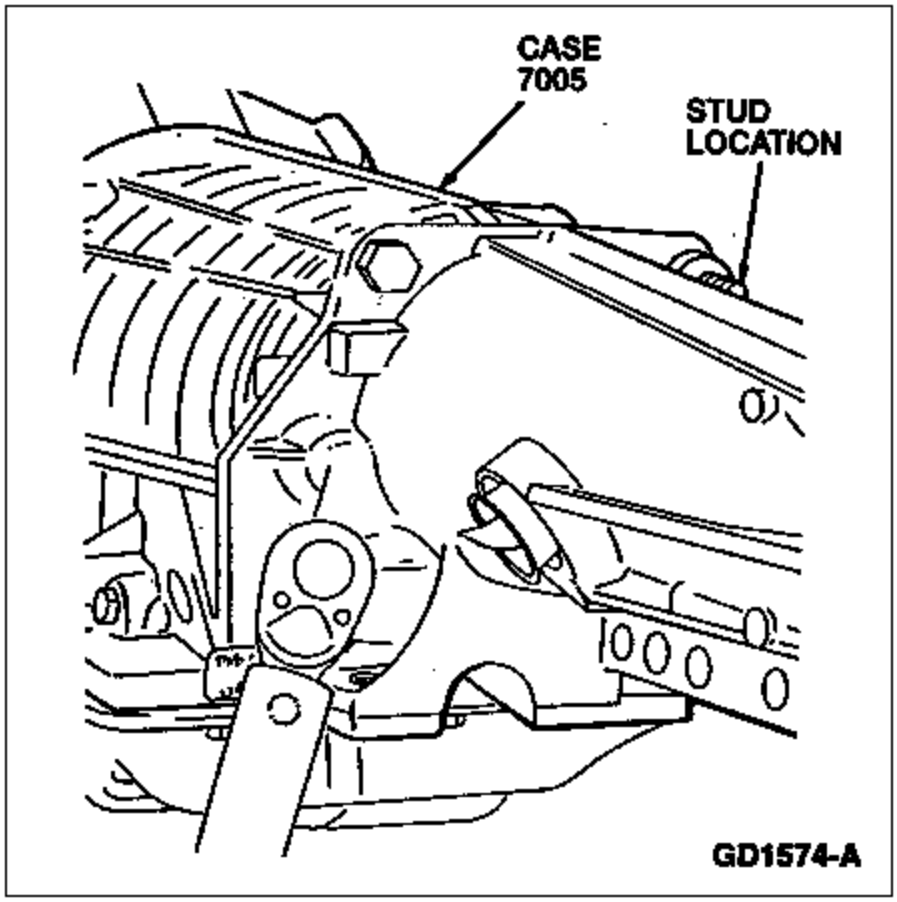
tomsn048@gmail.com

Extension Housing Gasket

Removal

1. Raise vehicle on hoist and position suitable safety stands under vehicle.
2. Remove front (4x4 only) and rear driveshaft. Refer to Section 05-01 .
3. Remove transfer case assembly (4x4 only). Refer to Section 07-07A or Section 07-07B .
4. Remove transmission mounting pad nuts and bolts. Refer to the transmission removal procedures in this section.
5. Carefully remove wire harness locators from extension housing wire bracket.
6. Position jack under transmission and raise transmission.
7. Remove five extension housing screws, one stud and wiring bracket using a 17 mm socket.

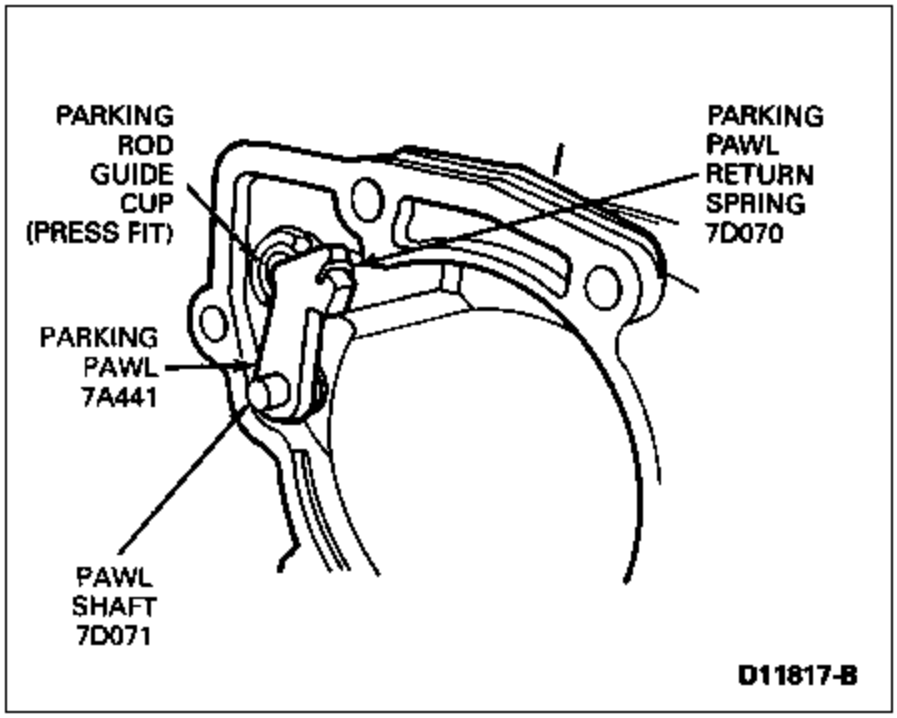
tomsn048@gmail.com



8. **CAUTION: The parking pawl, parking pawl return spring and parking pawl shaft could fall out during removal of the extension housing.**

   Carefully remove extension housing.

tomsn048@gmail.com



9. Remove and discard extension housing gasket (7086) from extension housing and mating surfaces.

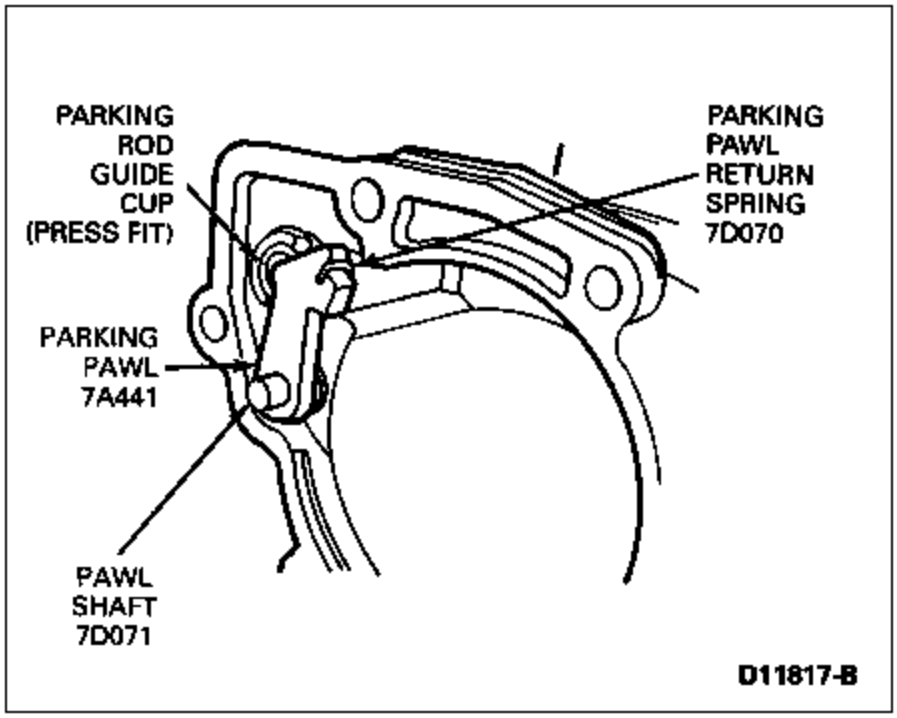
Installation

1. Clean extension housing and transmission mating surfaces. Place a light film of petroleum jelly on the extension housing gasket and position gasket on the transmission case.

2. **NOTE: The guide cup is press-fit into the extension housing and is not serviced separately.**

   Install the parking pawl, pawl return spring and pawl shaft into the extension housing.

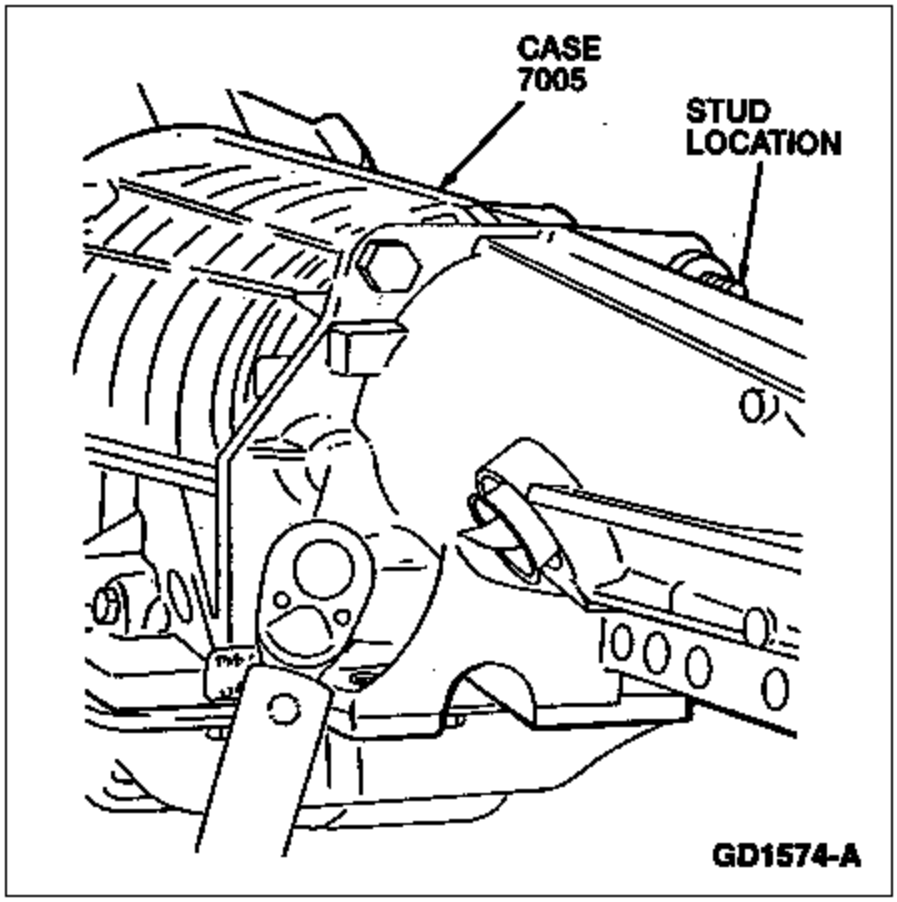
tomsn048@gmail.com



3. **CAUTION: Make sure the parking lever actuating rod is correctly seated into the case parking rod guide cup.**

   Install the extension housing. Install the five M10 x 30 mm extension housing screws and one stud. Tighten the extension housing-to-case stud and screws to 36-52 Nm (27-39 lb-ft).

tomsn048@gmail.com



4. On 4x4 models only, install transfer case. Refer to Section 07-07A or Section 07-07B .
5. On 4x4 models only, attach transfer case vent hose to attaching plate. Refer to Section 07-07A or Section 07-07B .
6. Install four-wheel drive connector, if equipped.
7. Install new wire harness locator into extension housing wire bracket.
8. Install transmission mounting pad nuts and bolts and tighten to 68-95 Nm (50-70 lb-ft).
9. On Ranger vehicles, install the two crossmember-to-frame through bolts and nuts and tighten to 88-115 Nm (65-85 lb-ft).
10. On Aerostar vehicles, install the two crossmember-to-frame through bolts and nuts and tighten to 37-52 Nm (28-38 lb-ft).
11. Remove universal high lift transmission jack.
12. Install front (4x4 only) and rear driveshaft. Refer to Section 05-01 .
13. Fill the transmission to the proper level. Refer to Preliminary Testing procedure in this section.

tomsn048@gmail.com

tomsn048@gmail.com

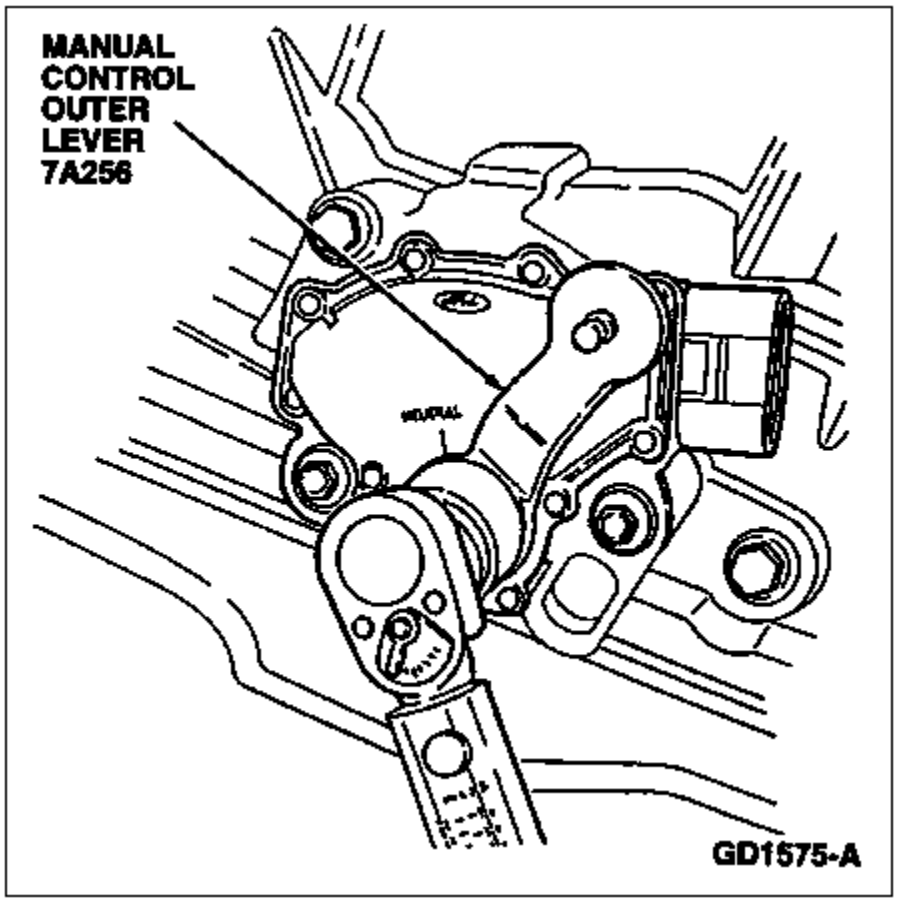
Digital Transmission Range (DTR) Sensor

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Digital TR Sensor Alignment Tool	T97L-70010-A

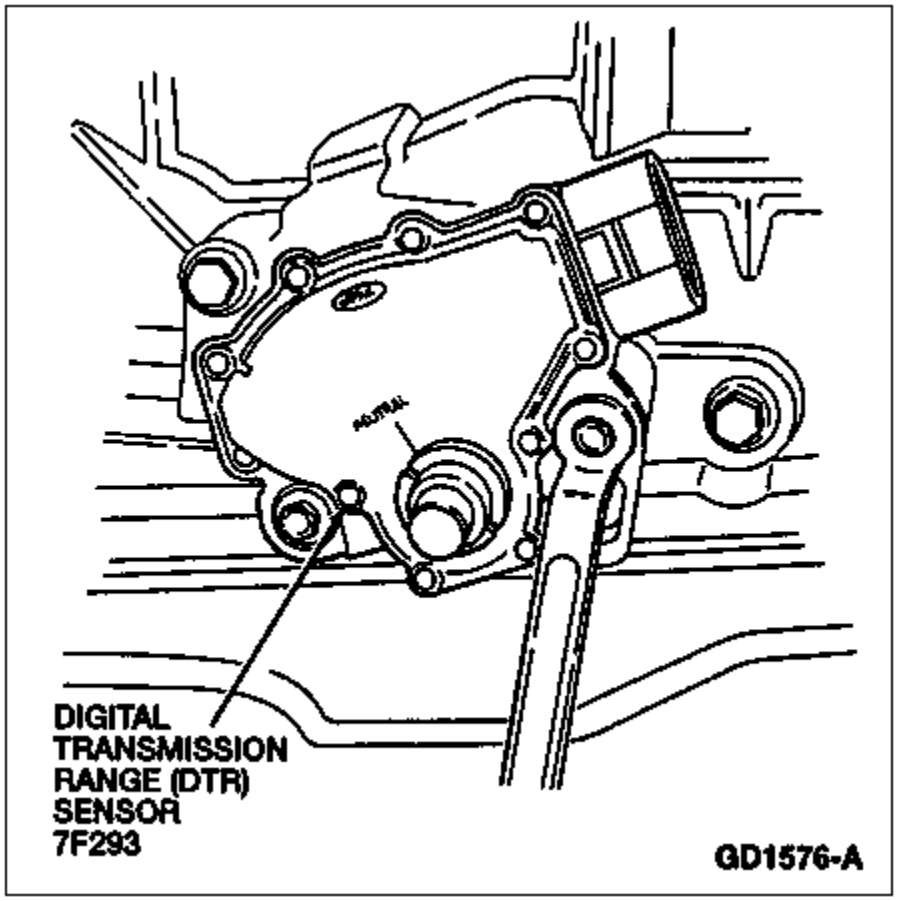
Removal

1. Use a screwdriver to remove the shift cable and fitting from the transmission lever ball stud.
2. Disconnect vehicle harness connector from digital transmission range (DTR) sensor by depressing tab.
3. Remove the manual control outer lever nut and manual control outer lever.



tomsn048@gmail.com

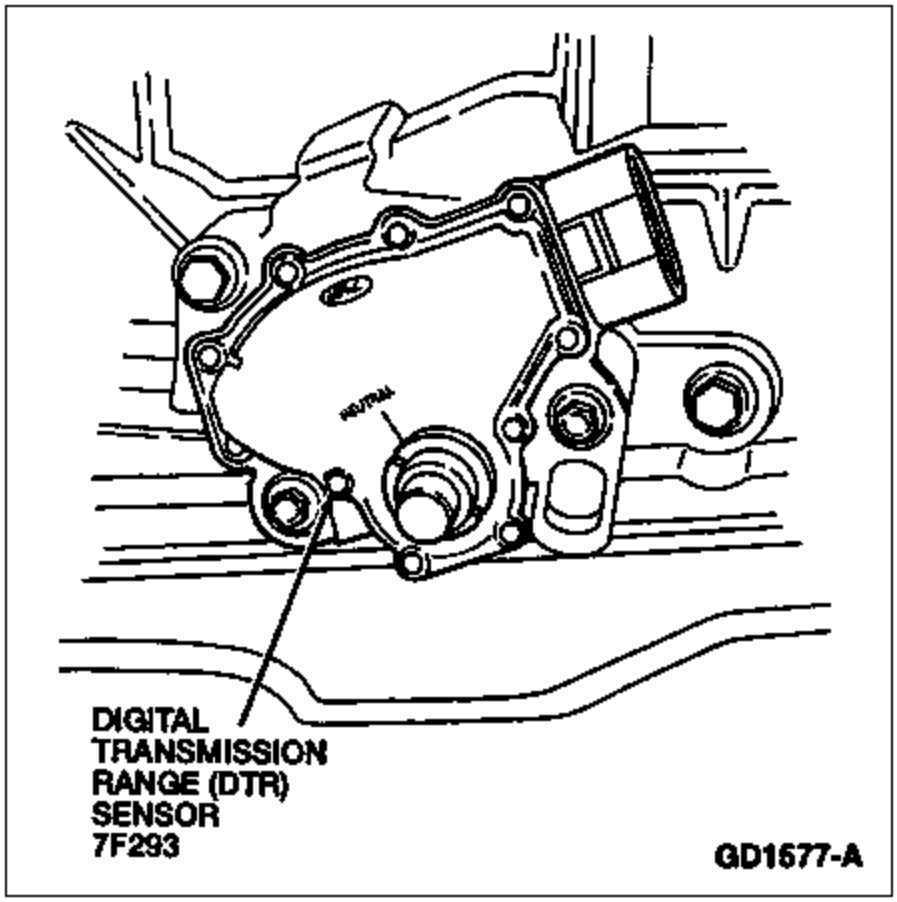
4. Remove the two M6 x 25 TR sensor screws and remove the DTR sensor.



Installation

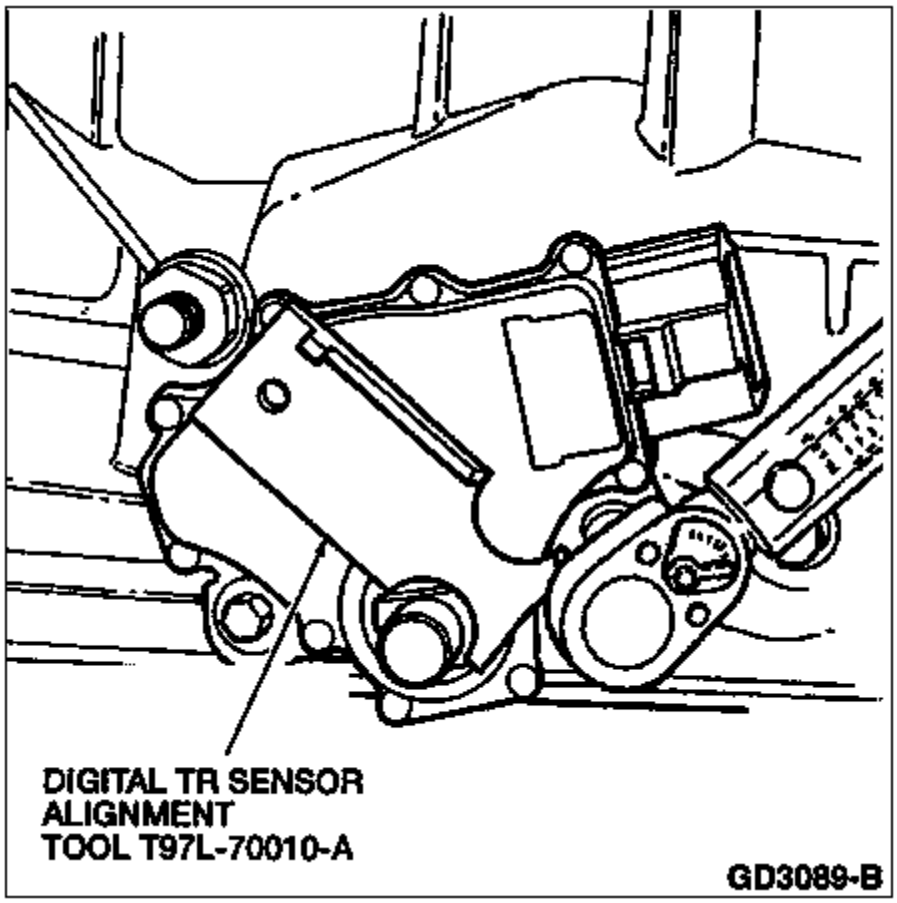
1. Install the DTR sensor on the manual lever. Install the two TR sensor screws and finger tighten. Rotate the manual lever to the neutral position (two detents rearward).

tomsn048@gmail.com



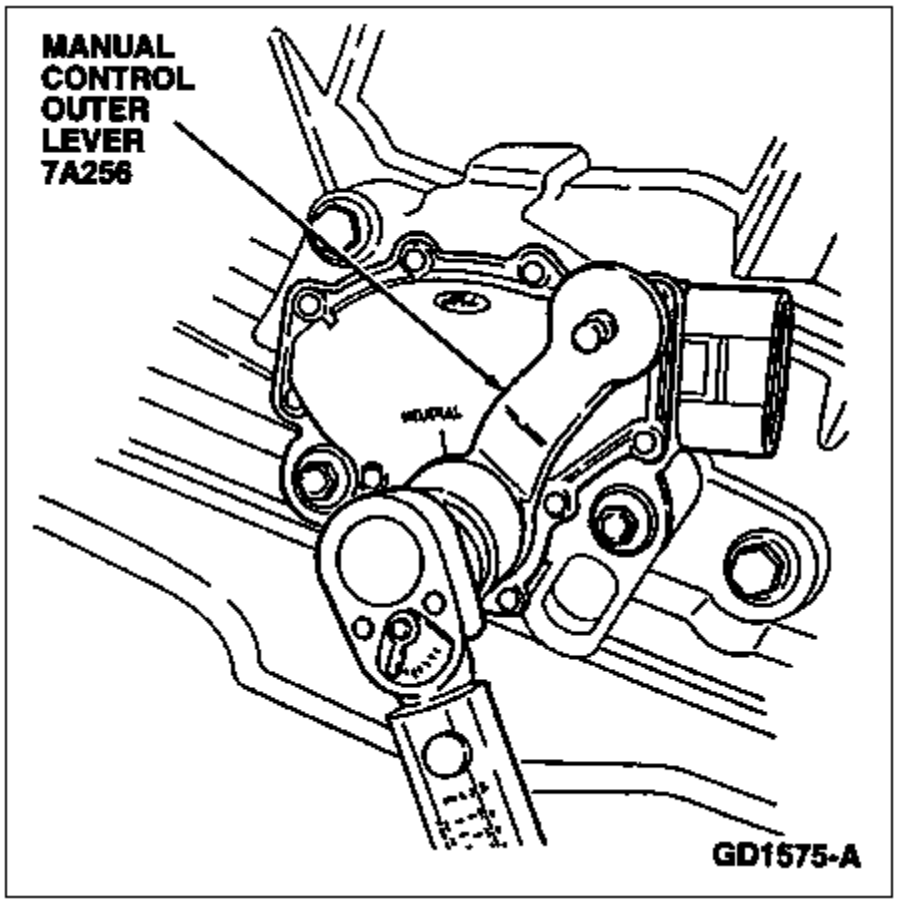
2. Install Digital TR Sensor Alignment Tool T97L-70010-A into the three slots on the DTR sensor. Tighten the TR sensor-to-case screws to 8-11 Nm (71-97 lb-in). Remove the alignment tool.

tomsn048@gmail.com



3. Install the manual control outer lever and manual control outer lever nut. Tighten the manual control outer lever nut to 41-54 Nm (30-40 lb-ft).

tomsn048@gmail.com



4. Install shift cable or linkage from manual control lever (7A256). Use a screwdriver to remove the cable and fitting from the transmission lever ball stud.

5. Adjust shift cable. Refer to adjustments in Section 07-05 .

6. Reconnect vehicle harness connector to DTR sensor.

---

tomsn048@gmail.com

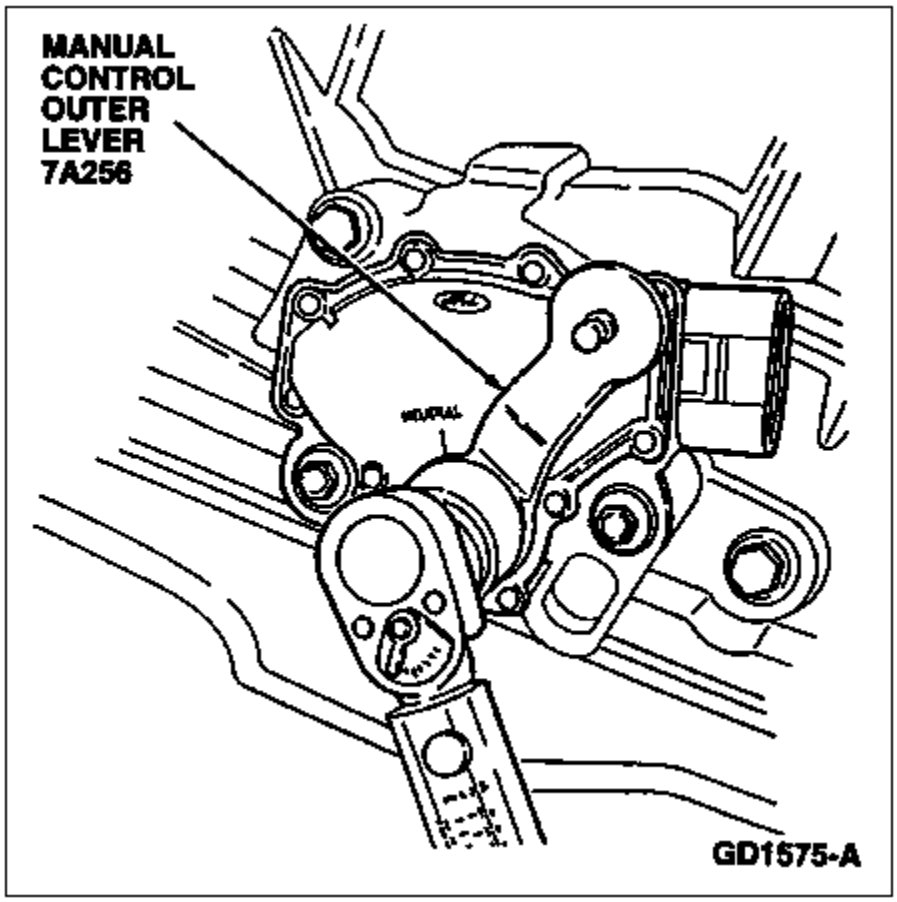
tomsn048@gmail.com

Digital Transmission Range (DTR) Sensor Adjustment

SPECIAL SERVICE TOOL(S) REQUIRED

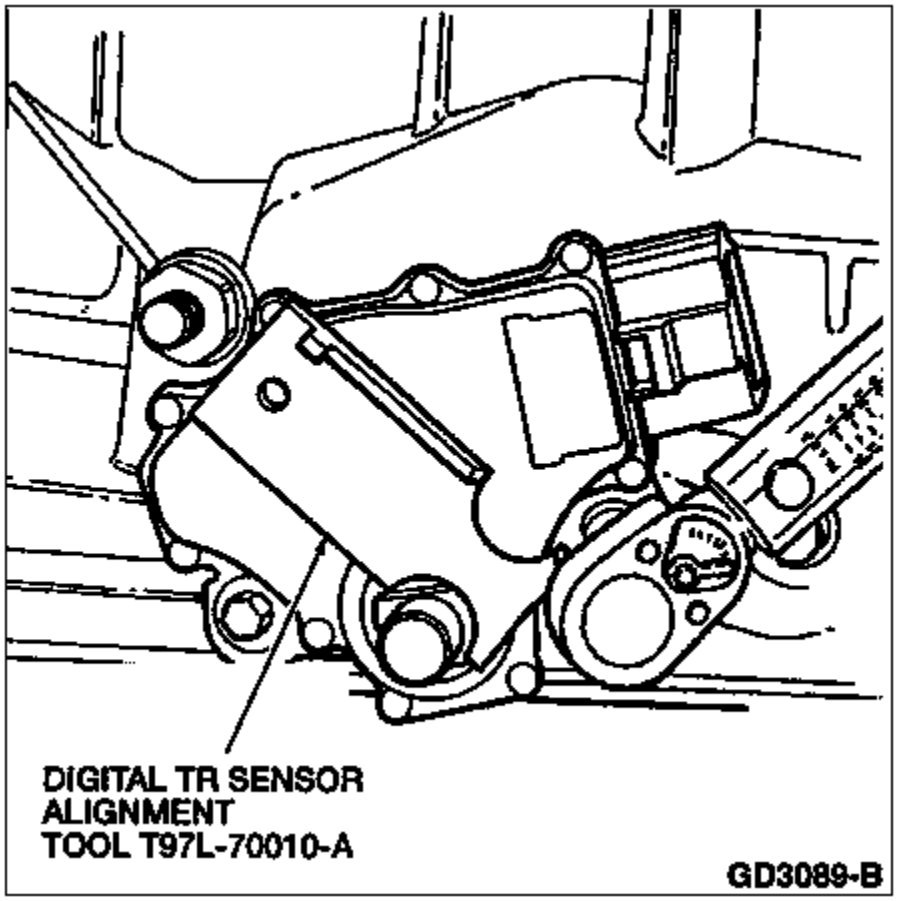
Description	Tool Number
Digital TR Sensor Alignment Tool	T97L-70010-A

1. Use a screwdriver to remove the shift cable and fitting from the transmission lever ball stud.
2. Disconnect vehicle harness connector from digital transmission range (DTR) sensor by depressing tab.
3. Remove the manual control outer lever nut and manual control outer lever.



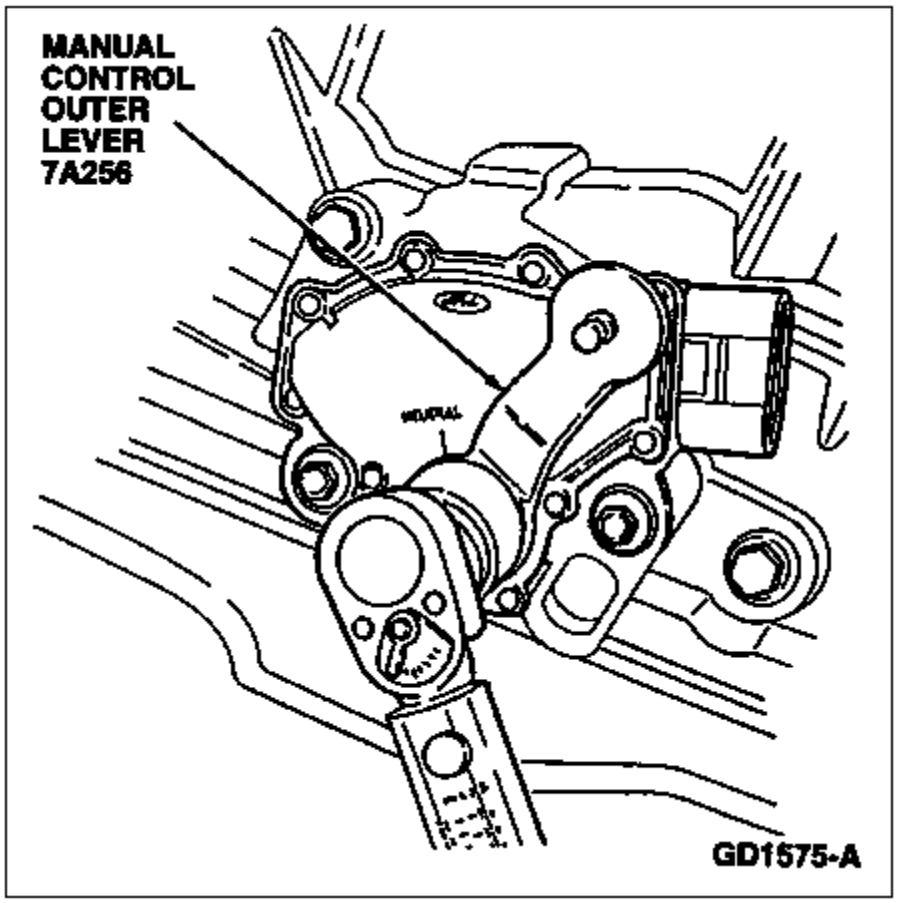
4. Loosen the two M6 x 25 TR sensor screws.
5. Install Digital TR Sensor Alignment Tool T97L-70010-A into the three slots on the DTR sensor. Tighten the TR sensor-to-case screws to 8-11 Nm (71-97 lb-in). Remove the alignment tool.

tomsn048@gmail.com



6. Install the manual control outer lever and manual control outer lever nut. Tighten the manual control outer lever nut to 41-54 Nm (30-40 lb-ft).

tomsn048@gmail.com



7. Install shift cable or linkage from manual control lever (7A256). Use a screwdriver to remove the cable and fitting from the transmission lever ball stud.

8. Adjust shift cable. Refer to adjustments in Section 07-05 .

9. Reconnect vehicle harness connector to DTR sensor.

---

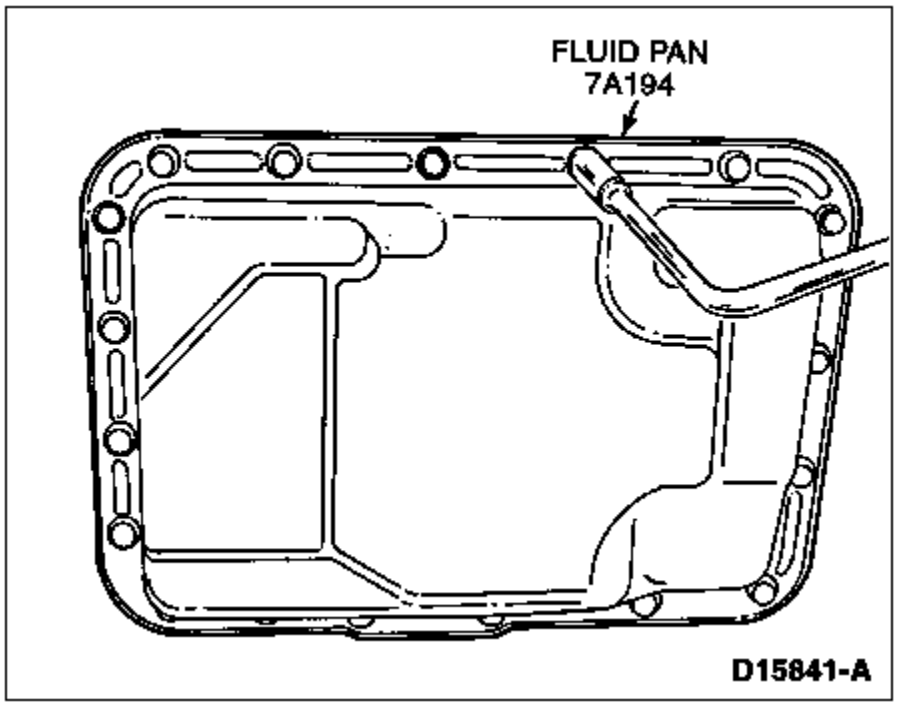
tomsn048@gmail.com

tomsn048@gmail.com

Fluid Pan, Gasket and Filter

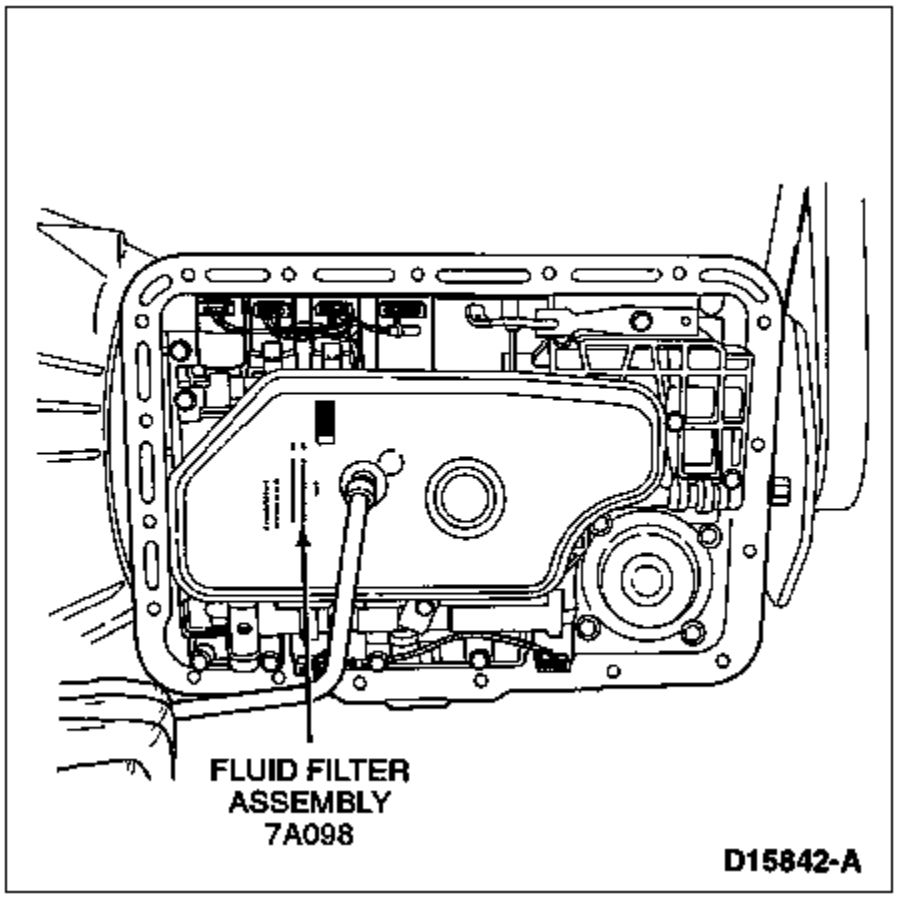
Removal

1. Using a 13 mm socket, remove all M8 x 16 mm fluid pan screws, except for two in the front. Loosen two front screws only.



2. Pry the rear of the pan down and allow fluid to drain.
3. Support fluid pan and remove two remaining screws.
4. Remove fluid pan and discard old gasket.
5. Use a 10 mm socket to remove the M6 x 55 mm fluid filter assembly screw. Remove the fluid filter assembly and discard.

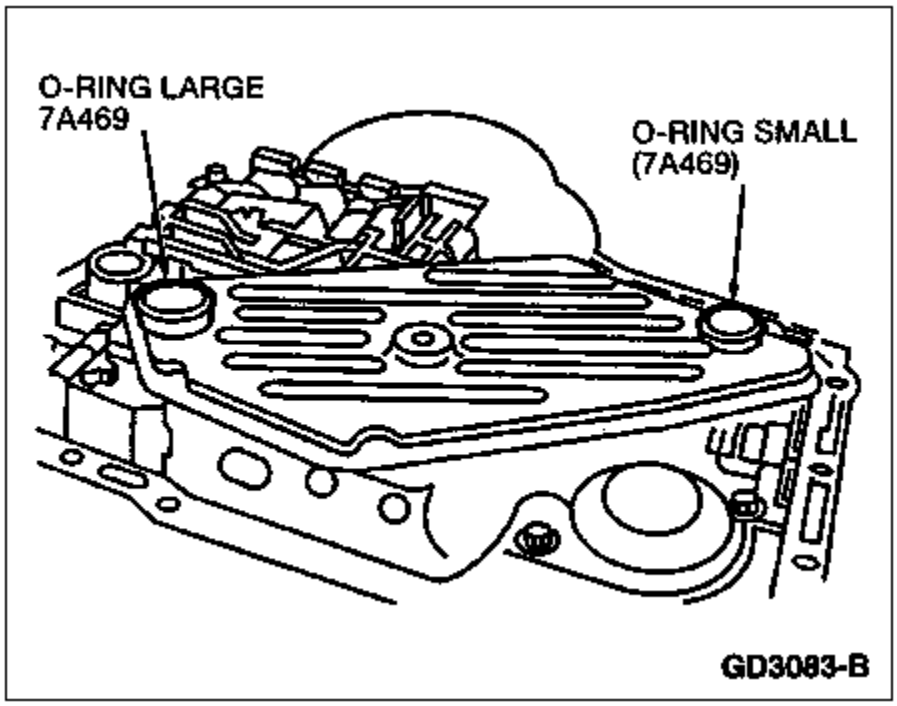
tomsn048@gmail.com



Installation

1. Clean all mating surfaces, making sure they are free from debris and oil.
2. Install new fluid pan gasket on fluid pan and align holes.
3. Lube and install new O-rings onto filter assembly.
4. Install new filter onto main control assembly.
5. Make sure that both O-rings are properly installed on filter prior to installation.

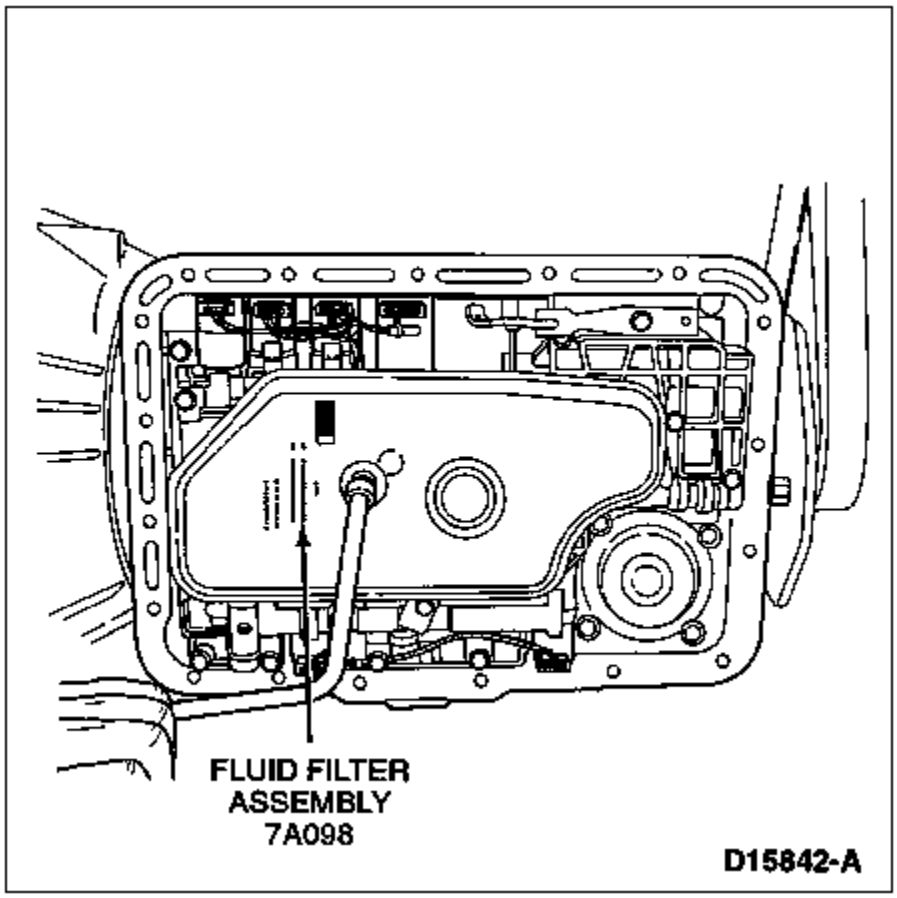
tomsn048@gmail.com



6. **CAUTION: Make sure wire harness is not pinched under filter.**

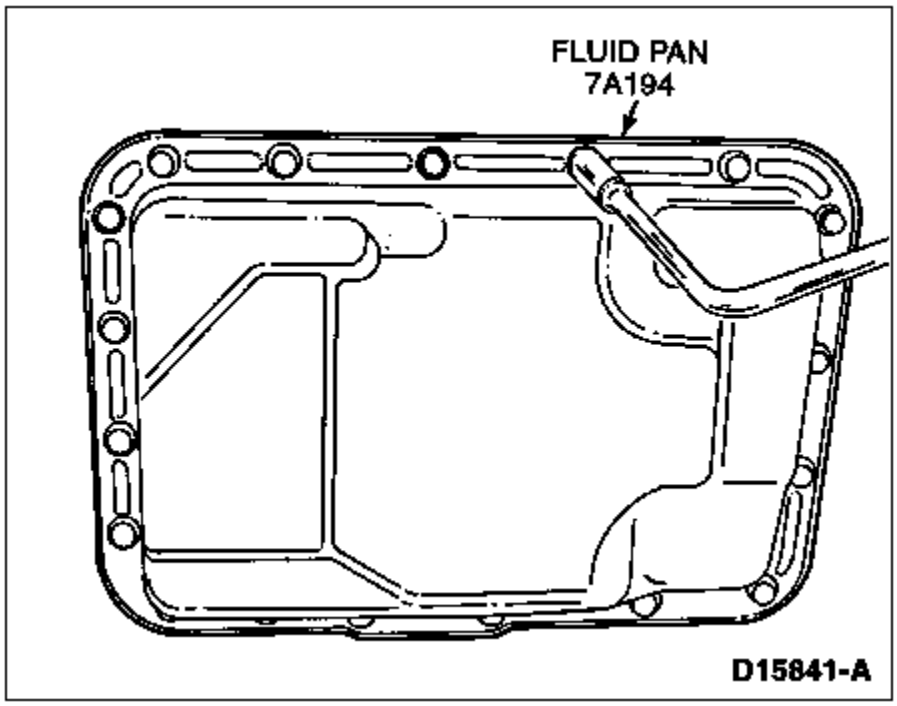
   Install one M6 x 55 mm fluid filter assembly-to-main control assembly screw using a 10 mm socket as shown. Tighten to 8-11 Nm (71-97 lb-in).

tomsn048@gmail.com



7. Install fluid pan and gasket onto transmission and install eighteen M8 x 16 mm fluid pan-to-case screws. Tighten to 13-15 Nm (115-133 lb-in) using a crisscross sequence.

tomsn048@gmail.com



8. Fill the transmission to the proper level. Refer to the procedure in this section.

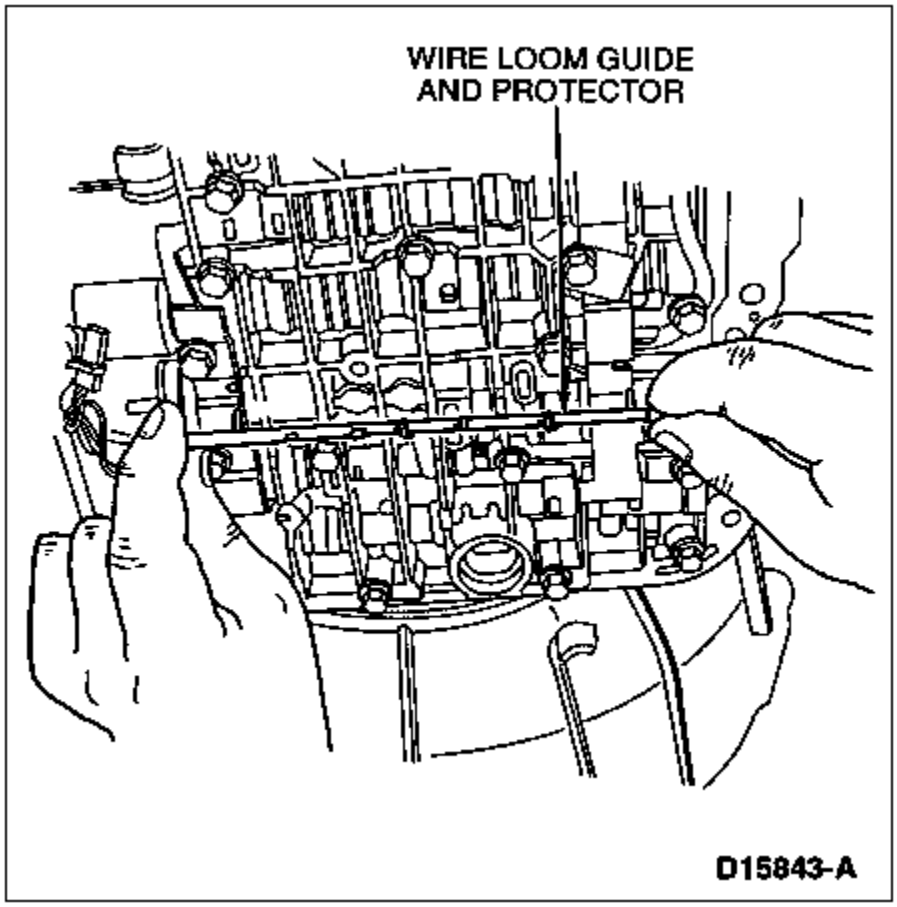
tomsn048@gmail.com

Solenoid Service

Removal

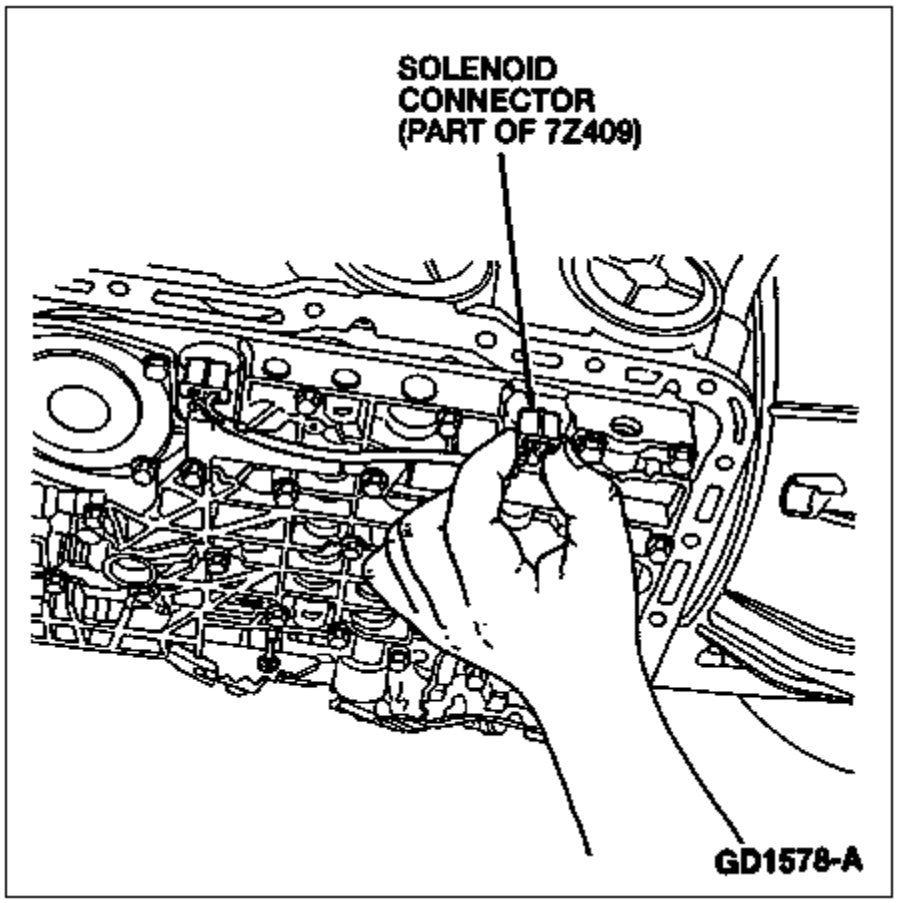
NOTE: Main control assembly does not need to be removed for solenoid service.

1. Remove fluid pan gasket and filter as described in this section.
2. Carefully lift up on the wire loom guide and protector. Disengage the retaining pins from the solenoid brackets.



3. Disconnect the appropriate solenoid connector(s) from the solenoid(s) by carefully pulling downward and wiggling side to side.

tomsn048@gmail.com

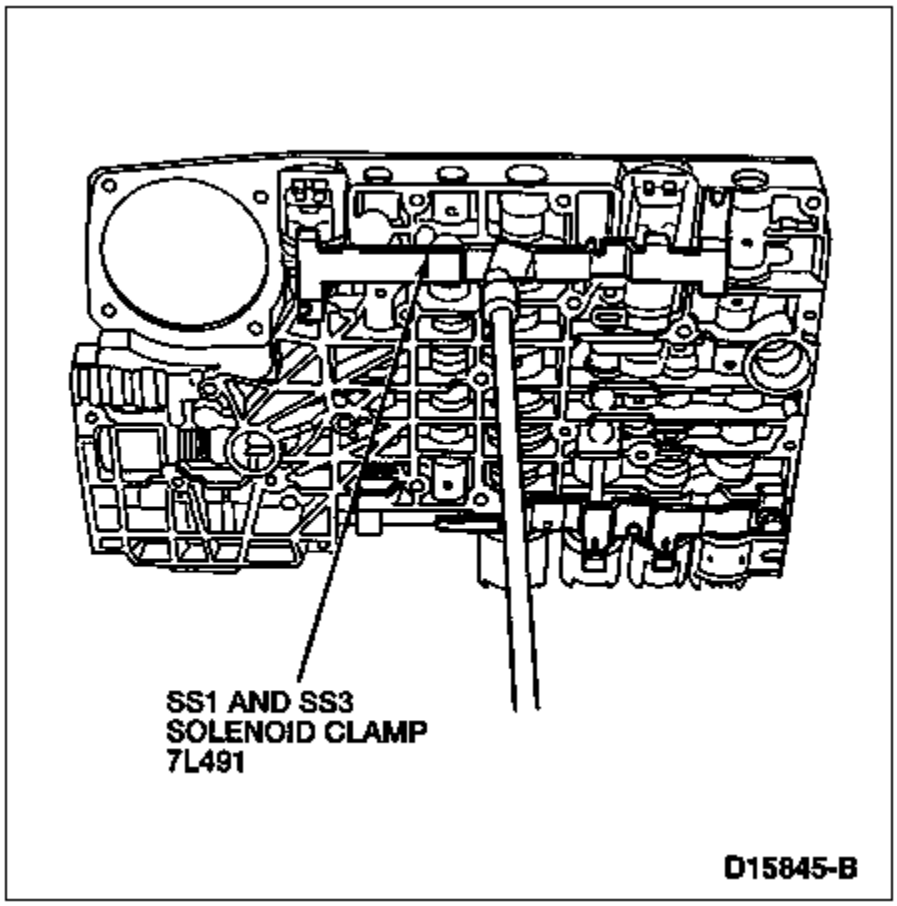


4. **CAUTION: SS3 may pop out of its bore. This may damage the solenoid.**

   NOTE: Steps 4, 5 and 6 refer to SS1 and SS3 solenoids only.

   Use a 10 mm socket to remove the SS1 and SS3 solenoid clamp screws. Remove the solenoid clamp.

tomsn048@gmail.com



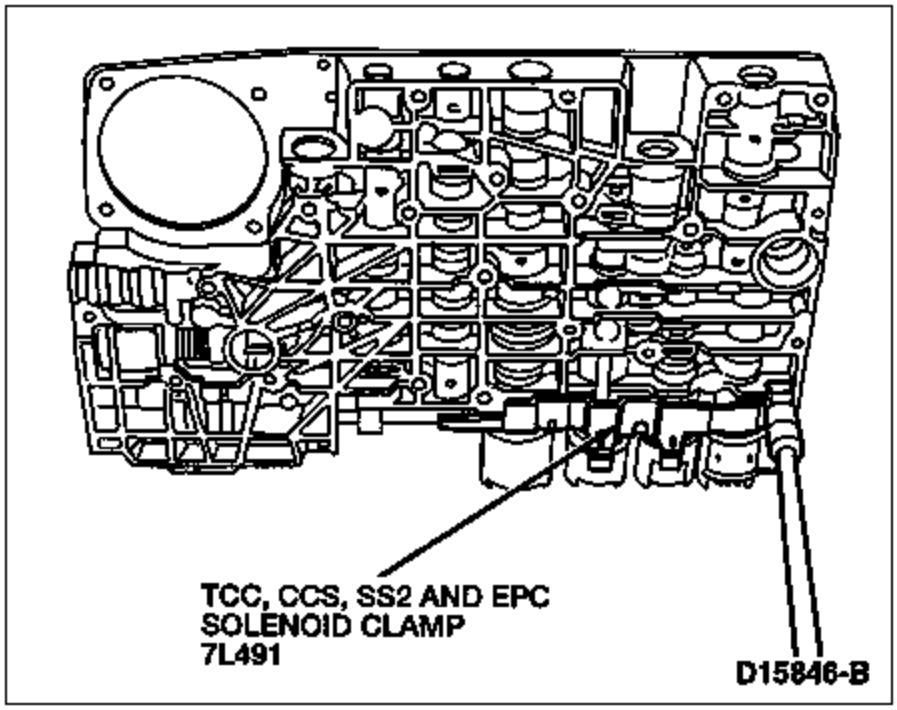
5. Remove SS1 and SS3 and service as required.

6. **CAUTION: The TCC solenoid may pop out of its bore. The converter modulator valve may come out after the TCC solenoid has been removed. This may damage the solenoid or converter modulator valve.**

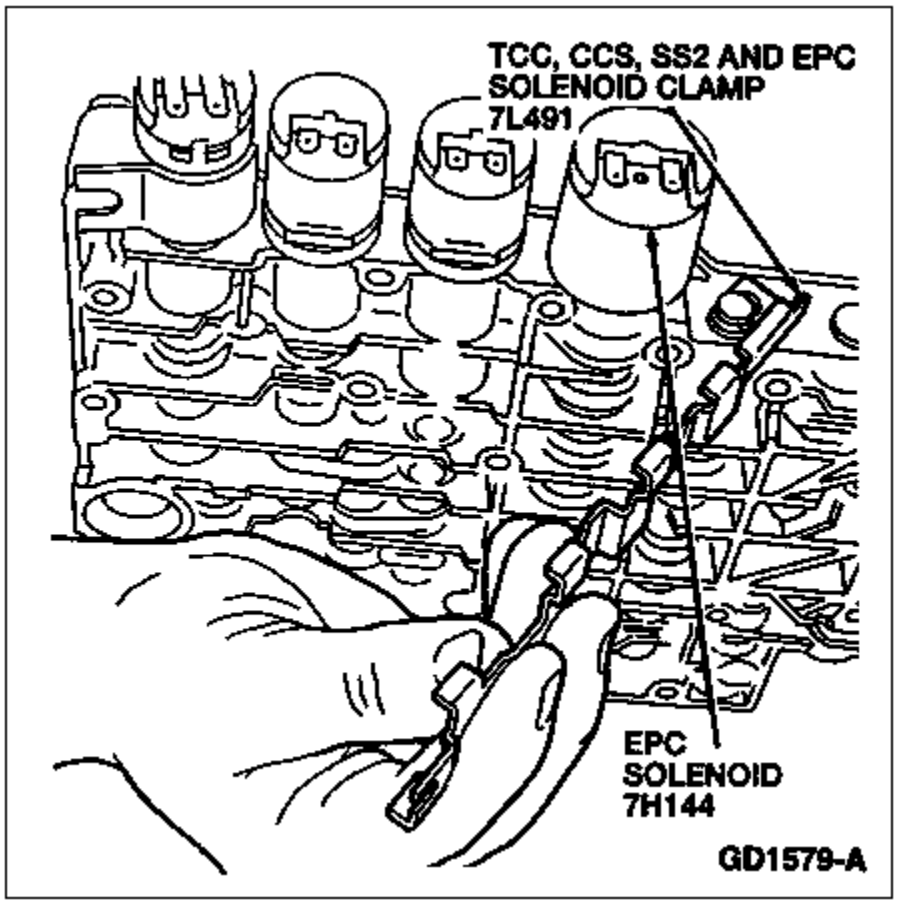
   NOTE: Steps 6-8 refer to TCC, CCS, SS2 and EPC solenoids only.

   Remove the TCC, CCS, SS2 and EPC solenoid clamp screws.

tomsn048@gmail.com



7. Remove the solenoid clamp.



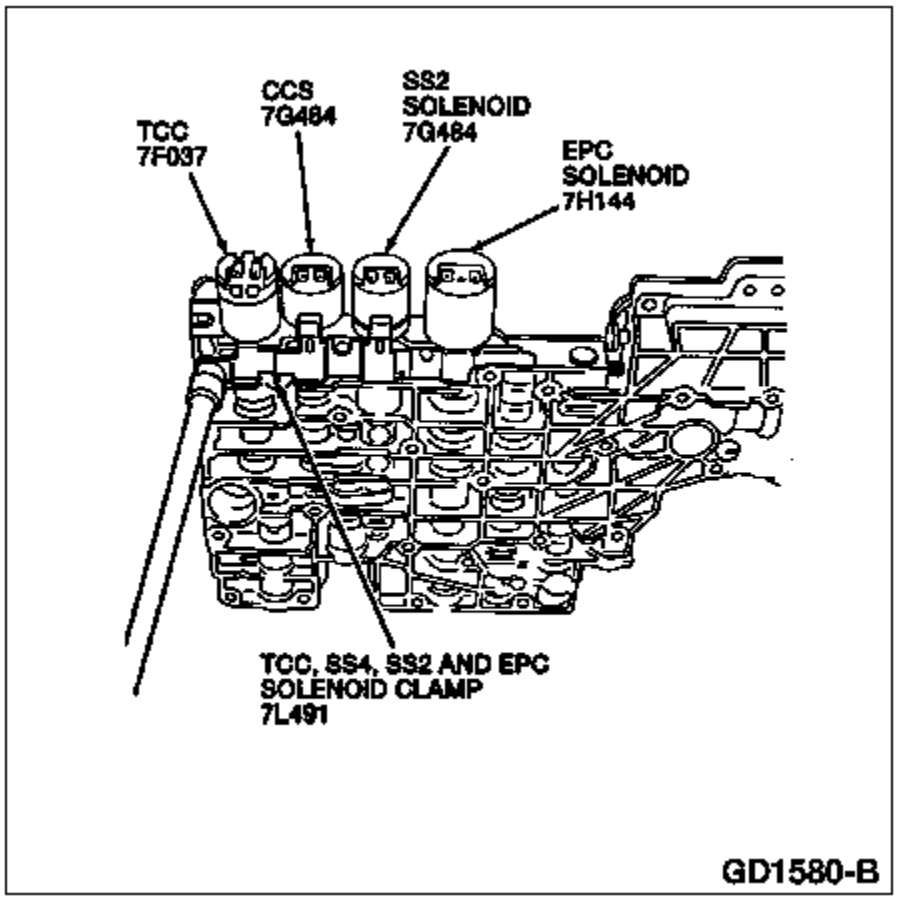
tomsn048@gmail.com

8. Remove solenoids and service as required.

Installation

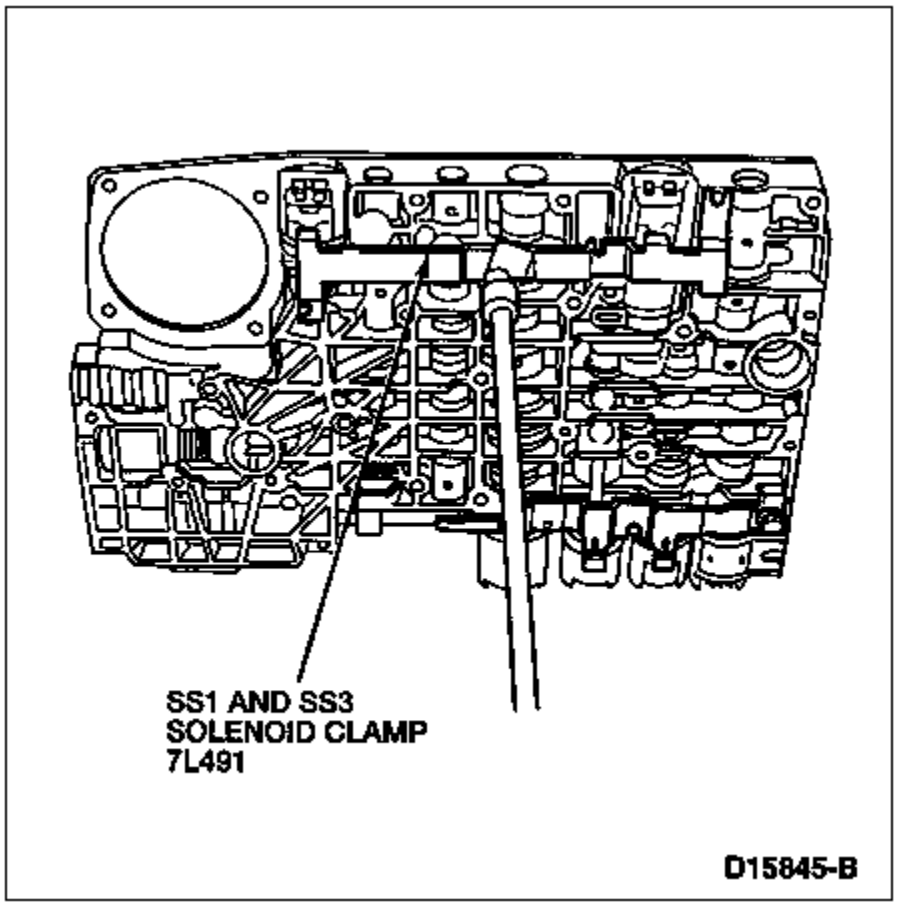
1. **CAUTION: The solenoid clamp must be installed in the TCC and EPC solenoid grooves, shift solenoid pockets and the No. 204 plug.**

   Install the TCC, CCS, SS2, EPC solenoids, solenoid bracket and screws. Tighten to 6-8 Nm (53-71 lb-in).



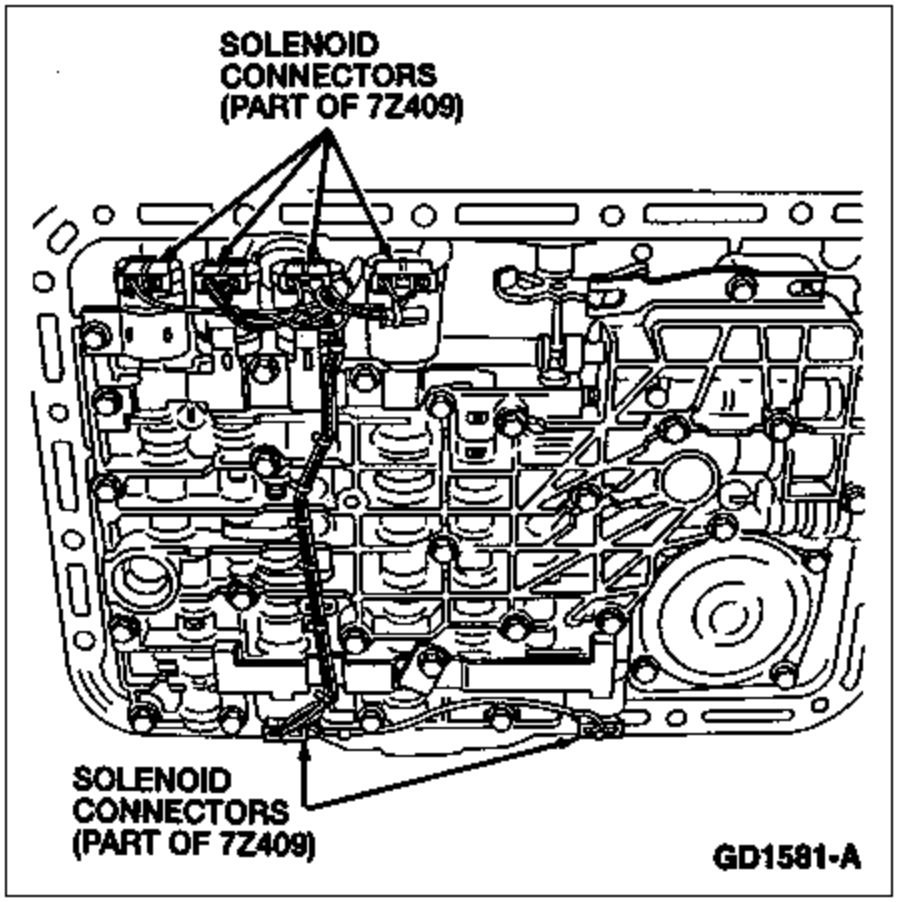
2. Install the SS1 and SS3 solenoids, solenoid bracket and screws. Tighten to 6-8 Nm (53-71 lb-in).

tomsn048@gmail.com



3. Carefully press down to install the solenoid connectors on the solenoids as shown.

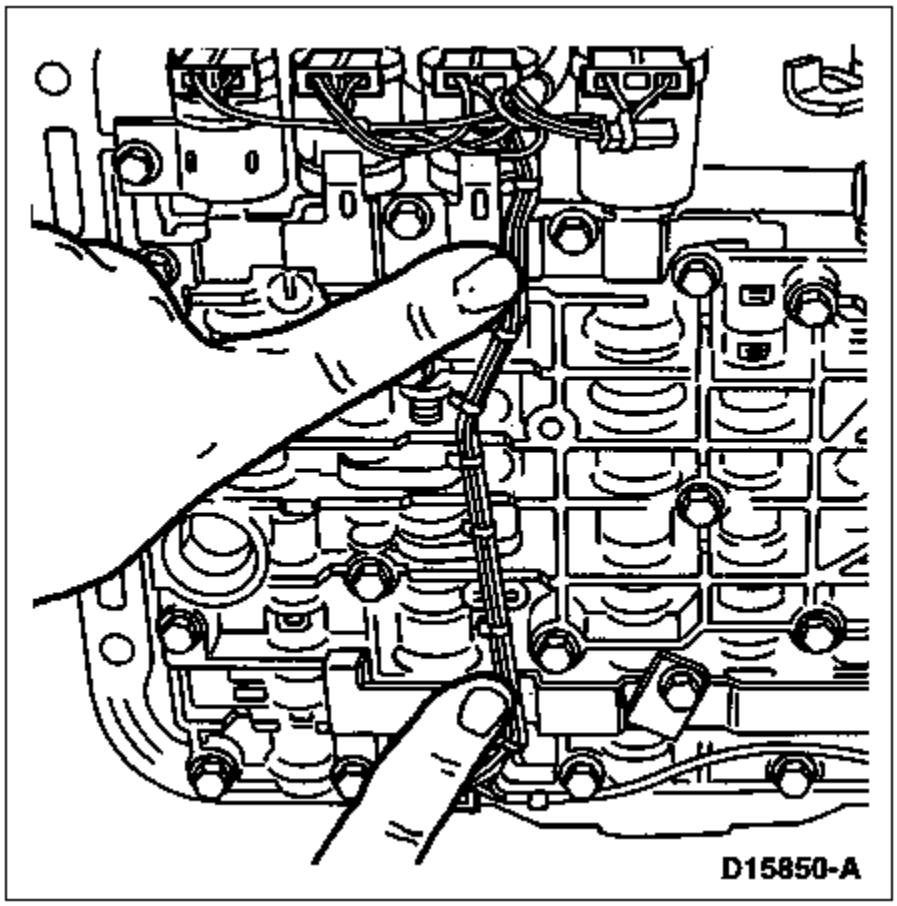
tomsn048@gmail.com



4. **CAUTION: Excessive pressure may break the locating pins.**

   Install the wiring loom protector and guide. Align the pins in the holes of the solenoid clamps and gently push down.

tomsn048@gmail.com



5. Install new fluid pan gasket and filter as described in this section.
6. Fill the transmission to the proper level. Refer to the procedure in this section.

---

tomsn048@gmail.com

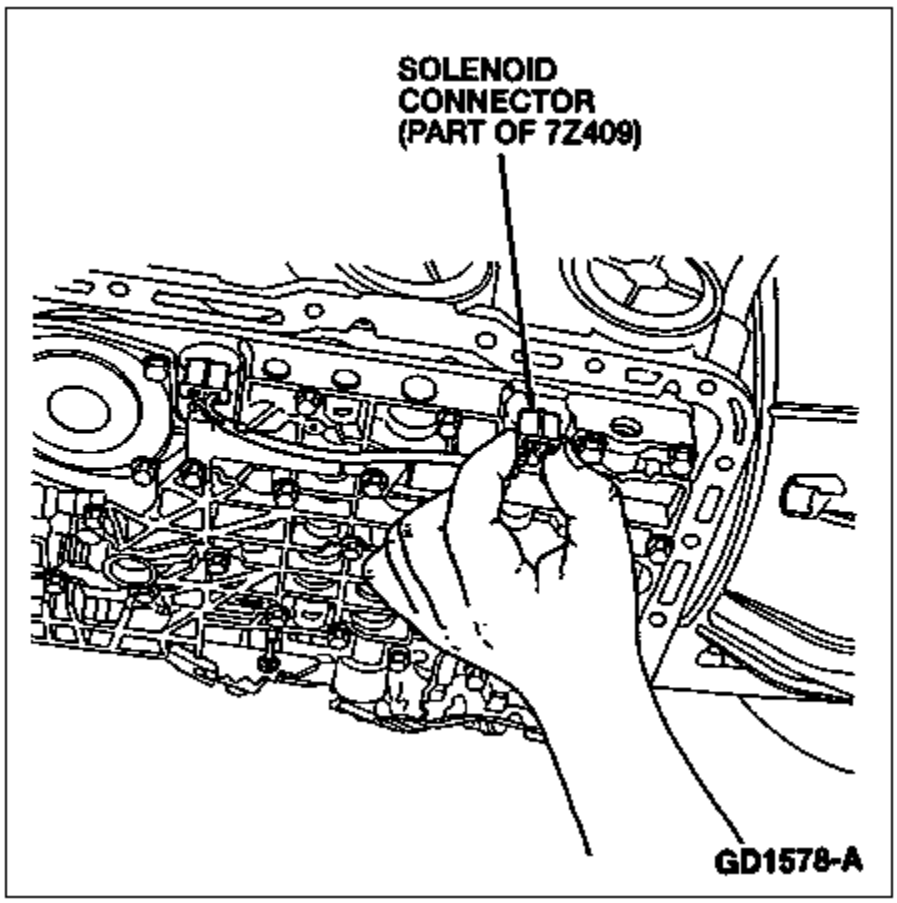
Internal Harness Service

16-Pin Connectors

Removal

NOTE: The main control assembly does not need to be removed.

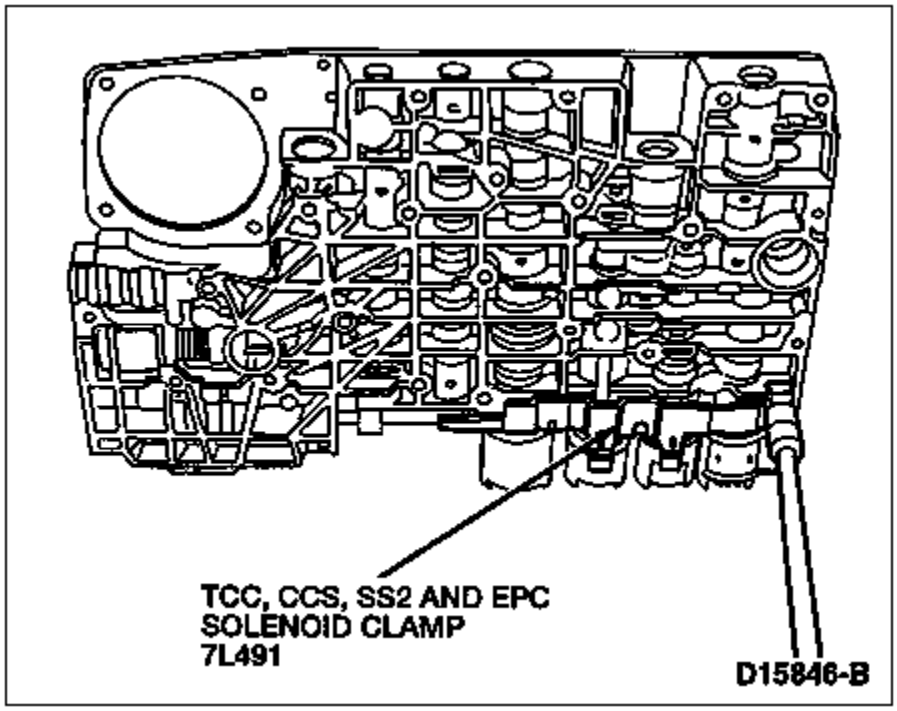
1. Remove fluid, pan, gasket and filter as described in this section. Discard gasket.
2. Disconnect the solenoid connectors from the solenoids by carefully pulling downward and wiggling side to side.



3. **CAUTION: The TCC solenoid may pop out of its bore. The converter modulator valve may come out after the TCC solenoid clamp has been removed. This may damage the solenoid or converter modulator valve.**

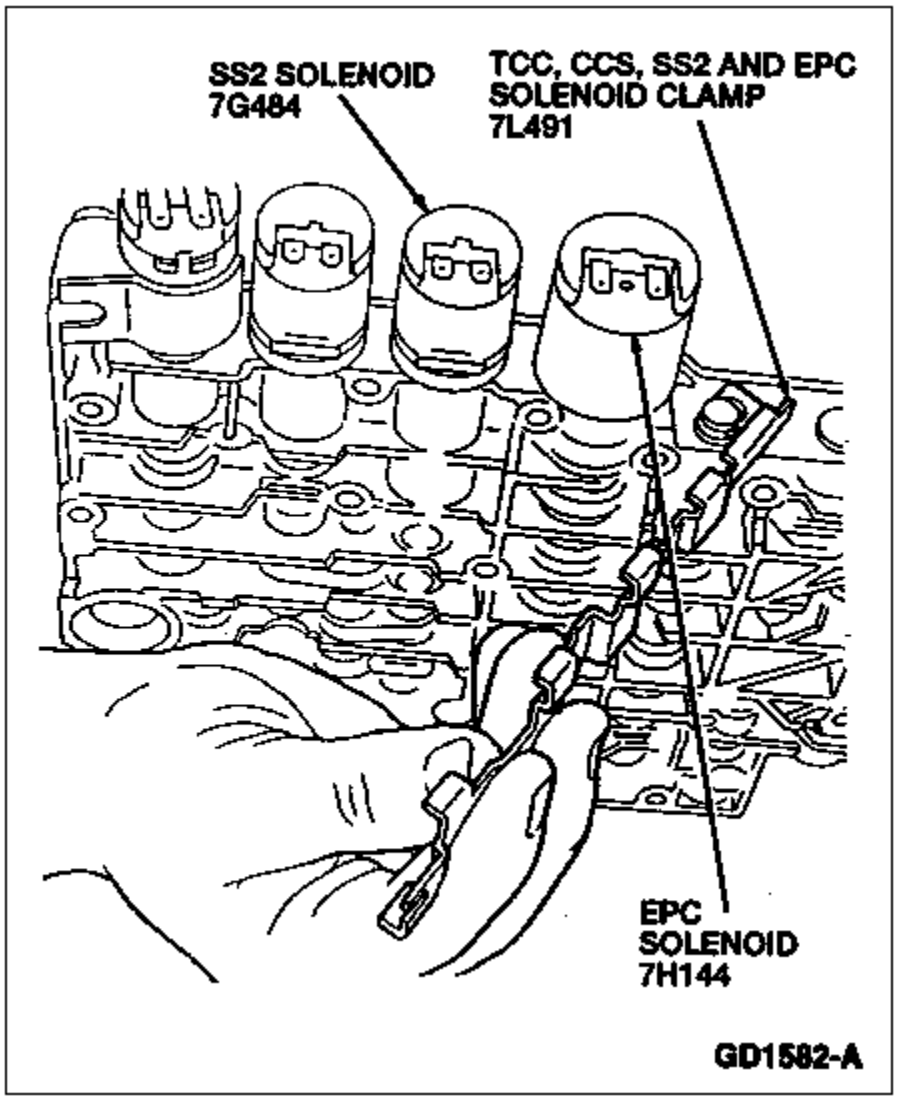
tomsn048@gmail.com

Remove the TCC, CCS, SS2 and EPC solenoid clamp screws.



4. Remove the solenoid clamp and EPC and SS2 solenoids.

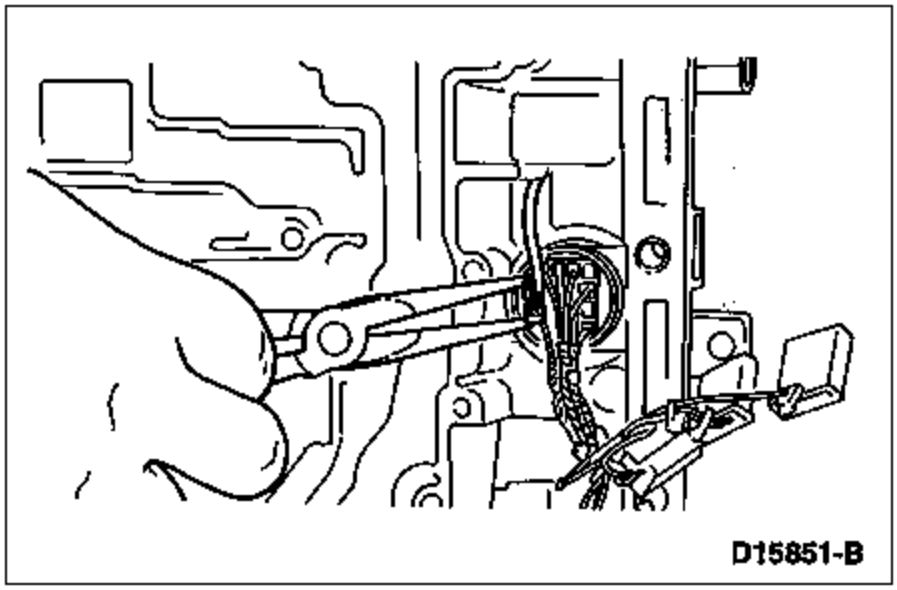
tomsn048@gmail.com



5. **CAUTION: Do not pry on other wires or damage the connector case surface.**

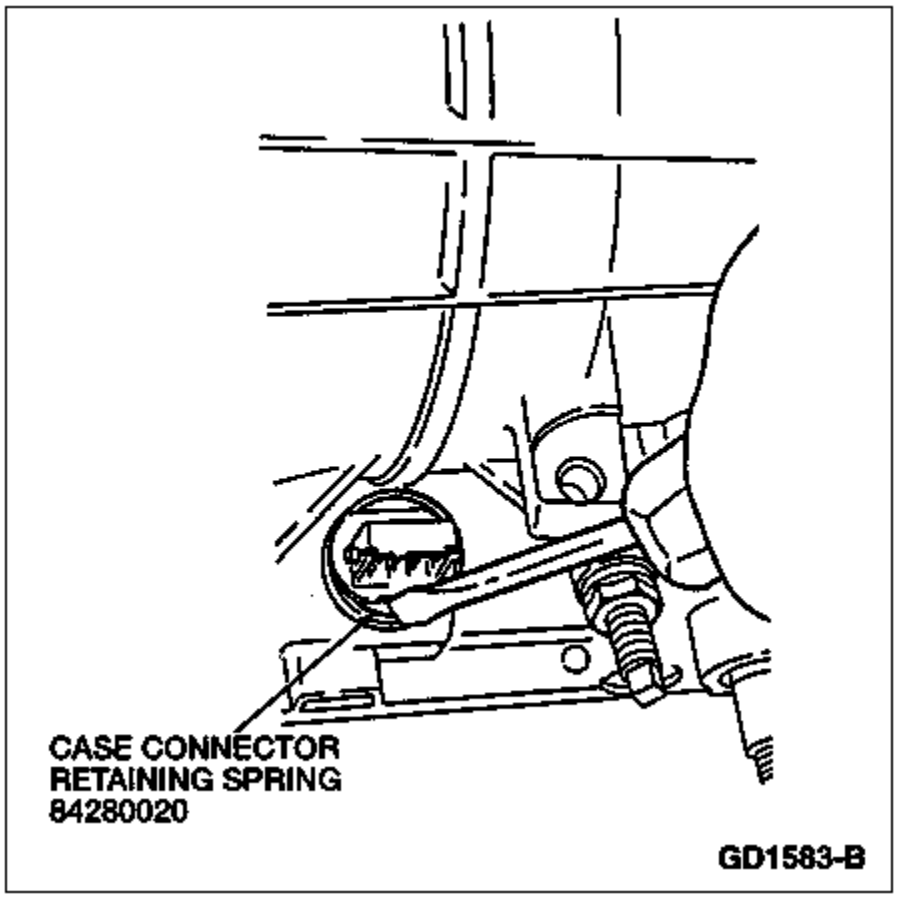
   Carefully disconnect the turbine shaft speed (TSS) sensor connector from the 16-pin case connector.

tomsn048@gmail.com



6. **CAUTION: Do not overstretch the case connector retaining spring.**

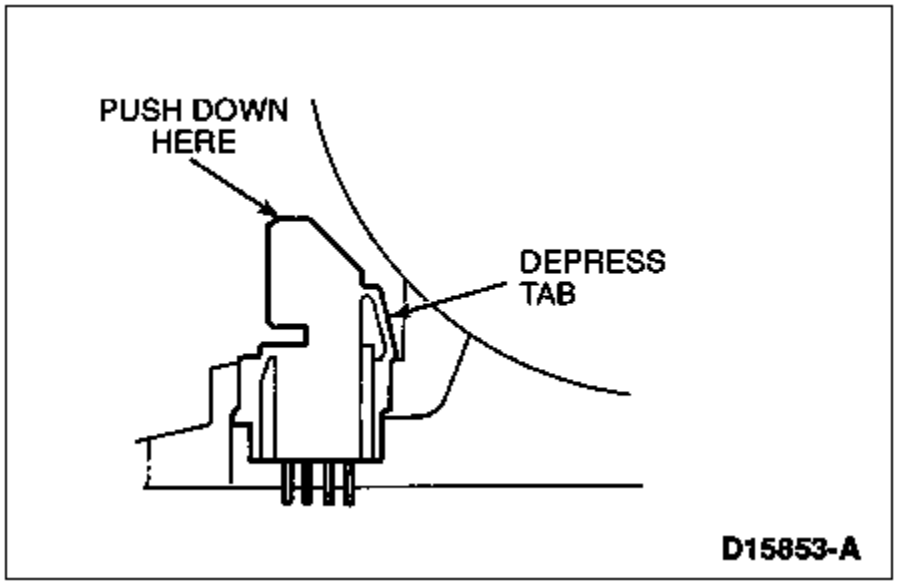
   Use a screwdriver to carefully remove the case connector retaining spring.



tomsn048@gmail.com

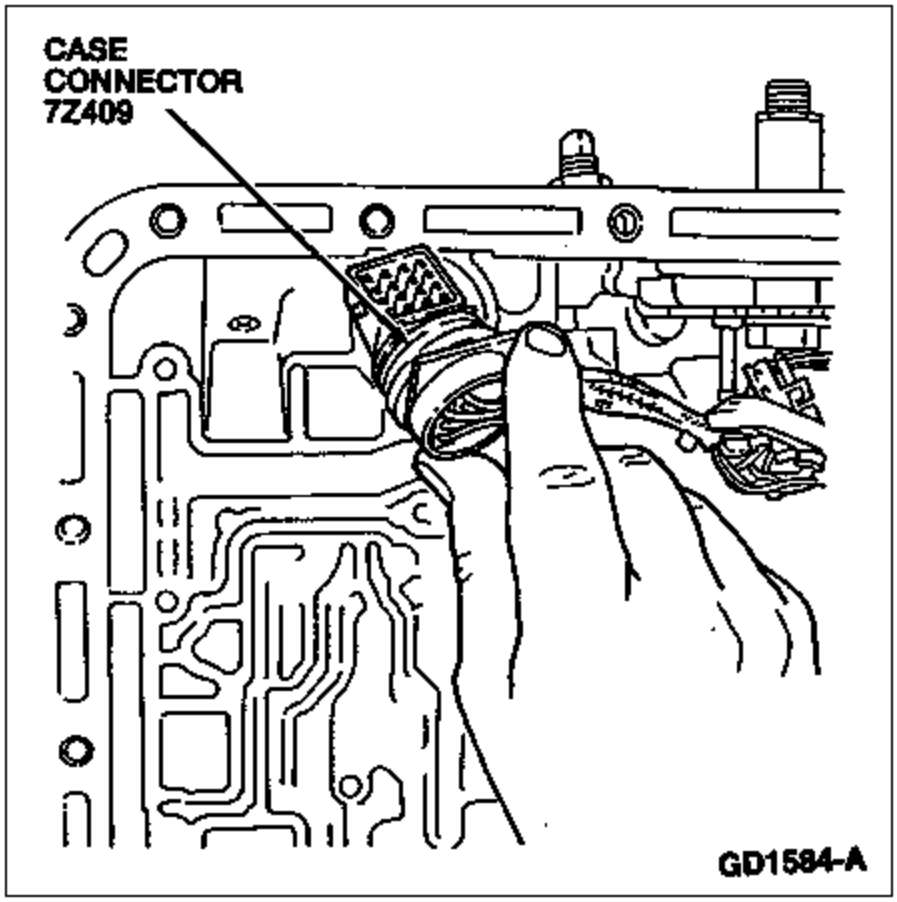
7. **CAUTION: Do not damage the connector or harness.**

   Carefully push down on the top of the connector until it stops. Depress the tab on the back side of the connector and push down on the connector.



8. Remove the connector and harness through the bottom of the case.

tomsn048@gmail.com

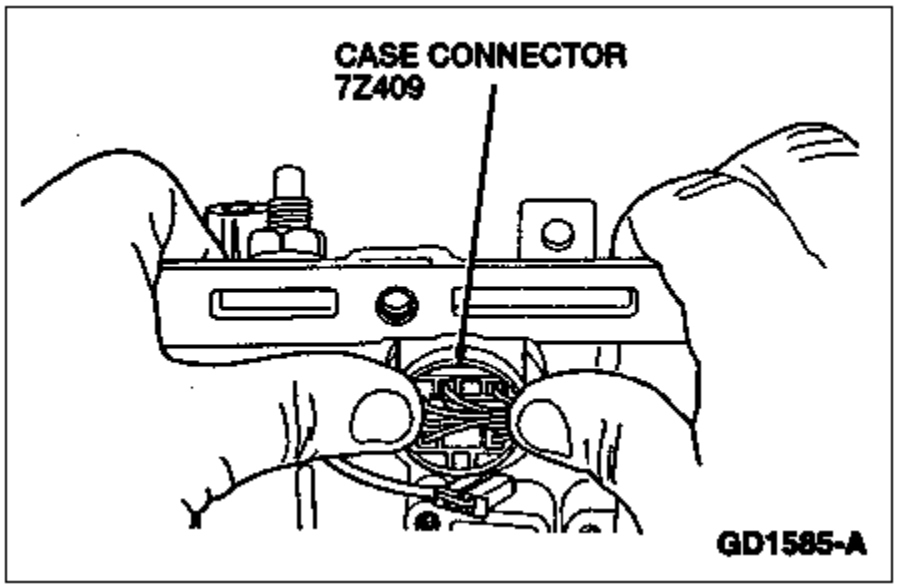


Installation

1. Replace O-rings (W703015-S300) on connector.
2. **NOTE: Make sure the tab is in the lock position.**

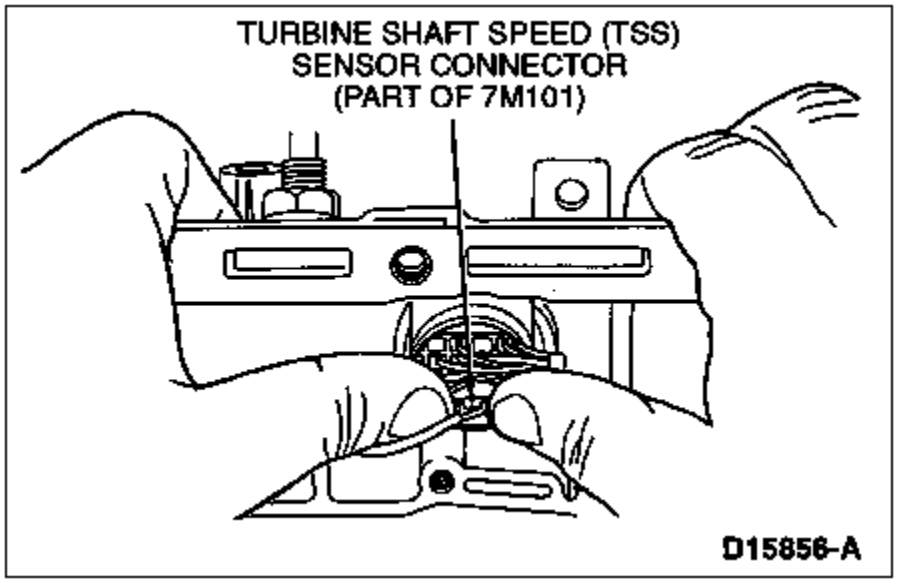
   Install the case 16-pin connector through the case until a click is heard.

tomsn048@gmail.com



3. **NOTE: Align the slot on the TSS connector with the slot on the 16-pin case connector.**

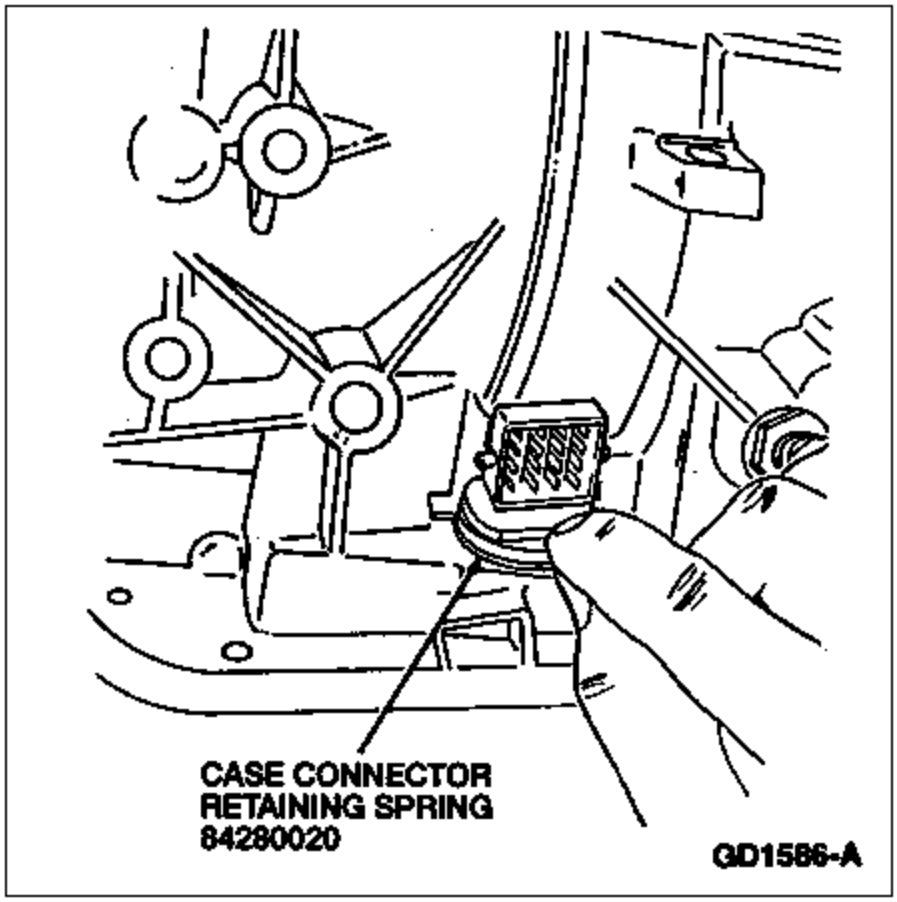
   Carefully install the TSS connector into the 16-pin case connector.



4. **CAUTION: Do not overstretch the retaining spring.**

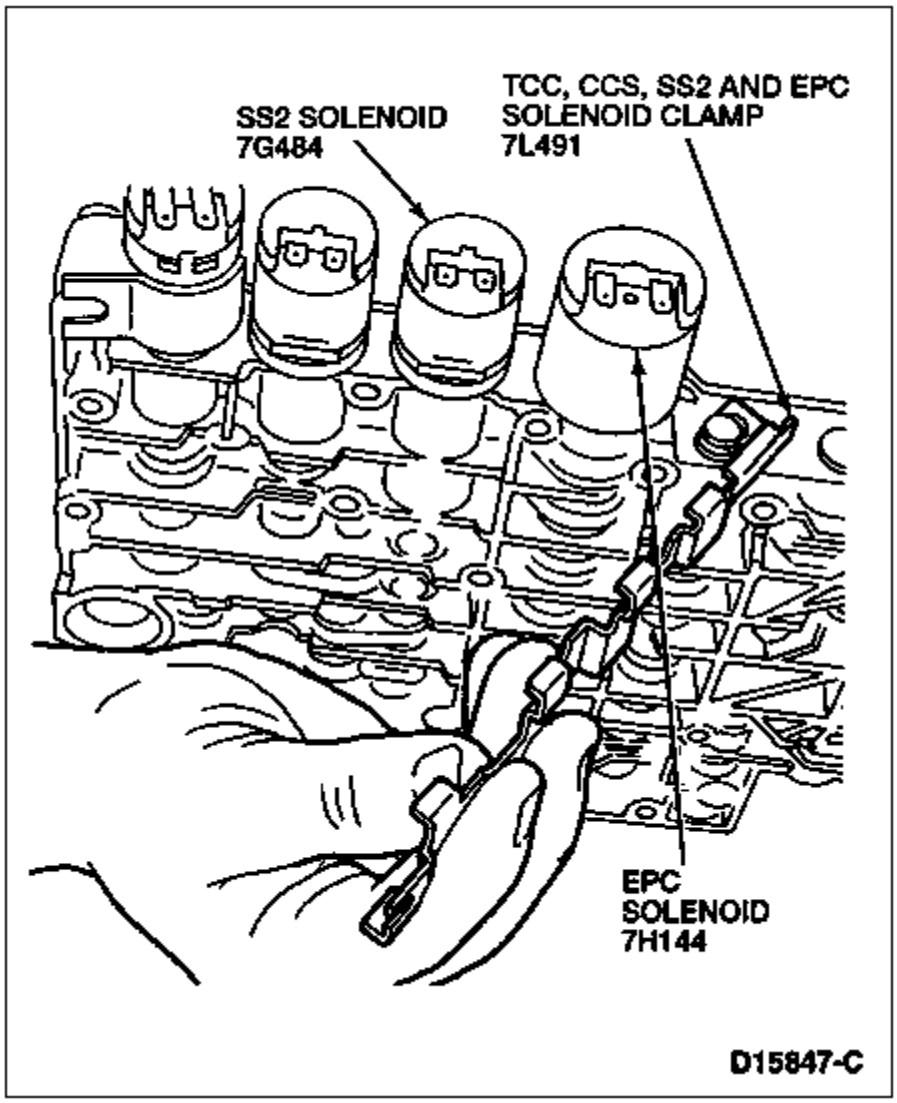
   Install the case connector retaining spring.

tomsn048@gmail.com



5. Install SS2 and EPC solenoids.

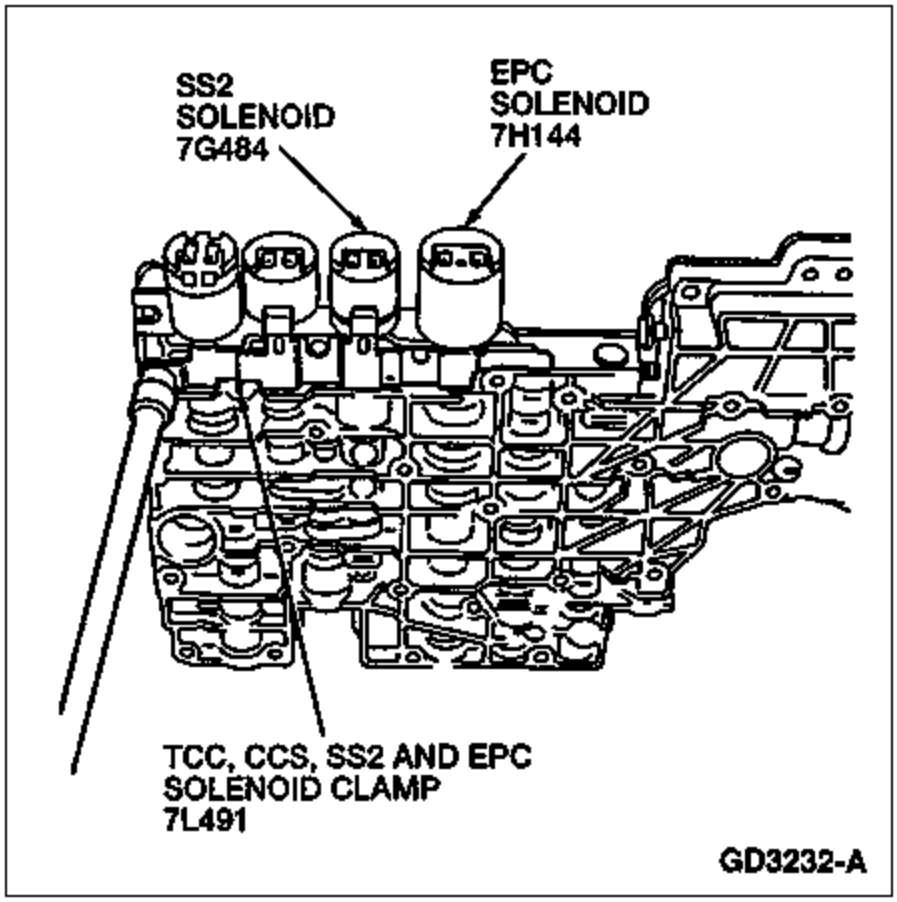
tomsn048@gmail.com



6. **CAUTION: The solenoid bracket must be installed in the TCC and EPC solenoid grooves, shift solenoid pockets and the No. 204 plug.**

   Install the solenoid clamp with solenoid clamps-to-main control screws. Tighten to 6-8 Nm (53-71 lb-in).

tomsn048@gmail.com



7. Install connectors on solenoids.
8. Install filter.
9. Install new fluid pan gasket onto pan.
10. Install pan.
11. Fill the transmission to the proper level. Refer to the procedure in this section.

---

tomsn048@gmail.com

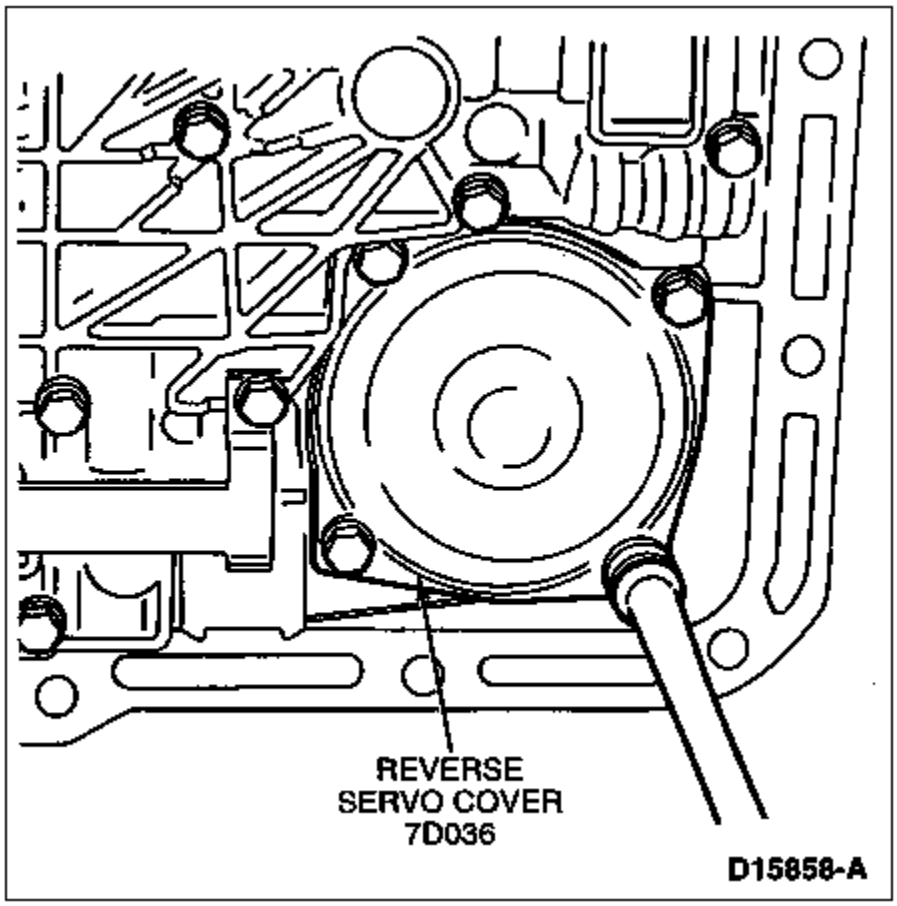
tomsn048@gmail.com

Rear Servo Assembly

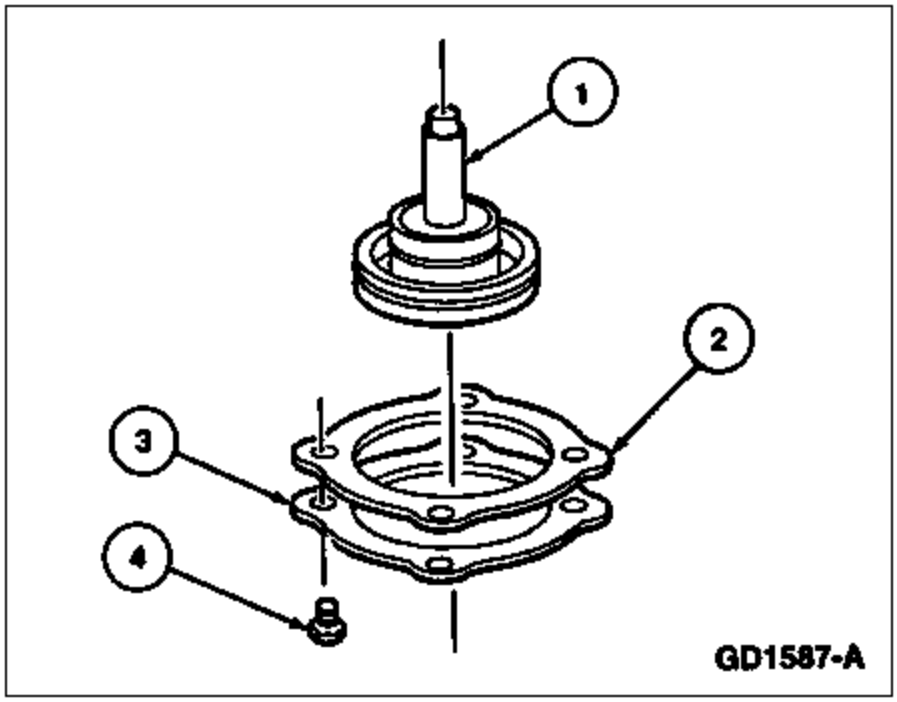
Removal

1. Remove fluid pan and filter as described in this section.

2. Use a 10 mm socket to remove the four M6 x 20 mm reverse servo cover screws. Remove the reverse servo cover, gasket and the reverse servo piston and rod assembly.



tomsn048@gmail.com



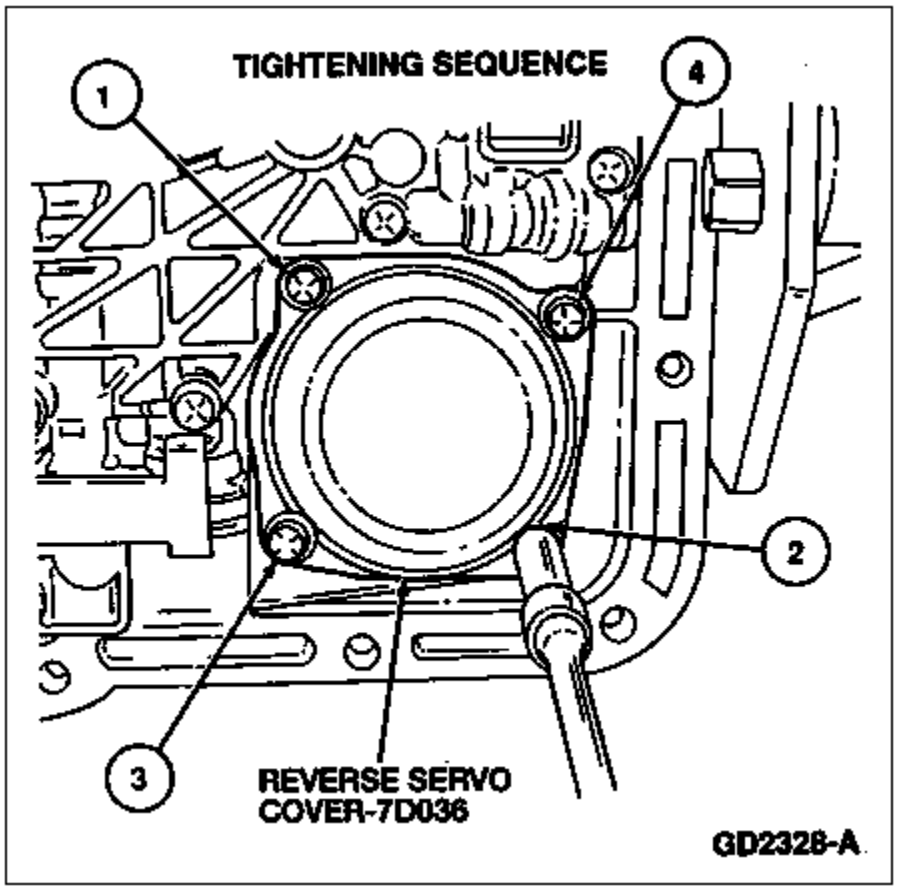
Item	Part Number	Description
1	7D189	Piston Assembly with Rod and Retainer (Rear Band Servo)
2	7L173	Reverse Servo Cover-to-Case Gasket
3	7D036	Reverse Servo Cover
4	E800156-S	Low/Reverse Servo Cover-to-Case Screw (4 Req'd)

3. Clean and inspect servo bore, piston and rod assembly. Service as required.

Installation

1. Install the reverse servo and rod assembly into the case.
2. Install the reverse servo cover, new gasket and the four reverse servo cover-to-case screws. Tighten cover-to-case screws in sequence as shown to 12-14 Nm (106-124 lb-in).

tomsn048@gmail.com



3. Install pan, new gasket and filter as described in this section.
4. Refill transmission.

tomsn048@gmail.com

Manual Control Lever Shaft Seal

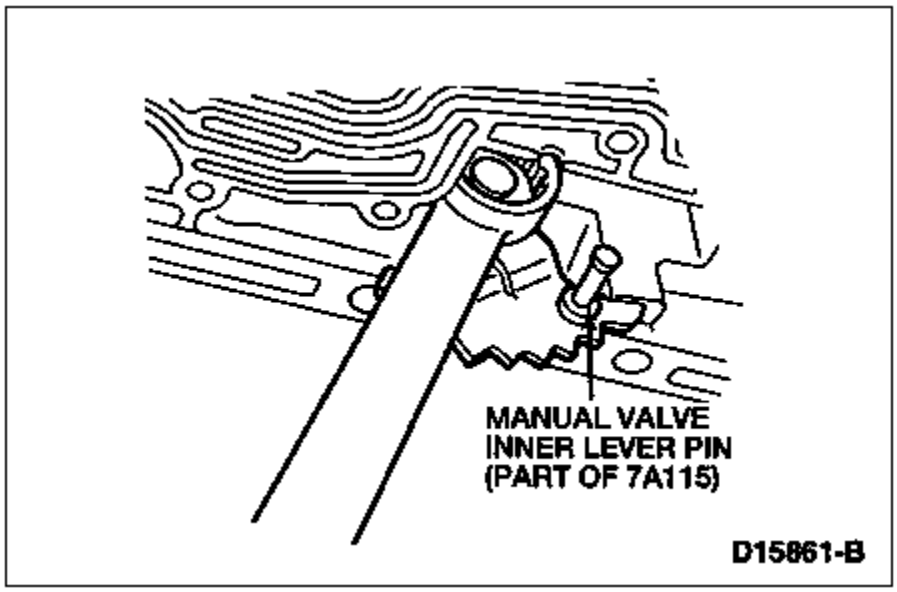
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Shift Lever Seal Replacer	T74P-77498-A

Removal

1. Remove linkage and digital transmission range (DTR) sensor as described in this section.
2. Remove fluid pan. Filter does not need to be removed.
3. **CAUTION: Do not damage the manual valve inner lever pin.**

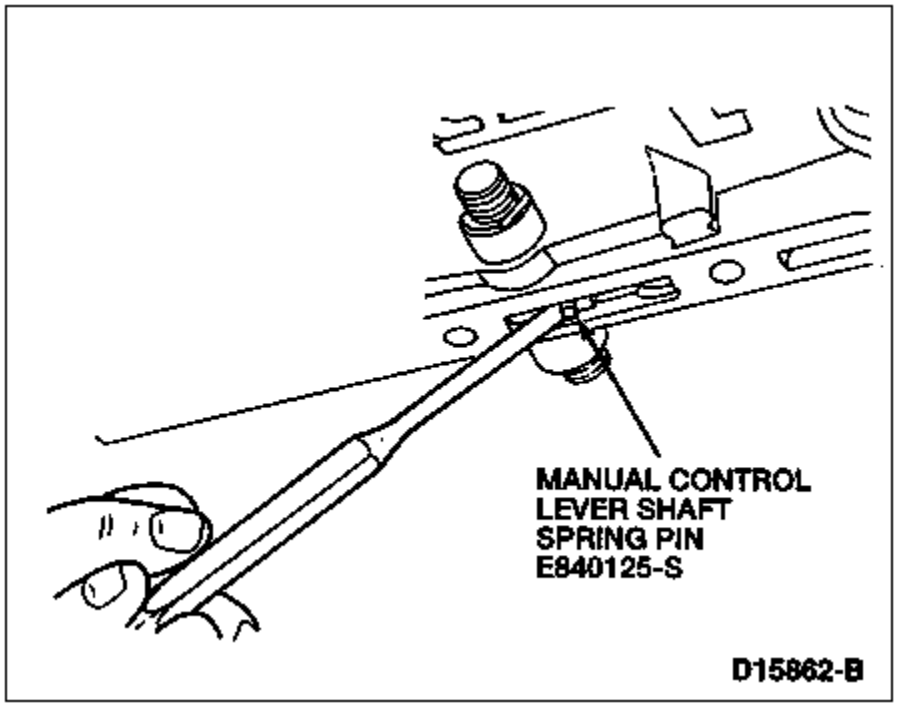
   Remove the manual valve inner lever nut. Support inner manual valve lever and park rod assembly.



4. **CAUTION: Do not damage the case fluid pan rail.**

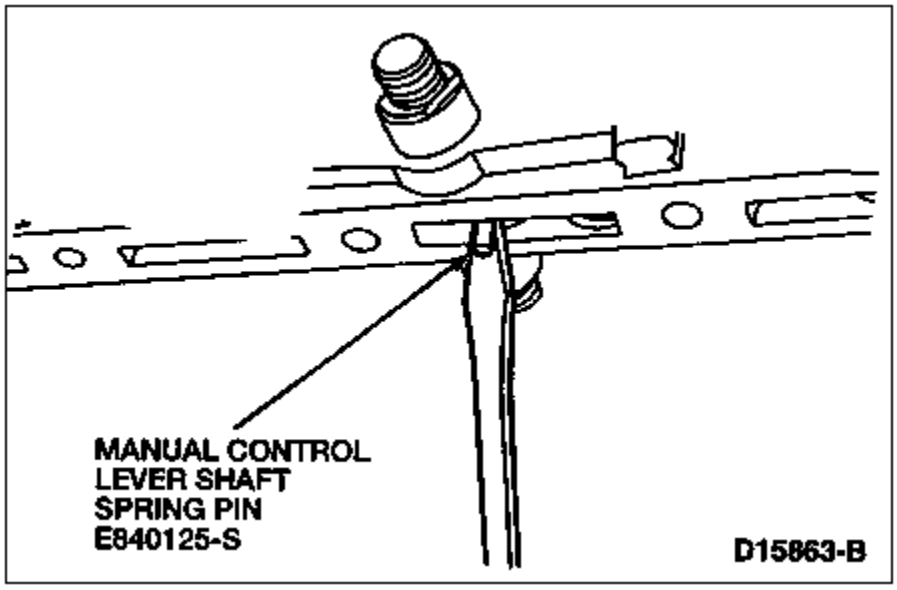
   Use a small hammer and drift punch to tap lightly on each side of the manual control lever shaft spring pin (two or three times). This will loosen the pin prior to removal.

tomsn048@gmail.com



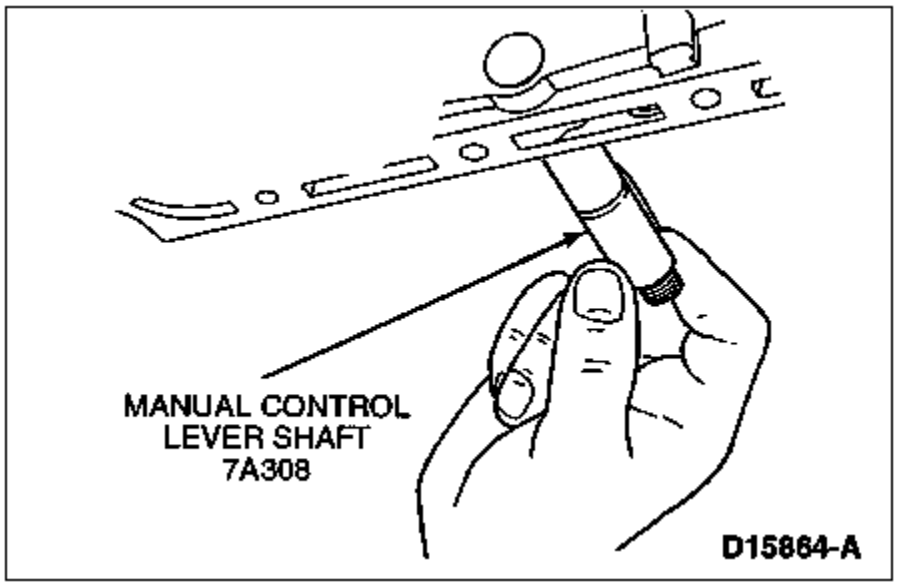
5. **CAUTION: Do not damage the case fluid pan rail.**

   Remove the manual control lever shaft spring pin with a narrow, sharp-edged screwdriver from the side as shown.



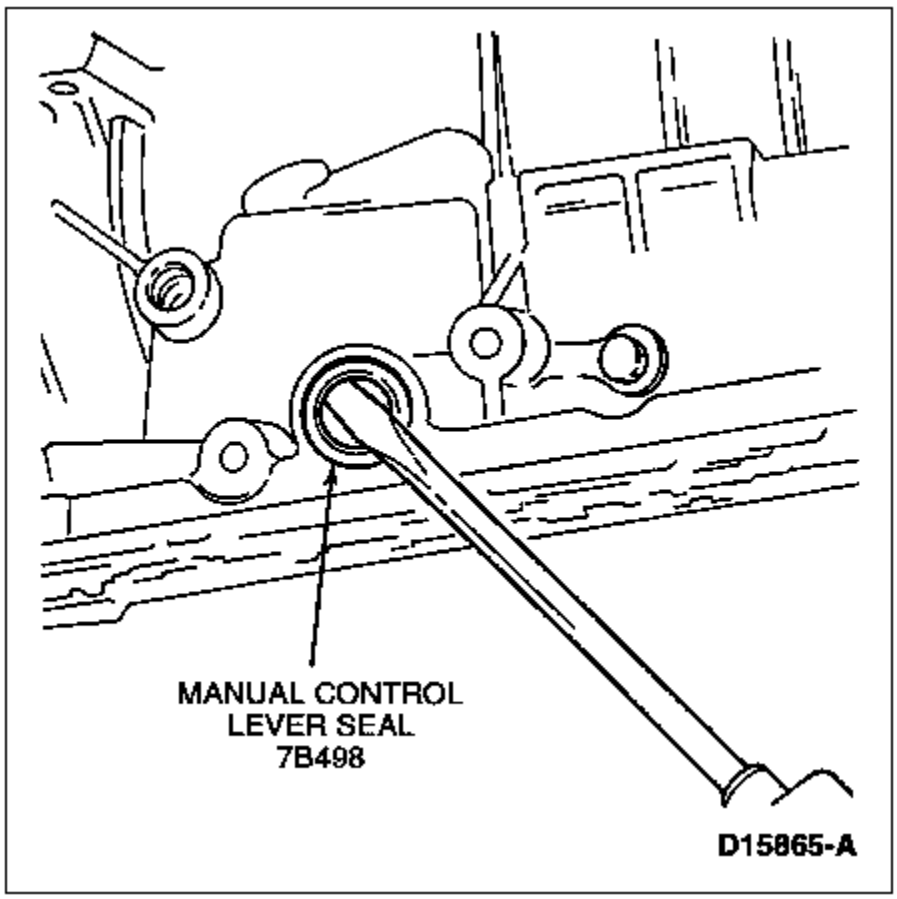
6. Remove the manual control lever shaft.

tomsn048@gmail.com



7. **CAUTION: Do not damage the bore.**

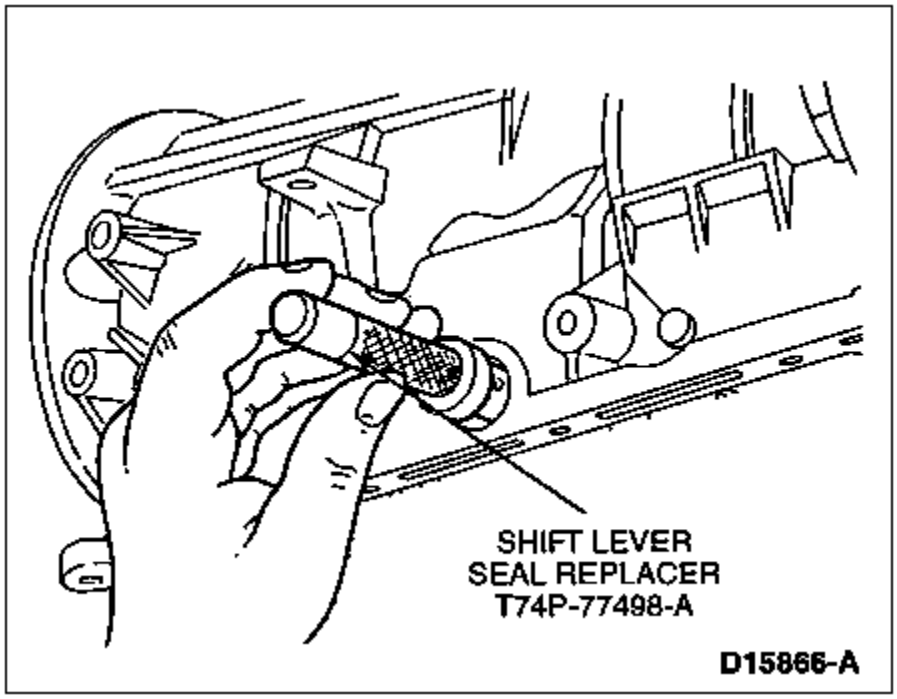
   Remove the manual control lever seal.



tomsn048@gmail.com

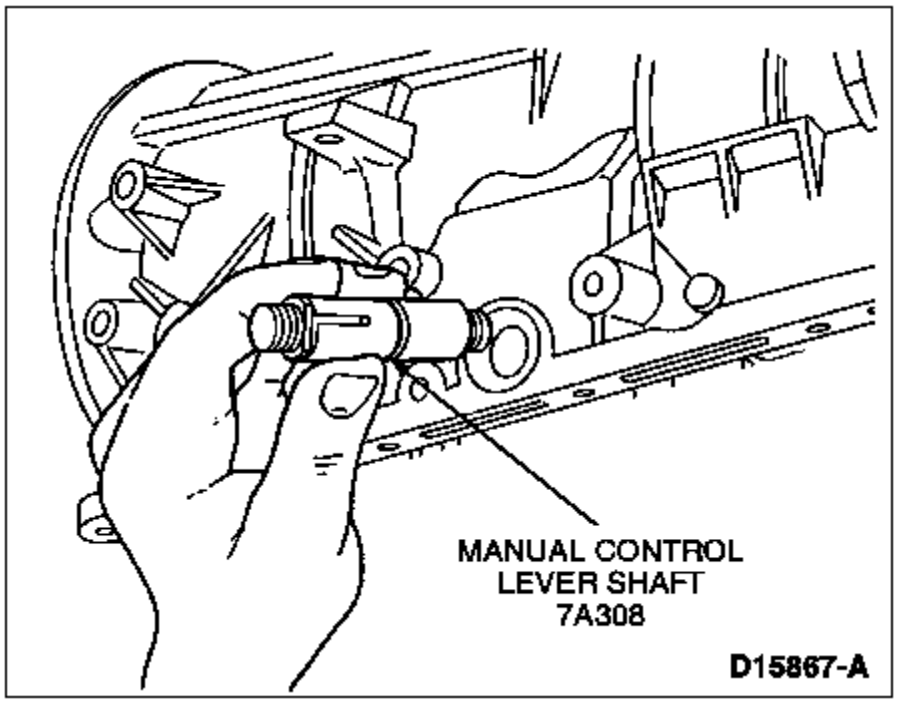
Installation

1. Lubricate and install the main control lever seal using Shift Lever Seal Replacer T74P-77498-A.



2. Install the manual control lever shaft into the case.

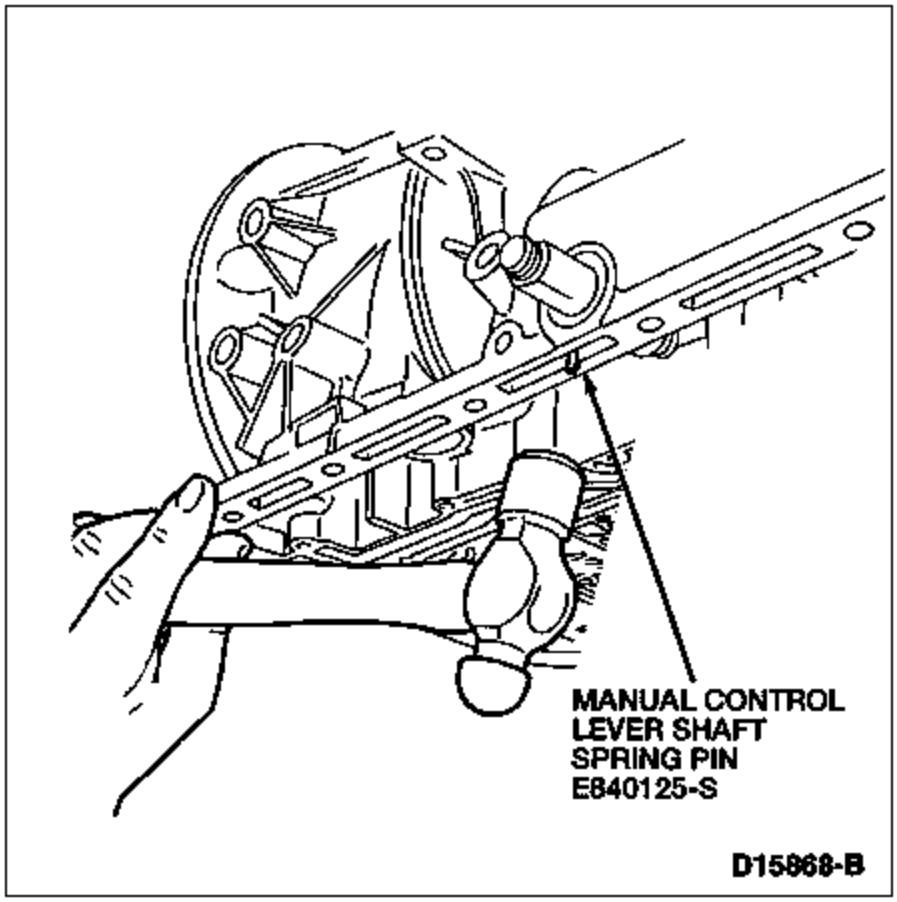
tomsn048@gmail.com



3. **CAUTION: Use care not to damage the fluid pan rail surface when installing the retaining pin.**

   Align the manual control lever shaft with the manual control lever shaft spring pin. Install the retaining pin.

tomsn048@gmail.com

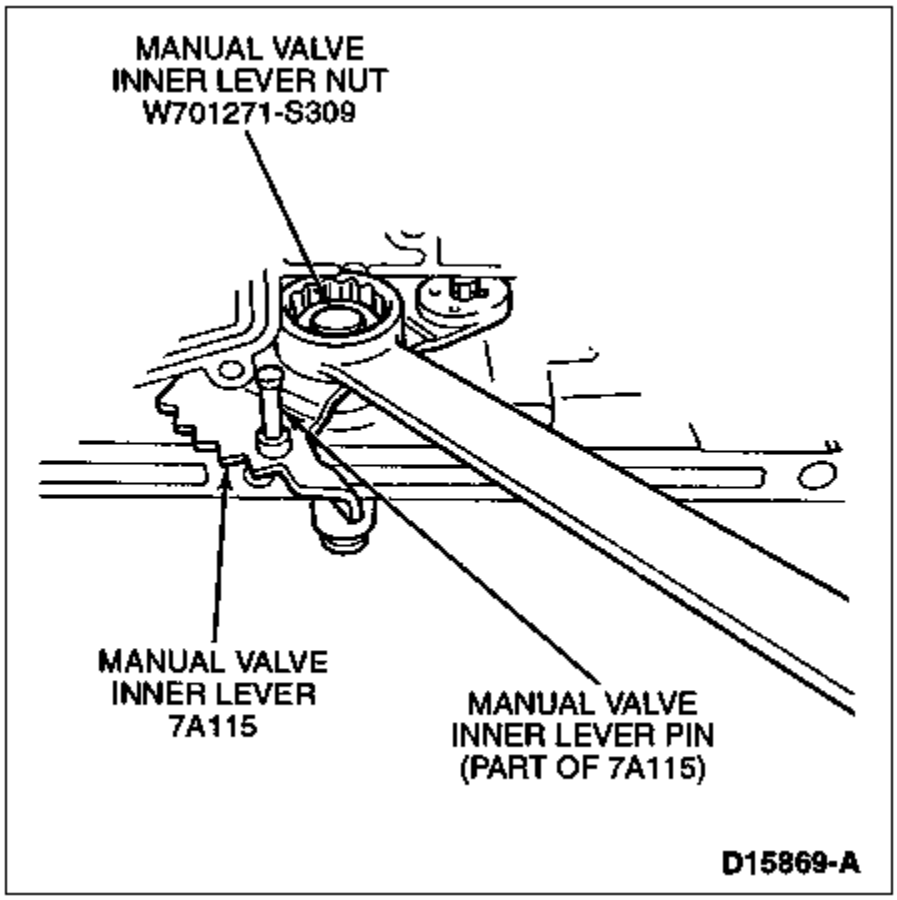


4. Align the flats of the manual valve inner lever with the flats on the manual control lever shaft.

5. **CAUTION: Do not bend the manual valve inner lever pin.**

   Install manual valve inner lever nut and tighten to 41-54 Nm (30-44 lb-ft).

tomsn048@gmail.com



6. **CAUTION: Park pawl actuating rod must be properly installed into parking pawl and guide cup located in extension housing. Verify park linkage function.**

   Verify that the output shaft is locked in the PARK position.

7. Install new gasket and install pan.

8. Install DTR sensor and linkage.

9. Fill the transmission to the proper level. Refer to the procedure in this section.

tomsn048@gmail.com

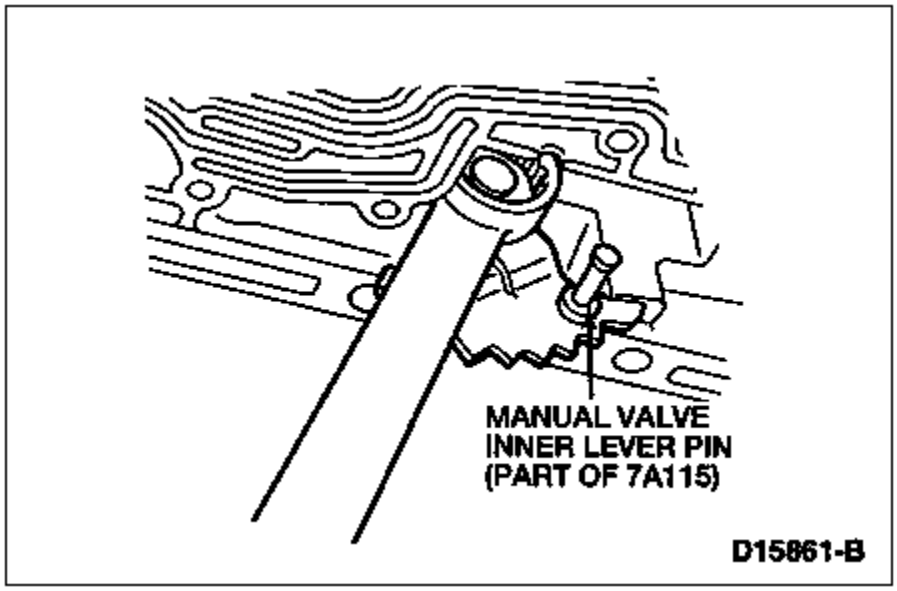
tomsn048@gmail.com

Park System

Removal

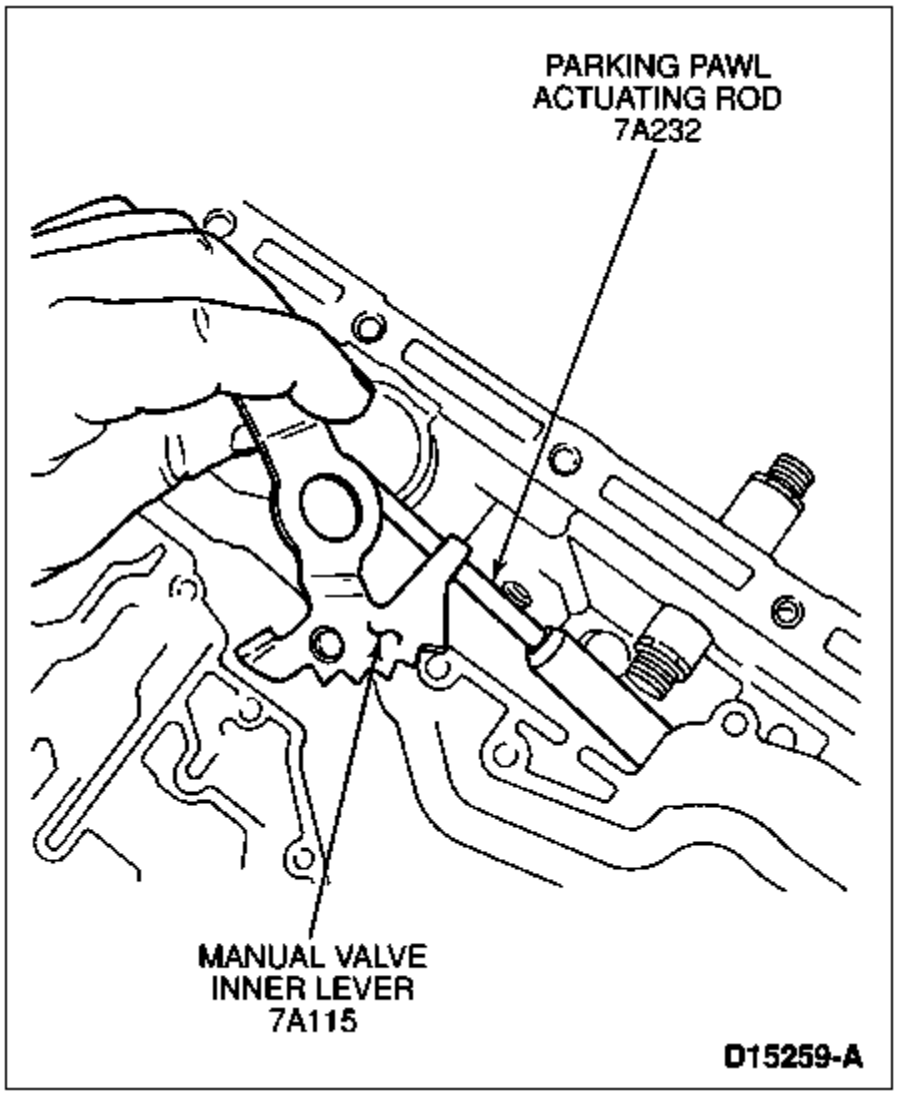
1. Remove fluid pan. Remove fluid filter.
2. Remove EPC, SS2 and CCS solenoids. Remove case connector as described in this section.
3. **CAUTION: To avoid damage, make sure the wrench does not strike the manual valve inner lever pin.**

   Remove the manual valve inner lever nut.



4. Remove the manual valve inner lever and parking pawl actuating rod assembly.

tomsn048@gmail.com



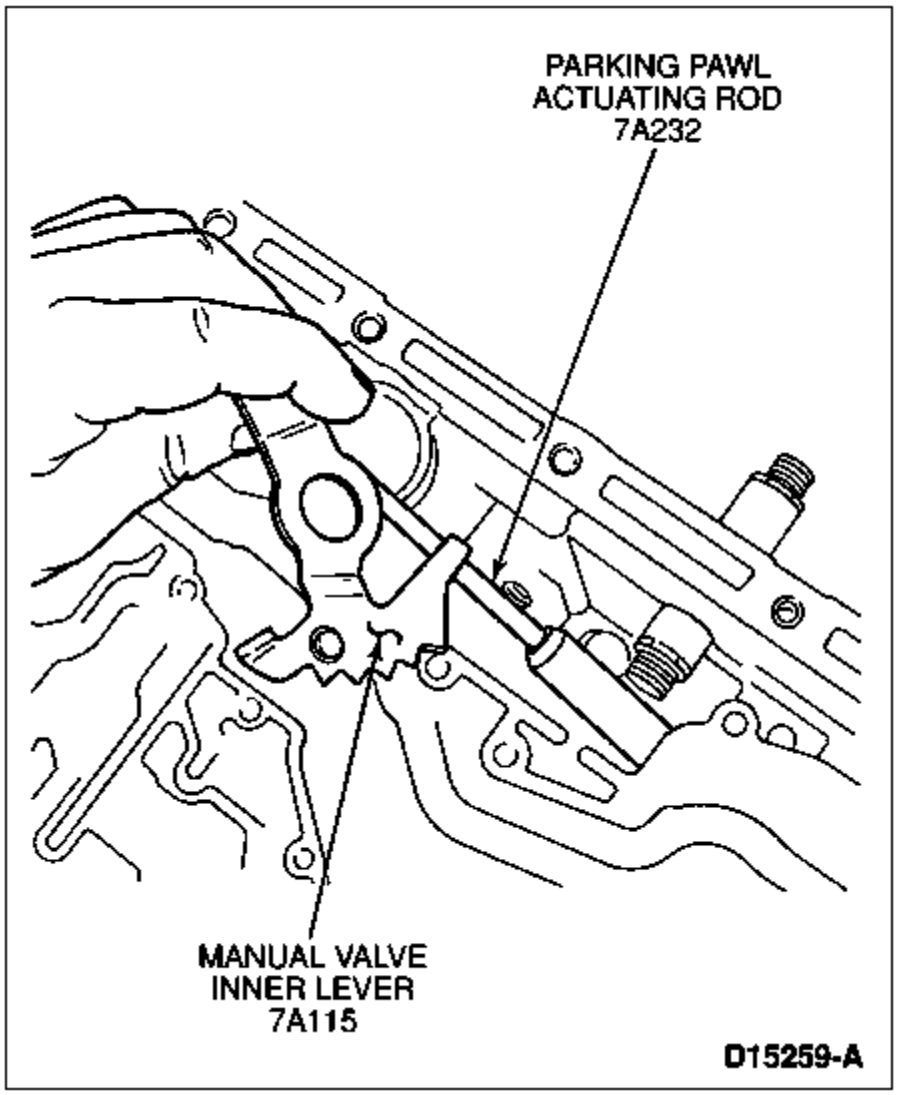
5. Remove extension housing as described in this section.

6. Inspect park pawl spring and shaft. Inspect park pawl actuating rod. Service as required.

Installation

1. Install the manual valve inner lever and parking pawl actuating rod into the case. Align the flats of the manual valve inner lever with the flats on the manual control lever shaft.

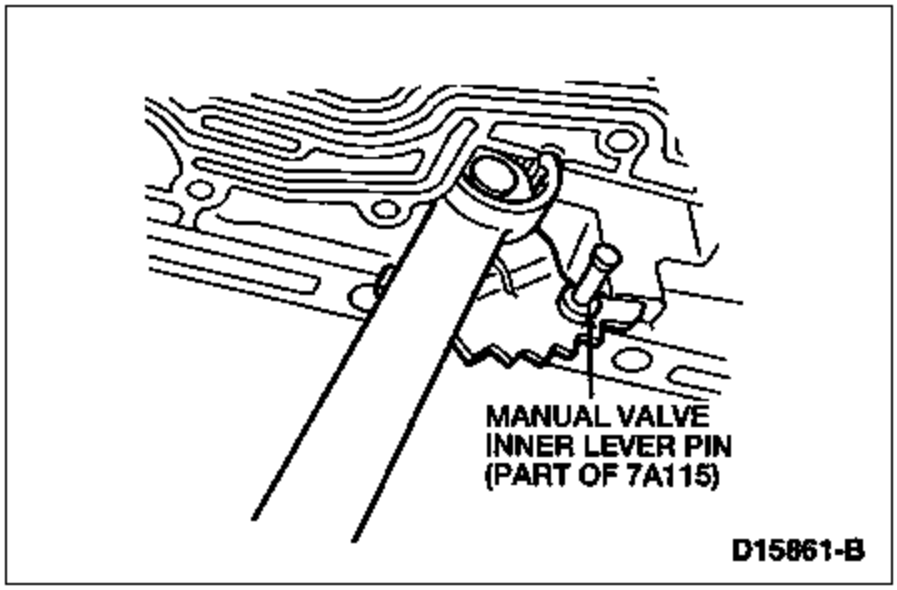
tomsn048@gmail.com



2. **CAUTION: Do not bend the manual valve inner lever pin.**

   Install manual valve inner lever nut and tighten to 41-54 Nm (30-40 lb-ft).

tomsn048@gmail.com



3. Install extension housing as described in this section, noting all cautions and notes.
4. Install EPC, SS2 and CCS solenoids and 16-pin case connector as described in this section.
5. Install fluid filter, fluid pan and new pan gasket with fluid pan-to-case screws. Tighten fluid pan-to-case screws to 13-15 Nm (115-133 lb-in).

tomsn048@gmail.com

Main Control Valve Body

NOTE: If a transmission has been disassembled to replace worn or damaged parts and the valves in the main control valve body (7A100) stick repeatedly from foreign material, the torque converter must be removed and cleaned by using a mechanically agitated cleaner, such as Rotunda Torque Converter/Fluid Cooler Cleaner 014-00028 or equivalent.

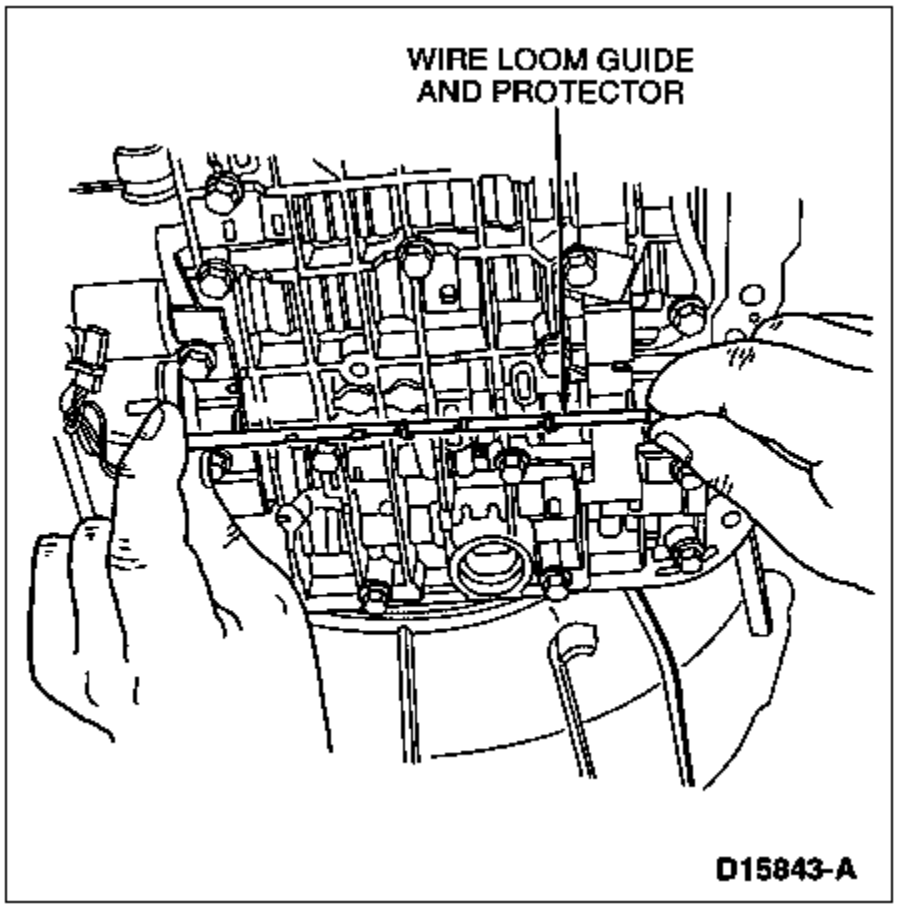
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Valve Body Guide Pin (.235)	T95L-70010-B
Valve Body Guide Pin (.248)	T95L-70010-C

Removal

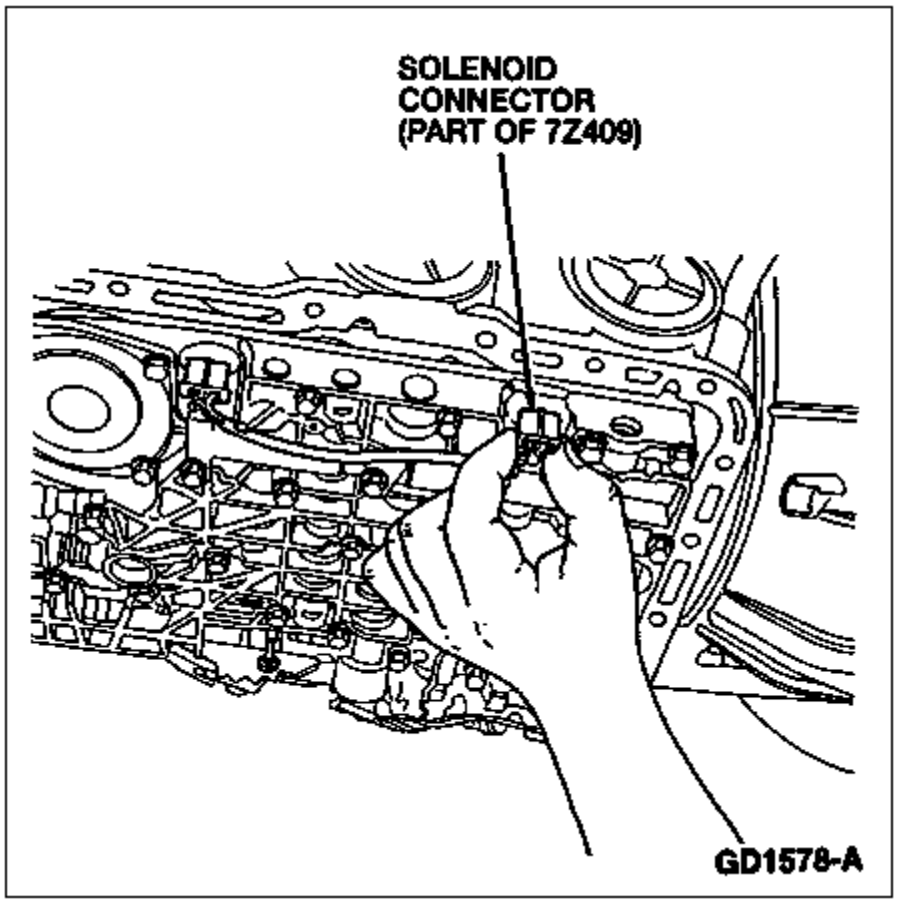
1. Remove fluid pan.
2. Carefully lift up on the wire loom guide and protector. Disengage the retaining pins from the solenoid clamps.

tomsn048@gmail.com



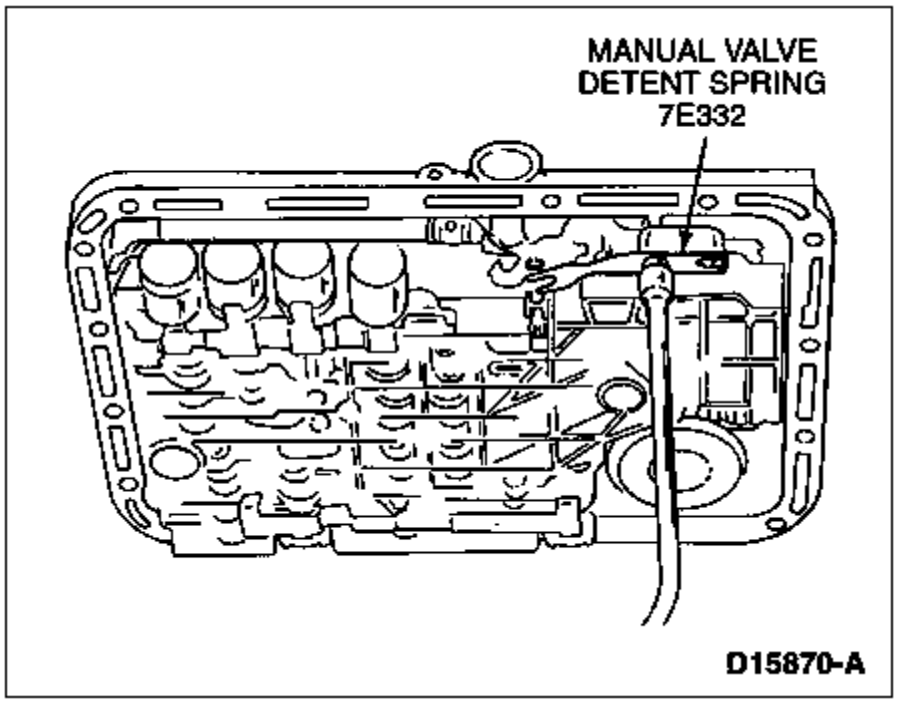
3. Disconnect the six solenoid connectors from the solenoids by carefully pulling downward and wiggling side to side.

tomsn048@gmail.com



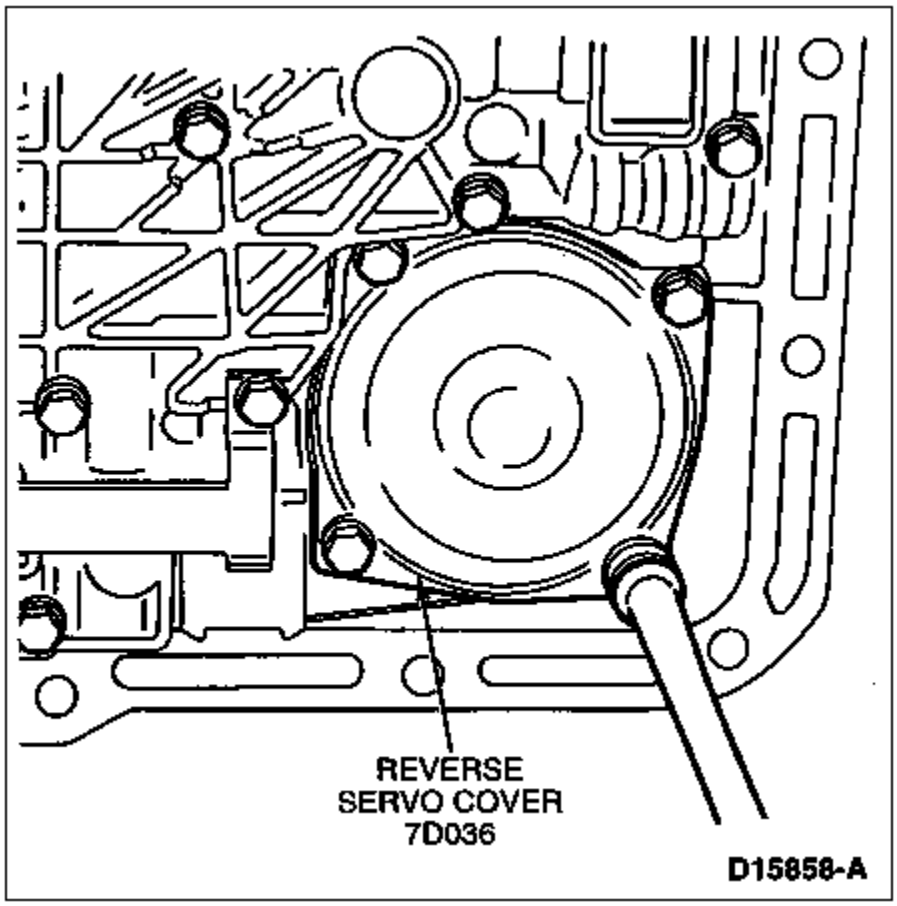
4. Use a 10 mm socket to remove the M6 x 30 mm manual valve detent spring screw. Remove the manual valve detent spring.

tomsn048@gmail.com



5. Use a 10 mm socket to remove the four M6 x 20 mm reverse servo cover screws. Remove the reverse servo cover, gasket and the servo piston and rod assembly.

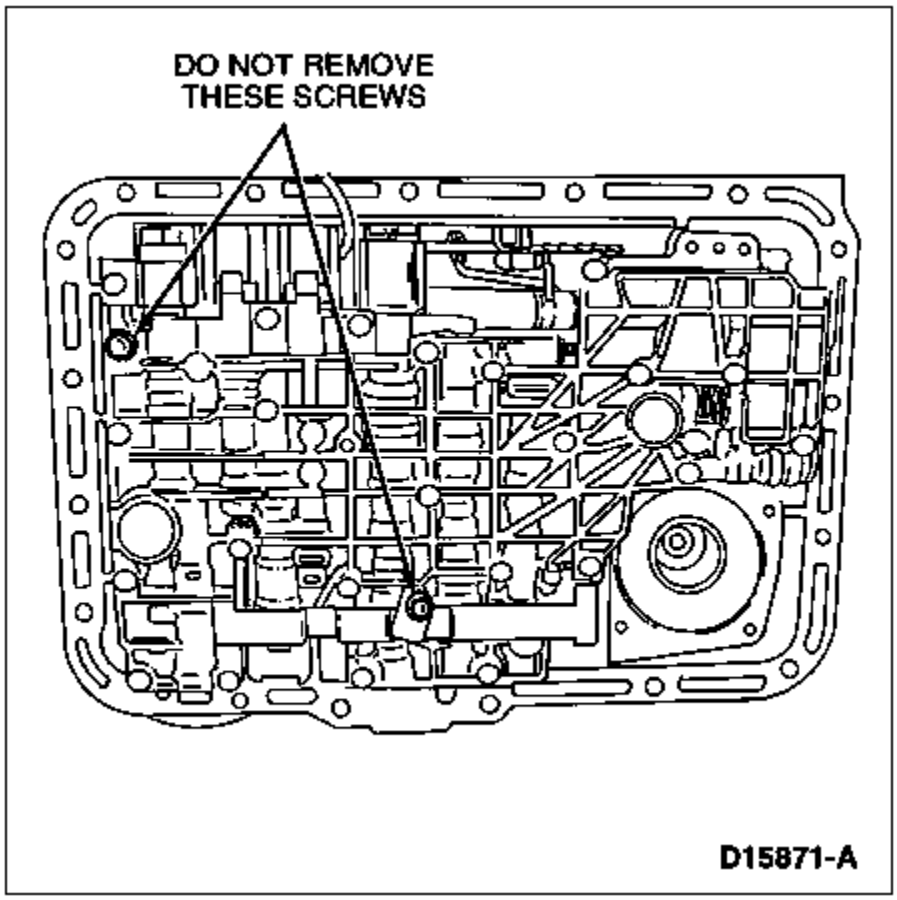
tomsn048@gmail.com



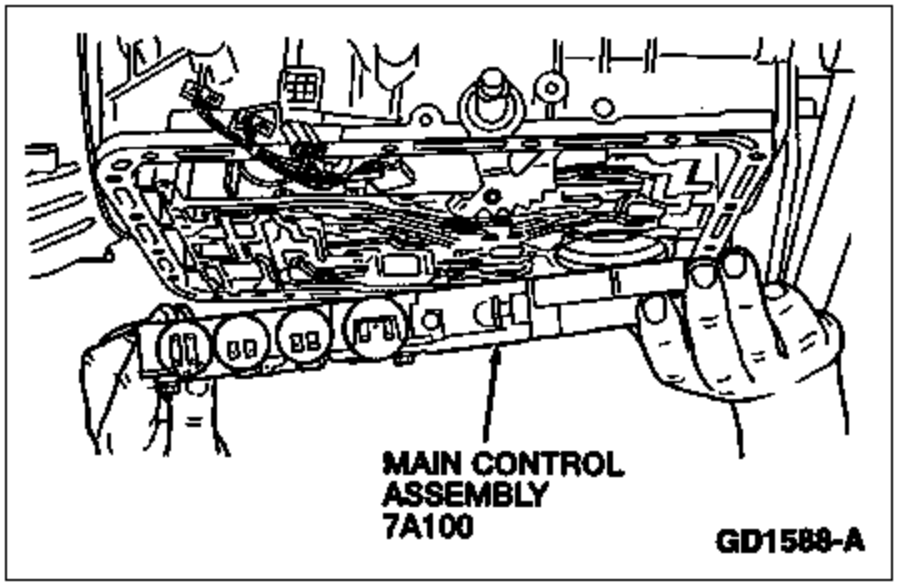
6. **CAUTION: Support main control valve body.**

   Use a 10 mm socket to remove the sixteen M6 x 40 mm, four M6 x 45 mm, two M6 x 35 mm and one M6 x 30 mm main control valve body screws.

tomsn048@gmail.com

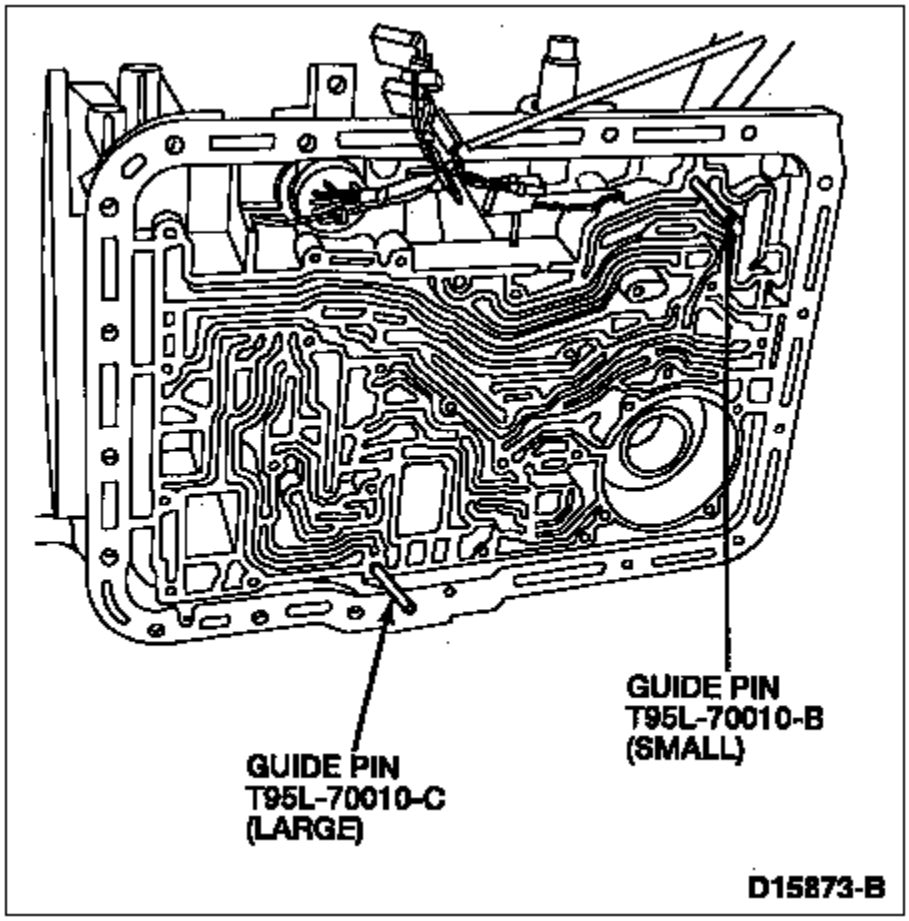


7. Remove the main control assembly.



8. Install the guide pins into the case in the positions shown.

tomsn048@gmail.com

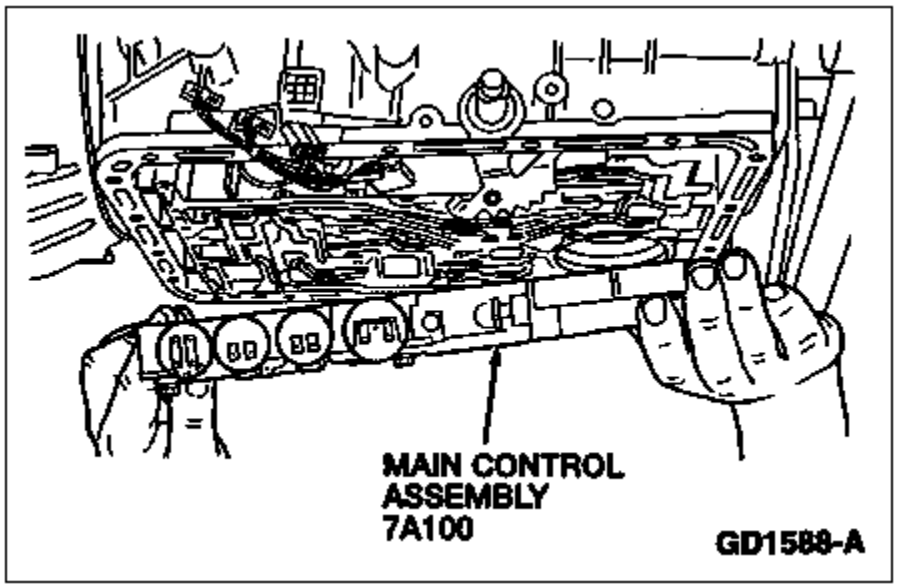


9. Install new separator to case gasket.

10. **NOTE: Make sure main control assembly gasket is properly aligned.**

    Install the main control assembly on the case. Align the manual valve with the manual valve inner lever pin as shown.

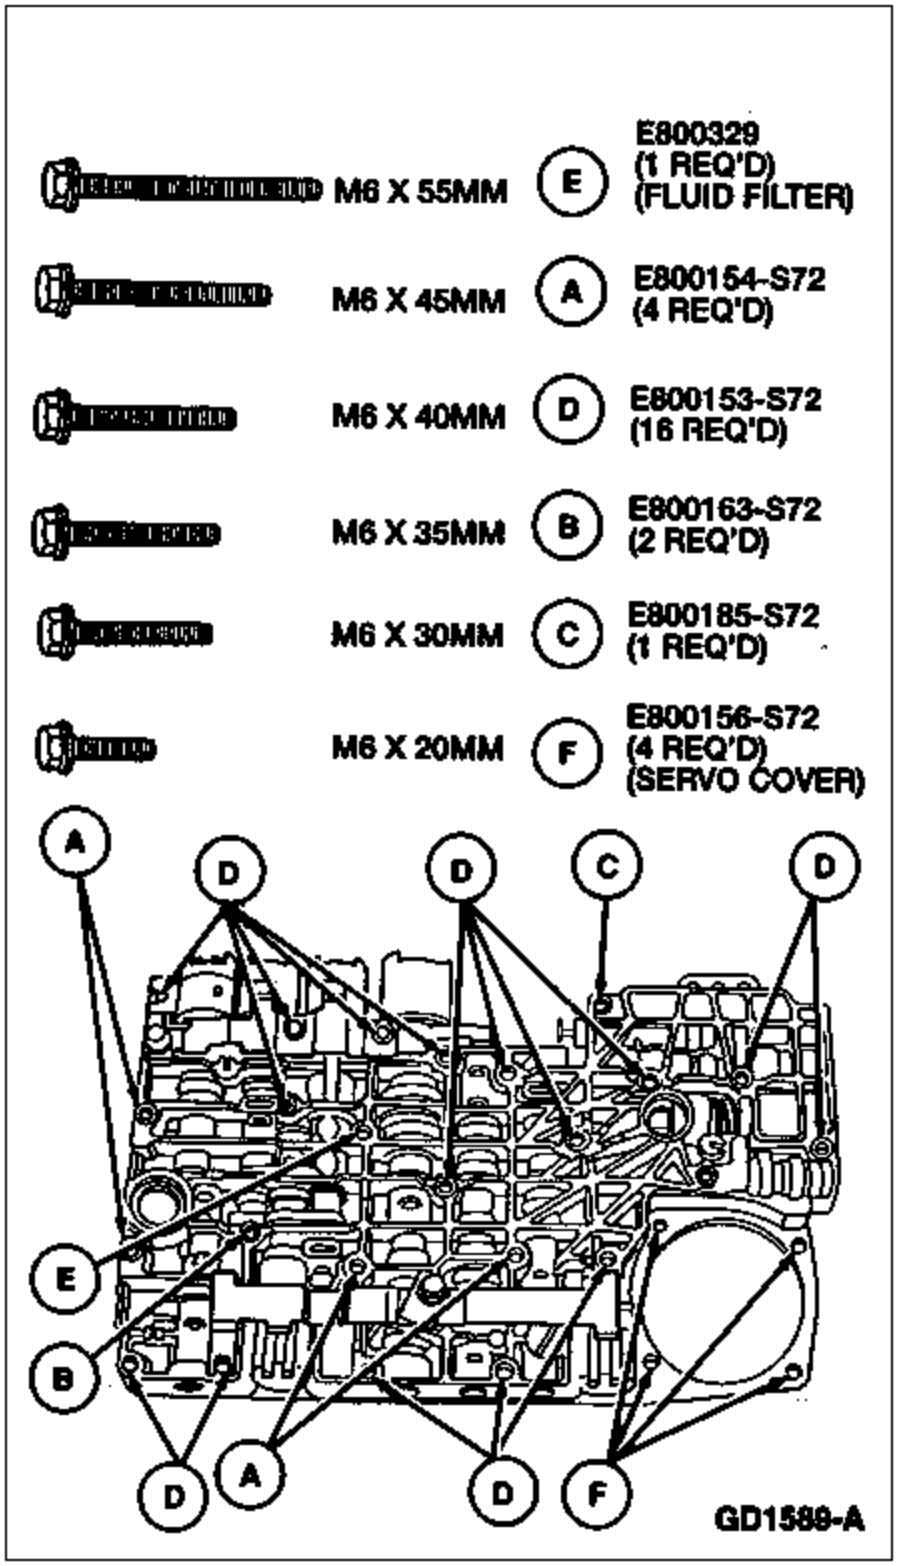
tomsn048@gmail.com



11. Install four M6 x 45 mm screws in locations A. Finger tighten.
12. Install two M6 x 35 mm main control assembly-to-case screws in locations B. Finger tighten.
13. Install one M6 x 30 mm main control assembly-to-case screws in location C. Finger tighten.
14. Remove both valve body guide pins T95L-70010-B and T95L-70010-C.
15. Install sixteen M6 x 40 mm main control assembly-to-case screws in locations D. Finger tighten.
16. Tighten all main control assembly-to-case screws to 8-11 Nm (71-97 lb-in) in sequence shown, using a 10 mm socket.

Main Control Assembly Screws and Locations

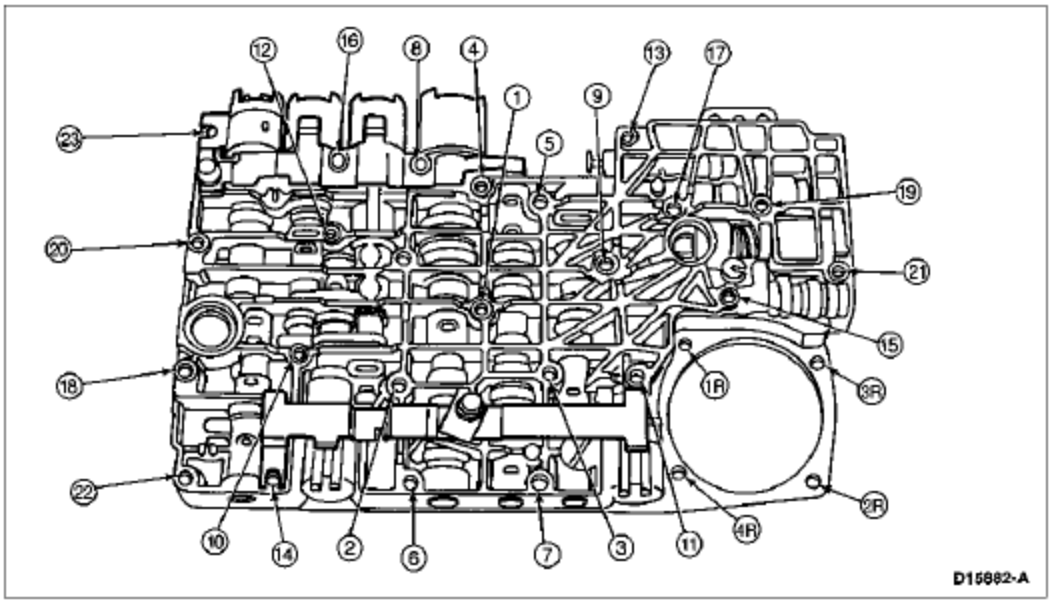
tomsn048@gmail.com



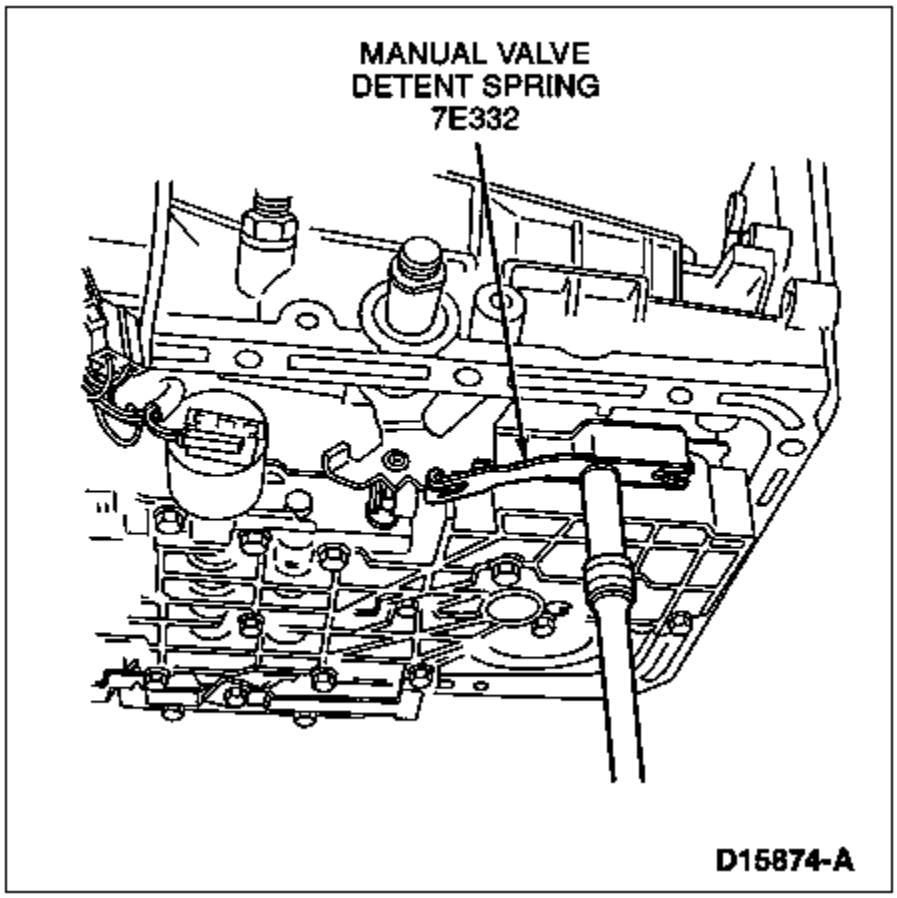
Refer to the tightening sequence (1R, 2R, 3R, 4R) for reverse servo cover installation also.

Tightening Sequence

tomsn048@gmail.com



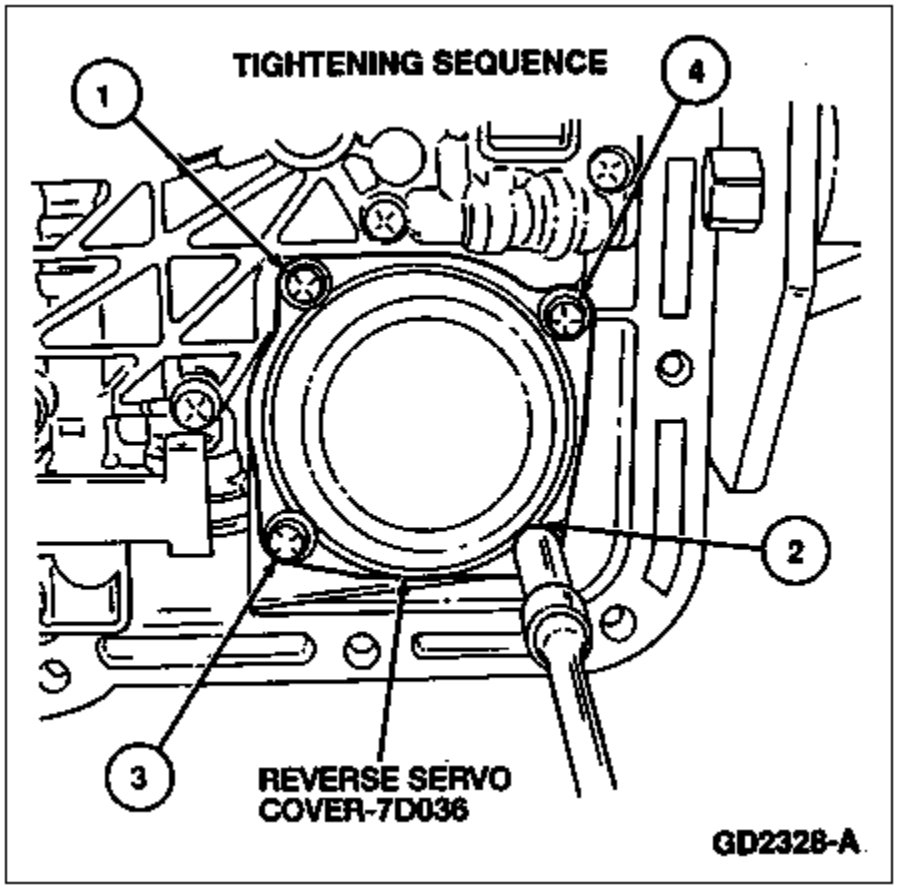
17. Install the manual valve detent spring. Install the manual valve detent spring screw and tighten to 8-11 Nm (71-97 lb-in).



18. Install the reverse servo assembly into the case.

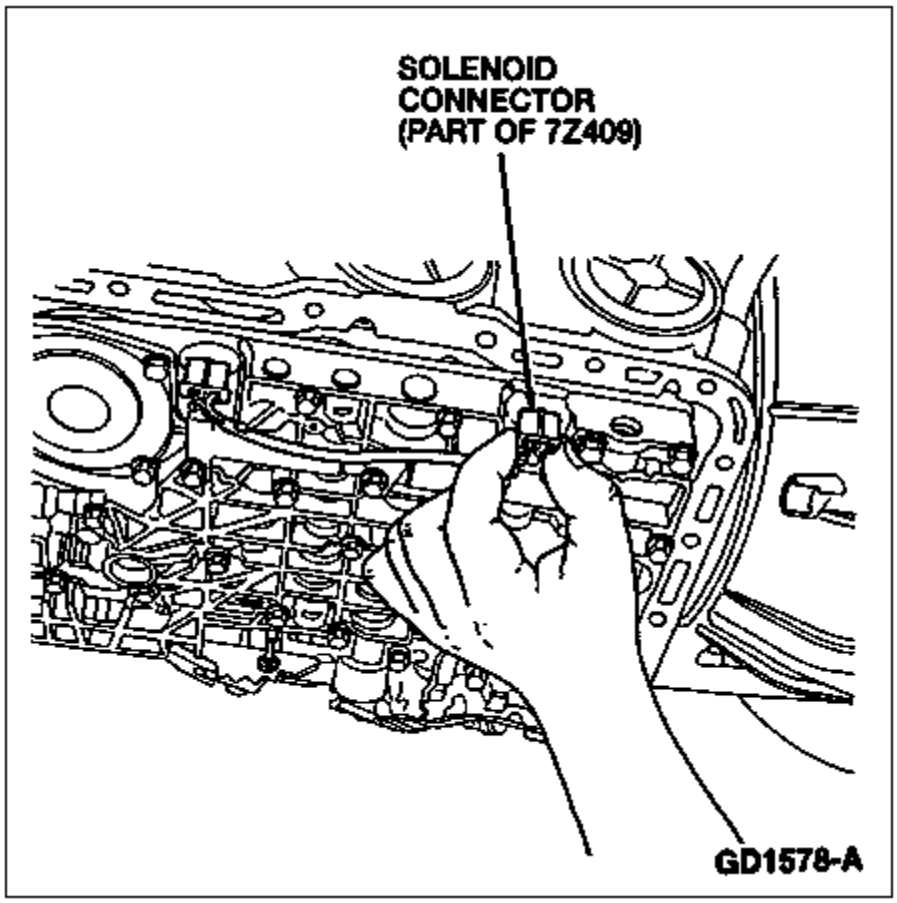
tomsn048@gmail.com

19. Install the reverse servo and rod assembly cover, new gasket and the four servo cover-to-case screws. Tighten the screws in sequence as shown to 12-14 Nm (106-124 lb-in).



20. Carefully press down to install the solenoid connectors on the solenoid.

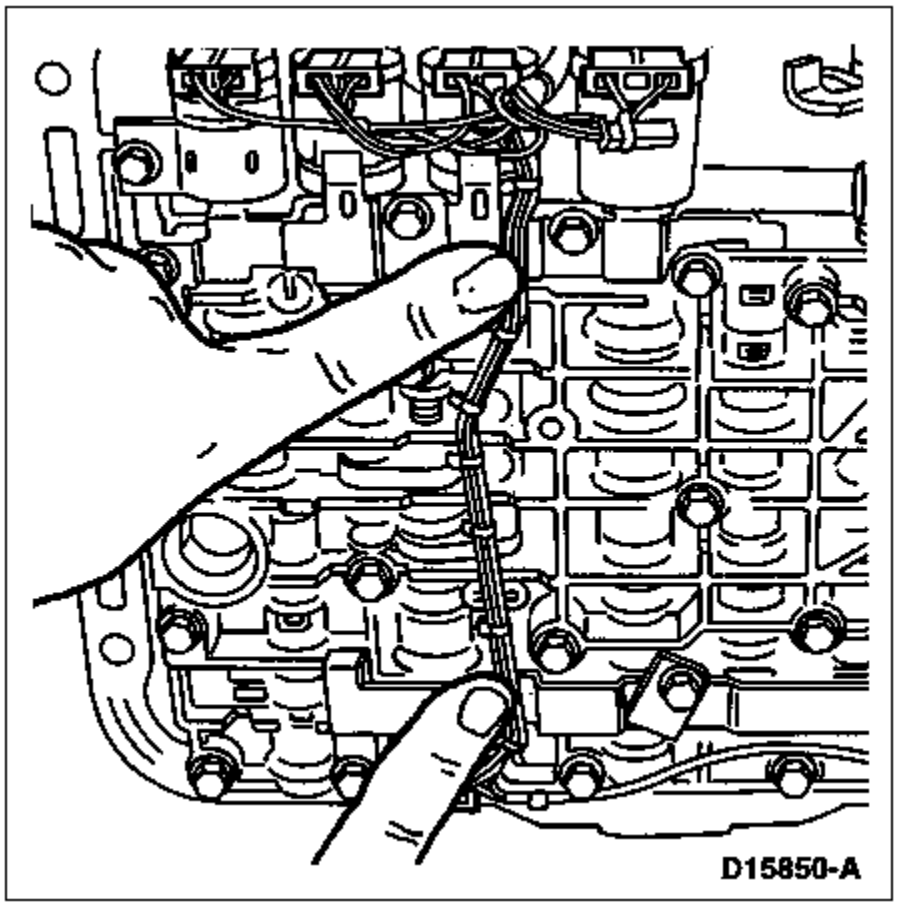
tomsn048@gmail.com



21. **CAUTION: Excessive pressure may break the locating pins.**

Install the wiring loom protector and guide. Align the pins in the holes of the solenoid clamps and gently push down.

tomsn048@gmail.com



22. Install filter, new gasket and fluid pan.

23. Fill the transmission to the proper level. Refer to the procedure in this section.

---

tomsn048@gmail.com

Intermediate and Overdrive Servos

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Servo Cover Compressor	T95L-77028-A
Servo Removal Tool	T97T-7D021-A

Removal

NOTE: Procedures are the same for both O/D and intermediate servos.

1. **NOTE: Catalytic converter(s) may have to be removed.**

   Remove heat shield, if equipped.

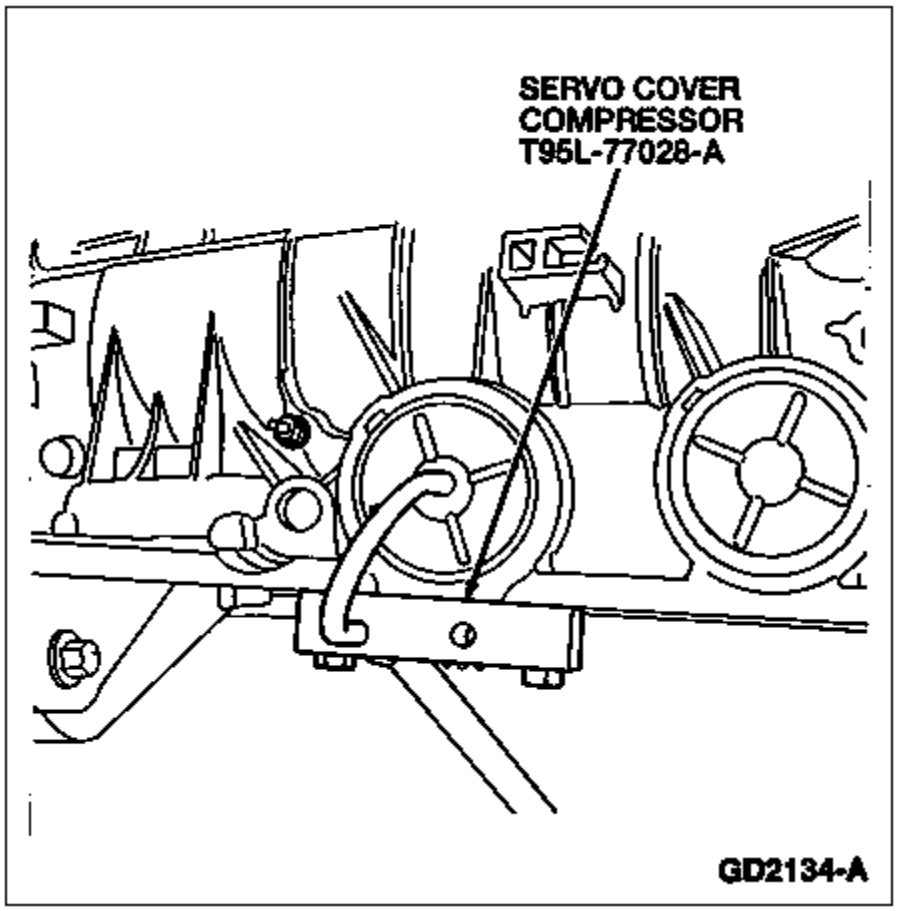
2. **CAUTION: Servo is under spring tension. Use caution when removing.**

   NOTE: The J-hook must be in the appropriate hole for the servo being removed.

   Install Servo Cover Compressor T95L-77028-A over the intermediate servo cover at the fluid pan rail with tool stamping facing up. Tighten the screws.

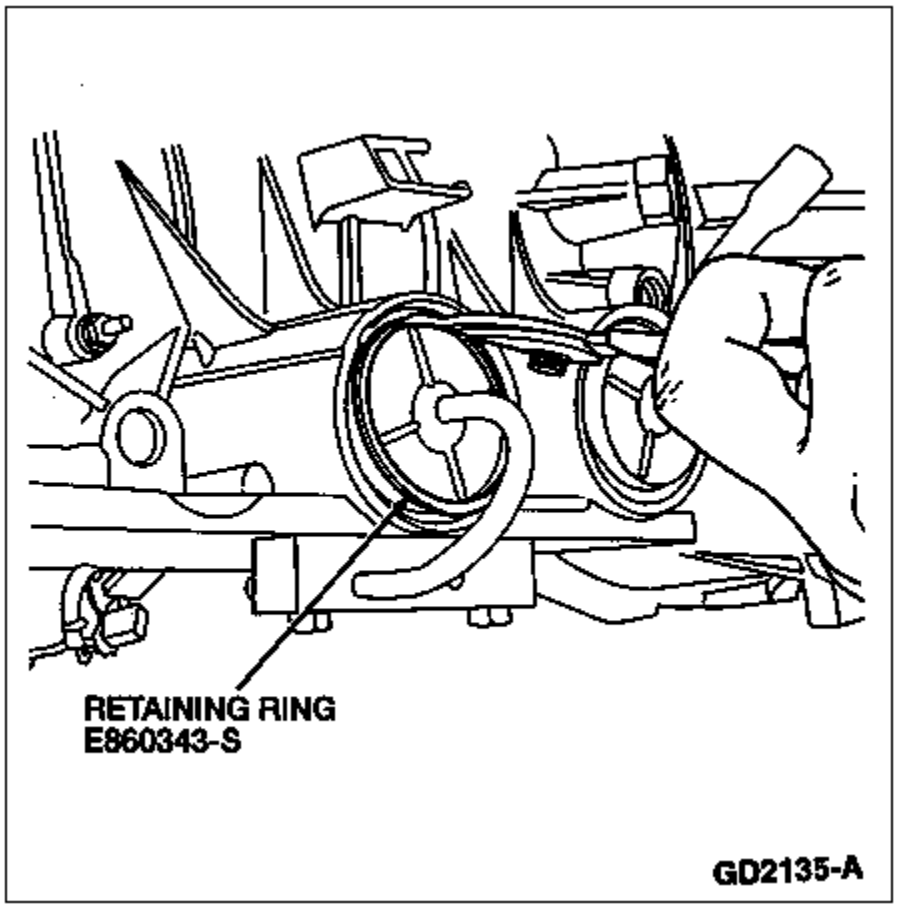
3. Using a 1/2-inch wrench, tighten the nut on the J-hook until there is a gap between the servo cover and the snap ring.

tomsn048@gmail.com



4. Carefully remove the servo cover retaining ring.

tomsn048@gmail.com

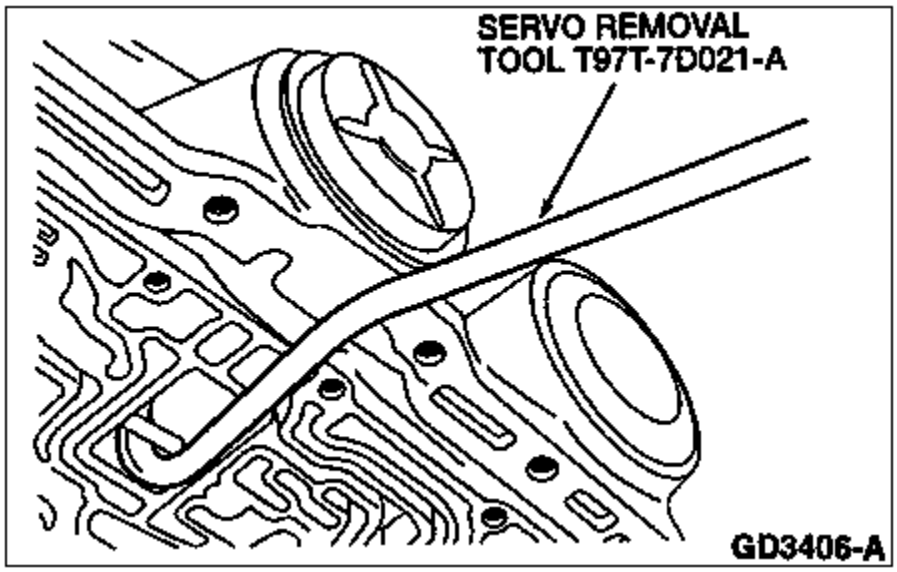


5. **CAUTION: The servo cover is under spring tension.**

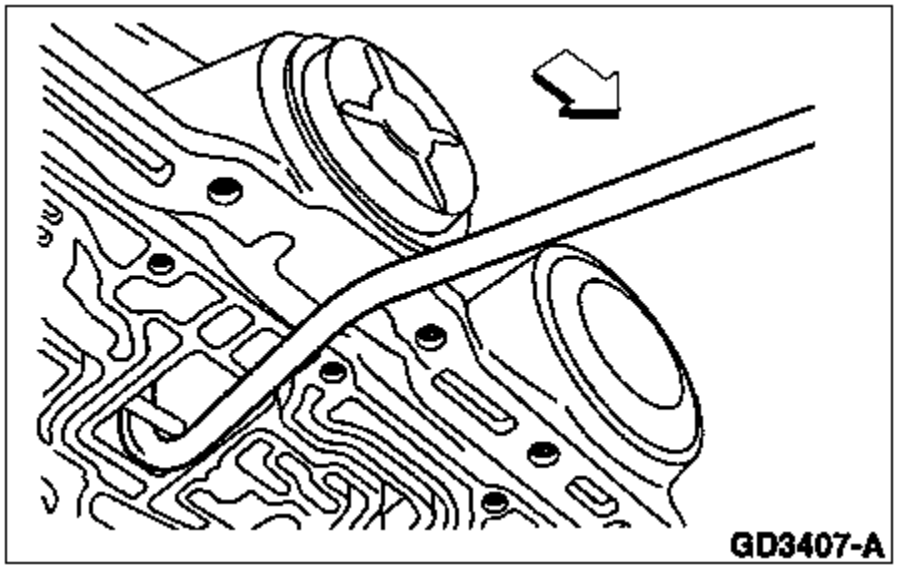
   Carefully back off the nut on the J-hook until the servo spring is unloaded.

6. Insert Servo Removal Tool T97T-7D021-A into case and locate on servo rod.

tomsn048@gmail.com



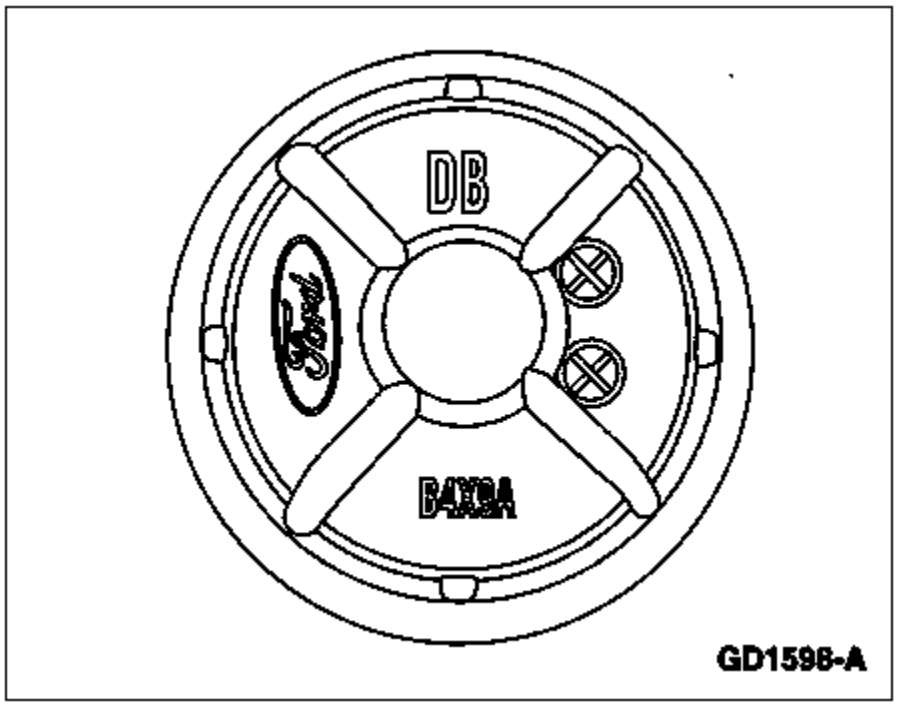
7. Gently push on Servo Removal Tool T97T-7D021-A to remove front servo cover, piston and spring.



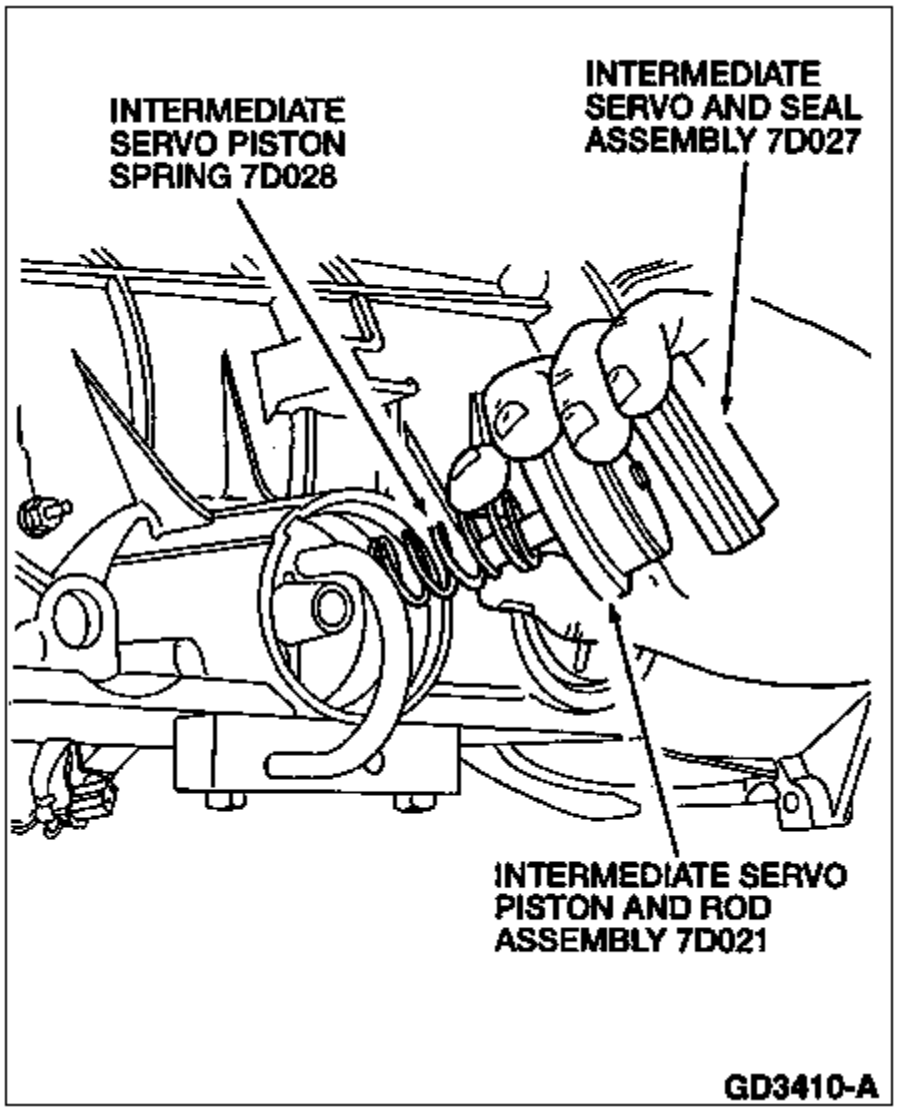
8. **NOTE: Tag the spring, piston and cover assembly. Label accordingly for assembly. The covers have letters cast on the outer surface for identification.**

   Remove the intermediate servo cover, piston and spring.

tomsn048@gmail.com



tomsn048@gmail.com



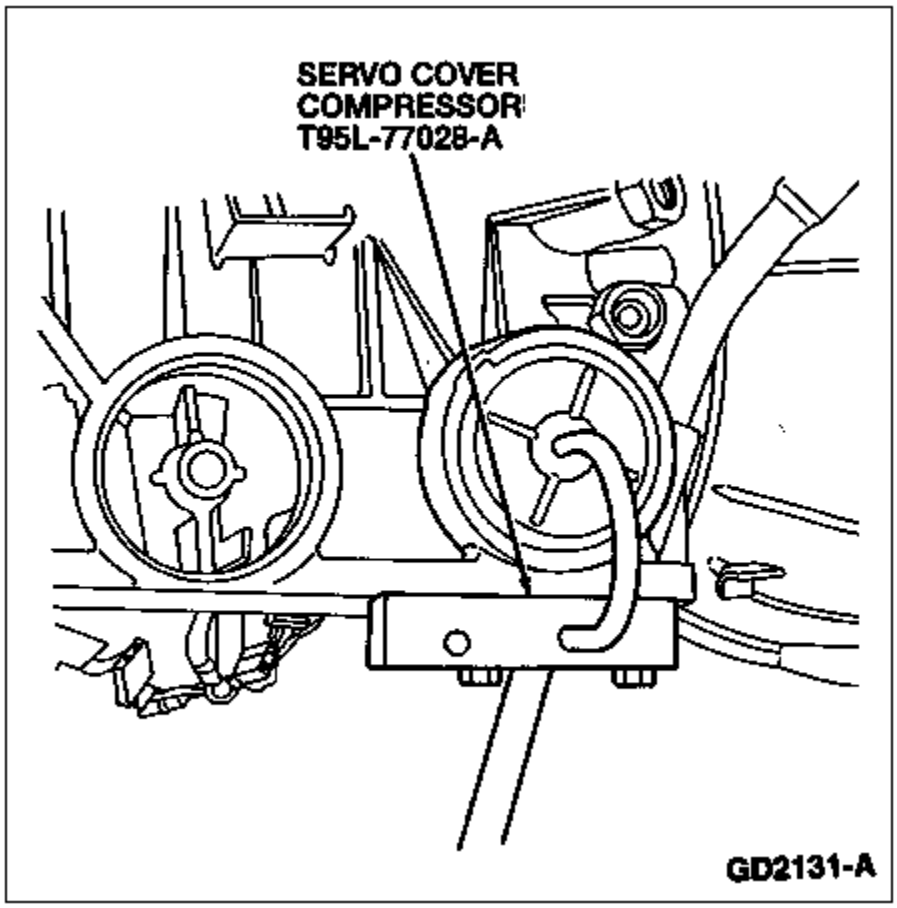
9. Remove Servo Cover Compressor T95L-77028-A.

10. **NOTE: The J-hook must be in the appropriate hole for the servo being removed.**

    Install Servo Cover Compressor T95L-77028-A over the overdrive servo cover at the fluid pan rail. Tighten the screws.

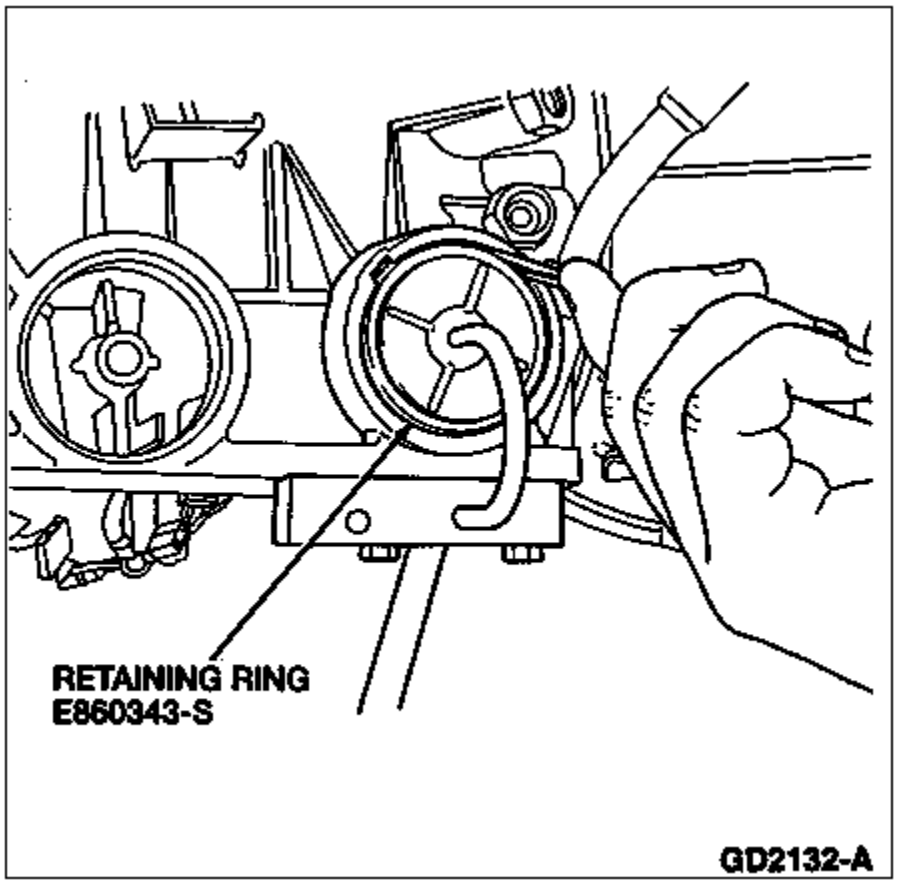
11. Using a 1/2-inch wrench, tighten the nut on the J-hook until there is a gap between the servo cover and the retaining ring.

tomsn048@gmail.com



12. Carefully remove the servo cover retaining ring.

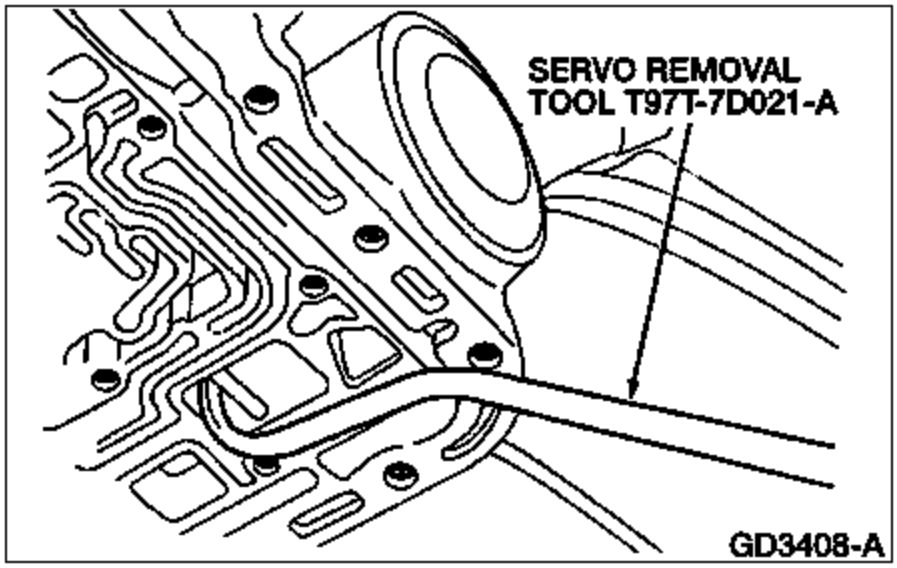
tomsn048@gmail.com



13. **CAUTION: The servo cover is under spring tension.**

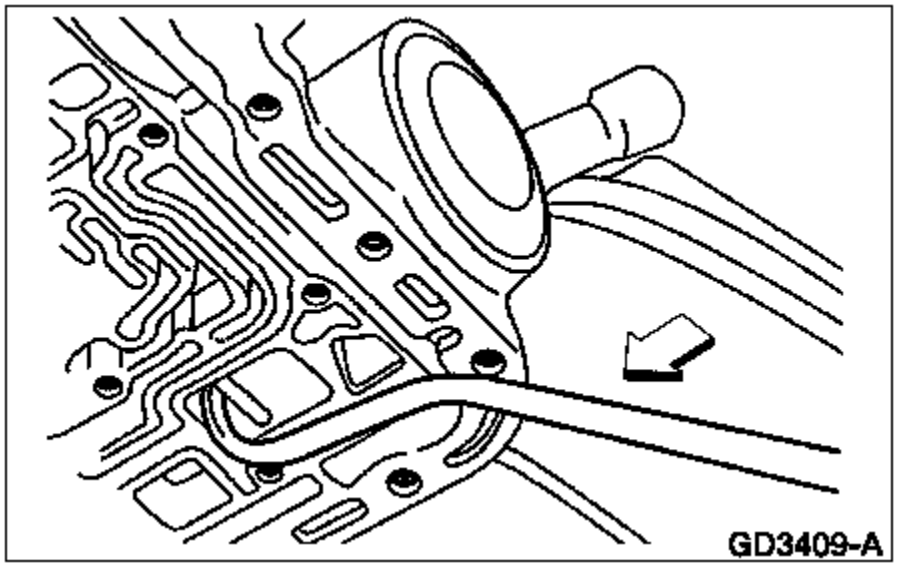
    Carefully back off the nut on the J-hook until the servo spring is unloaded.

14. Insert Servo Removal Tool T97T-7D021-A into case and locate on servo rod.



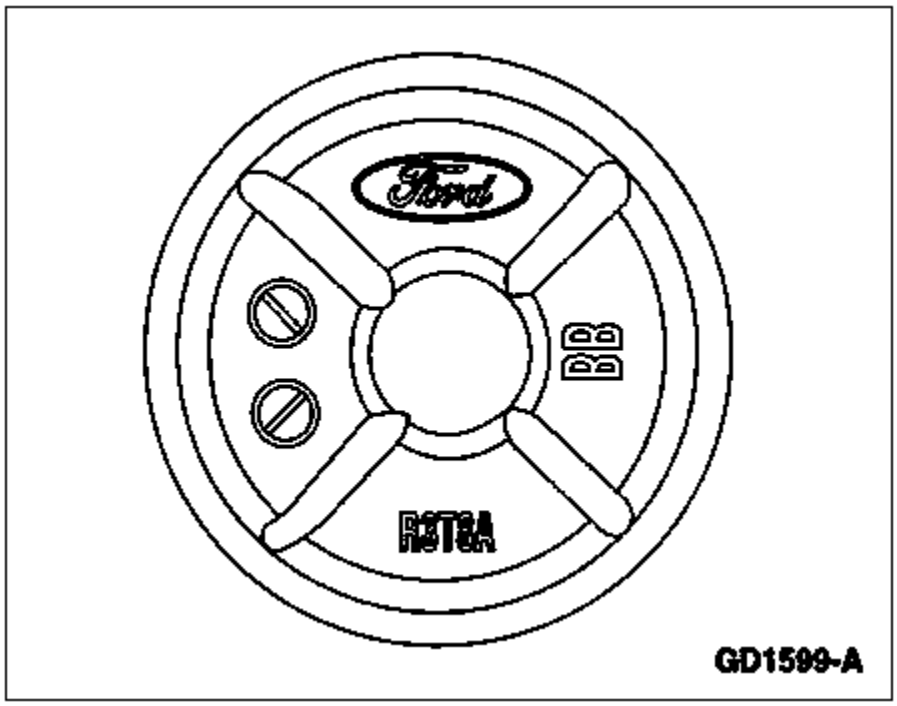
tomsn048@gmail.com

15. Gently push on Servo Removal Tool T97T-7D021-A to remove front servo cover, piston and spring.

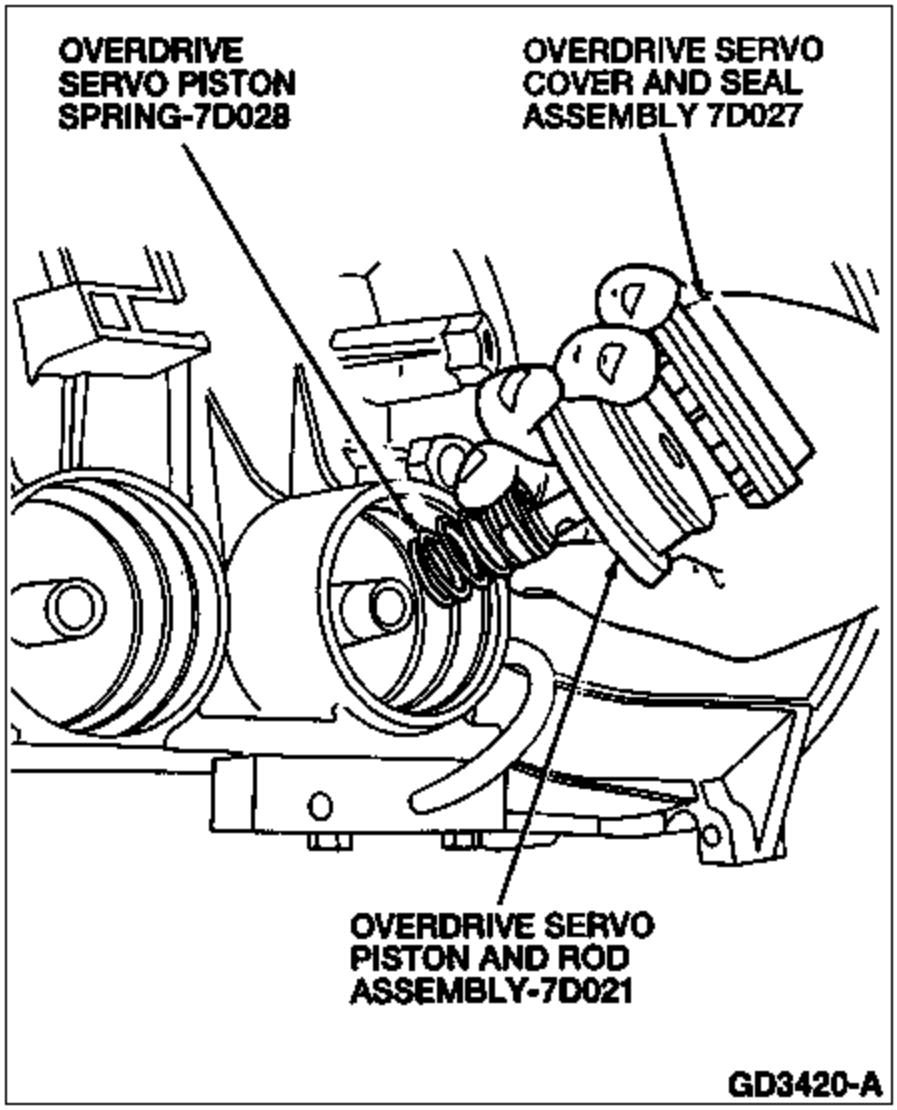


16. **NOTE: Tag the spring, piston and cover assembly. Label accordingly for assembly. The covers have letters cast on the outer surface for identification.**

    Remove the overdrive servo cover, piston and spring.



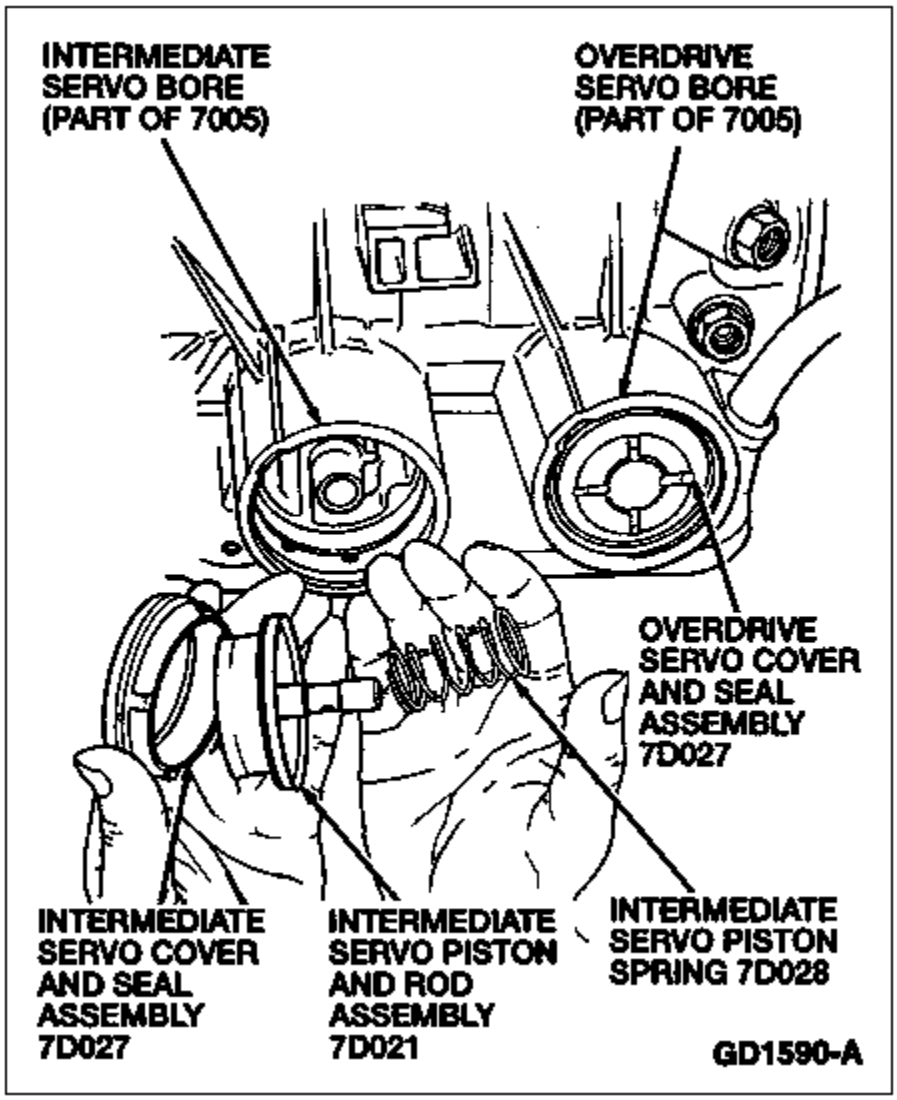
tomsn048@gmail.com



17. Remove Servo Cover Compressor T95L-77028-A.

18. Service as required.

tomsn048@gmail.com

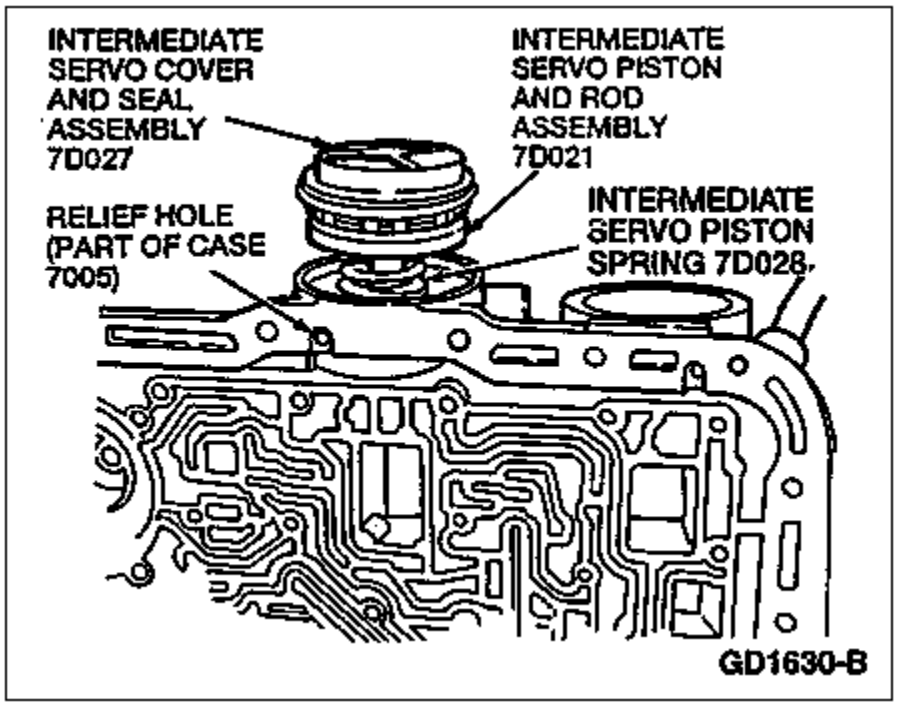


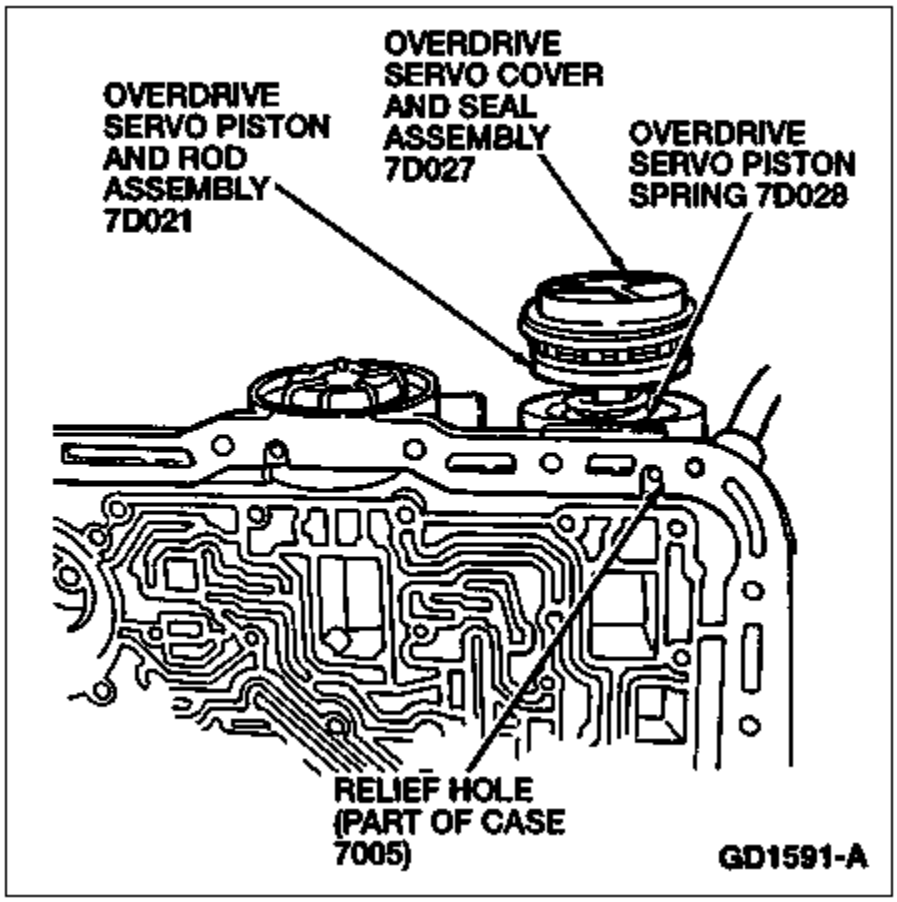
Installation

1. **CAUTION: Do not damage O-ring during installation. Do not press servo cover and O-ring past relief hole in case, or O-ring damage may occur.**

   Install servo assembly.

tomsn048@gmail.com





2. Carefully compress servo cover and install retaining ring.

tomsn048@gmail.com

3. Install heat shield, if equipped.
4. Install catalytic converter if removed.

---

tomsn048@gmail.com

Band Adjustments

SPECIAL SERVICE TOOL(S) REQUIRED

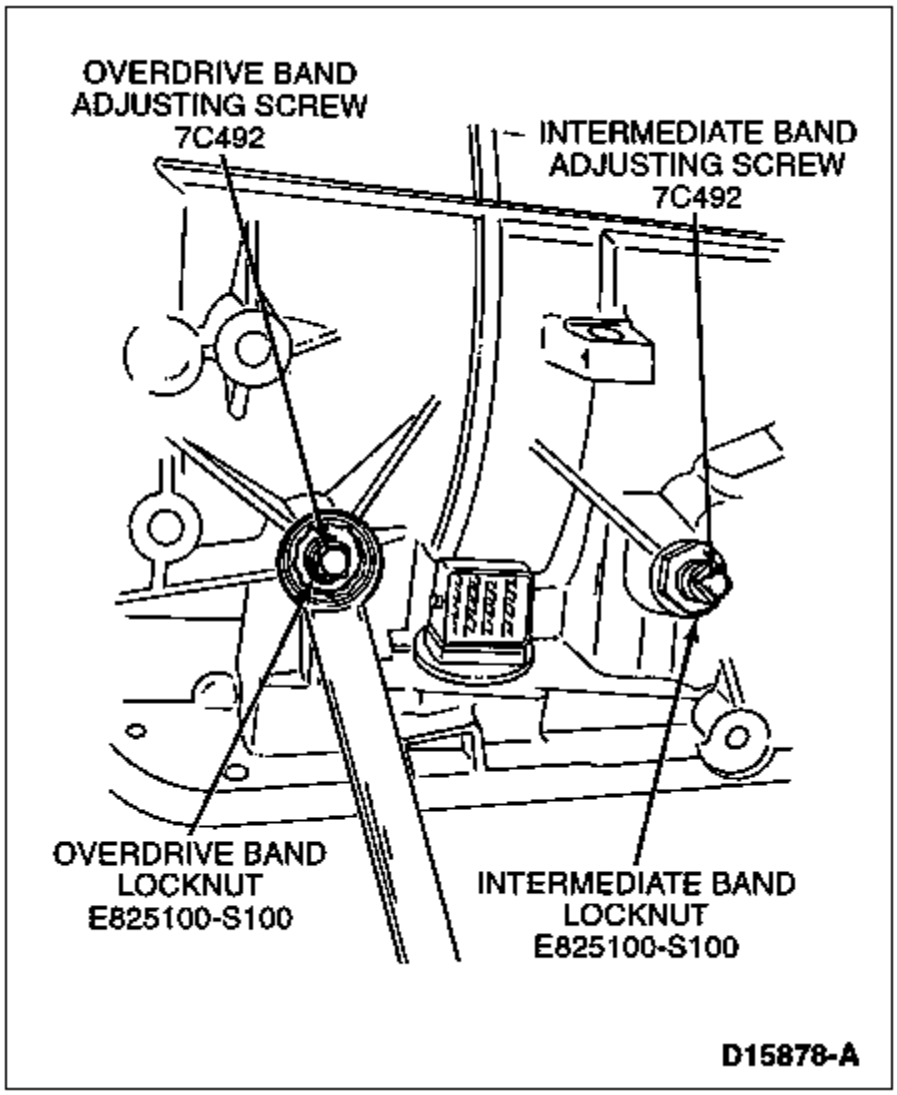
Description	Tool Number
Band Adjustment Torque Wrench Set	T71P-77370-A

1. **CAUTION: Do not allow adjustment screw to back out. Band strut could fall in transmission assembly.**

   CAUTION: Throw the locknuts away. The locknuts are not reusable for assembly.

   Remove the overdrive and intermediate band locknuts and discard, then back off the band adjusting screws.

tomsn048@gmail.com



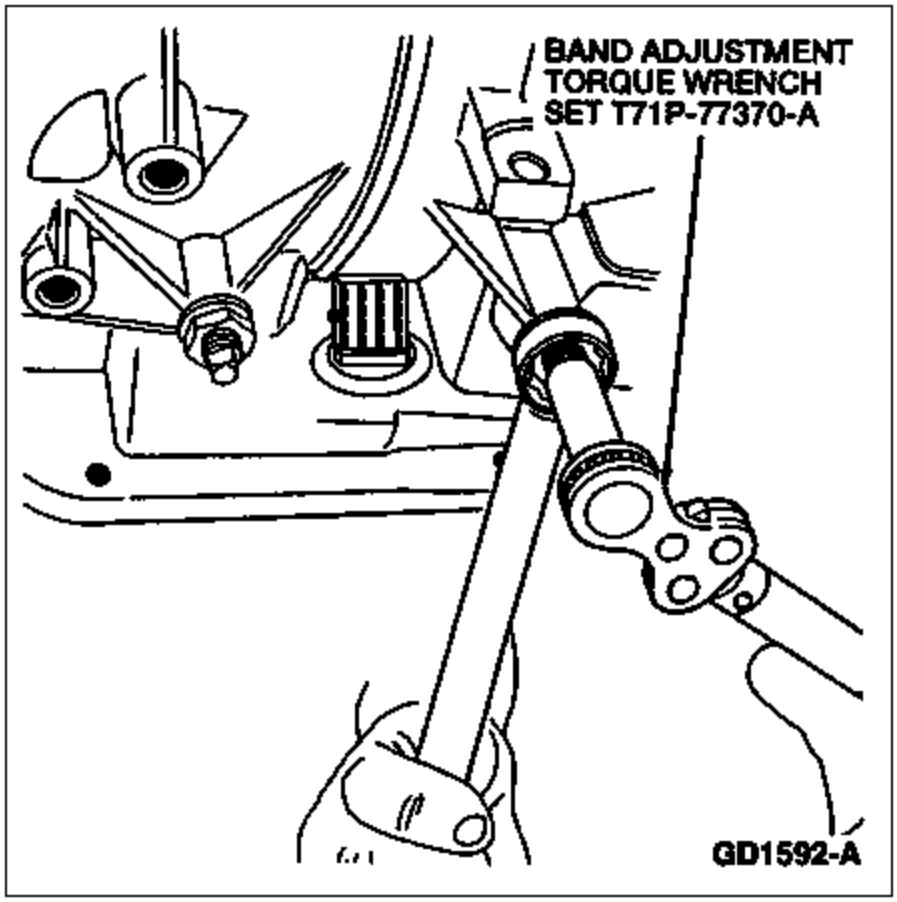
2. **CAUTION: Install, but do not tighten, a new locknut on the band adjusting screw. Apply petroleum jelly to the locknut seal.**

CAUTION: Servos must be installed prior to band adjustment.

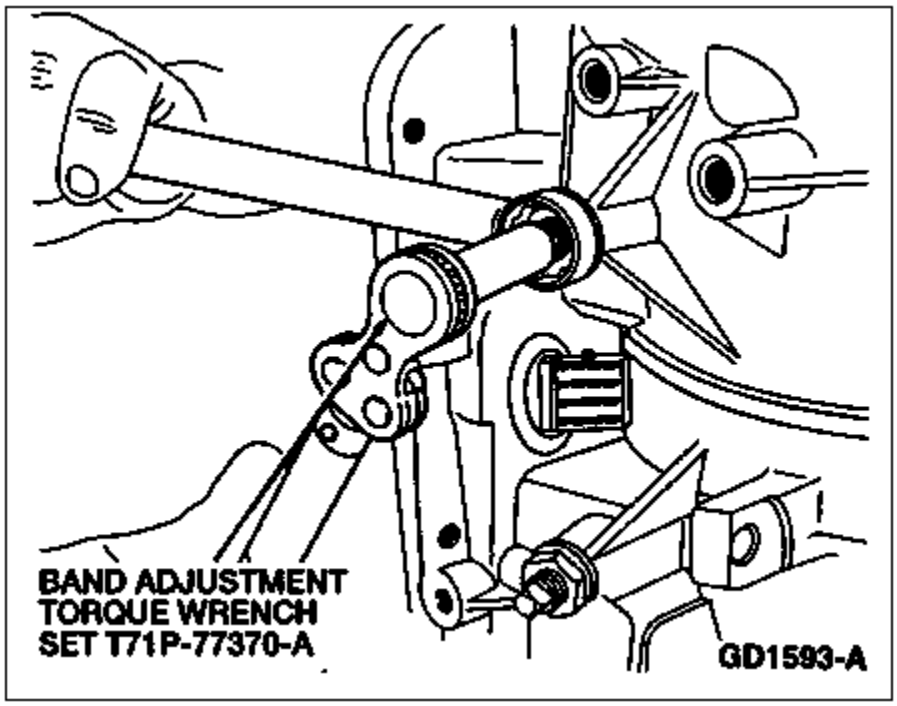
Install two new locknuts. Tighten the band adjusting screws using Band Adjustment Torque Wrench Set T71P-77370-A. The wrench will click at 14 Nm (10 lb-ft). Back off the band adjusting screw exactly two and one-half (2 1/2) turns for the intermediate band and two turns for the overdrive band and hold that position. Tighten the overdrive and intermediate band locknut-to-case adjusting screws to 47-61 Nm (35-45 lb-ft) using a 19 mm wrench.

Intermediate Band Adjustment

tomsn048@gmail.com



Overdrive Band Adjustment



tomsn048@gmail.com

tomsn048@gmail.com

Transmission — 4x2 Aerostar

1. Disconnect the negative battery cable. Remove the transmission fluid level indicator.
2. Raise the vehicle and position safety stands under the vehicle.
3. Mark the relationship of the driveshaft centering flange and the rear axle companion flange.
4. Remove the four bolts retaining the driveshaft centering flange to the rear axle companion flange and disconnect the driveshaft from the rear axle. Remove the driveshaft from the vehicle.
5. Install a transmission plug in the output shaft seal.
6. Remove the transmission pan bolts and drain the transmission. Install the transmission pan, using the original gasket.
7. Disconnect the shift cable from the shift lever and from the shift cable bracket.
8. **NOTE: Note the position of the ground cable at the starter bolt for installation.**

   Remove three starter motor bolts and position the starter aside, using mechanics wire.
9. Remove two transmission access cover bolts and the access cover from the converter housing.
10. **NOTE: Mark and index one converter stud to the flexplate. The flexplate-to-converter nuts are not reuseable.**

    Rotate the torque converter and remove four converter-to-flexplate nuts. Discard the nuts.
11. **NOTE: The transmission harness is removed from the transmission after the transmission is removed.**

    Disconnect the 8-pin and 16-pin connectors (for transmission sensors) at the left rear cylinder head. Disconnect the rear HO2S connector at the rear extension housing. Disconnect the right HO2S connector.
12. Remove two transmission mount nuts.
13. Support the engine.
14. Place Rotunda E4OD Transmission Jack Adapter 014-00763 or equivalent on the Transmission Jack 014-00942. Raise and secure the adapter to the transmission. Secure a safety strap to the transmission.
15. Remove the left and right crossmember bolts and nuts. Remove the crossmember. Remove the exhaust hanger bolt.
16. Remove the left and right bolts retaining the Three Way Catalytic (TWC) converters to the exhaust manifolds. Position the exhaust aside using mechanics wire.

tomsn048@gmail.com

17. **NOTE: The case connector fittings must be held in place to prevent them from moving while loosening the tube nuts.**

    Remove the transmission fluid cooler lines from the transmission case. Cap the transmission lines and plug the fittings at the transmission.

18. Slightly lower the transmission and remove six transmission-to-engine bolts.

19. **CAUTION: Make sure the torque converter separates from the flexplate, remains seated in the transmission, and does not tip forward (so it will not fall out while lowering the transmission).**

    Separate transmission from the engine and flexplate. While carefully lowering the transmission and watching for obstructions, disconnect the fill tube.

---

tomsn048@gmail.com

Transmission — 4x2 Ranger

Removal

1. Disconnect the negative battery cable and remove the transmission fluid level indicator.
2. Remove two bolts retaining the fan shroud to the radiator.
3. Raise the vehicle and position suitable jack stands under the vehicle.
4. Mark the relationship of the driveshaft flange and the rear axle companion flange, so the driveshaft can be installed in the original position.
5. Remove two bolts and clips retaining the mid-ship bearing to the rear crossmember. Remove four bolts retaining the driveshaft flange to the rear axle companion flange. Disconnect and remove the driveshaft from the vehicle and install a plug into the extension housing.
6. Position a drain pan, remove the transmission pan bolts, and drain the fluid. Install the transmission pan, with the original gasket. Remove the drain pan.
7. Disconnect the shift cable from the transmission manual control lever and remove the cable from the cable bracket.
8. Remove the oil filter drain funnel retainers. Remove three starter motor bolts and position the starter aside, using mechanics wire. Remove the funnel.
9. Remove two torque converter access cover bolts and the access cover from the converter housing.
10. **NOTE: Mark the converter stud to the flexplate. The flexplate-to-converter nuts are not reusable.**

    Rotate the torque converter and remove four converter-to-flexplate nuts. Discard the nuts.
11. Support the engine.
12. Install a transmission jack under the transmission. Secure the transmission to the jack.
13. Remove the transmission mount nuts. Remove the left and right crossmember bolts and nuts. Remove the crossmember.
14. Disconnect three HO2S connectors from the catalytic converter assembly.
15. Remove the bolts retaining the Y-pipe to the exhaust manifolds. Remove the converter-to-tailpipe retainers. Secure the tailpipe. Remove the converter hanger bolt and the converter assembly.
16. **NOTE: The case connector fittings must be held in place while loosening the tube nuts from the cooler lines.**

tomsn048@gmail.com

Slightly lower the transmission. Remove the bolt retaining the cooler lines to the right side of the engine block. Disconnect the transmission fluid cooler lines. Cap the cooler lines and plug the fittings at the transmission.

17. Disconnect both transmission 16-pin connectors at the left rear cylinder head. Remove the transmission-to-engine bolts. Remove the fluid level indicator tube.

18. **CAUTION: Make sure the torque converter separates from the flexplate and remains seated in the transmission. Do not allow the transmission to tip forward, as the converter could fall out while lowering the transmission.**

    Separate the transmission from the engine and carefully lower the transmission from the vehicle.

tomsn048@gmail.com

Transmission

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Torque Converter Handles	T81P-7902-C
Impact Slide Hammer	T50T-100-A
Extension Housing Bushing Remover	T77L-7697-E
A4LD Holding Fixture Adapter	T93T-77002-AH
Bench-Mounted Holding Fixture	T57L-500-B
Servo Cover Compressor	T95L-77028-A
4R44E/4R55E Transmission Test Plate	T95L-77000-AH
Servo Removal Tool	T97T-7D021-A

SPECIAL SERVICE TOOLS DESIRED

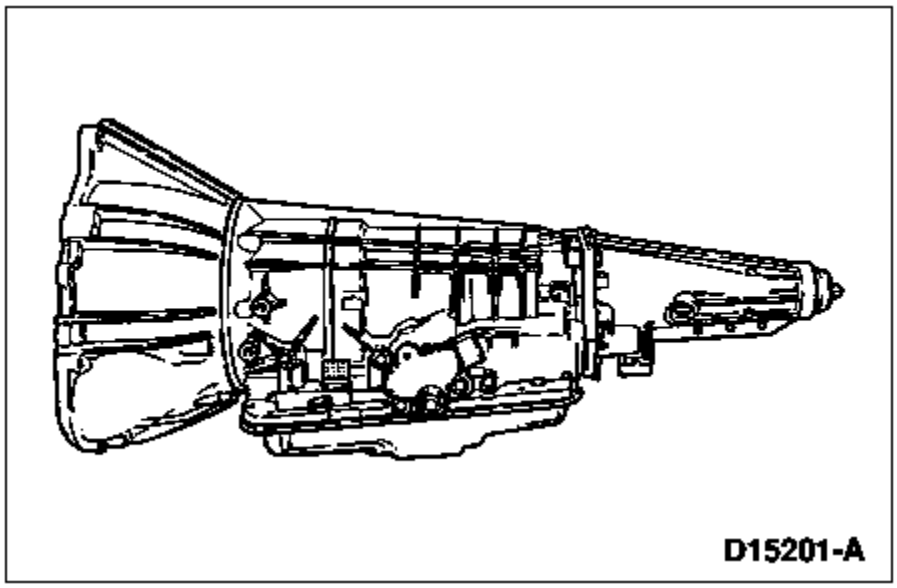
Tool Number	Description
T94P-77001-BH	Seal Remover

Disassembly

1. **WARNING: DO NOT REMOVE THE TORQUE CONVERTER OR TRANSFER CASE FROM THE TRANSMISSION WHILE STILL ON THE JACK. DOING SO COULD CAUSE THE TRANSMISSION TO FALL OFF THE JACK.**

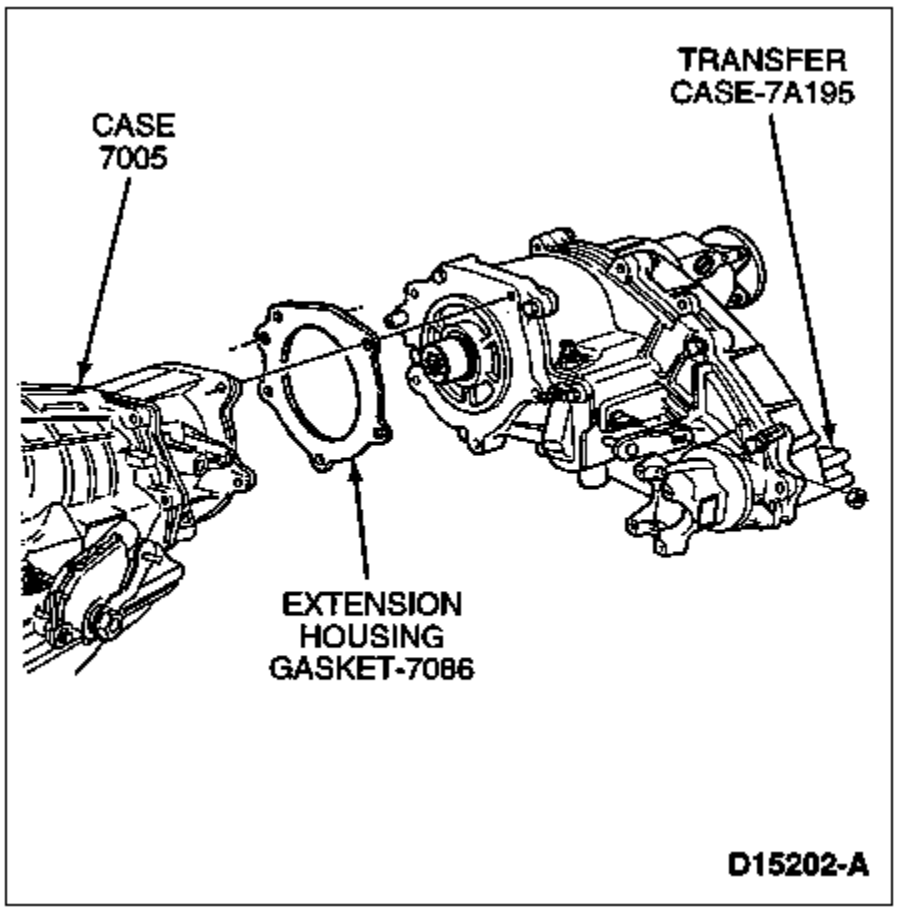
   Relocate the transmission to the top of a flat workbench.

tomsn048@gmail.com



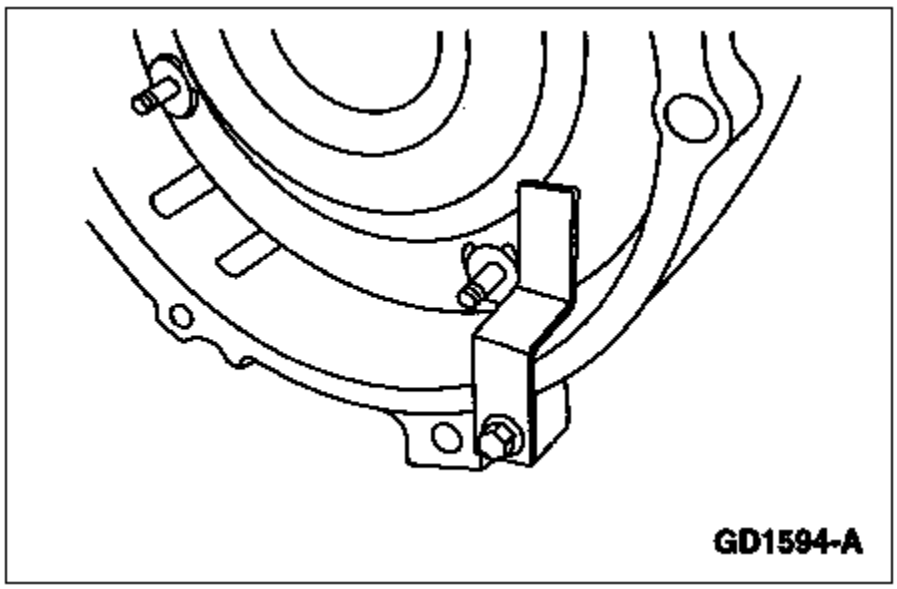
2. **NOTE: Refer to Section 07-07A , Section 07-07B , Section 07-07C or Section 07-07D for transfer case service.**

   If the vehicle has a transfer case, use a 13 mm socket to remove the five transfer case-to-extension housing screws. Remove the transfer case and set aside for assembly.



tomsn048@gmail.com

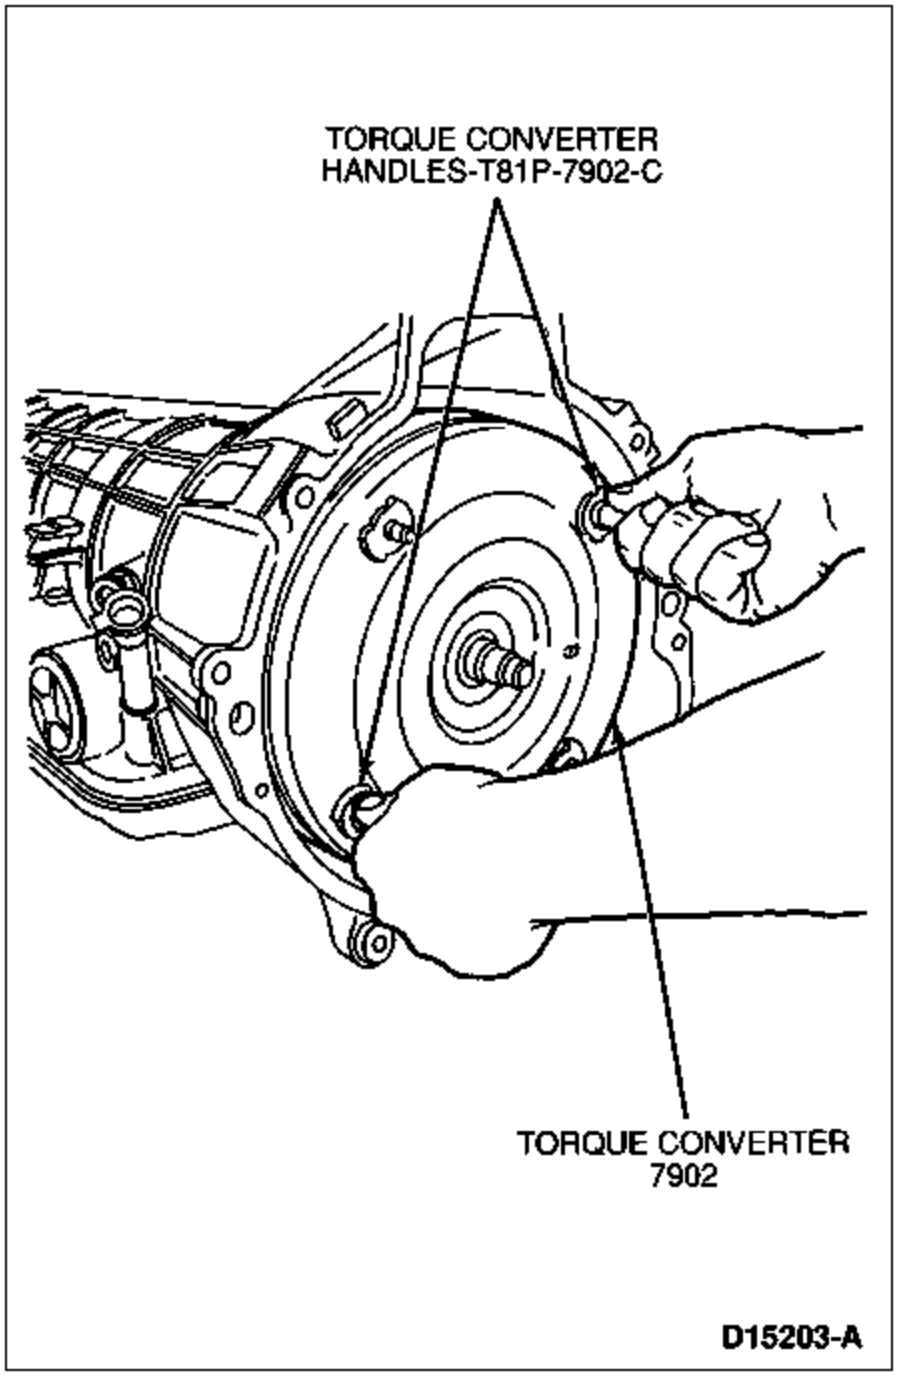
3. Remove Torque Converter Holding Tool T97T-7902-A from transmission.



4. **WARNING: THE TORQUE CONVERTER IS HEAVY, ESPECIALLY WHEN FULL OF FLUID.**

   Remove the torque converter using Torque Converter Handles T81P-7902-C.

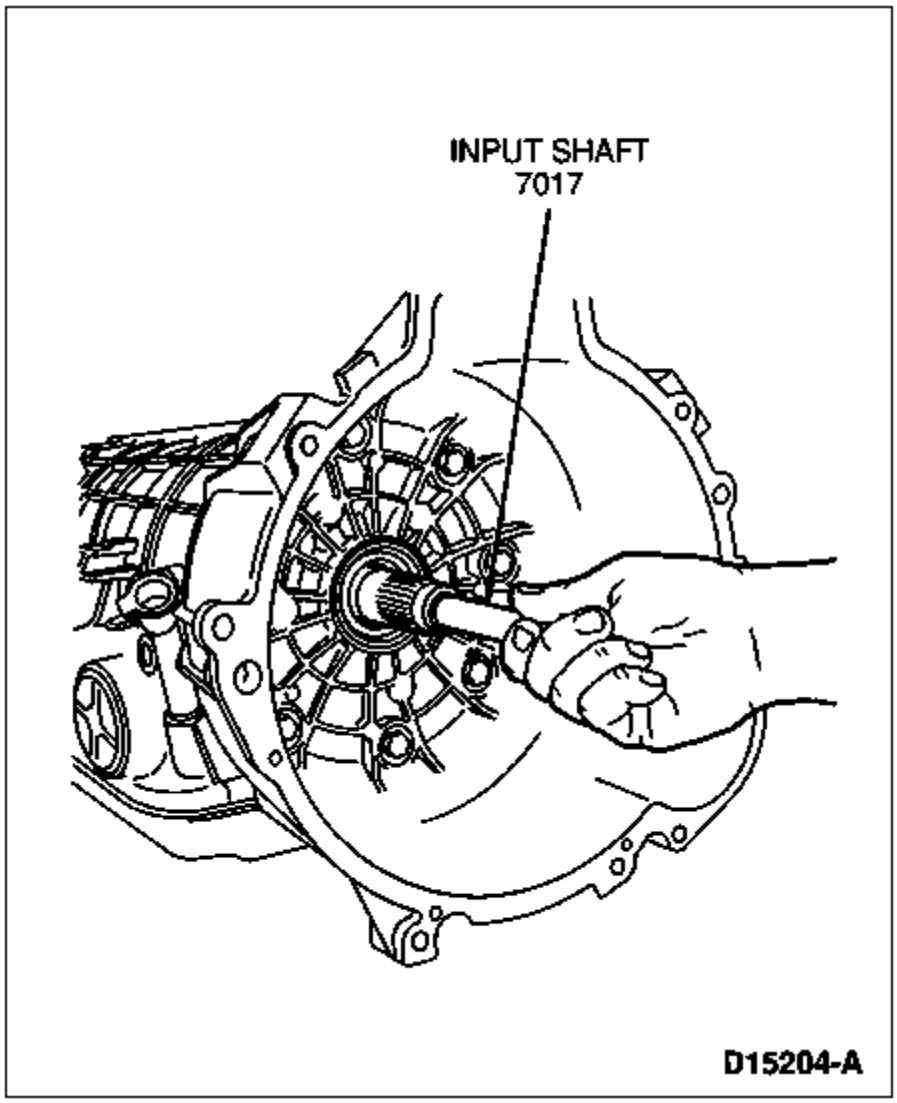
tomsn048@gmail.com



5. **NOTE: The splines on the input shaft are not the same on both ends. The end with the shorter spline goes into the assembly.**

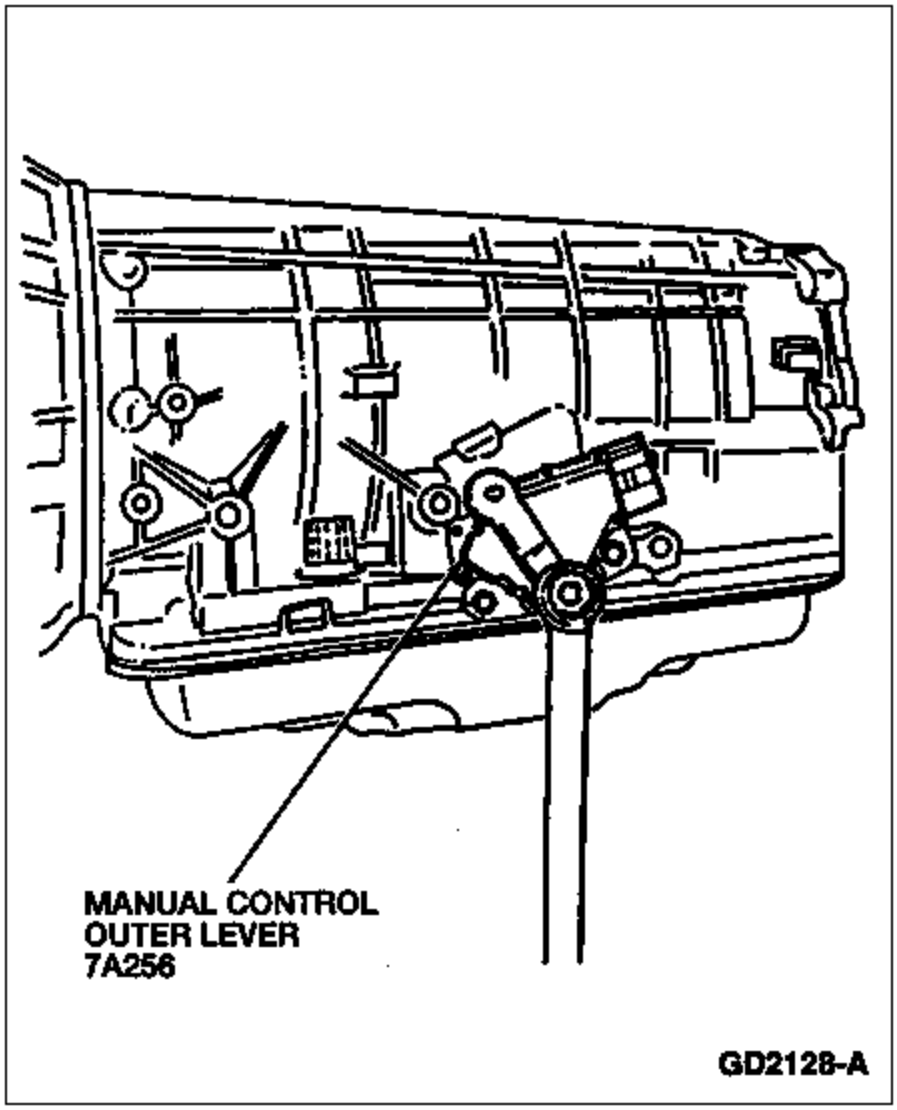
   Remove the input shaft.

tomsn048@gmail.com



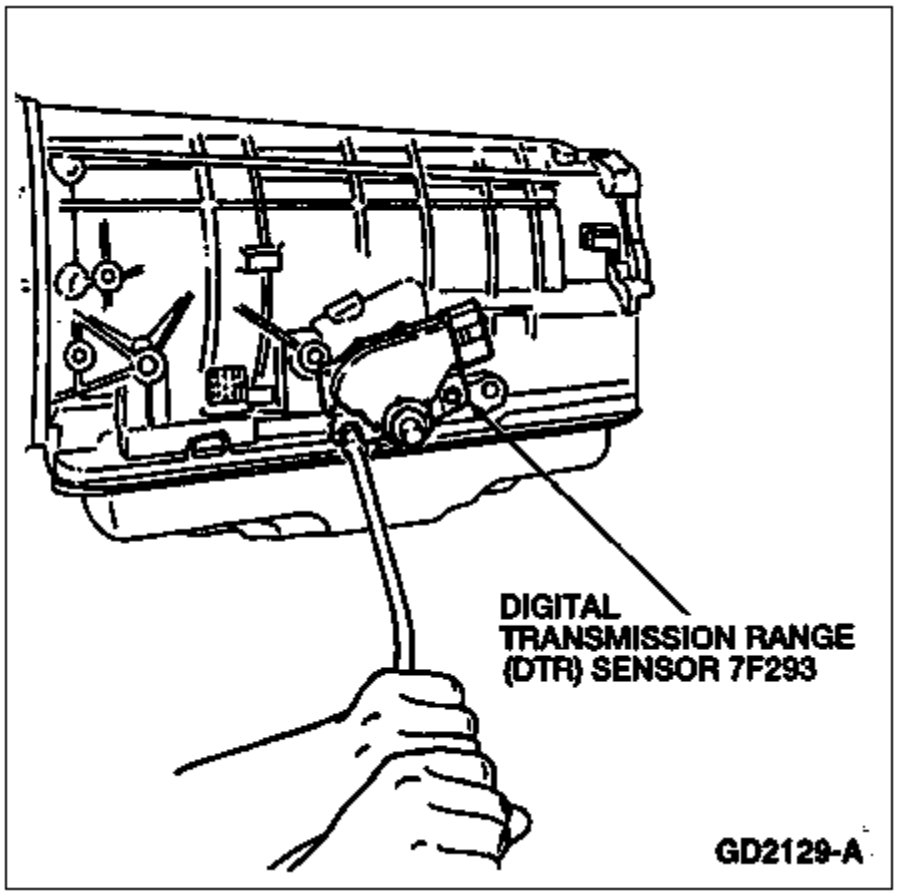
6. Remove the manual control outer lever nut and manual control outer lever.

tomsn048@gmail.com

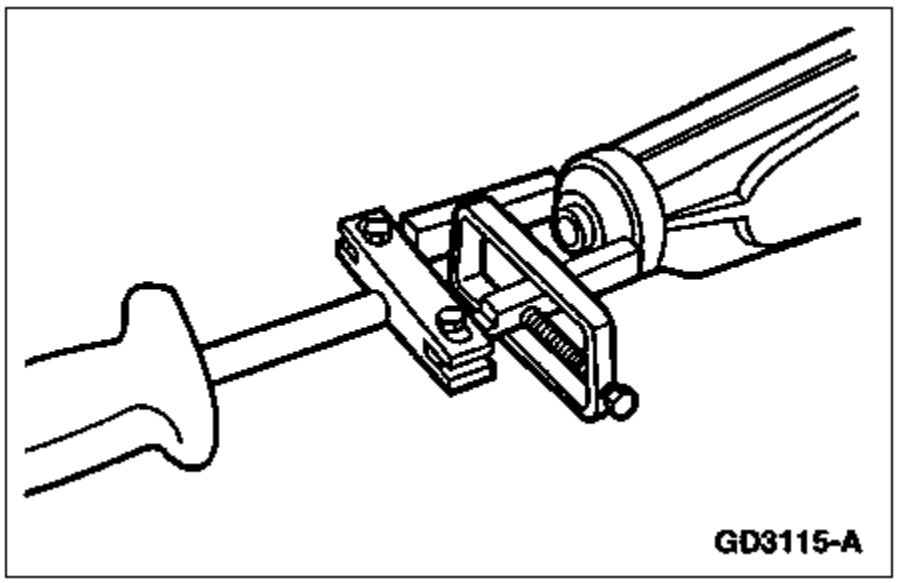


7. Remove the two M6 x 25 digital transmission range (DTR) sensor screws and remove the DTR sensor.

tomsn048@gmail.com



8. Remove the extension housing seal using Seal Remover T94P-77001-BH and Impact Slide Hammer T50T-100-A.

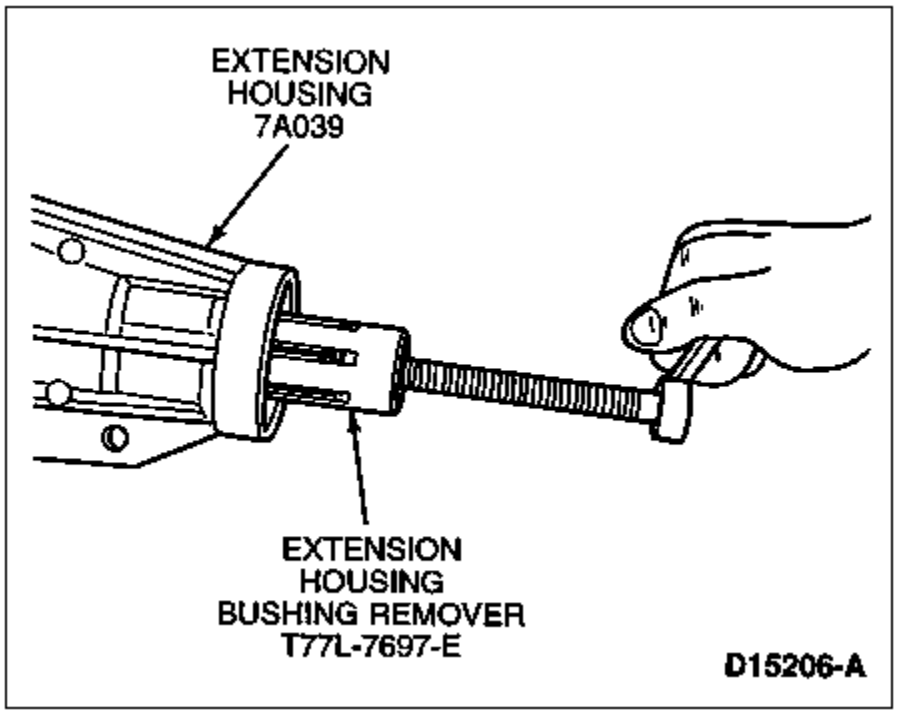


9. **NOTE: Remove the extension housing bushing only if service is required.**

tomsn048@gmail.com

Inspect the extension housing bushing and driveshaft slip-yoke for nicks, gouges, scoring and wear.

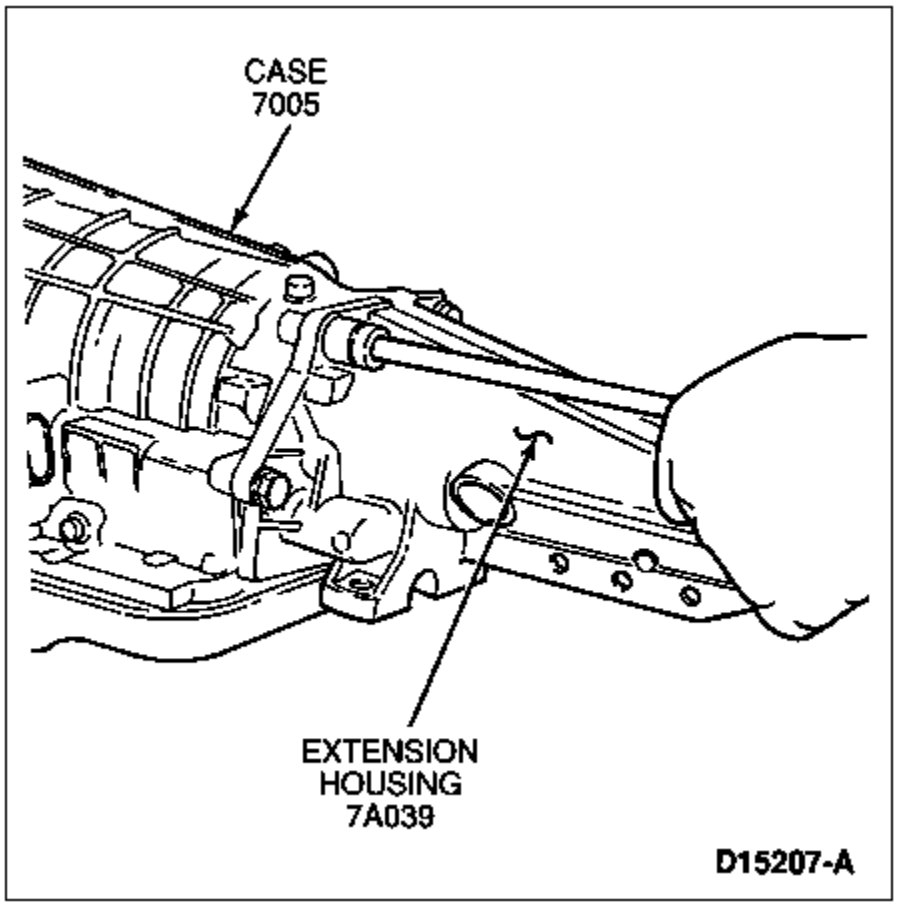
Remove the extension housing bushing using Extension Housing Bushing Remover T77L-7697-E.



10. **CAUTION: The parking pawl, parking pawl return spring and parking pawl shaft could fall out during removal of the extension housing.**

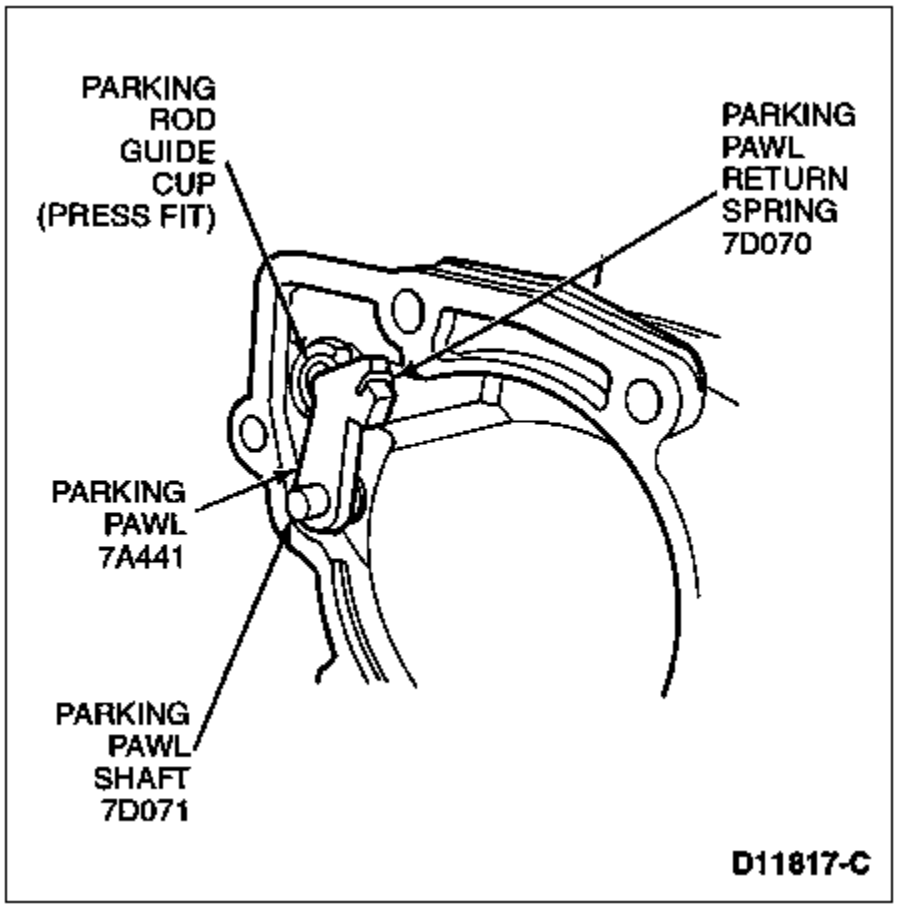
    Use a 17 mm socket to remove the five M10 x 30 mm extension housing-to-transmission case screws and one (1) stud.

tomsn048@gmail.com



11. Remove the parking pawl, parking pawl return spring and parking pawl shaft.

tomsn048@gmail.com

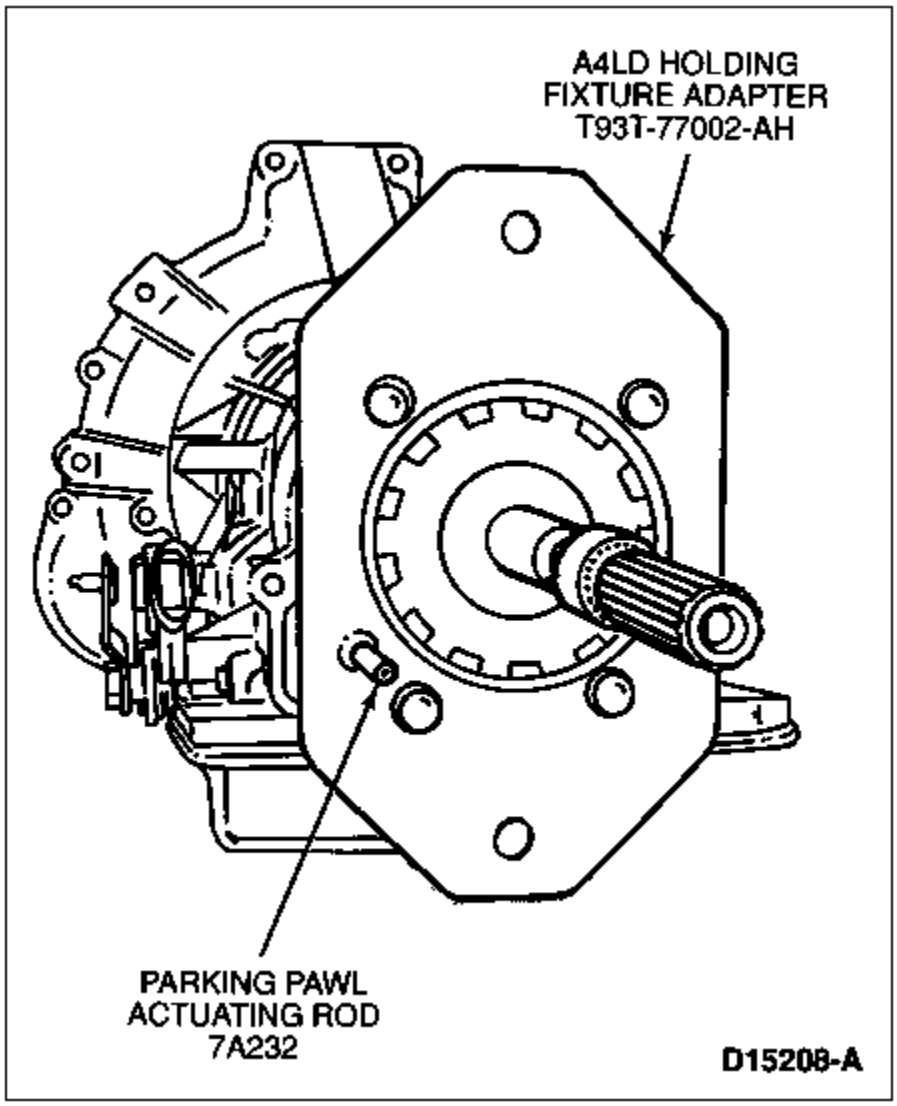


12. **CAUTION: The parking pawl actuating rod must slip freely into the clearance hole in the adapter plate.**

    NOTE: See the special service tool section for a drawing of this optional adapter plate.

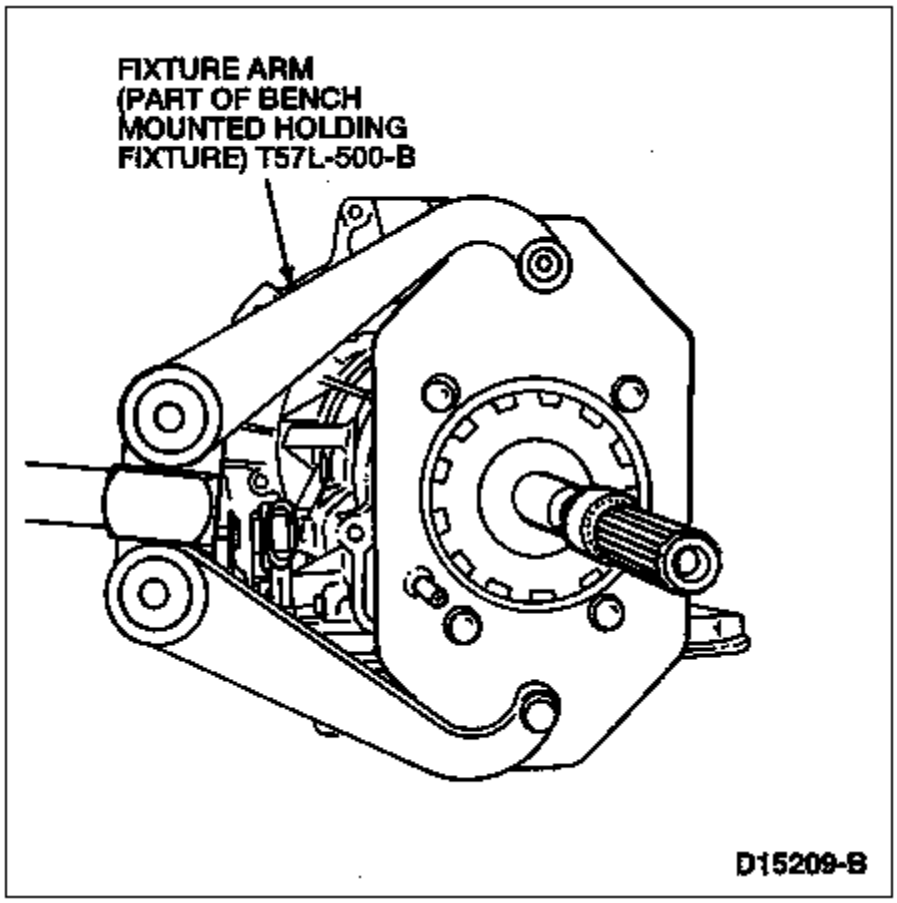
    Use four M10 x 30 mm extension housing to transmission case screws to attach the adapter plate to the transmission.

tomsn048@gmail.com



13. Attach the fixture arm assembly (part of T57L-500-B) with two 7/16 x 2-inch bolts and nuts.

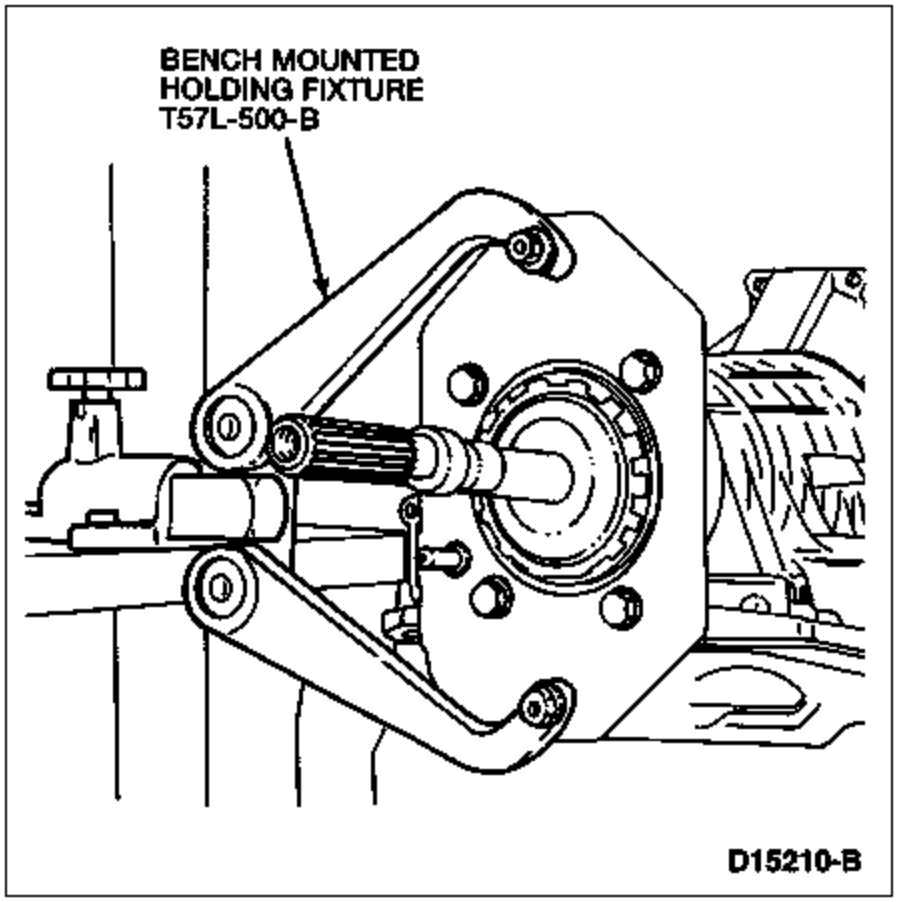
tomsn048@gmail.com



14. **WARNING: MAKE SURE THE LOCK PIN ON BENCH-MOUNTED HOLDING FIXTURE T57L-500-B IS SECURE.**

    Install the transmission assembly to Bench-Mounted Holding Fixture T57L-500-B. Rotate to the position shown. Place a drain pan under the assembly.

tomsn048@gmail.com



15. **WARNING: MAKE SURE THE LOCK PIN ON BENCH-MOUNTED HOLDING FIXTURE T57L-500-B IS SECURE.**

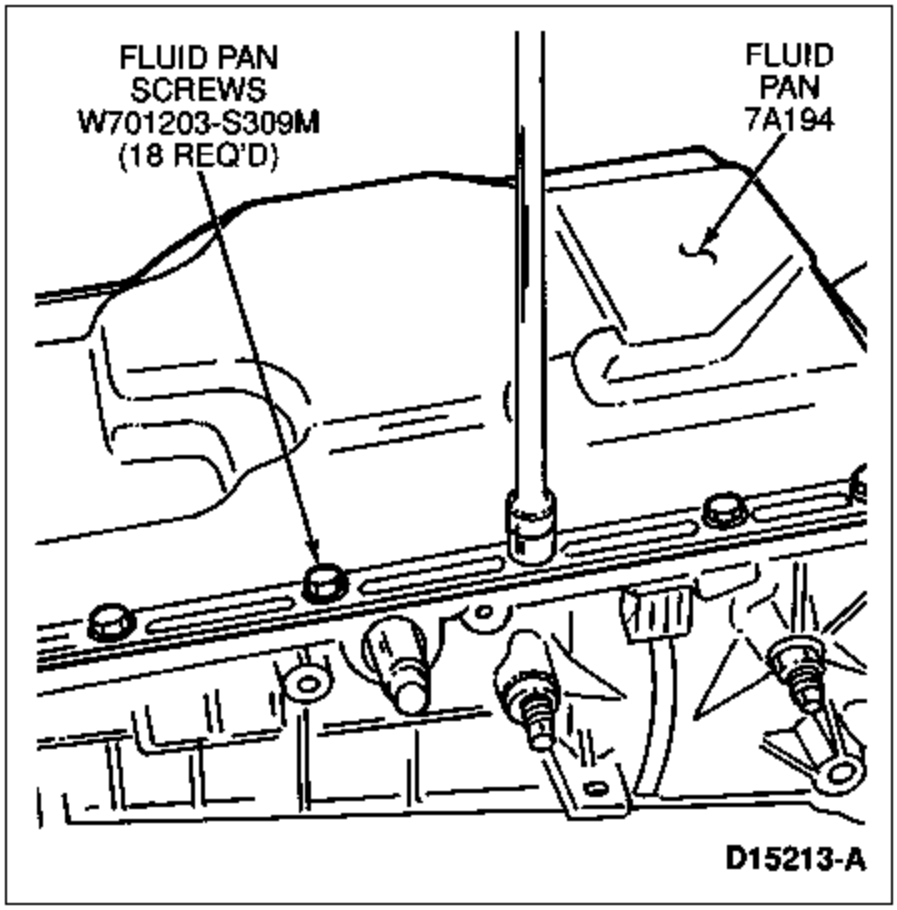
    Rotate transmission assembly so that the fluid pan is facing up.

16. **CAUTION: Do not reuse the fluid pan gasket.**

    Use a 13 mm socket to remove the eighteen M8 x 16 mm fluid pan screws. Remove the fluid pan and fluid pan gasket. Discard the fluid pan gasket.

Fluid Pan Removal

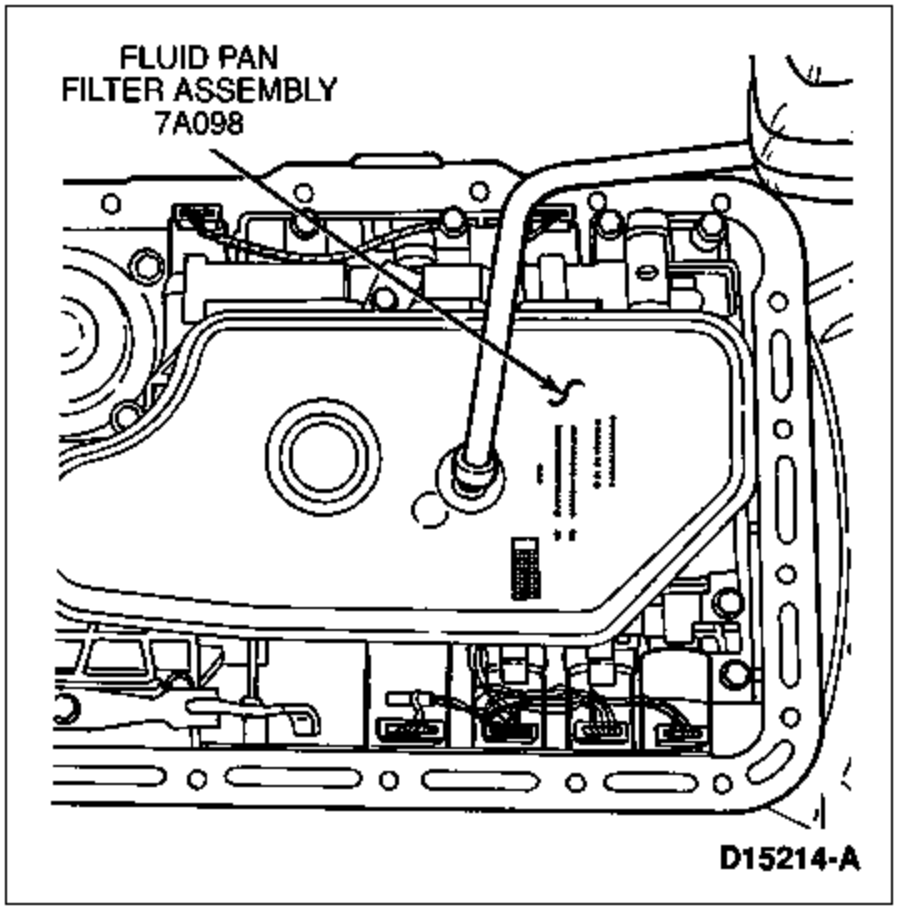
tomsn048@gmail.com



17. Use a 10 mm socket to remove the M6 x 55 mm fluid pan filter assembly screw. Remove and discard the fluid pan filter assembly.

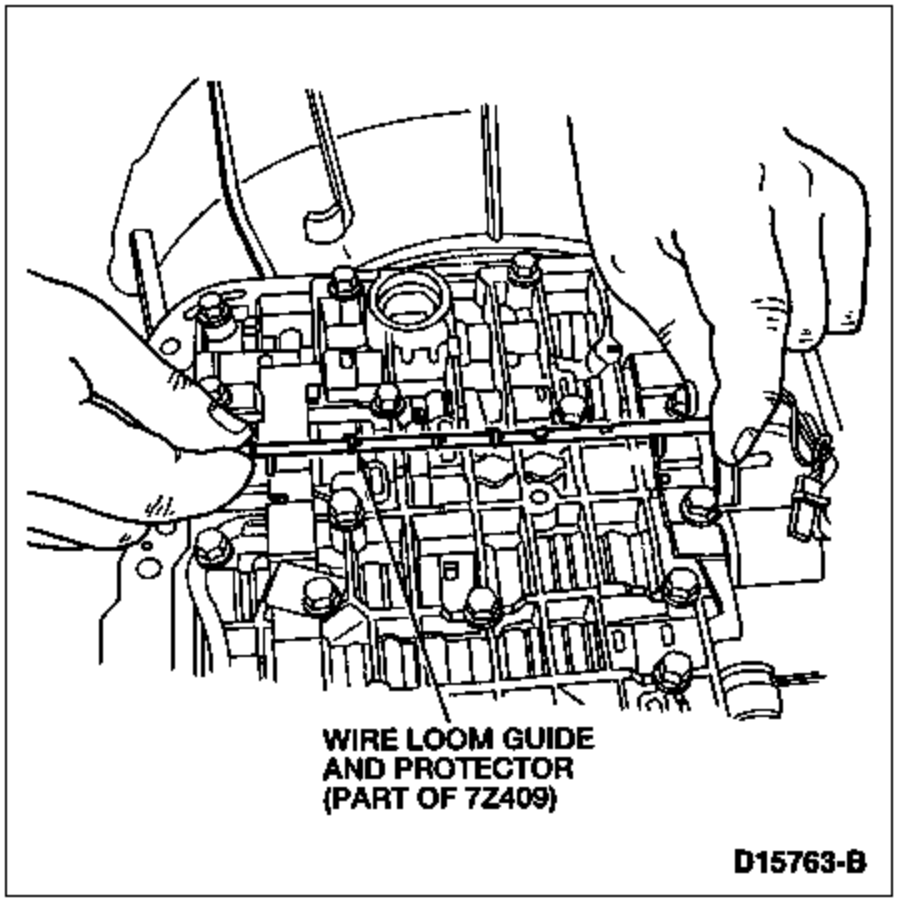
Fluid Pan Filter Removal

tomsn048@gmail.com



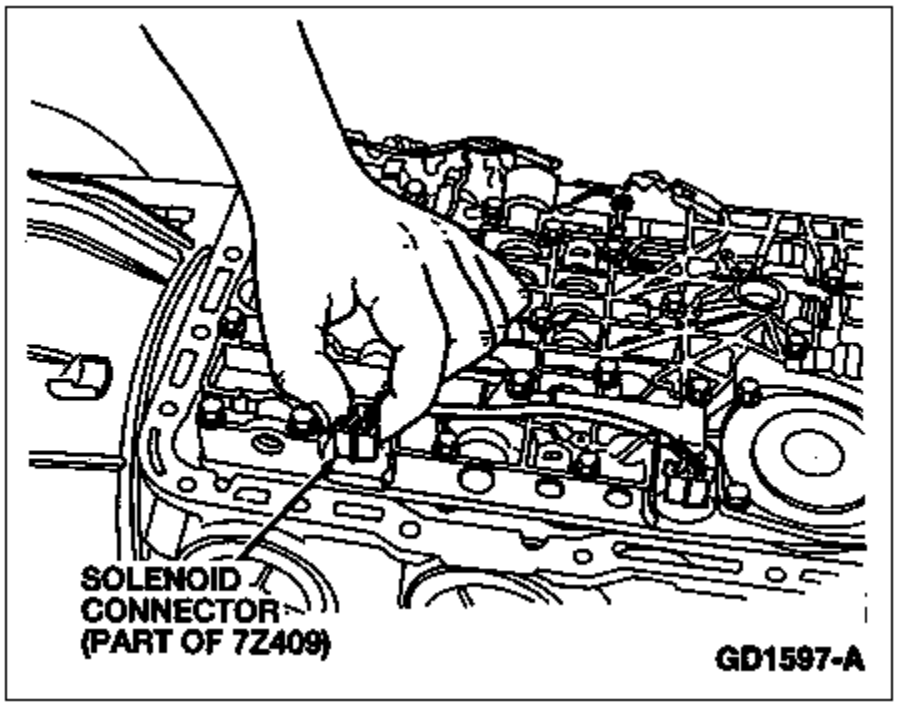
18. Carefully lift up on the wire loom guide and protector. Disengage the retaining pins from the solenoid clamps.

tomsn048@gmail.com



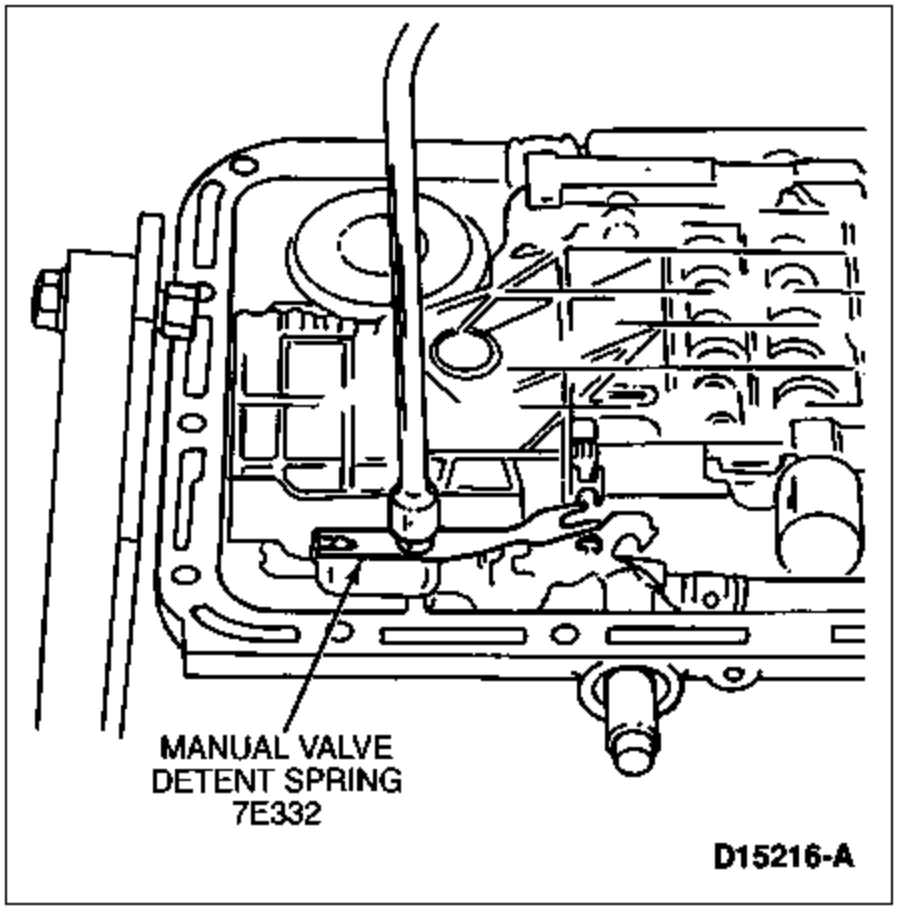
19. Disconnect the six solenoid connectors from the solenoids by carefully pulling upward and wiggling side to side.

tomsn048@gmail.com



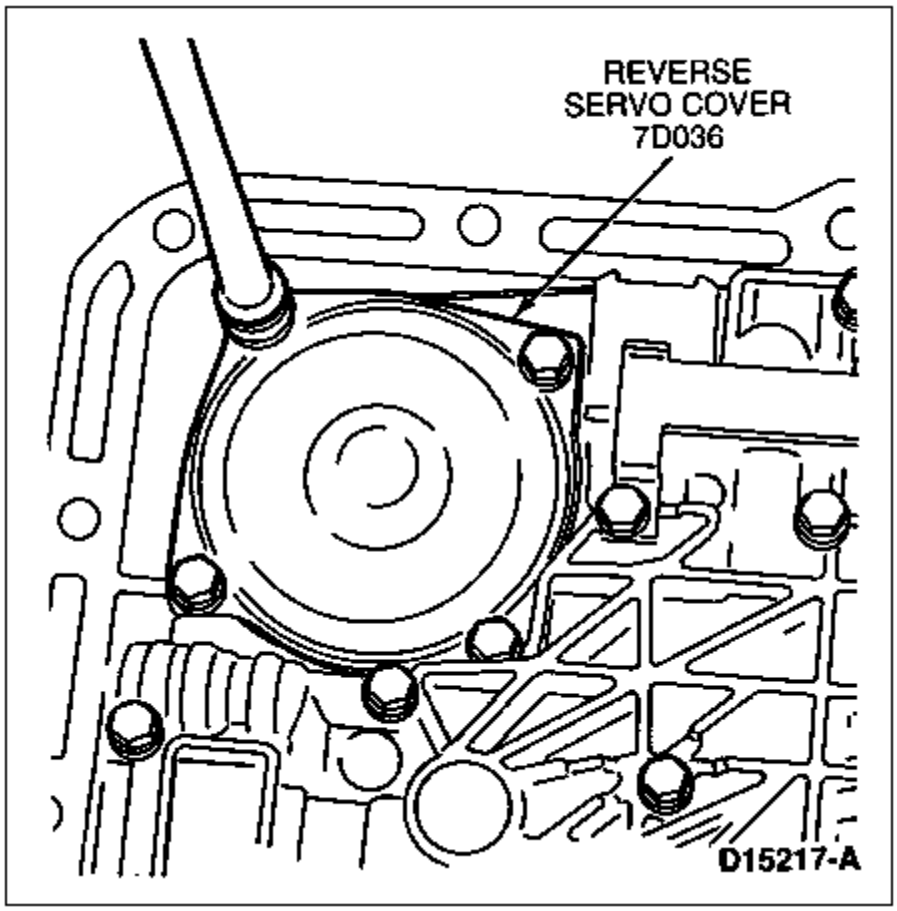
20. Use a 10 mm socket to remove the M6 x 30 mm manual valve detent spring screw. Remove the manual valve detent spring.

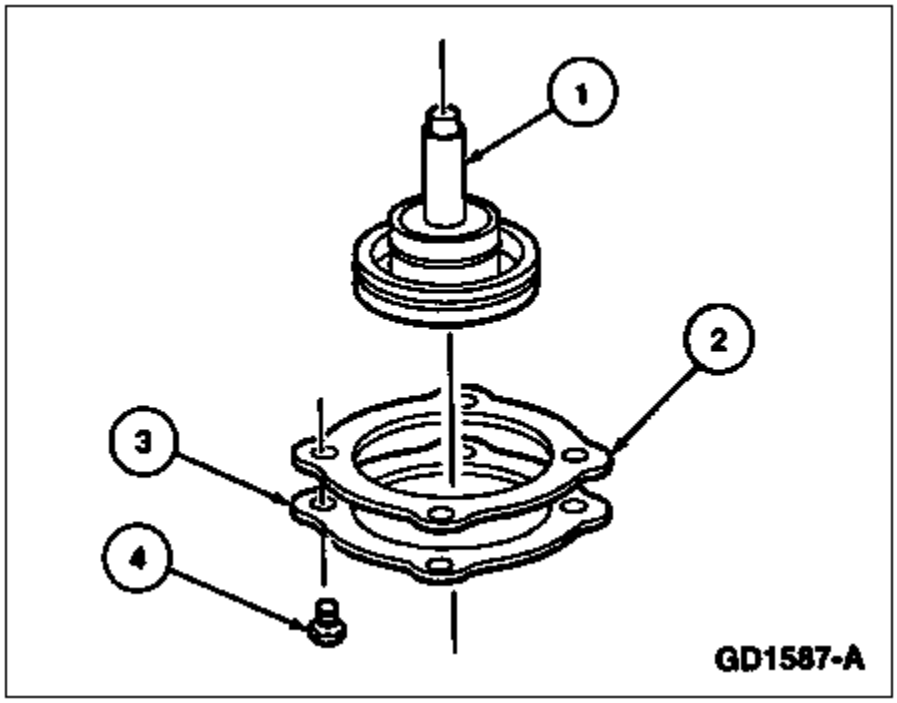
tomsn048@gmail.com



21. Use a 10 mm socket to remove the four M6 x 20 mm reverse servo cover screws. Remove the low/reverse servo cover, gasket and piston and rod assembly.

tomsn048@gmail.com





tomsn048@gmail.com

Item	Part Number	Description
1	7D189	Piston Assembly with Rod and Retainer (Rear Band Servo) (Select Fit)
2	7L173	Reverse Servo-to-Case Gasket
3	7D036	Reverse Servo Cover
4	E800156-S	Low/Reverse Servo Cover-to-Case Screw (4 Req'd)

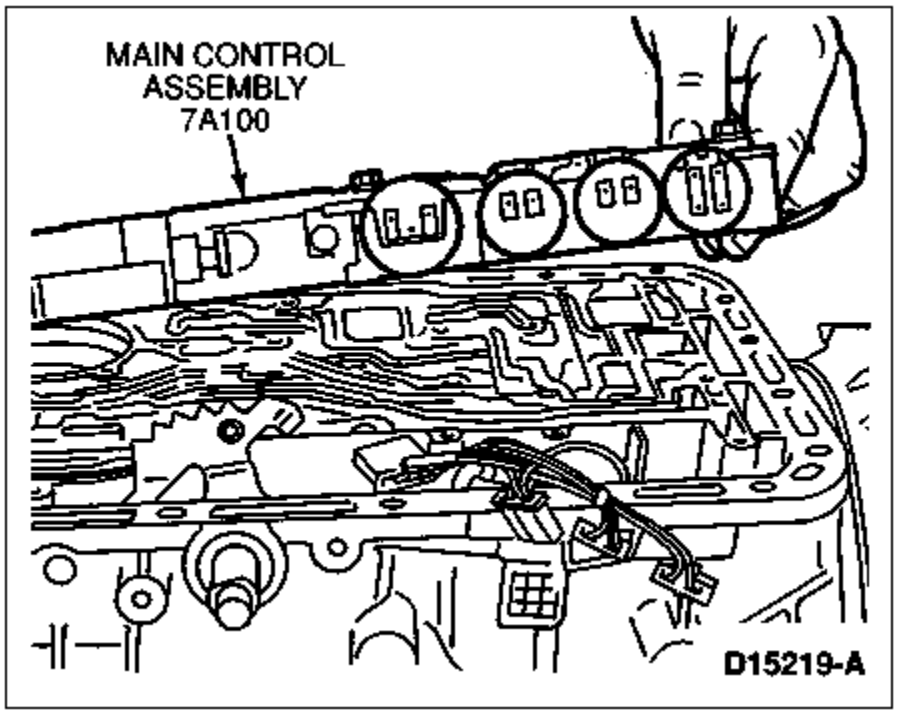
22. **CAUTION: To prevent solenoid valves from falling out, do not remove the two screws shown below.**

    NOTE: Refer to the main control disassembly and assembly in this section.

    Use a 10 mm socket to remove the sixteen M6 x 40 mm, four M6 x 45 mm, two M6 x 35 mm and one M6 x 30 mm main control valve body screws.

23. Remove the main control assembly, separator plate and gaskets. Discard gaskets.

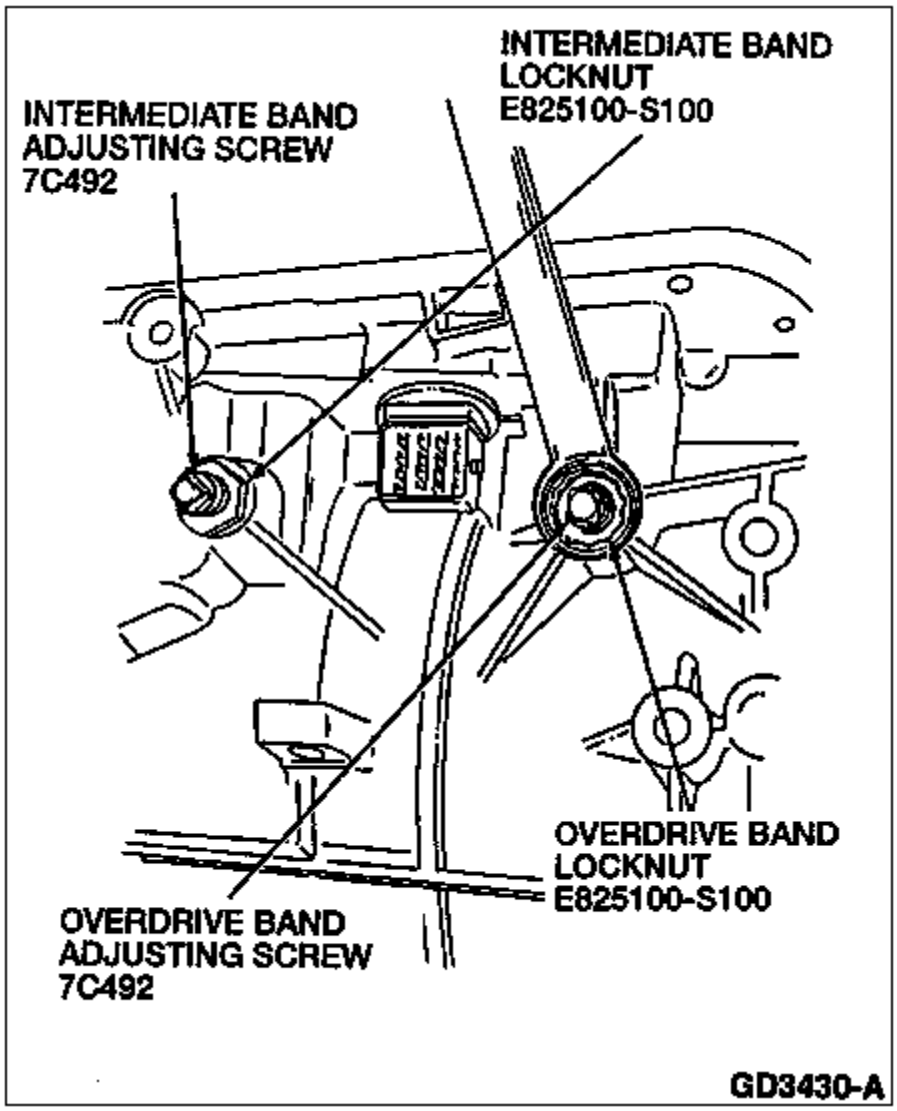
tomsn048@gmail.com



24. **CAUTION: Throw the locknuts away. The locknuts are not reusable for assembly.**

Remove the overdrive and intermediate band locknuts and discard. Back off the band adjusting screws.

tomsn048@gmail.com

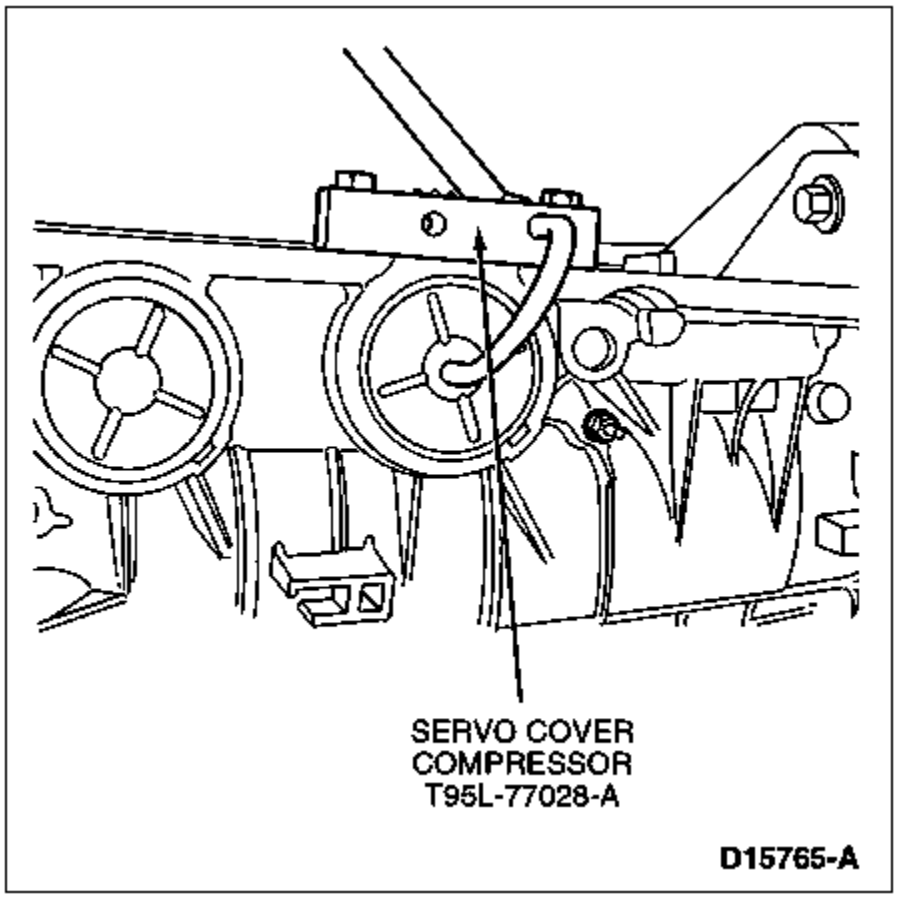


25. **NOTE: The J-hook must be in the appropriate hole for the servo being removed.**

    Install Servo Cover Compressor T95L-77028-A over the intermediate servo cover at the fluid pan rail with tool stamping facing up. Tighten the screws.

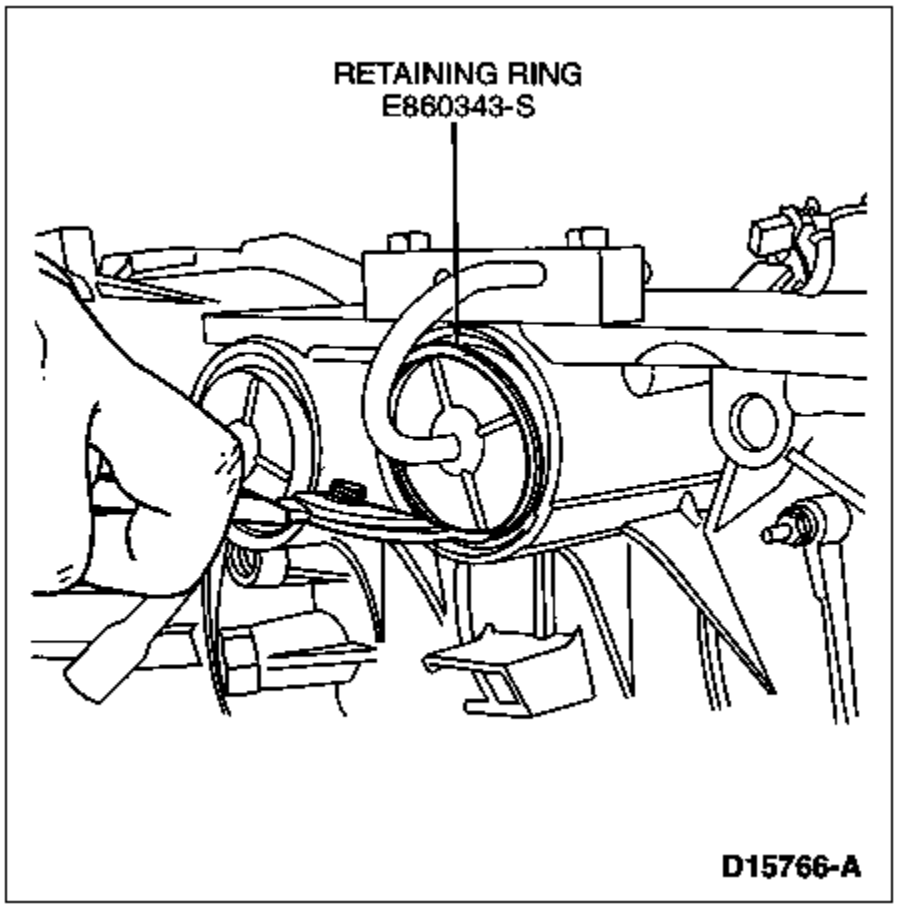
26. Using a 1/2-inch wrench, tighten the nut on the J-hook until there is a gap between the servo cover and the snap ring.

tomsn048@gmail.com



27. Carefully remove the servo cover retaining ring.

tomsn048@gmail.com

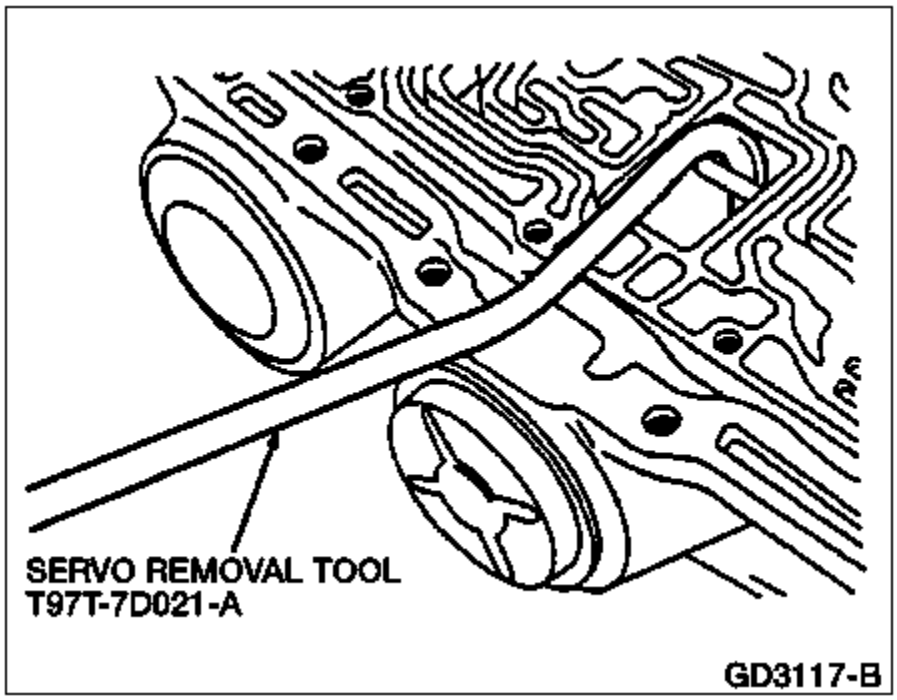


28. **CAUTION: The servo cover is under spring tension.**

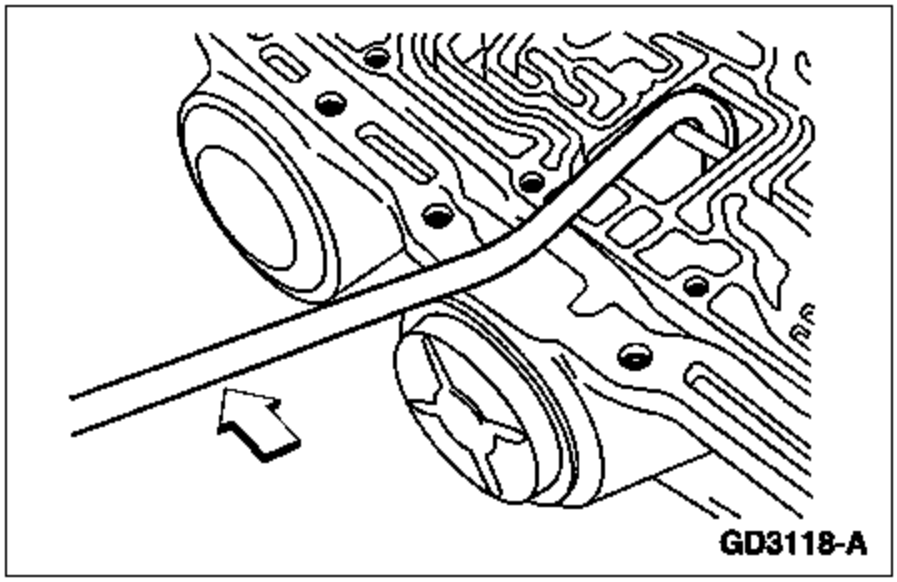
    Carefully back off the nut on the J-hook until the servo spring is unloaded.

29. Insert Servo Removal Tool T97T-7D021-A into case and locate on servo rod.

tomsn048@gmail.com



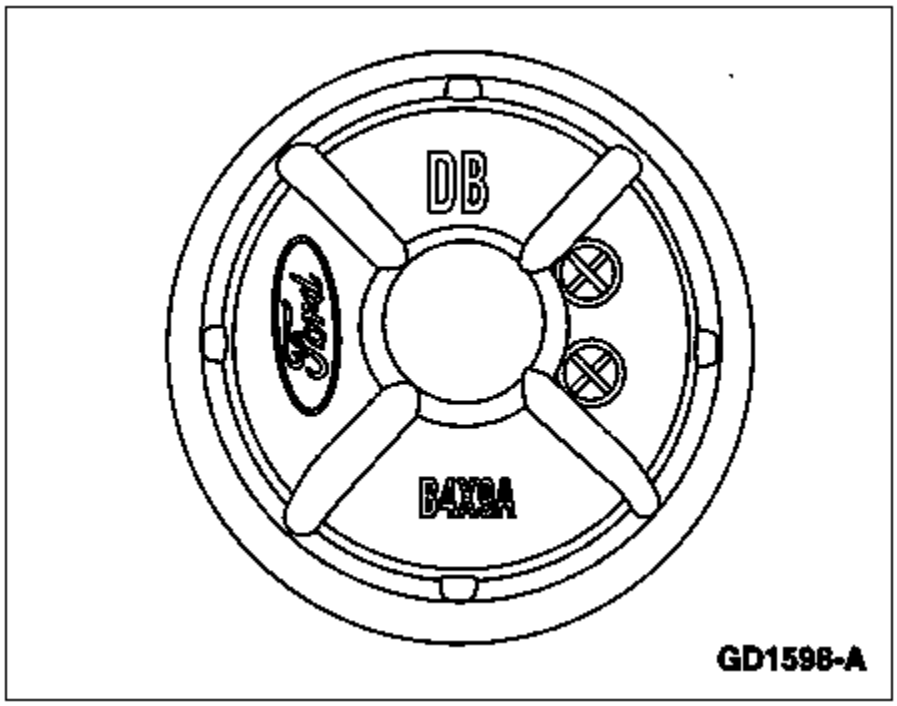
30. Gently push on Servo Removal Tool T97T-7D021-A to remove front servo cover, piston and spring.



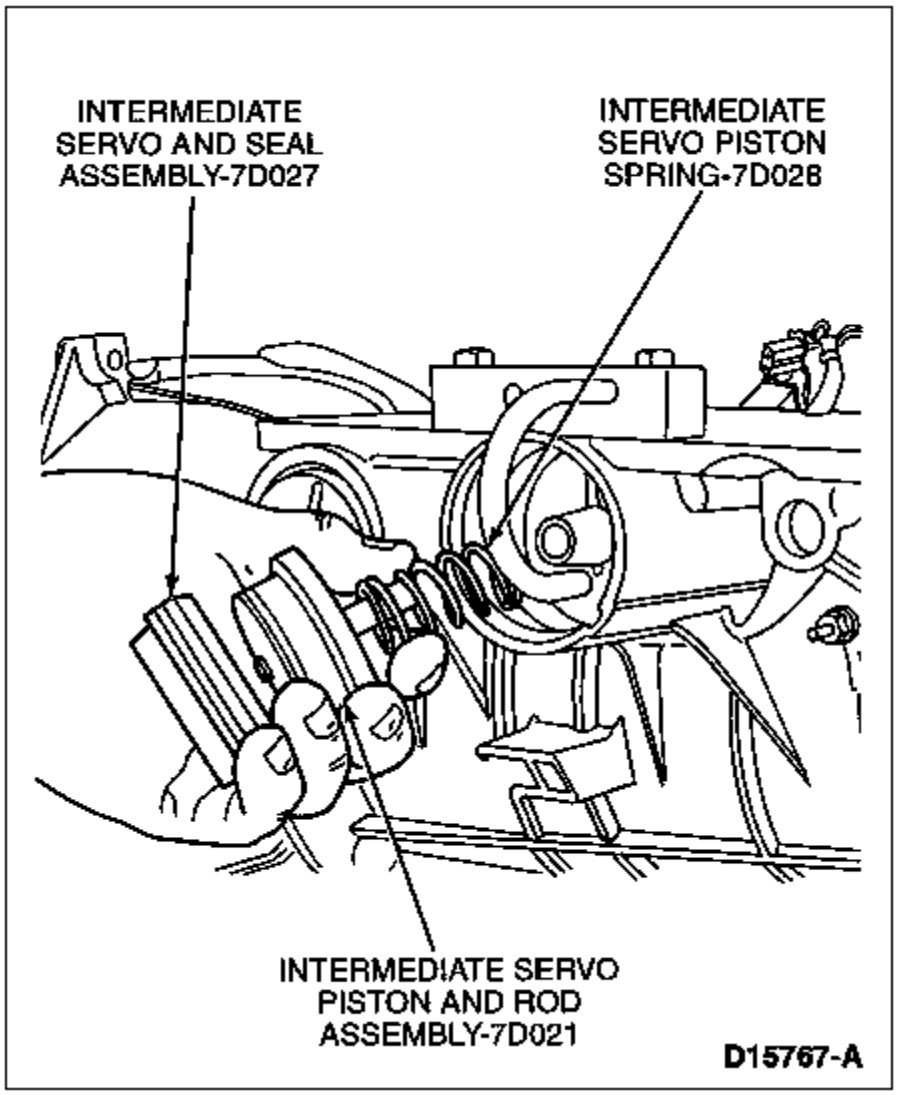
31. **NOTE: Tag the spring, piston and cover assembly. Label accordingly for assembly. The covers have letters cast on the outer surface for identification.**

    Remove the intermediate servo cover, piston and spring.

tomsn048@gmail.com



tomsn048@gmail.com



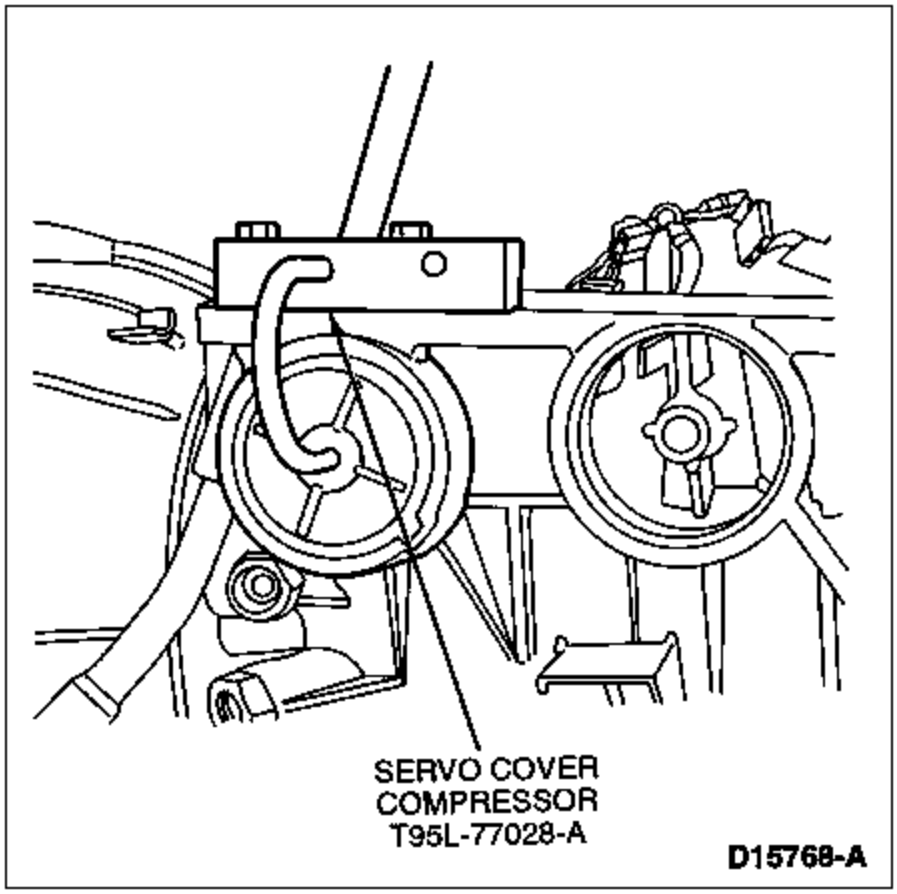
32. Remove Servo Cover Compressor T95L-77028-A.

33. **NOTE: The J-hook must be in the appropriate hole for the servo being removed.**

    Install Servo Cover Compressor T95L-77028-A over the overdrive servo cover at the fluid pan rail. Tighten the screws.

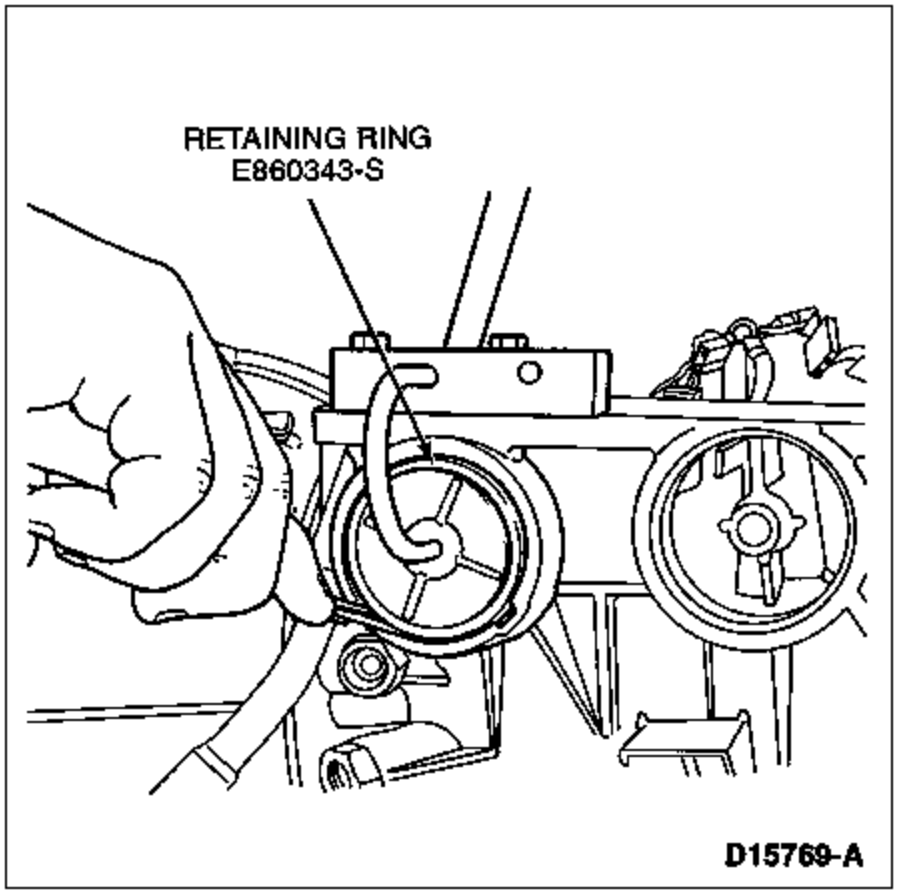
34. Using a 1/2-inch wrench, tighten the nut on the J-hook until there is a gap between the servo cover and the retaining ring.

tomsn048@gmail.com



35. Carefully remove the servo cover retaining ring.

tomsn048@gmail.com

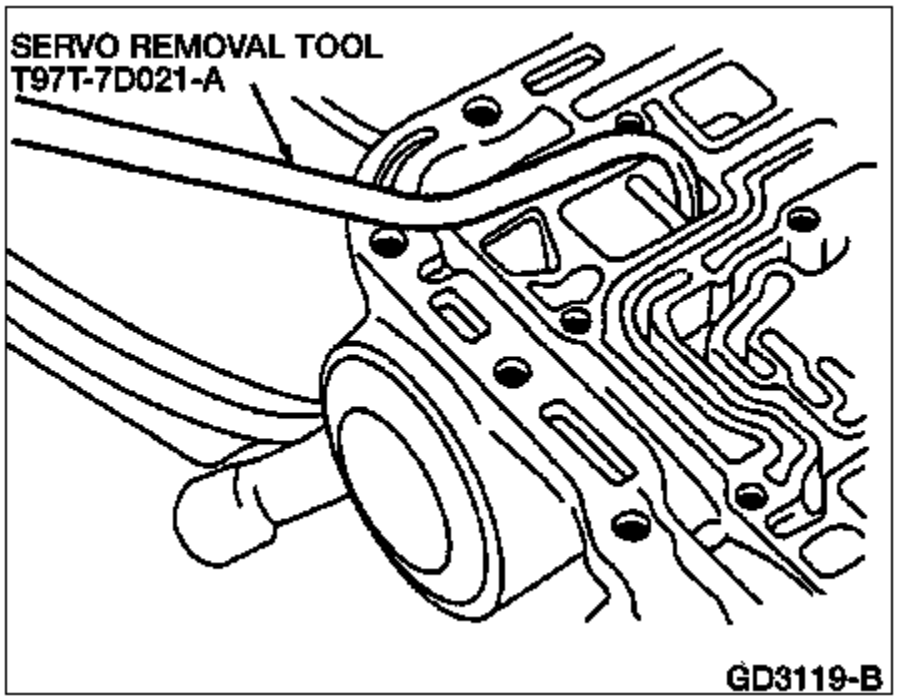


36. **CAUTION: The servo cover is under spring tension.**

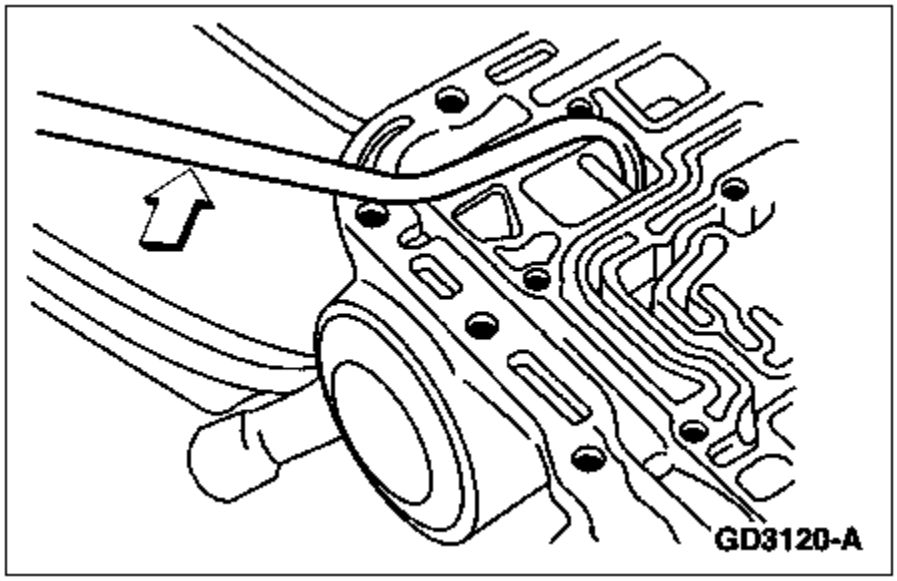
    Carefully back off the nut on the J-hook until the servo spring is unloaded.

37. Insert Servo Removal Tool T97T-7D021-A into case and locate on servo rod.

tomsn048@gmail.com



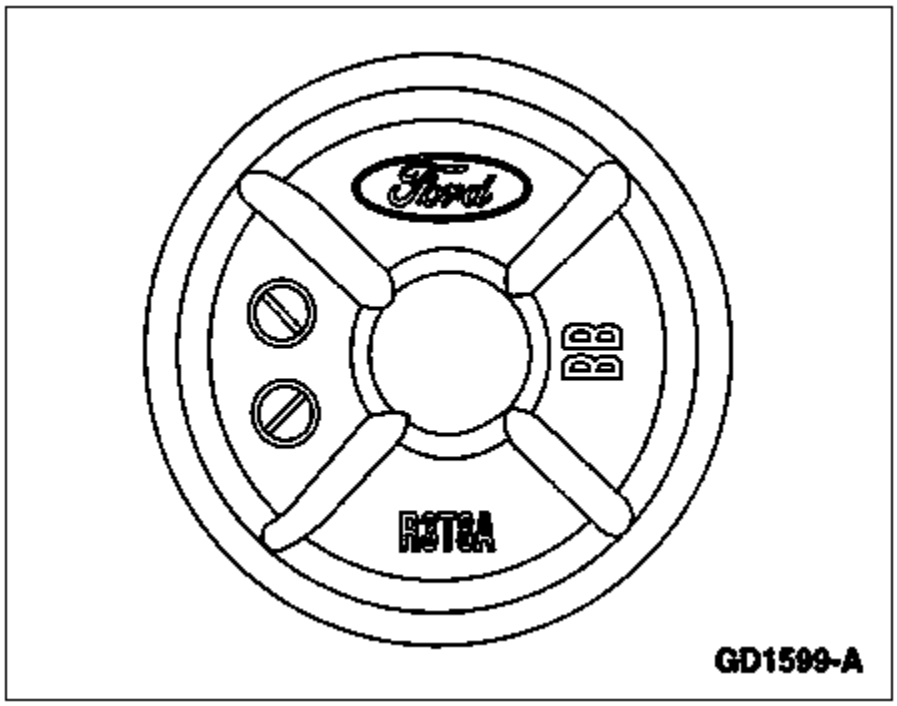
38. Gently push on Servo Removal Tool T97T-7D021-A to remove front servo cover, piston and spring.



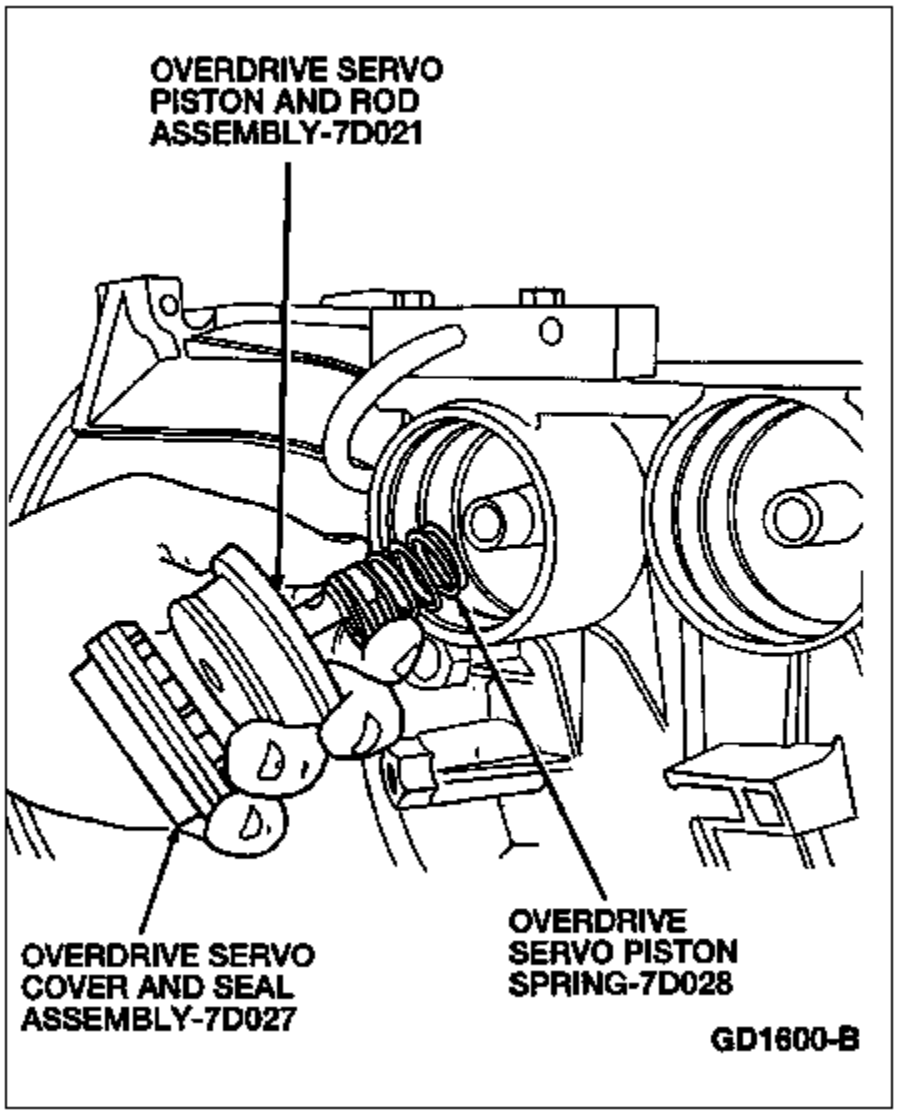
39. **NOTE: Tag the spring, piston and cover assembly. Label accordingly for assembly. The covers have letters cast on the outer surface for identification.**

    Remove the overdrive servo cover, piston and spring.

tomsn048@gmail.com



tomsn048@gmail.com



40. Remove Servo Cover Compressor T95L-77028-A.

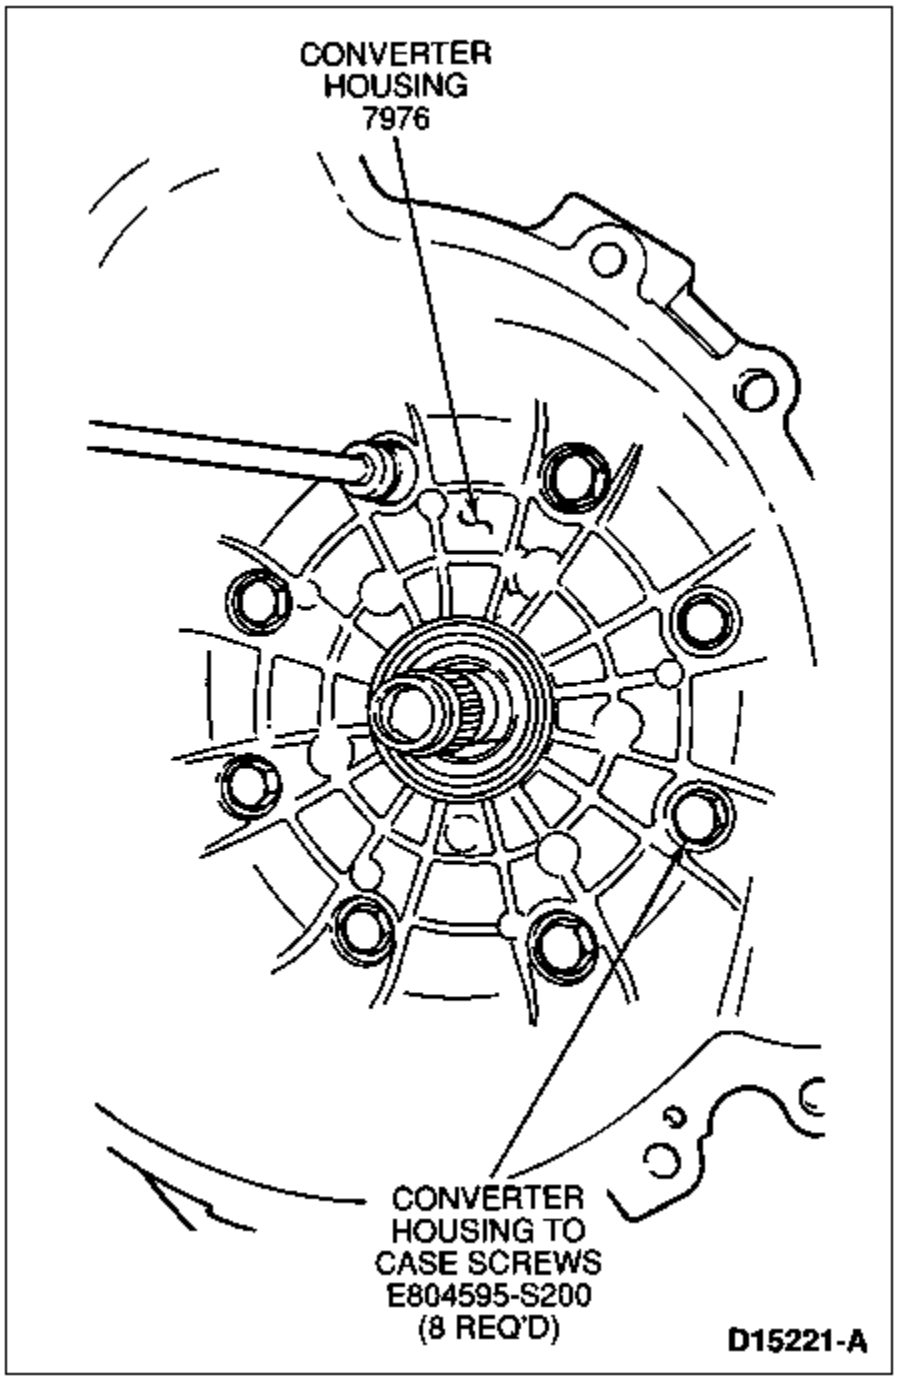
41. **WARNING: MAKE SURE THE LOCK PIN ON BENCH-MOUNTED HOLDING FIXTURE T57L-500-B IS SECURE.**

    Rotate the transmission assembly with the converter housing facing up.

42. **CAUTION: Throw the screws away. The screws are not reusable for assembly.**

    Use a 17 mm socket to remove the eight M10 x 33 mm converter housing-to-case screws. Discard the screws.

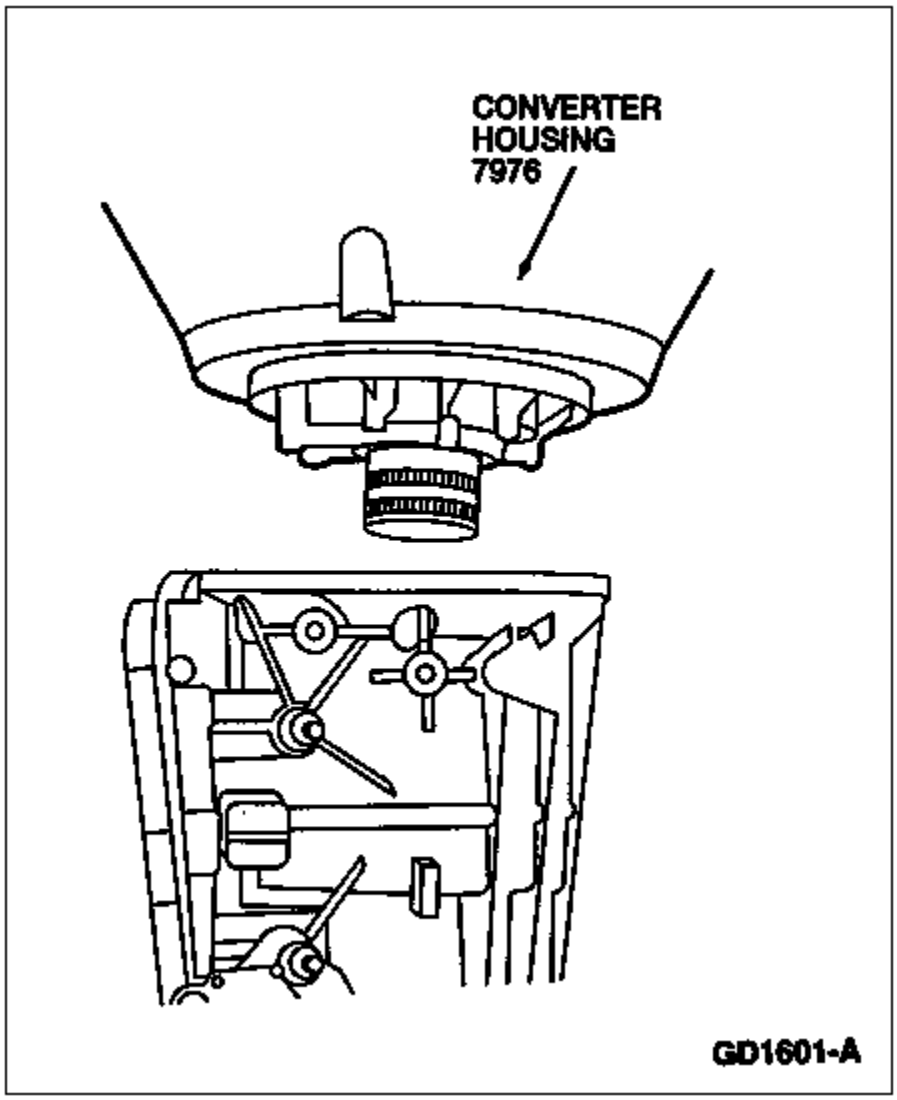
tomsn048@gmail.com



43. **NOTE: Rotate and lift the converter housing so that the clutch assemblies will stay in place.**

    Remove the converter housing and fluid pump support and gear assembly.

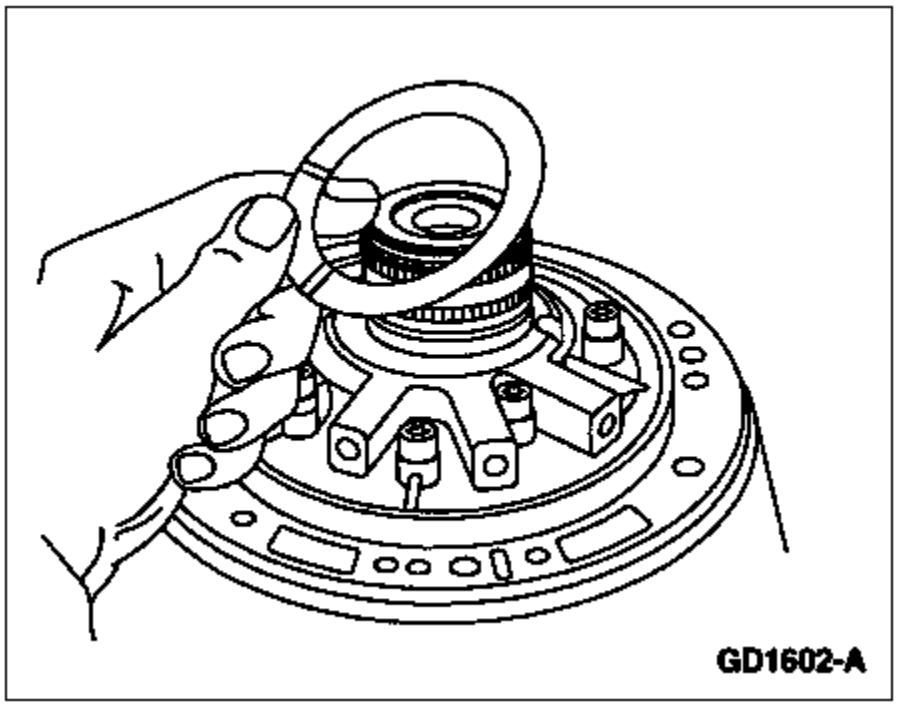
tomsn048@gmail.com



44. **NOTE: Refer to Converter Housing And Pump Assembly under subassemblies for service information.**

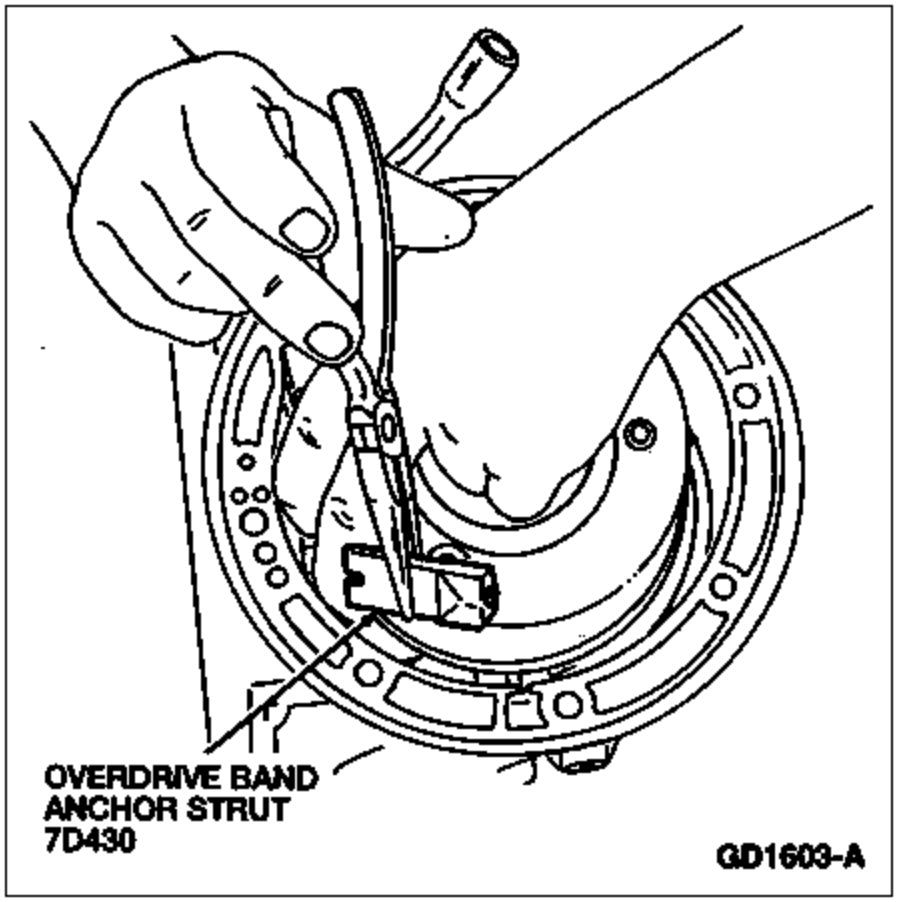
Remove the No. 1 fluid pump thrust washer. Tag the No. 1 fluid pump thrust washer for identification.

tomsn048@gmail.com



45. Remove overdrive band adjusting screw. Compress the overdrive band around the overdrive brake and coast clutch drum. Remove the overdrive band anchor strut.

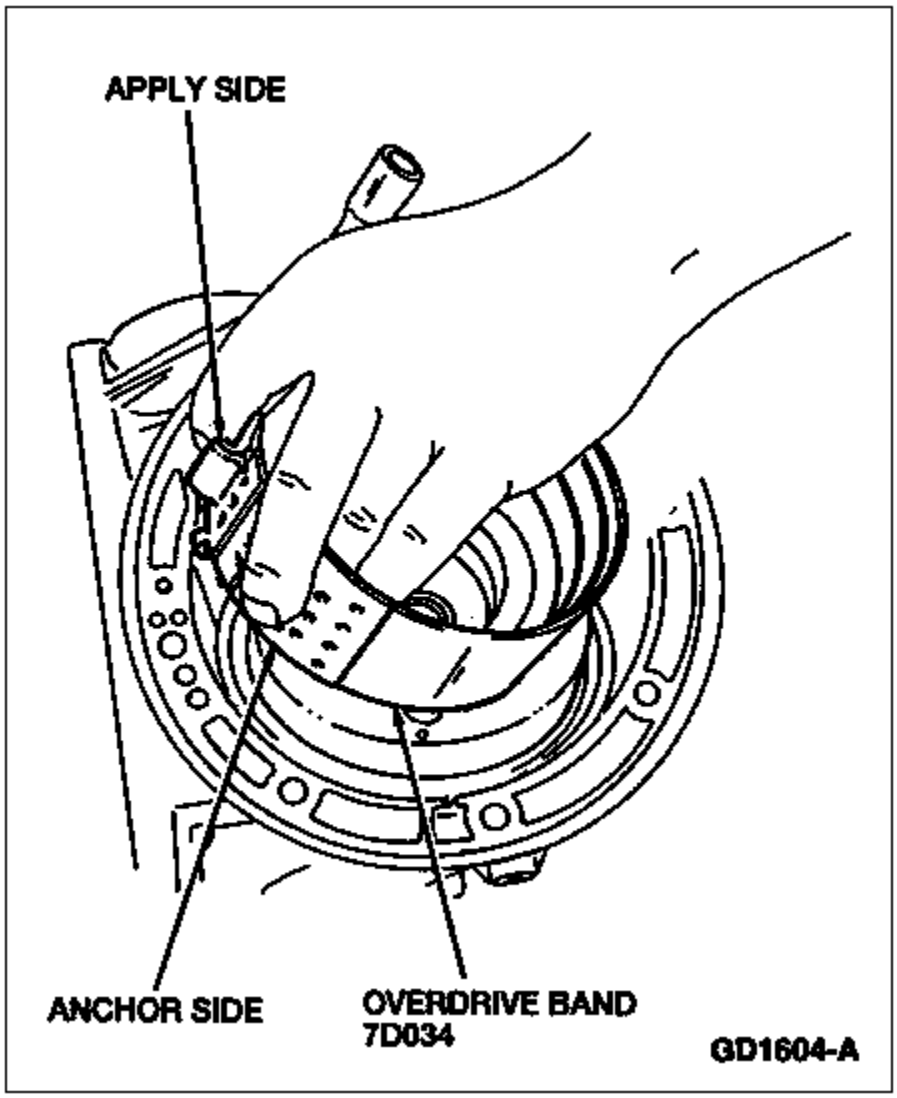
tomsn048@gmail.com



46. **CAUTION: Identify which end of the overdrive band is the anchor side or the apply side.**

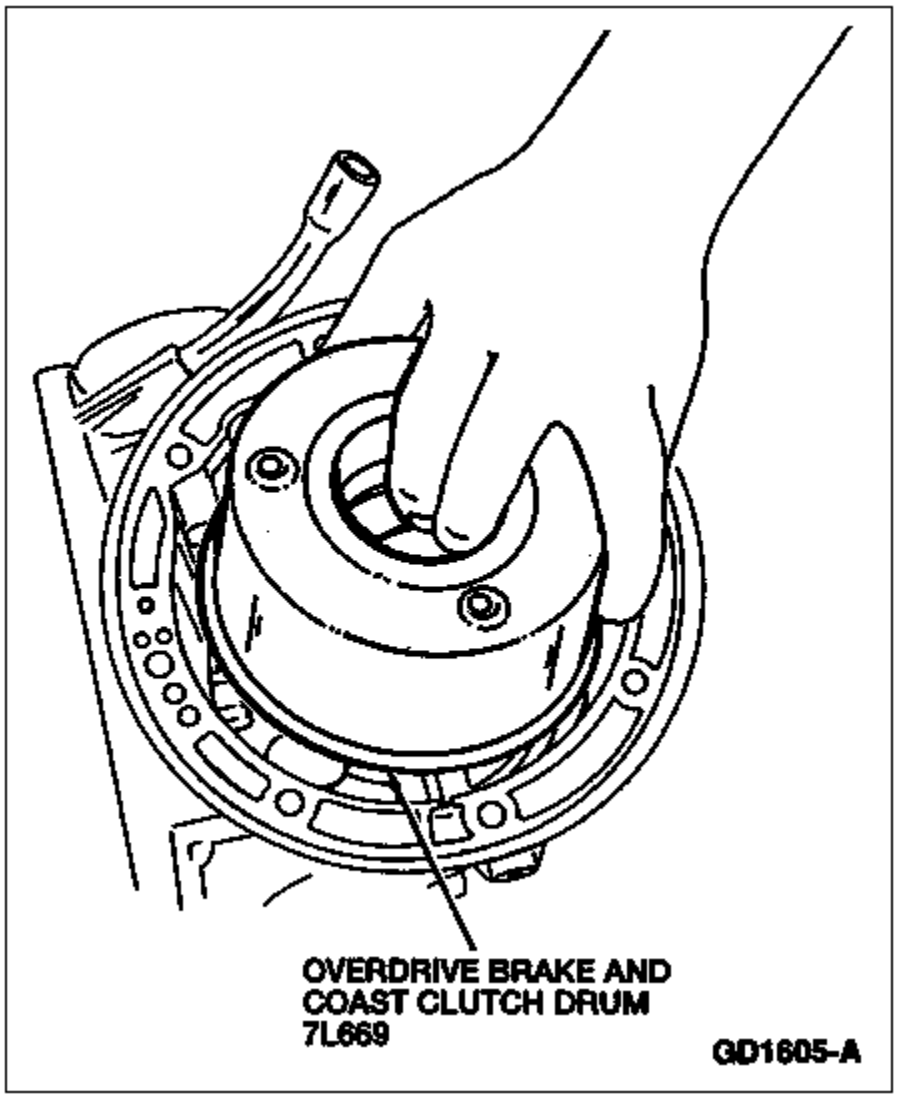
Remove the overdrive band.

tomsn048@gmail.com



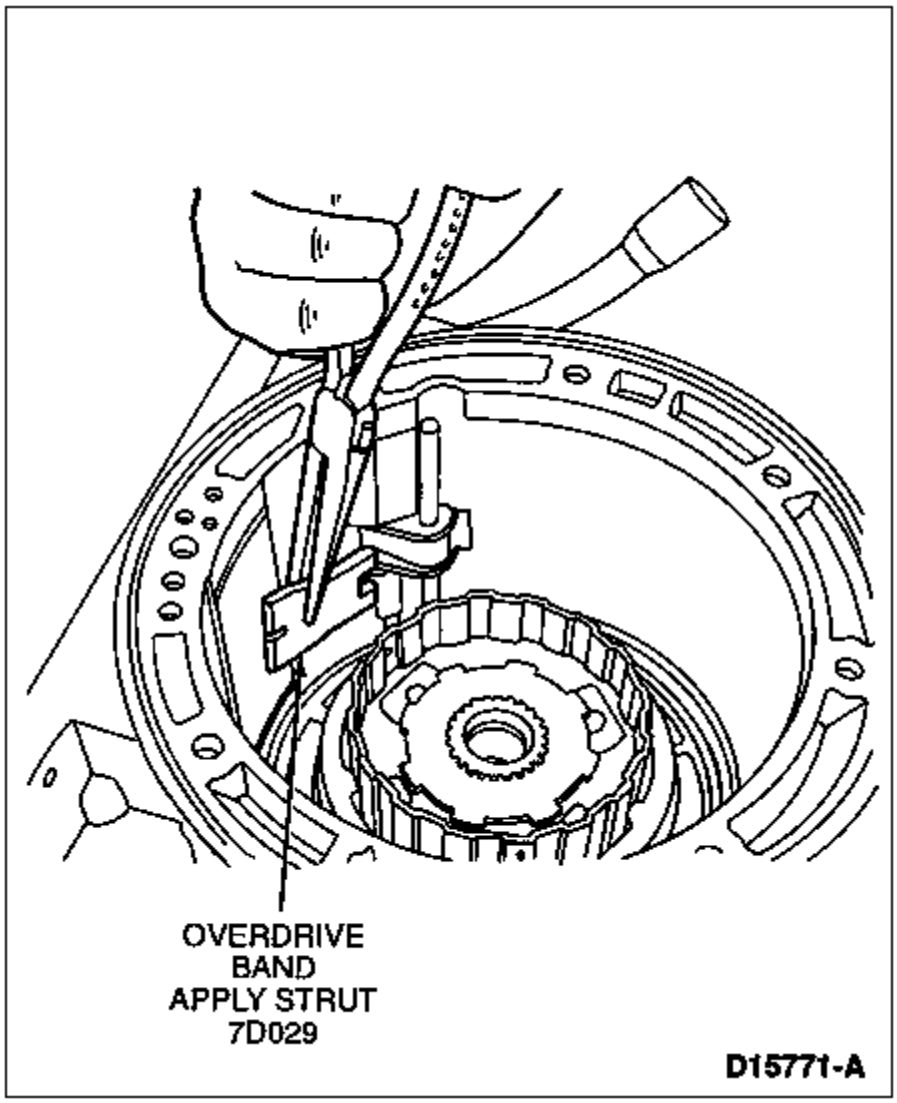
47. Remove the overdrive brake and coast clutch drum.

tomsn048@gmail.com



48. Remove the overdrive band apply strut.

tomsn048@gmail.com

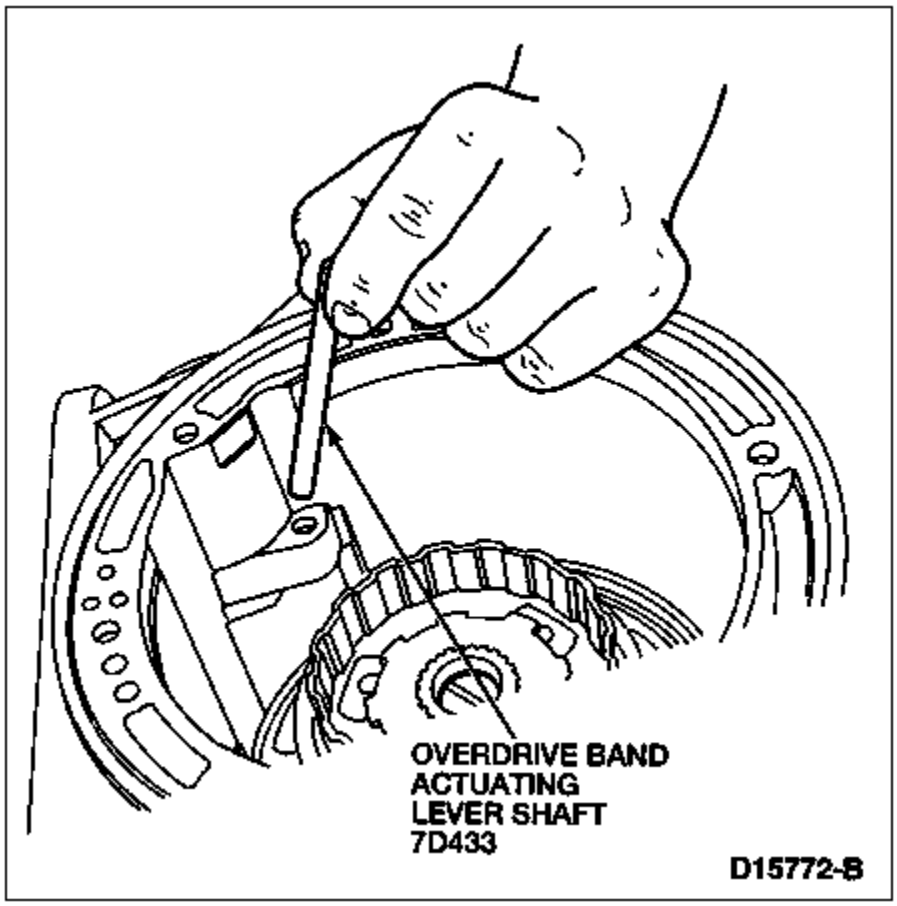


49. **NOTE: Tag and identify the overdrive lever for assembly. The overdrive lever has a letter stamped into its side.**

    NOTE: The overdrive band actuating lever shaft is longer than the intermediate shaft.

    Remove the overdrive band actuating lever shaft.

tomsn048@gmail.com

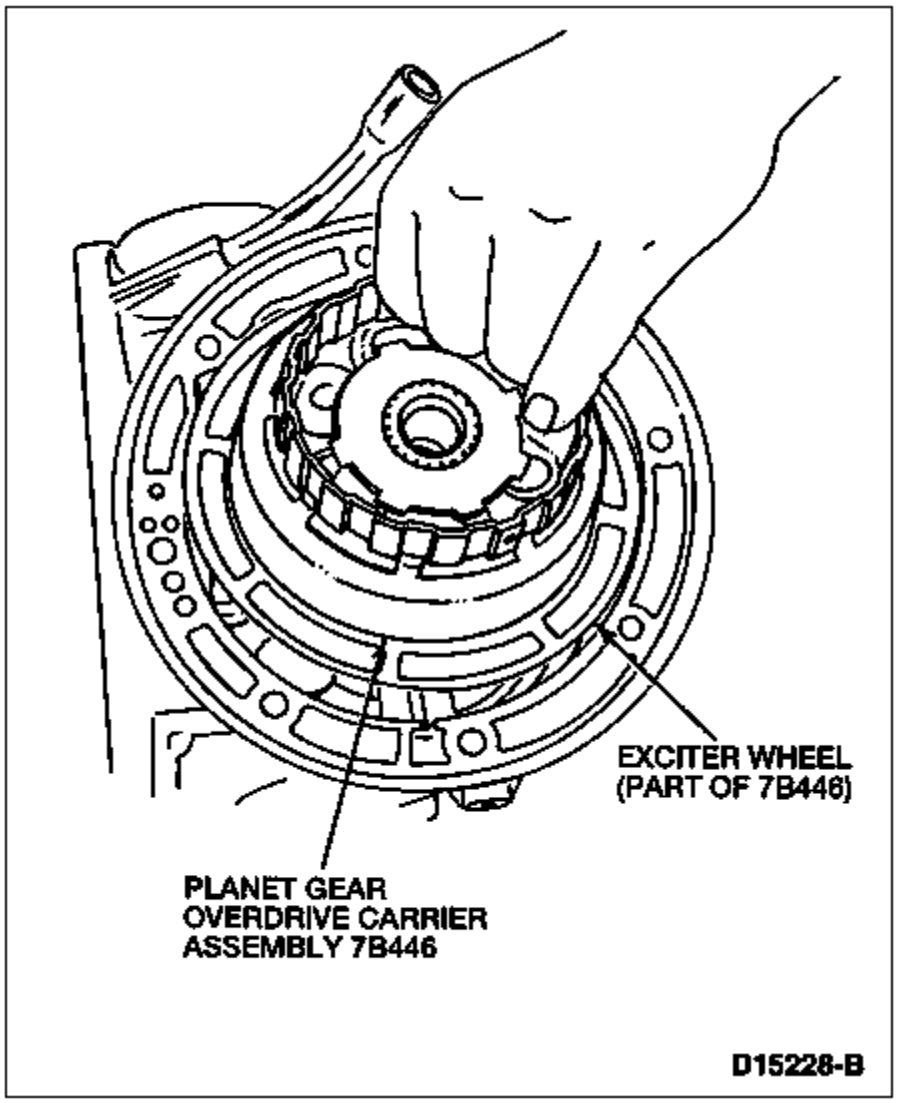


50. **CAUTION: Do not bend the exciter wheel.**

NOTE: No. 12 thrust bearing is in this assembly.

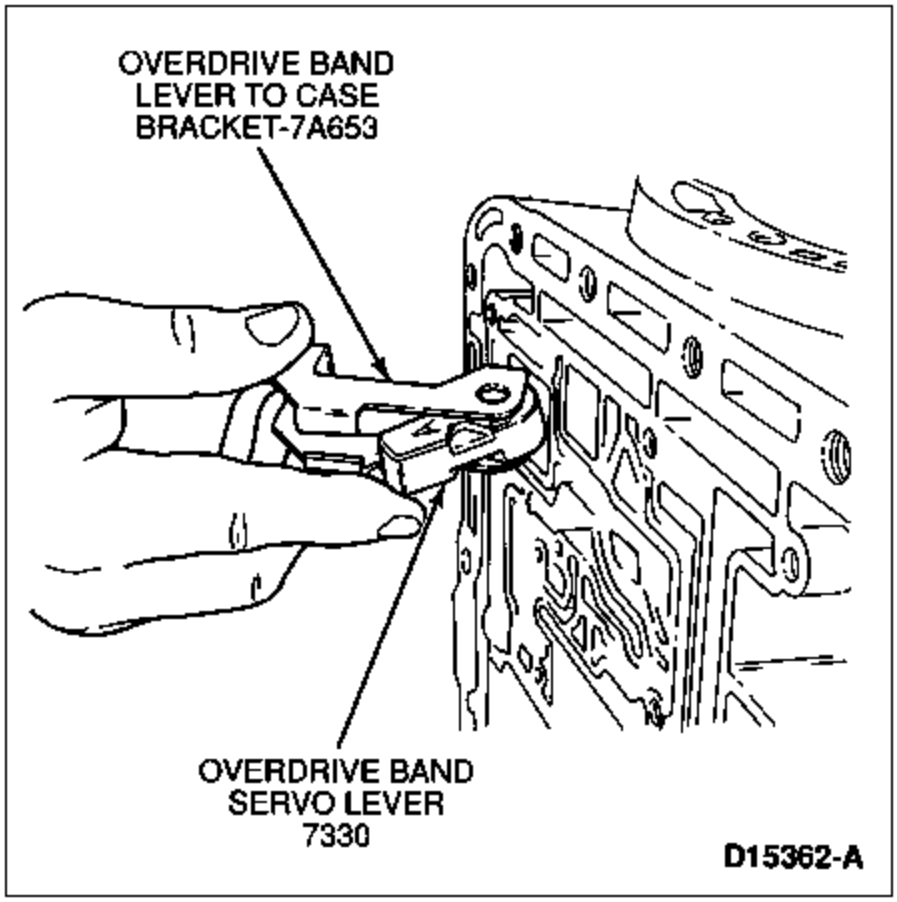
Remove the planetary gear overdrive carrier.

tomsn048@gmail.com

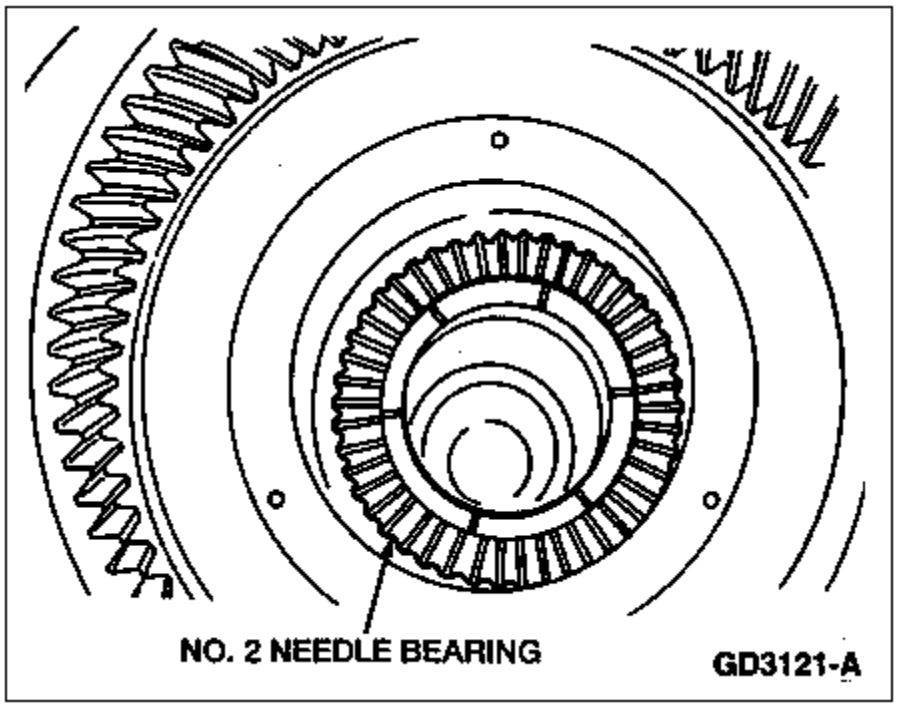


51. Remove the servo band lever and overdrive control bracket.

tomsn048@gmail.com

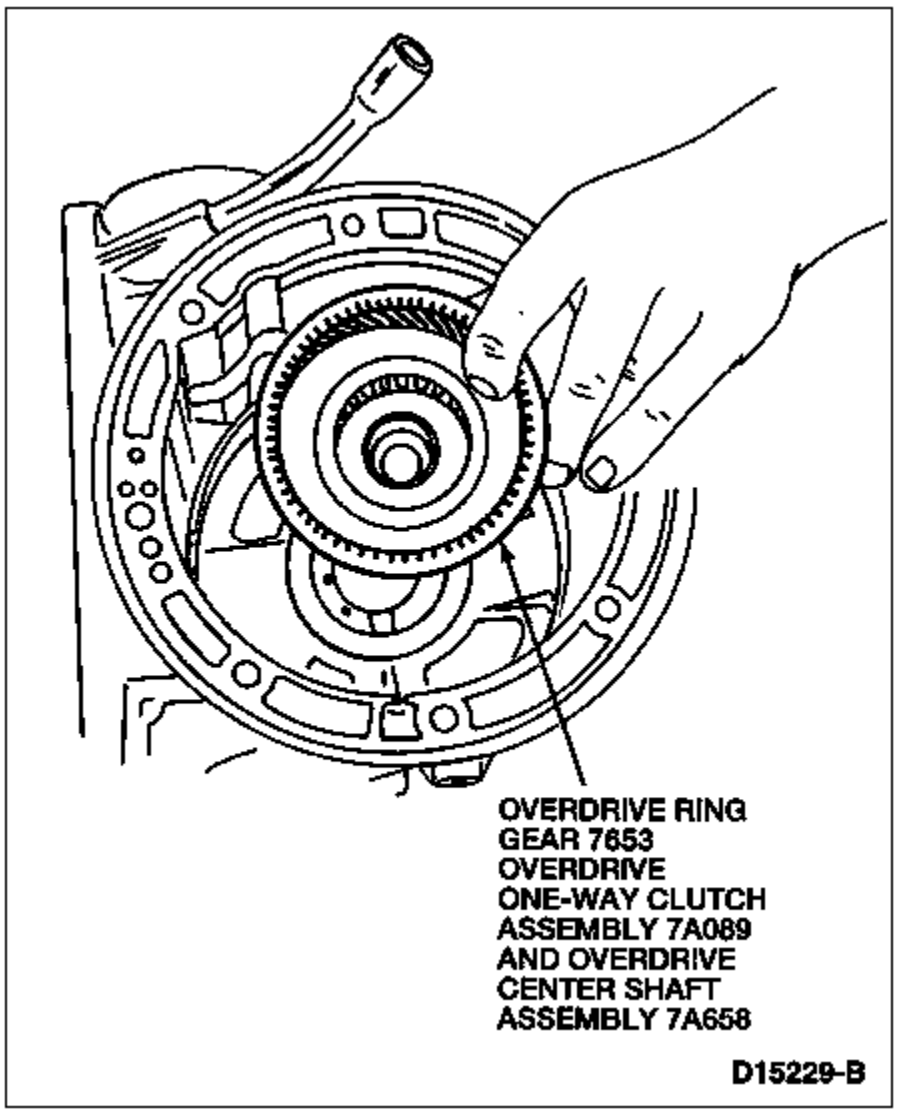


52. Remove the No. 2 needle bearing if not already removed with planetary gear overdrive carrier.



tomsn048@gmail.com

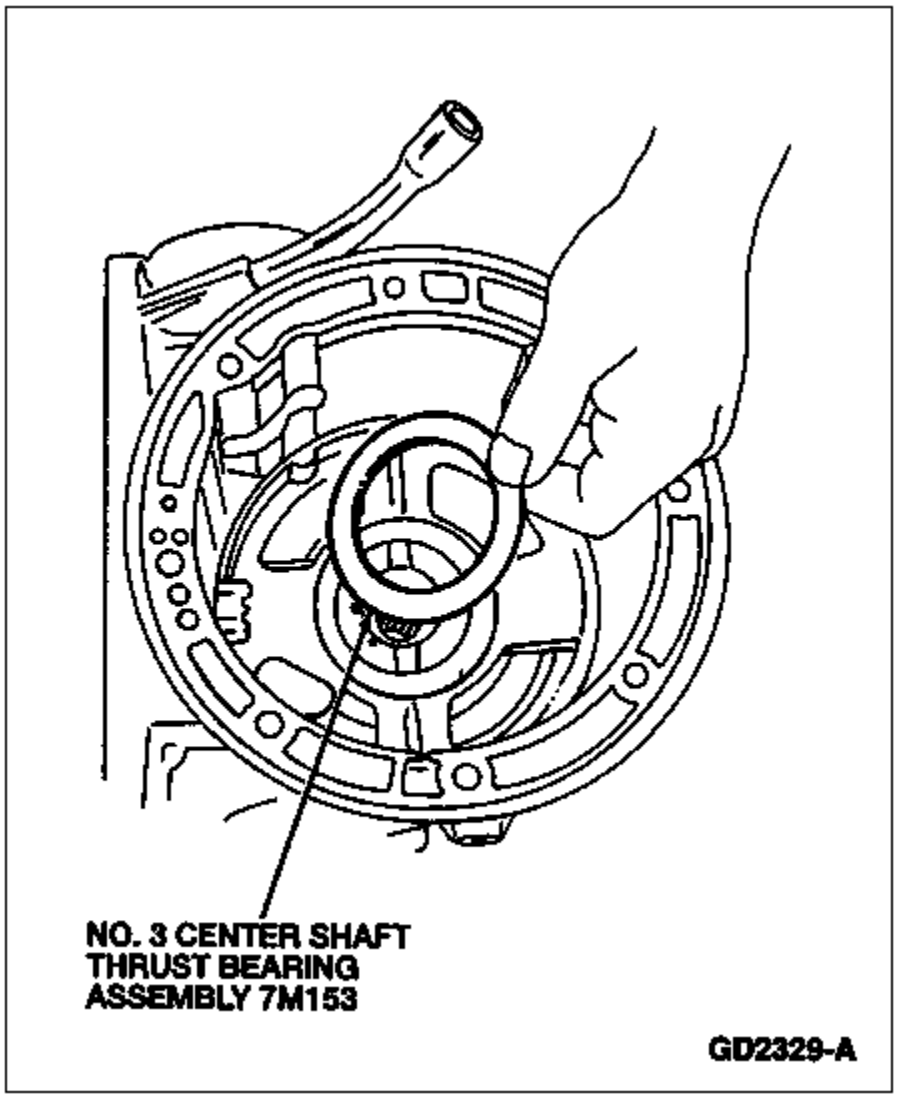
53. Remove the overdrive ring gear, overdrive one-way clutch and overdrive center shaft assembly.



54. **NOTE: Tag and identify the No. 3 center shaft thrust bearing assembly for assembly.**

Remove the No. 3 center shaft thrust bearing assembly.

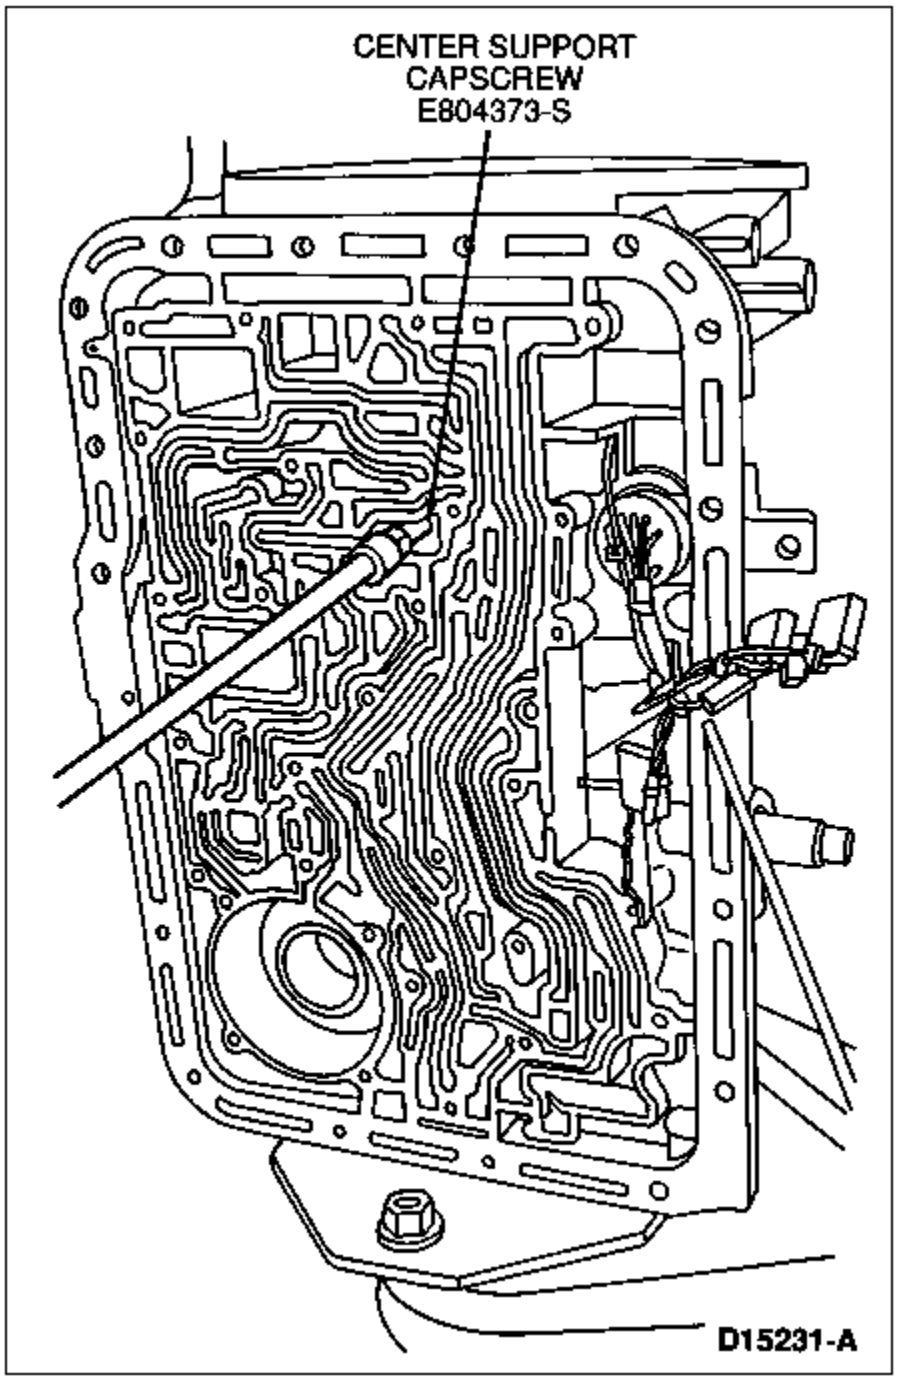
tomsn048@gmail.com



55. **CAUTION: The center support locking nut could fall into the remaining assembly if not removed.**

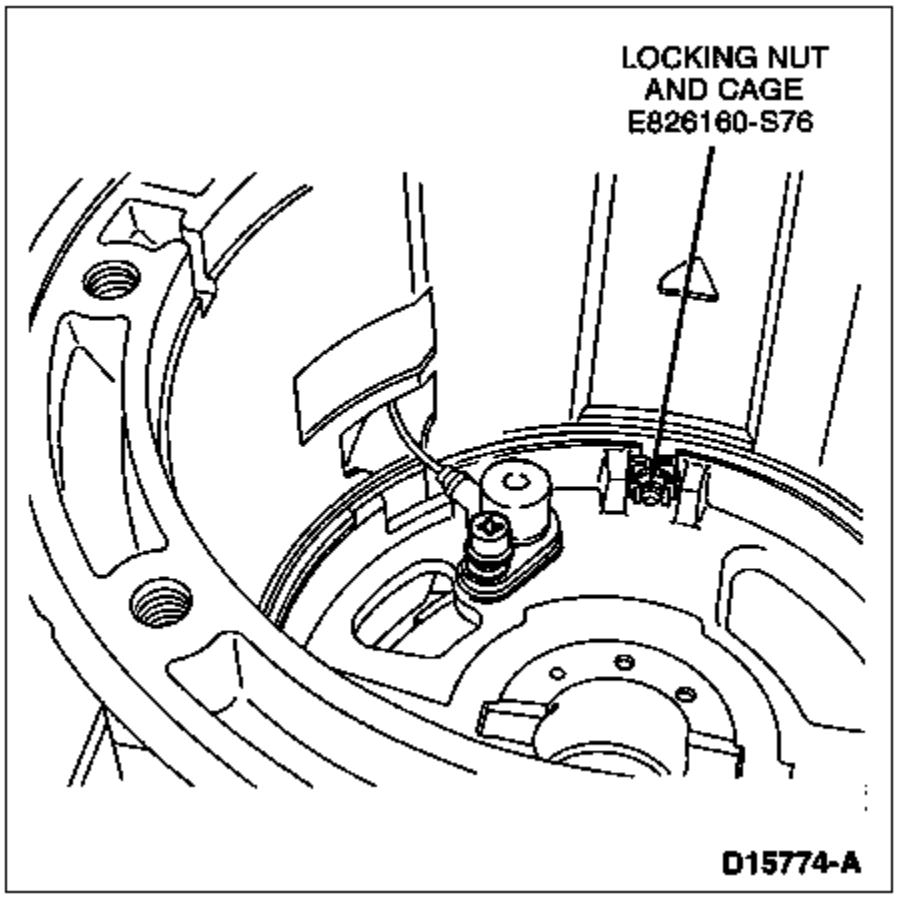
Use a 5 mm Allen wrench to remove the M6 x 20 mm center support capscrew.

tomsn048@gmail.com



56. Remove the locking nut and cage from center support.

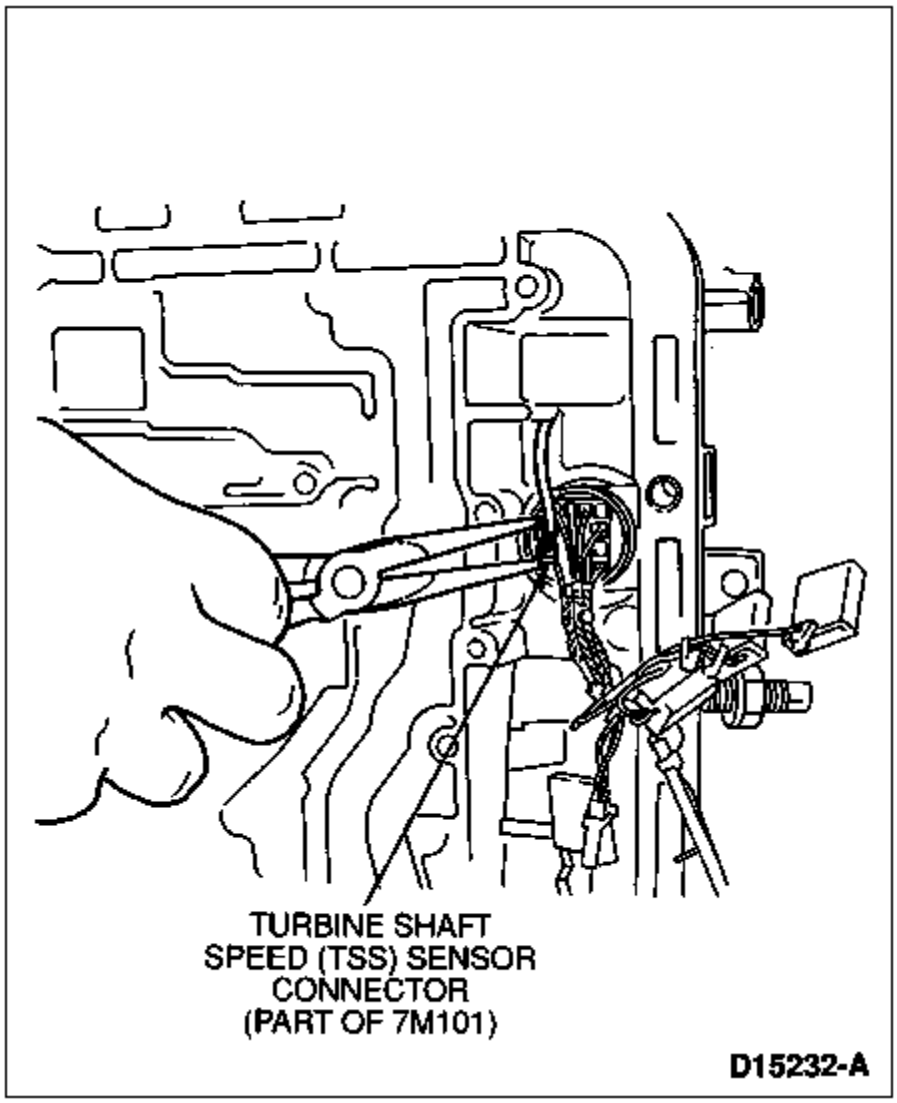
tomsn048@gmail.com



57. **CAUTION: Do not pry on other wires or damage the connector or case surface.**

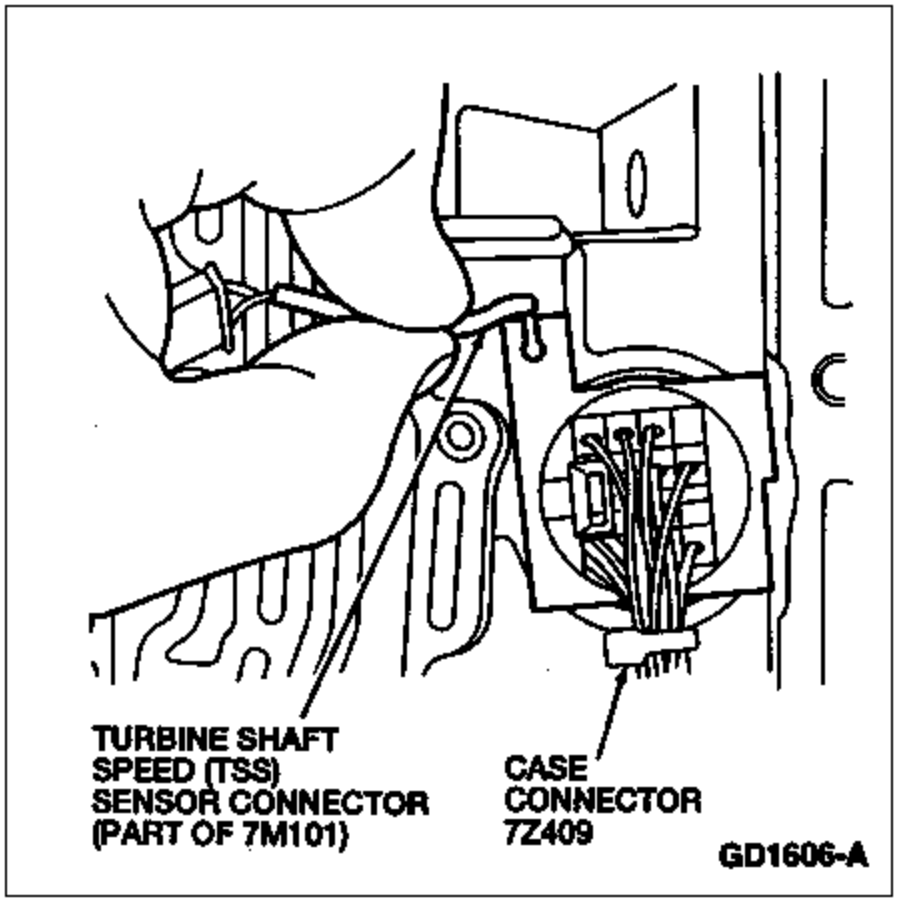
Carefully disconnect the turbine shaft speed (TSS) sensor connector from the 16-pin case connector.

tomsn048@gmail.com



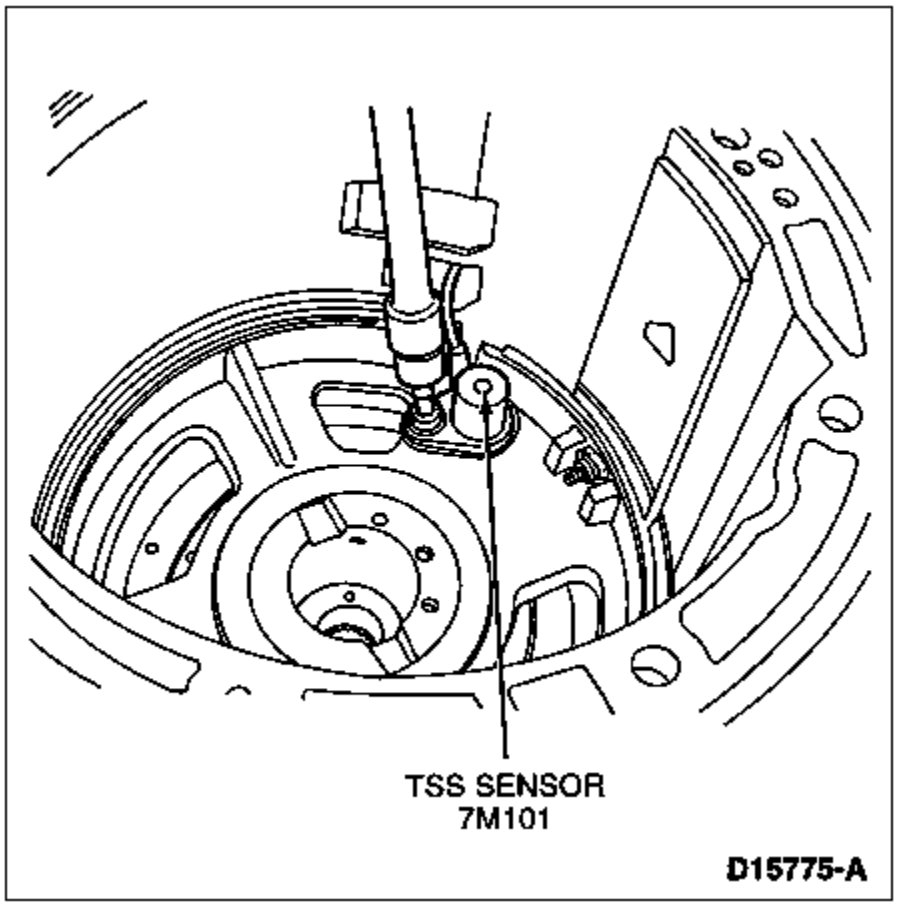
58. Carefully remove TSS sensor connector wires from the retaining slot on the 16-pin case connector.

tomsn048@gmail.com



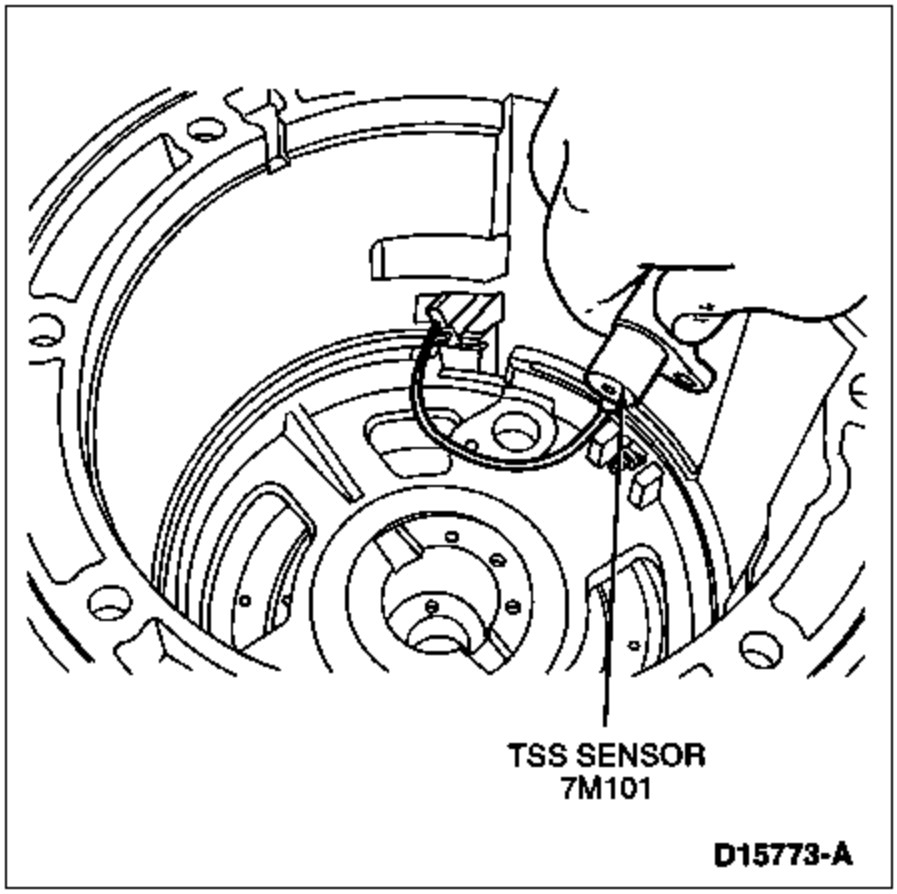
59. Use a T30 Torx® bit to remove the TSS screw.

tomsn048@gmail.com



60. Carefully route the TSS connector and wiring into the transmission through the opening in the case. Remove the TSS.

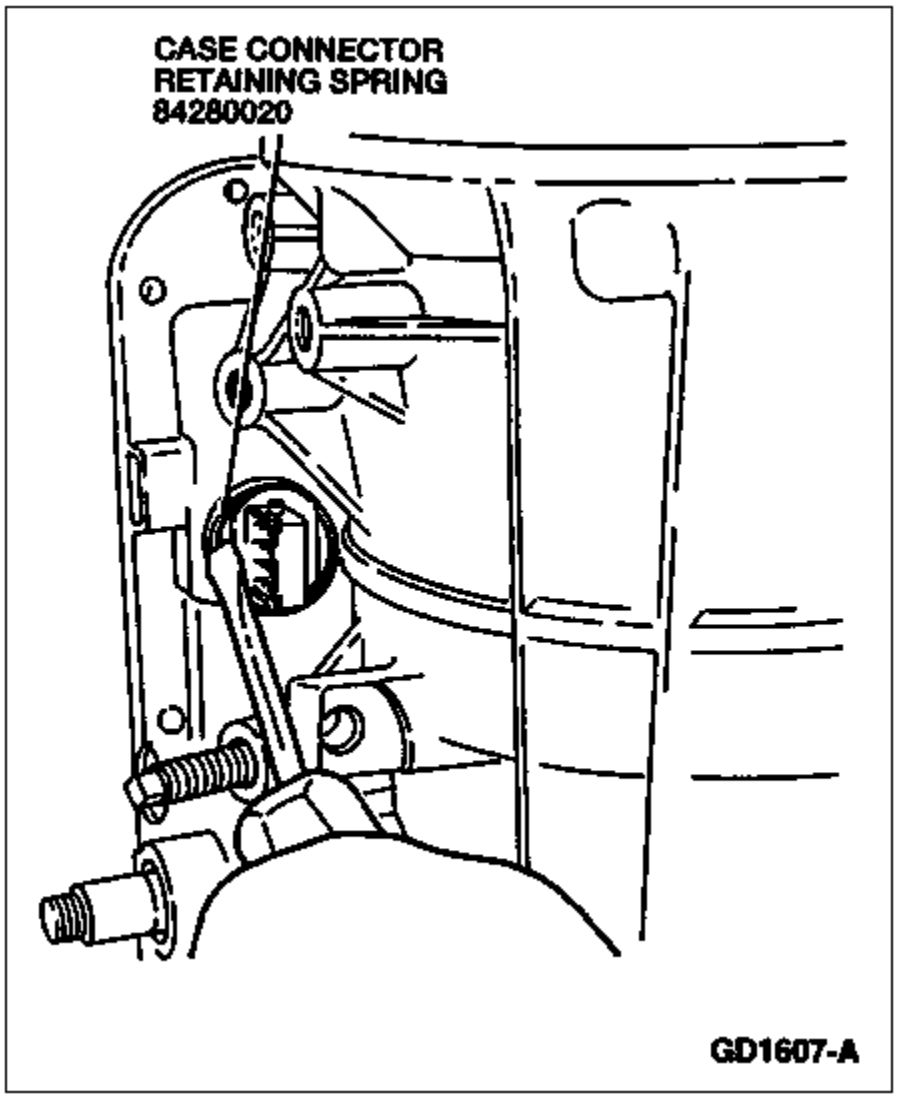
tomsn048@gmail.com



61. **CAUTION: Do not overstretch the case connector retaining spring.**

Use a screwdriver to carefully remove the case connector retaining spring.

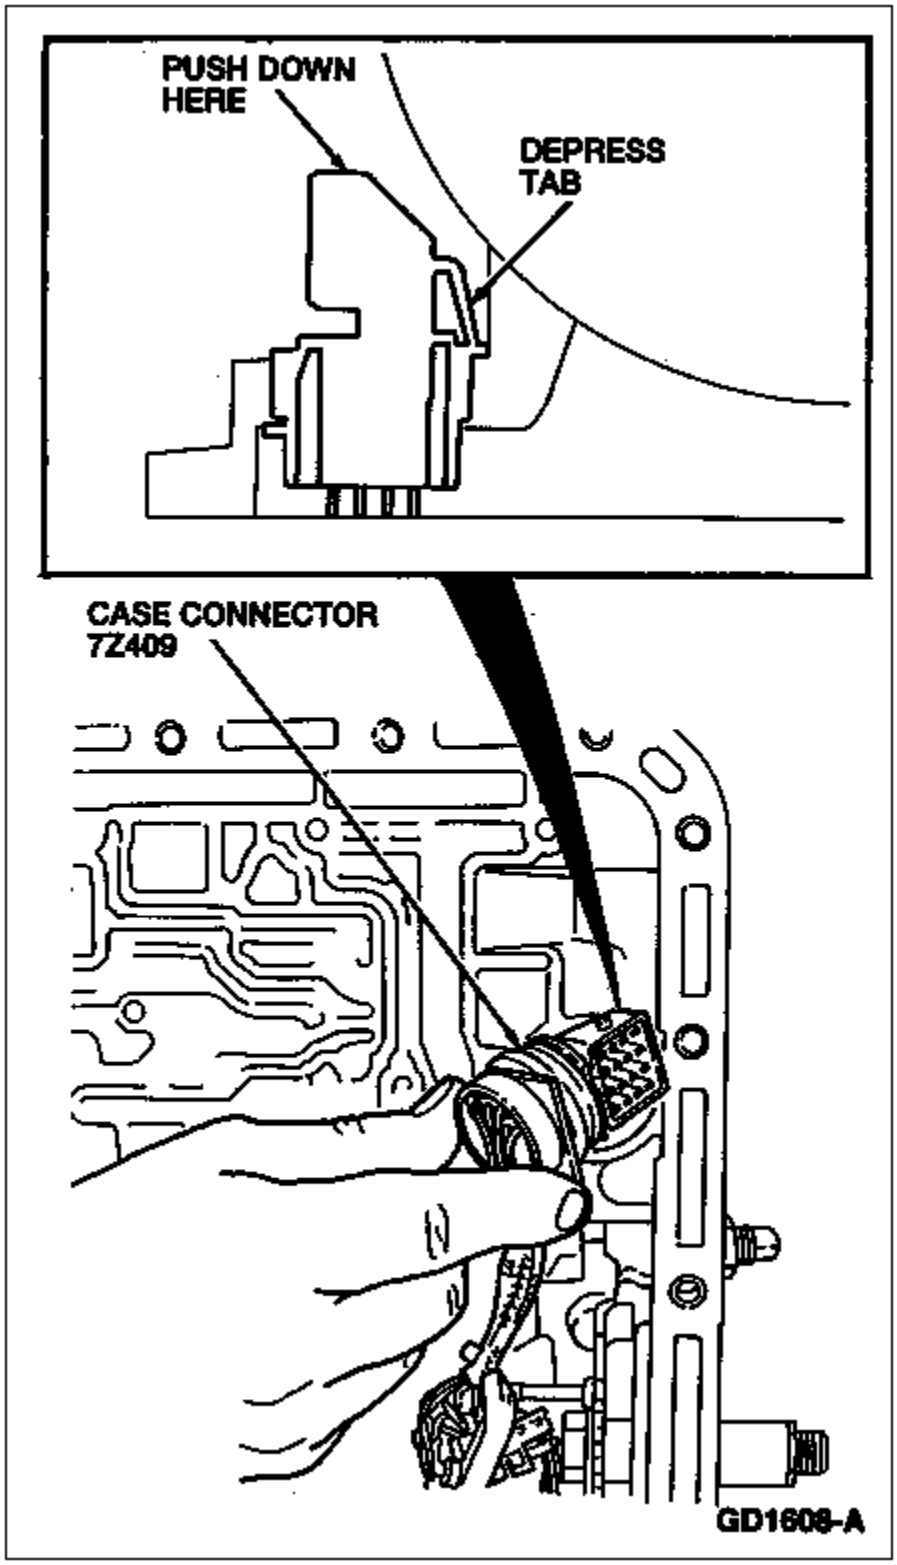
tomsn048@gmail.com



62. **CAUTION: Do not damage the connector or harness.**

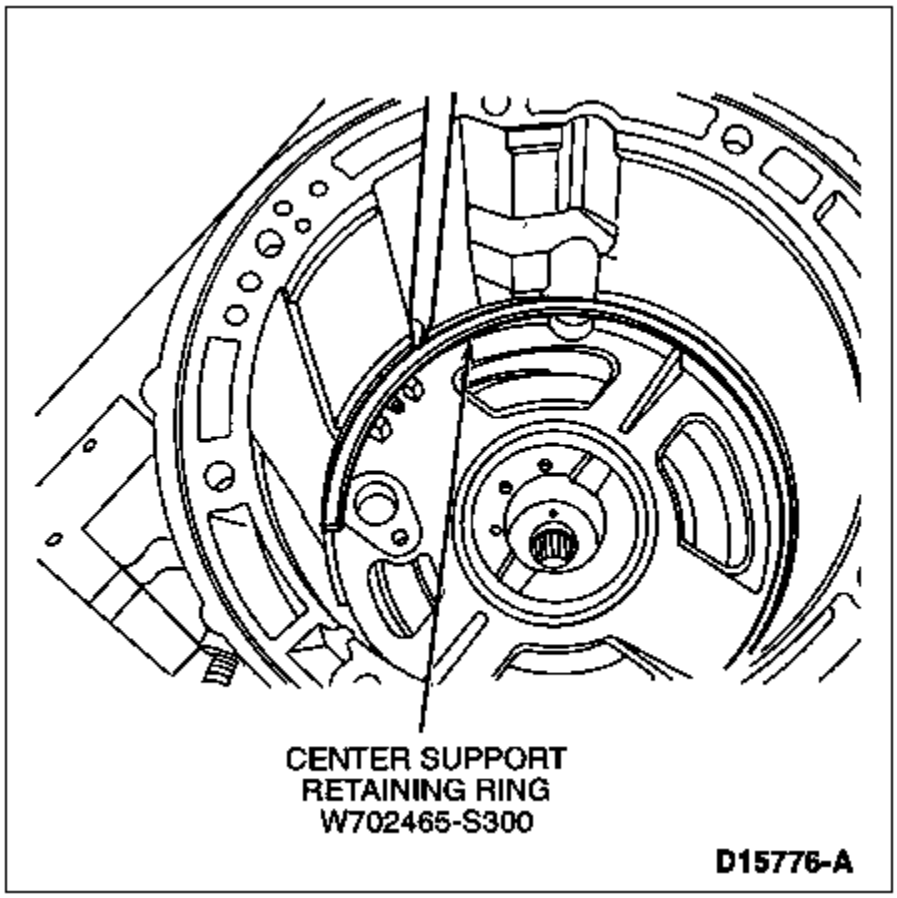
Carefully push down on the top of the connector until it stops. Depress the tab on the back side of the connector and push down on the connector. Remove the connector and harness through the bottom of the case.

tomsn048@gmail.com



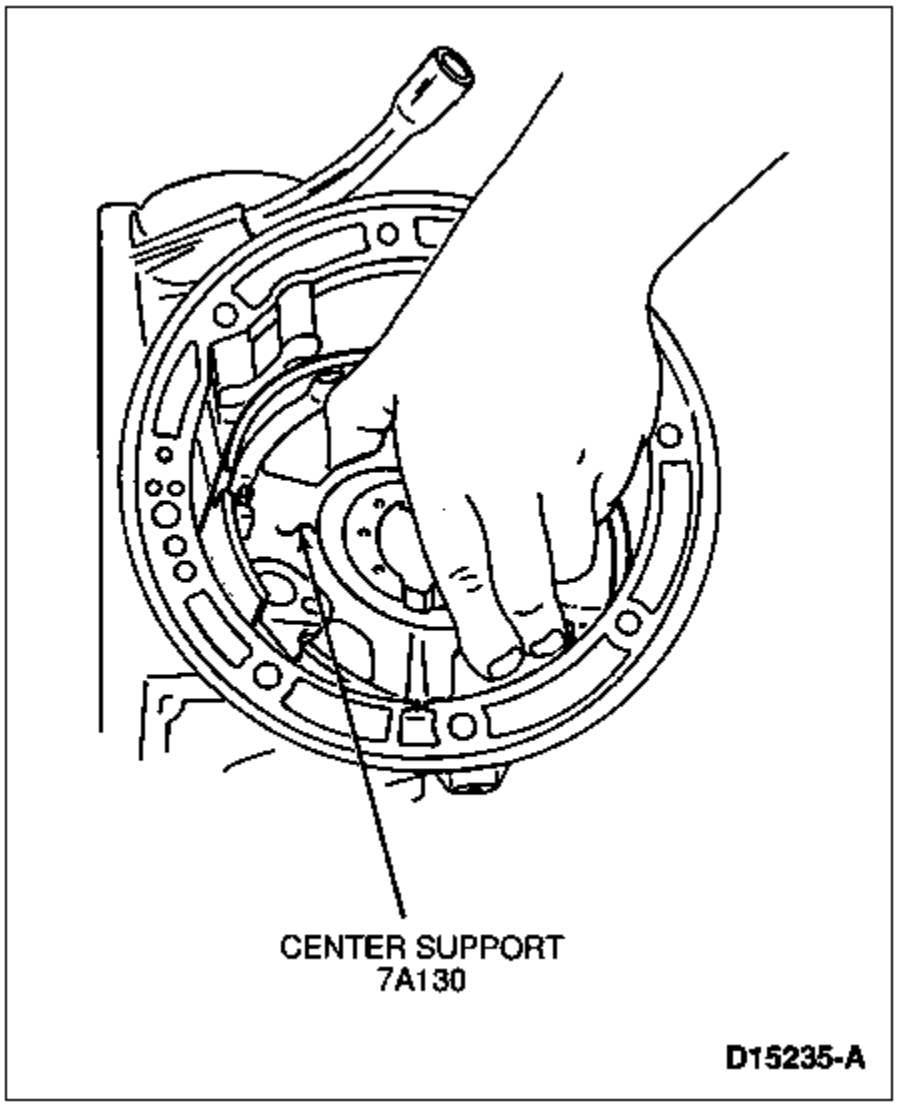
63. Remove the center support retaining ring.

tomsn048@gmail.com



64. Remove the center support by pulling evenly around the center support web.

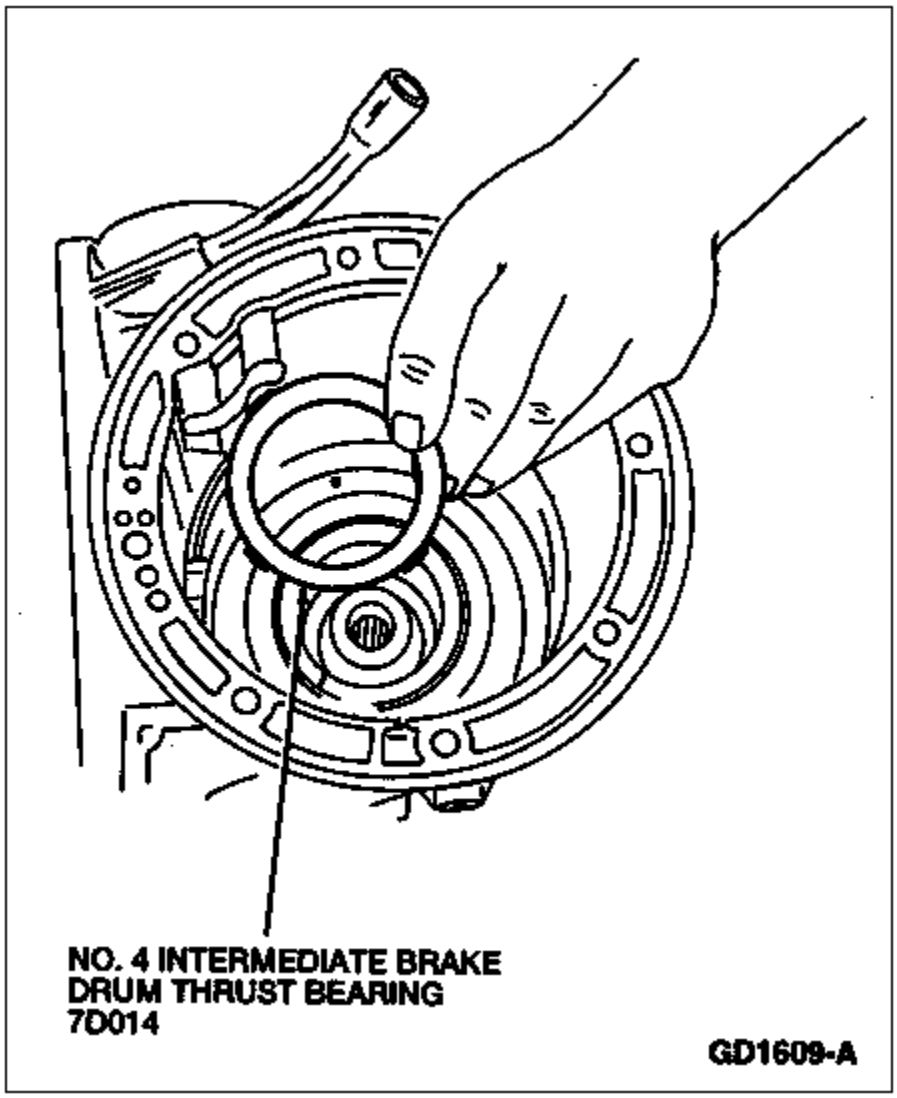
tomsn048@gmail.com



65. **NOTE: Tag and identify the No. 4 intermediate brake drum thrust bearing for assembly.**

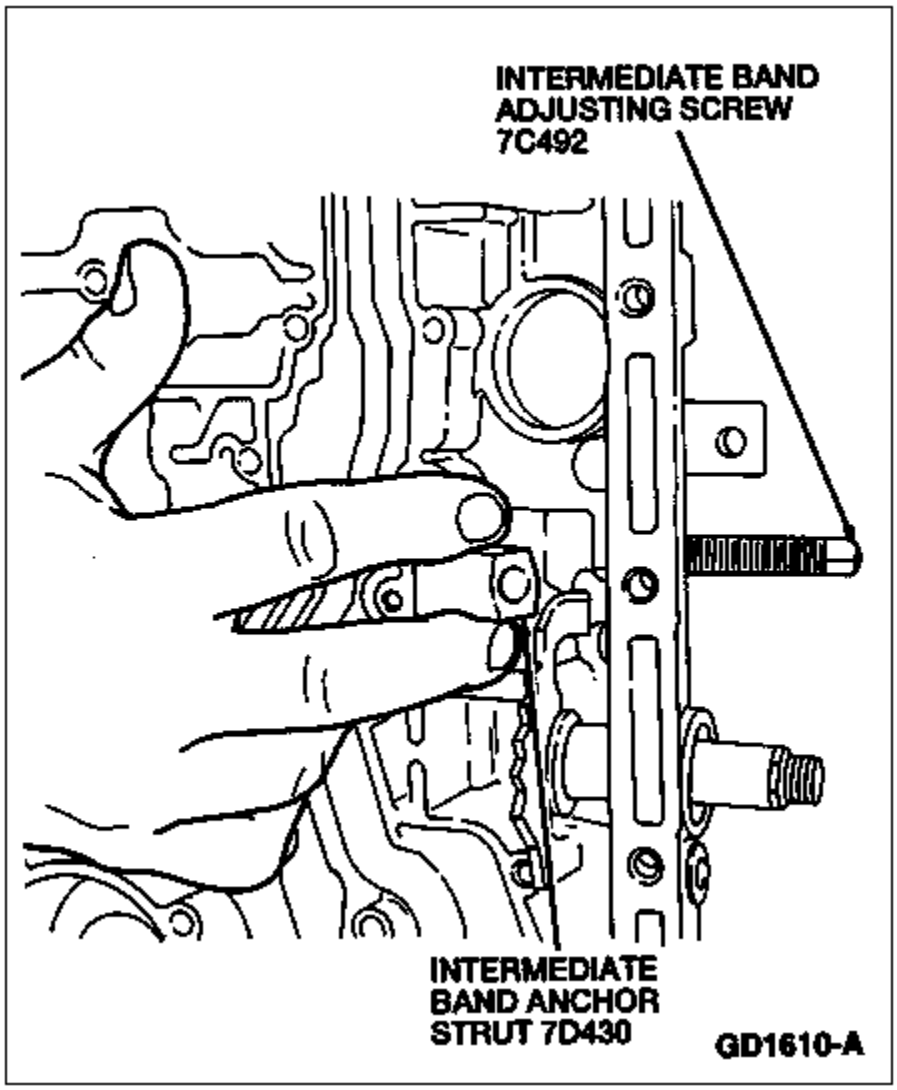
Remove the No. 4 intermediate brake drum thrust bearing.

tomsn048@gmail.com



66. Remove the intermediate band anchor strut through the bottom of the case. Remove intermediate band adjusting screw.

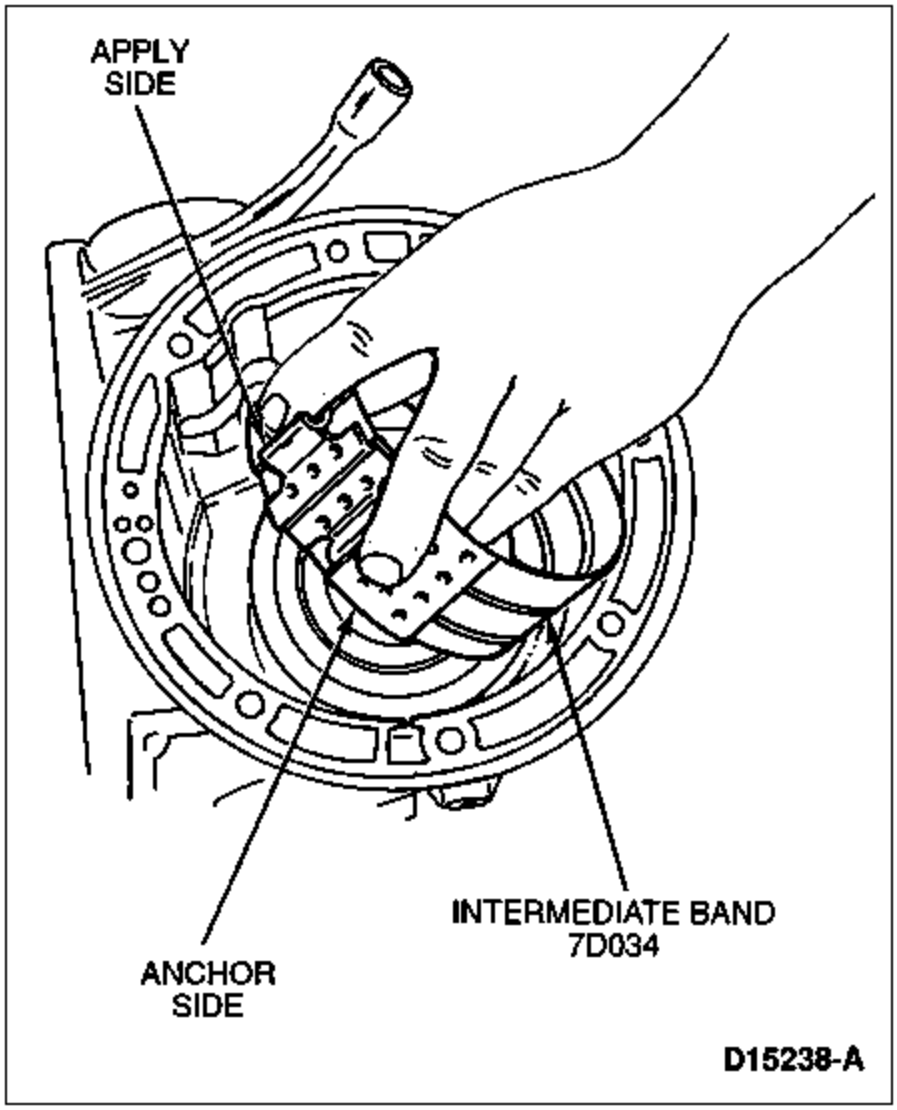
tomsn048@gmail.com



67. **CAUTION: Identify which end of the intermediate band is the anchor side or the apply side.**

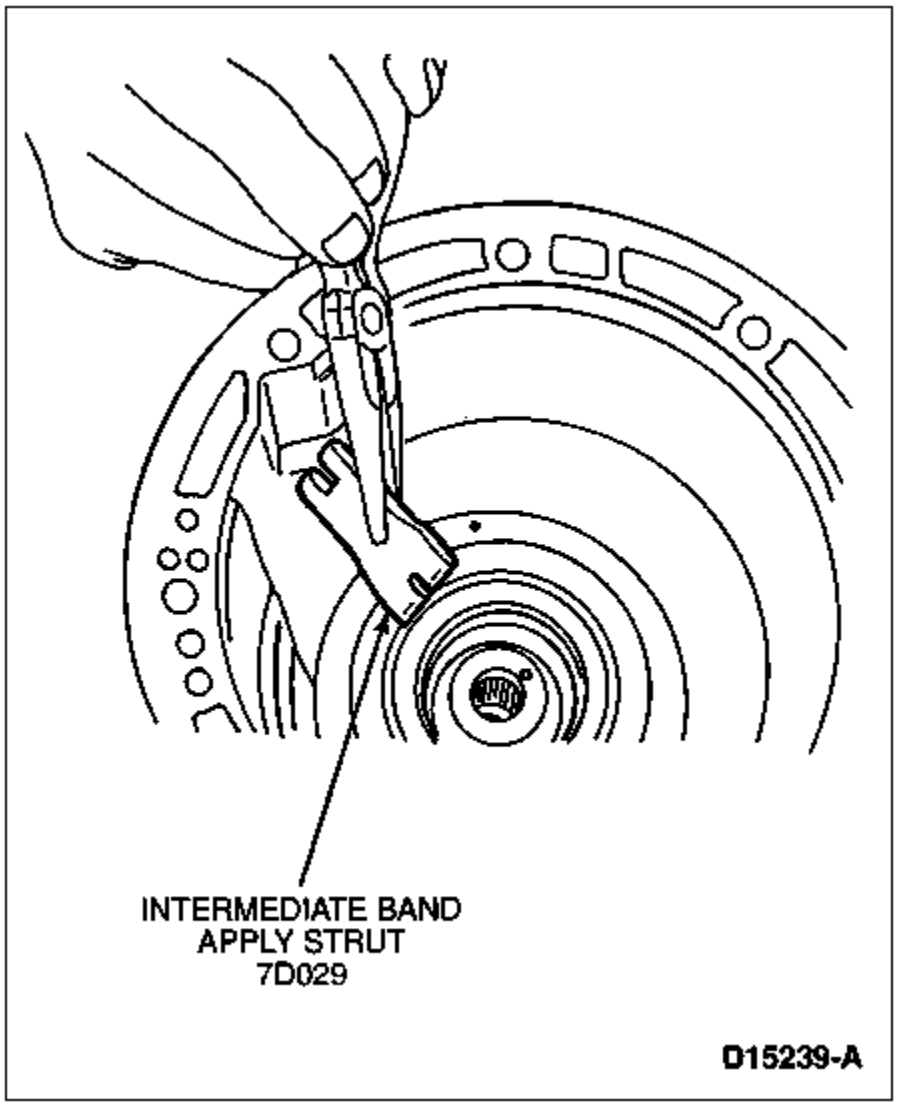
Remove the intermediate band.

tomsn048@gmail.com



68. Remove the intermediate band apply strut.

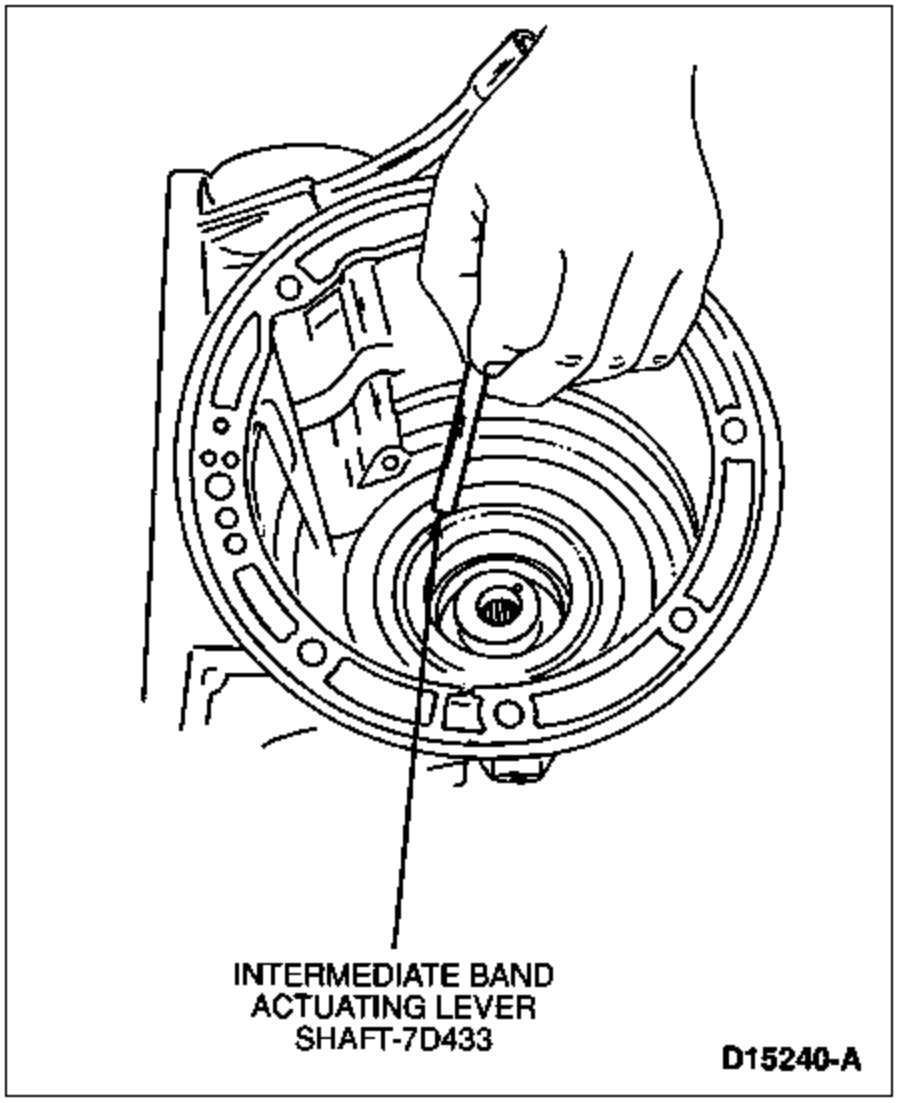
tomsn048@gmail.com



69. **NOTE: The intermediate band actuating lever shaft is shorter than the overdrive band actuating lever shaft.**

    Remove the intermediate band actuating lever shaft.

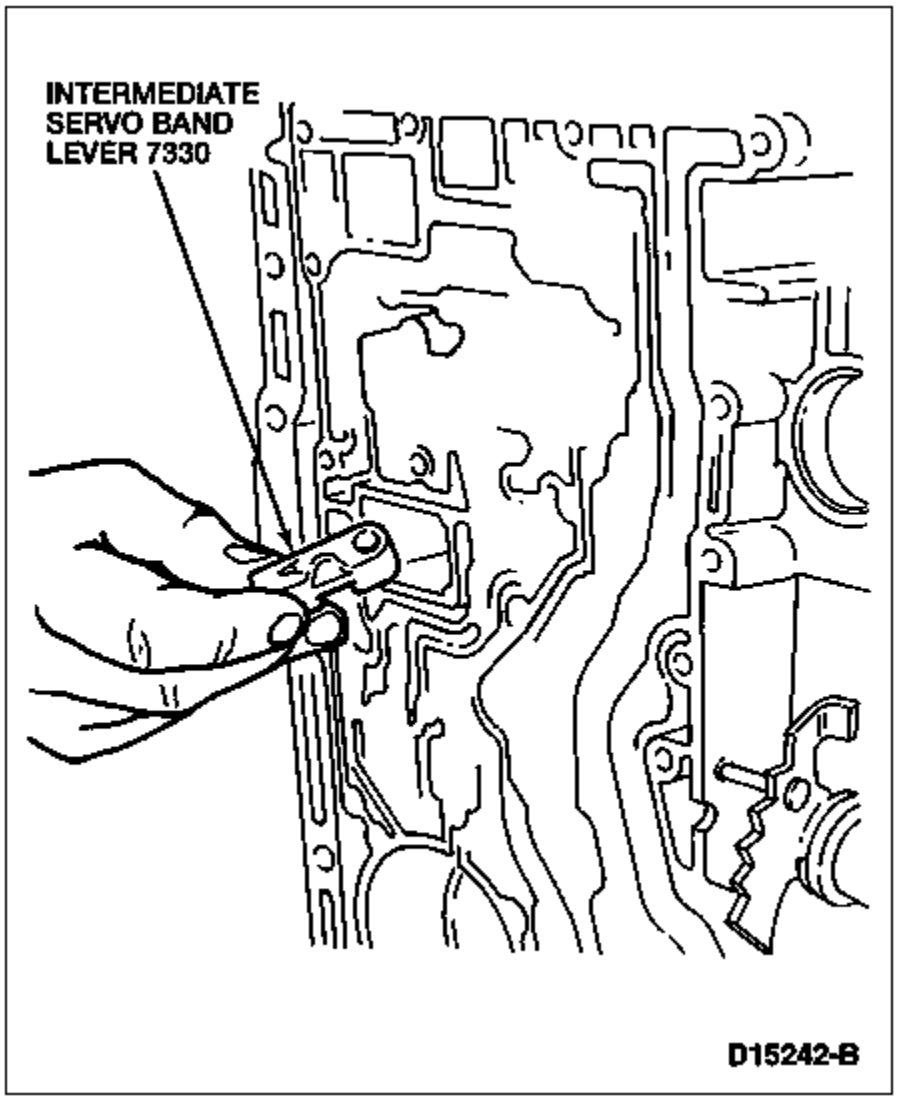
tomsn048@gmail.com



70. **NOTE: Tag and identify the intermediate band servo lever for assembly. The intermediate band servo lever has a letter stamped on its side for identification.**

    Remove the intermediate band servo lever.

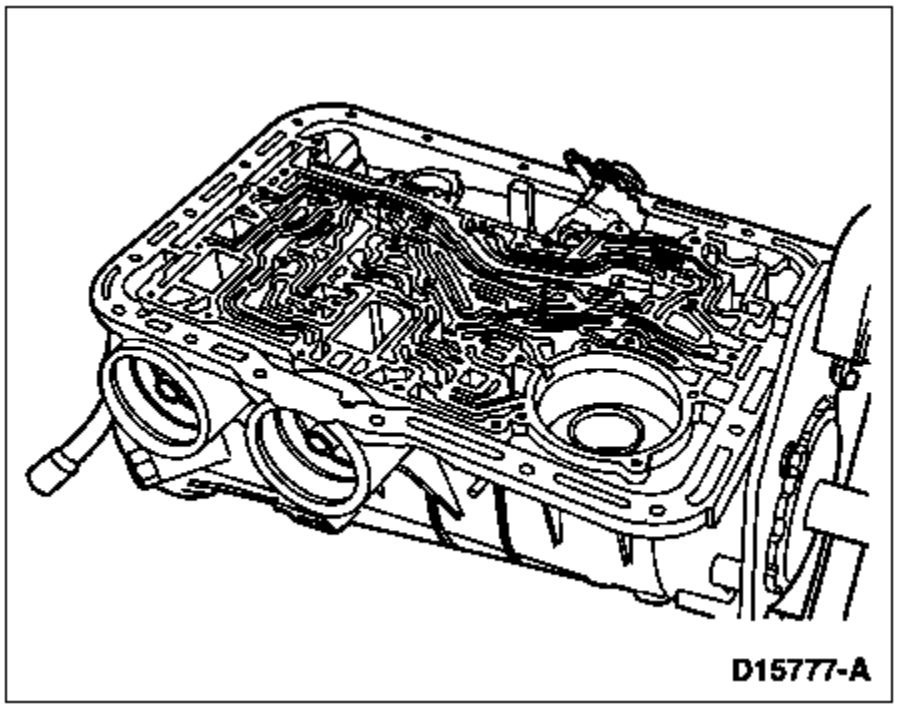
tomsn048@gmail.com



71. **CAUTION: Make sure the lock pin on Bench-Mounted Holding Fixture T57L-500-B is secure.**

Rotate the transmission so the fluid pan surface is facing up.

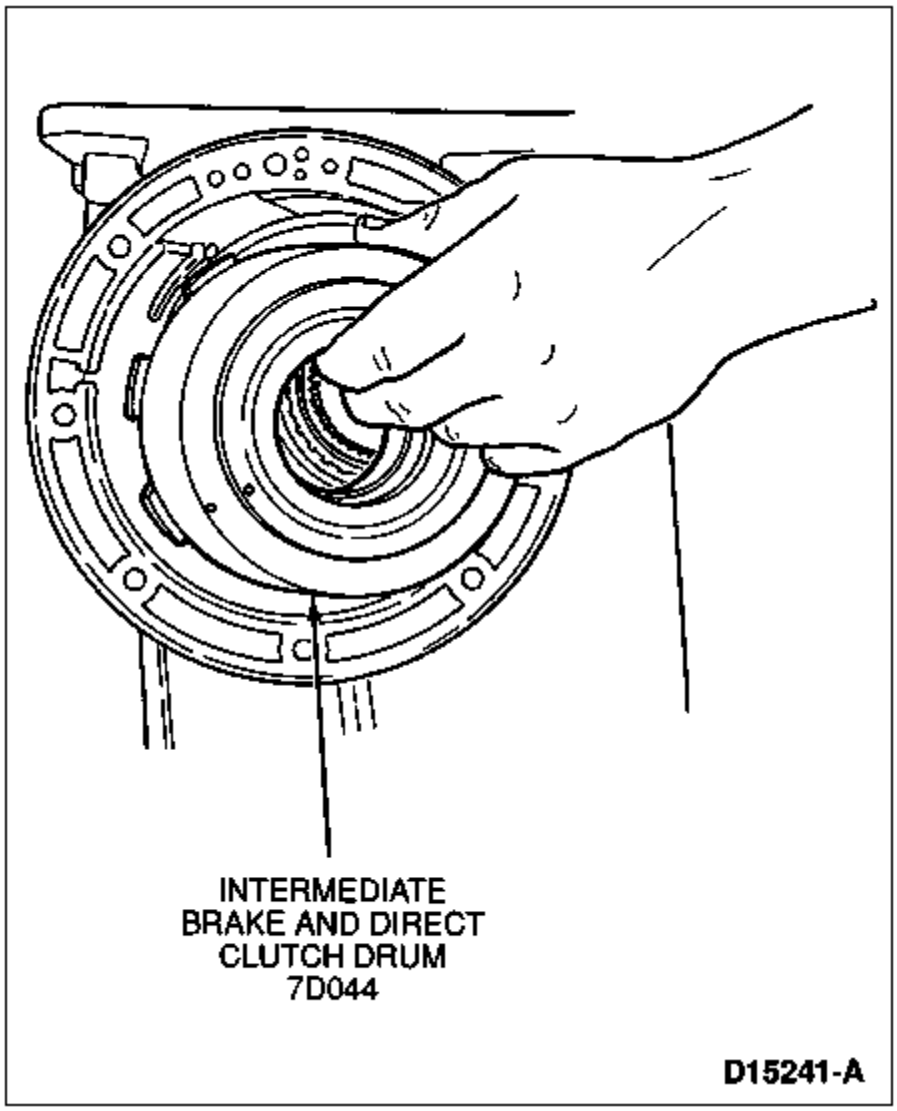
tomsn048@gmail.com



72. **NOTE: The No. 5 forward clutch cylinder thrust bearing may come out with the intermediate brake and direct clutch drum.**

    Remove the intermediate brake and direct clutch drum.

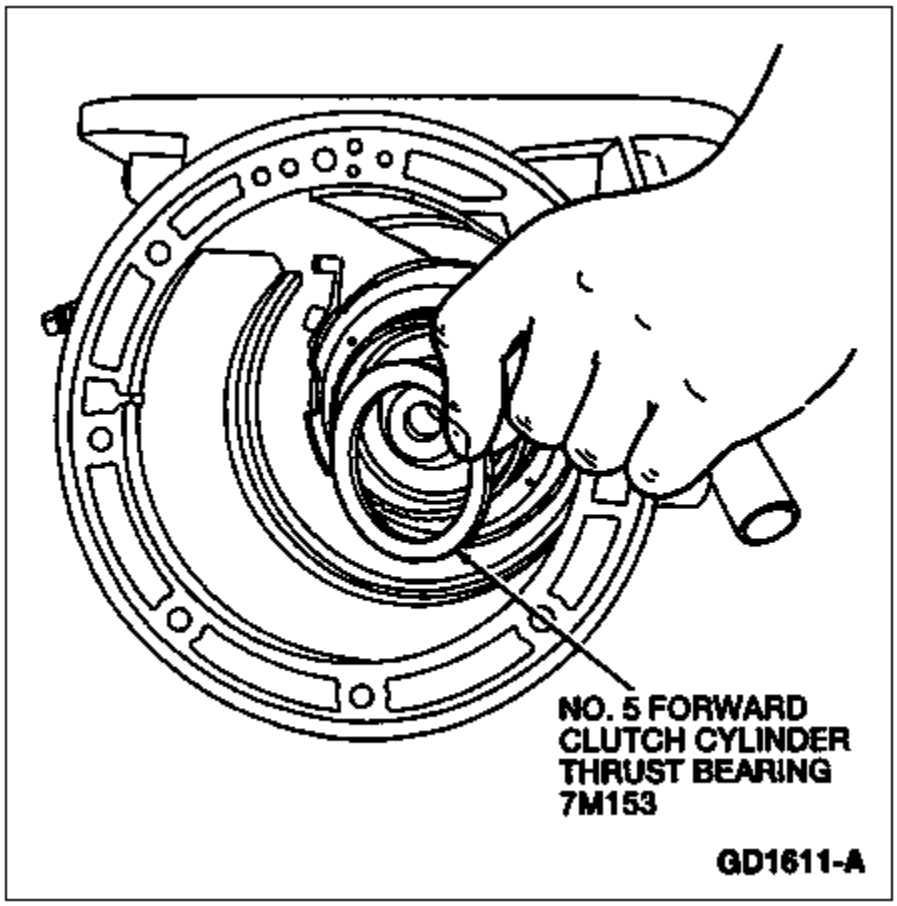
tomsn048@gmail.com



73. **NOTE: Tag and identity the No. 5 forward clutch cylinder thrust bearing for assembly.**

Remove the No. 5 forward clutch cylinder thrust bearing.

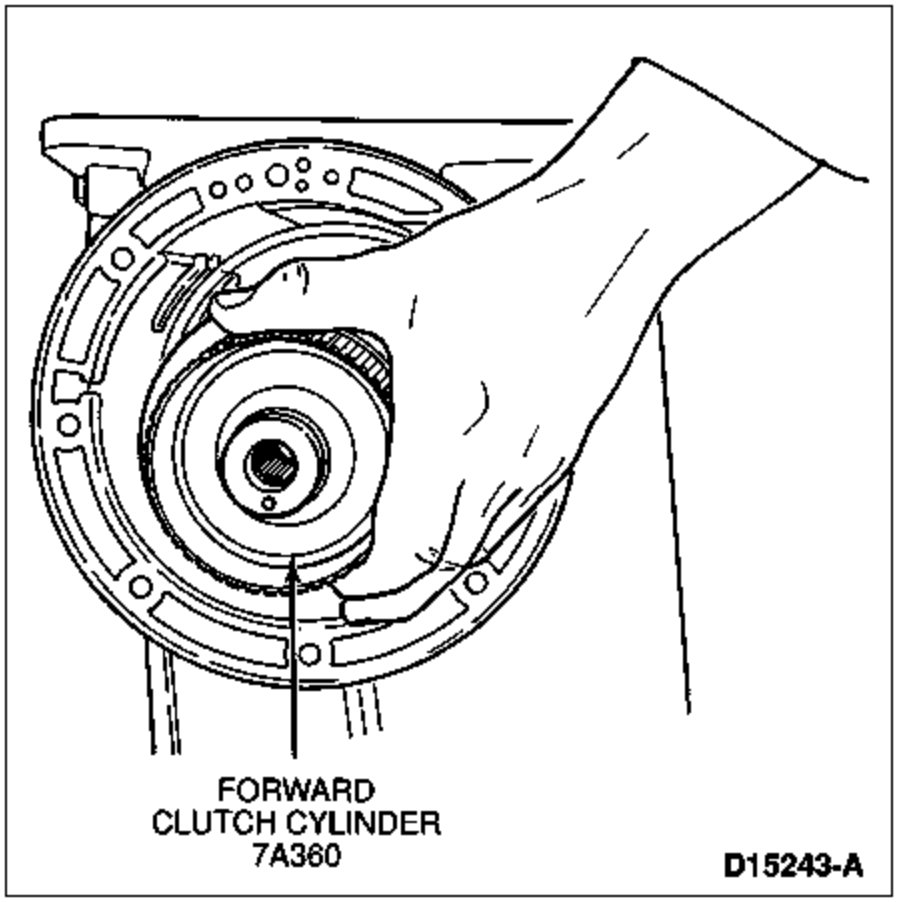
tomsn048@gmail.com



74. **NOTE: The No. 5 forward clutch cylinder thrust bearing may come out with the forward clutch cylinder.**

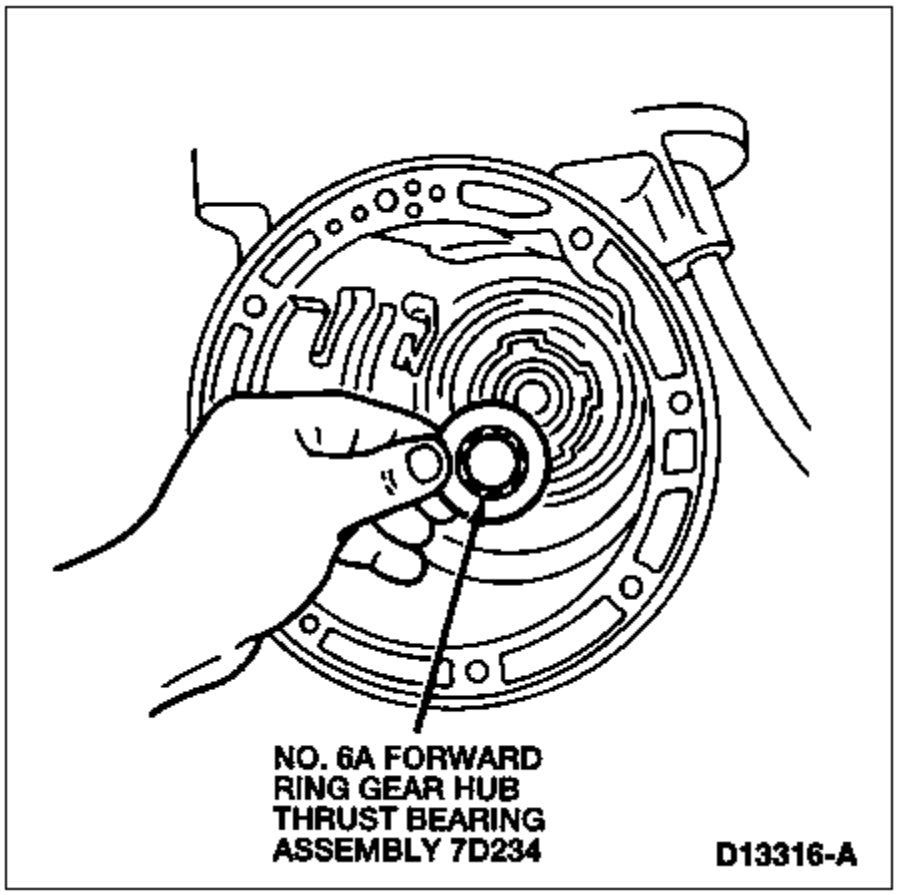
    Remove the forward clutch cylinder.

tomsn048@gmail.com



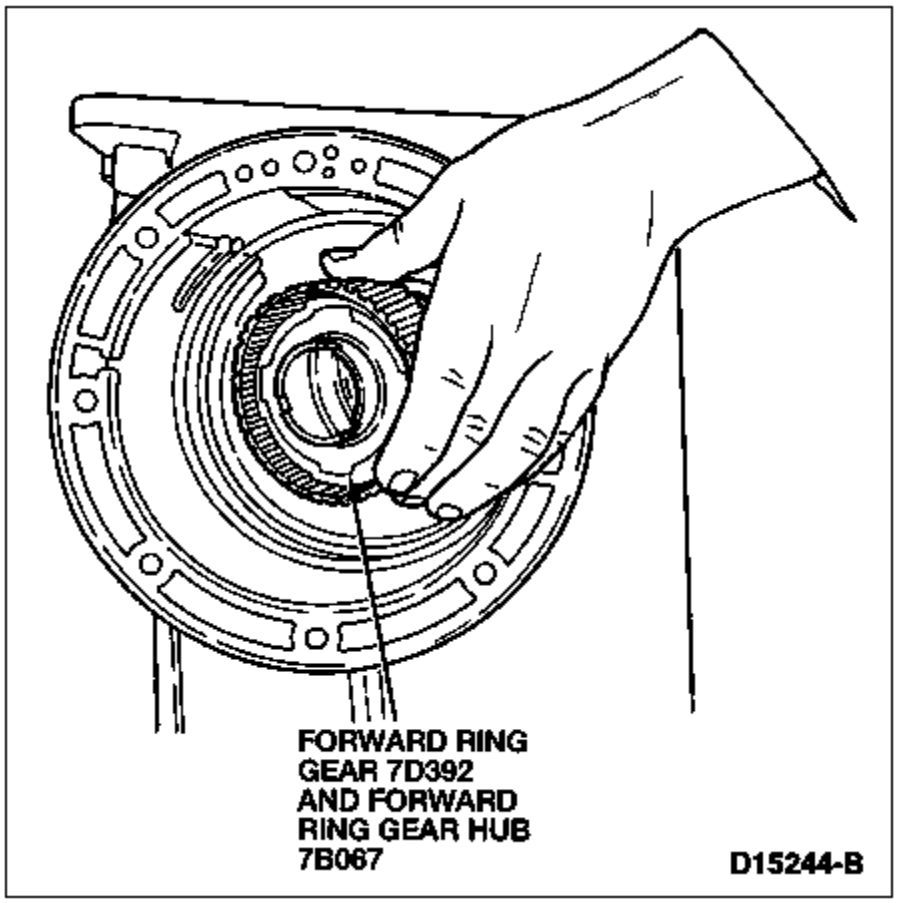
75. Remove No. 6A forward ring gear hub thrust bearing assembly.

tomsn048@gmail.com

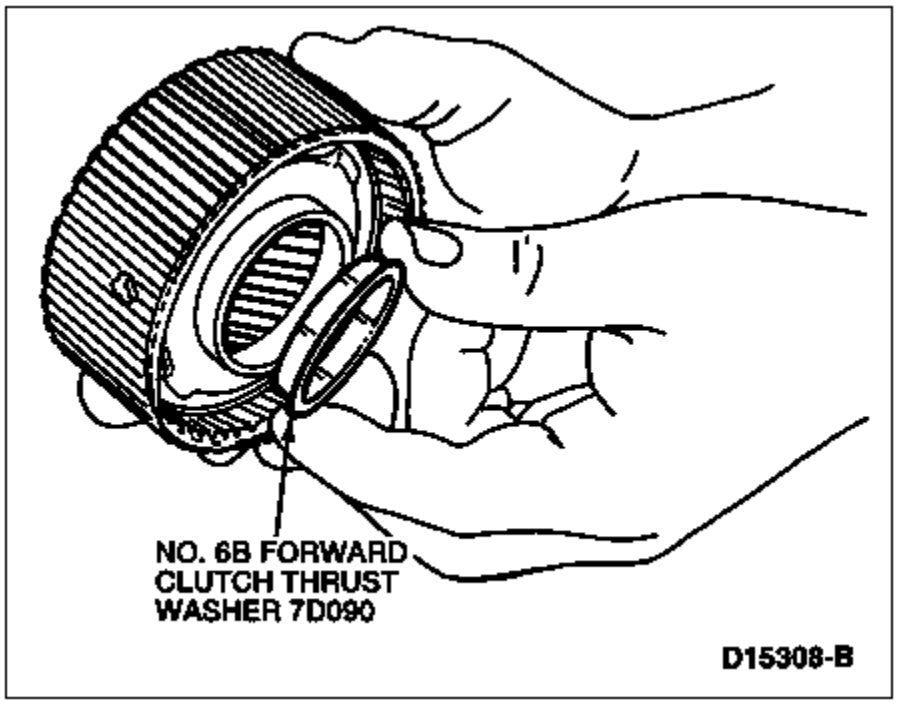


76. Remove the forward ring gear and forward ring gear hub.

tomsn048@gmail.com



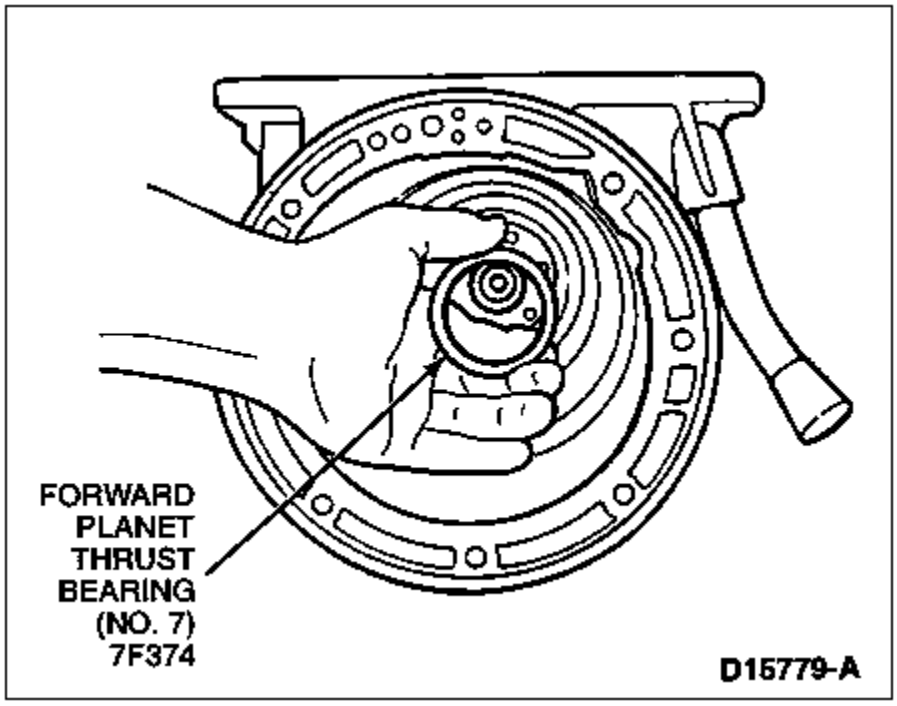
77. Remove No. 6B forward clutch thrust washer.



tomsn048@gmail.com

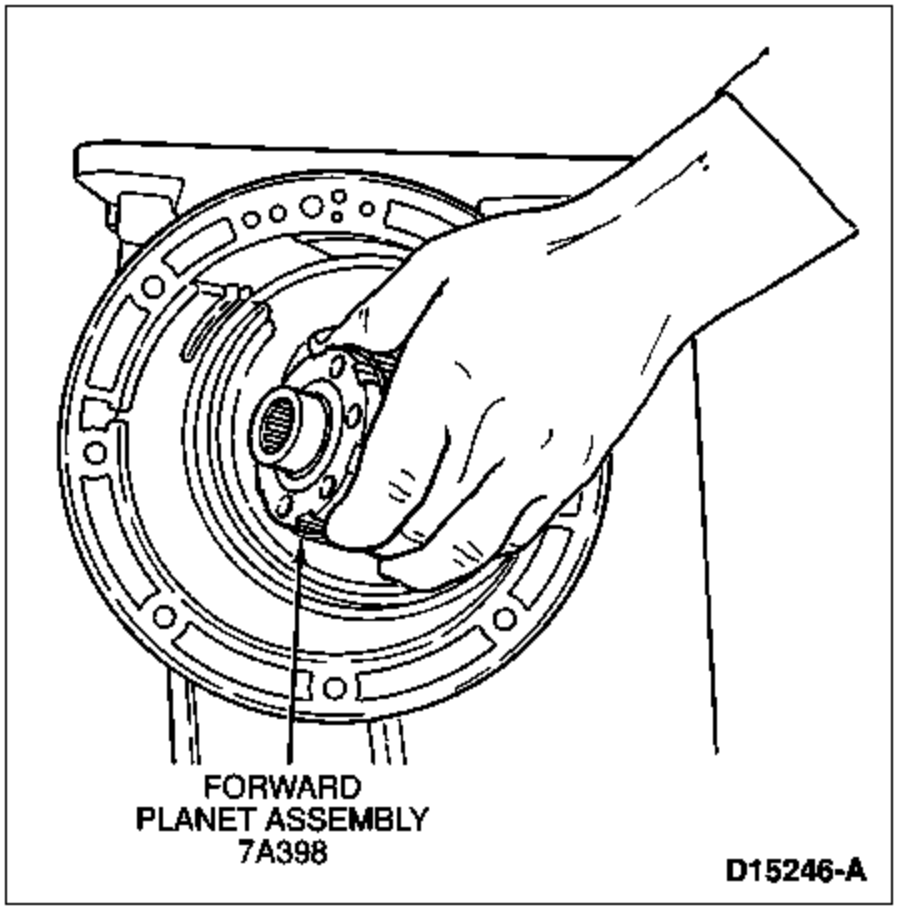
78. **NOTE: Check black oxidized side during removal to ensure correct placement during reassembly. Black oxidized side must be toward planetary assembly. The uncoated side must face up.**

    Remove the No. 7 forward planetary thrust bearing.



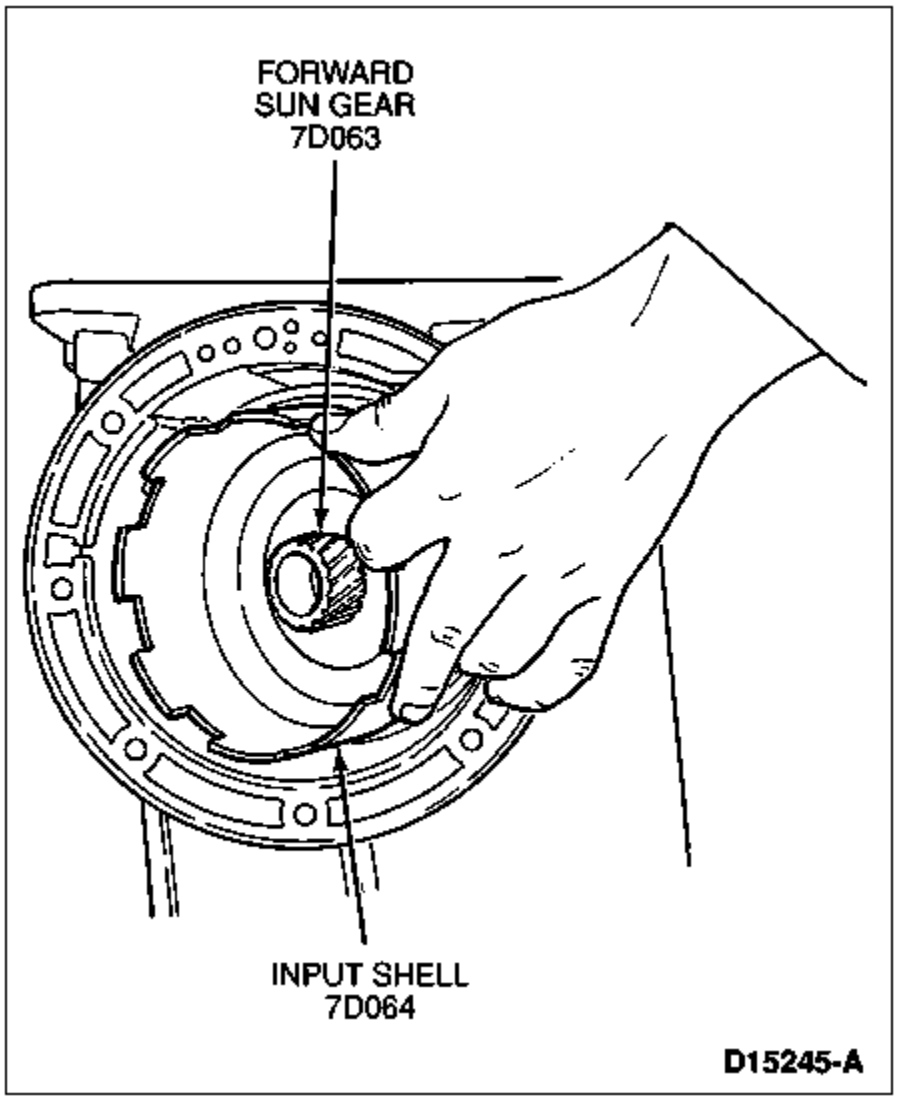
79. Remove the forward planetary assembly.

tomsn048@gmail.com



80. Remove the input shell with forward sun gear.

tomsn048@gmail.com



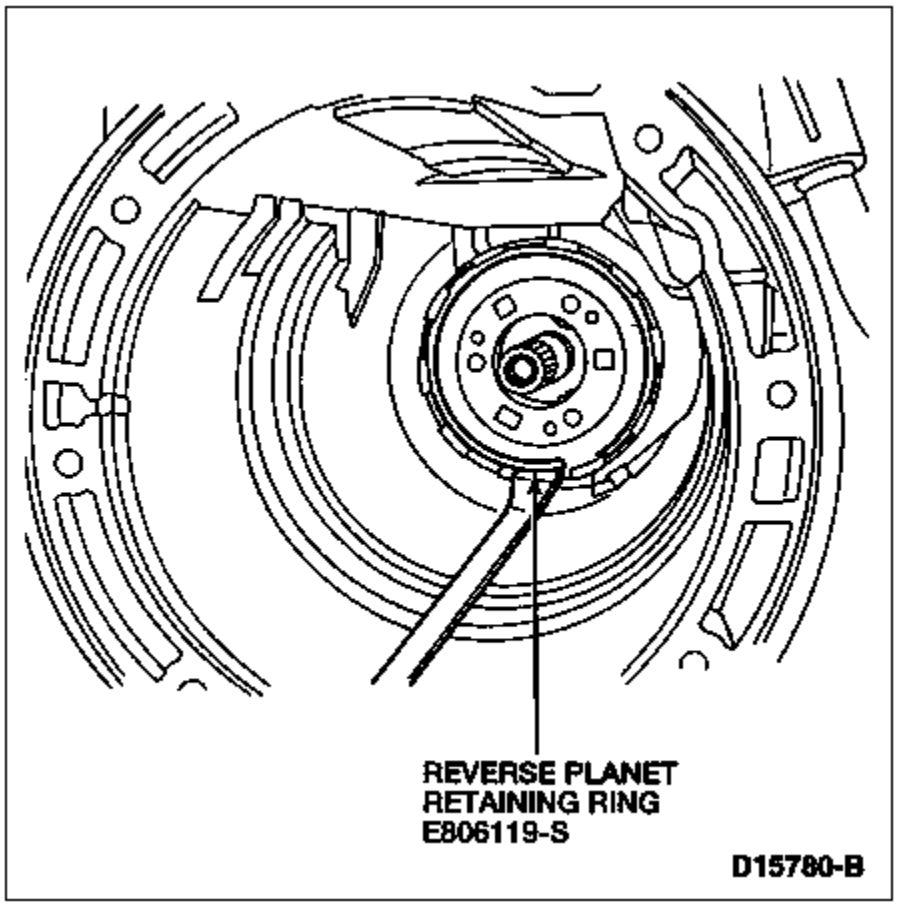
81. **NOTE: Tag and identify the No. 8 thrust bearing for assembly.**

Remove the No. 8 thrust bearing from the reverse planetary assembly.

tomsn048@gmail.com

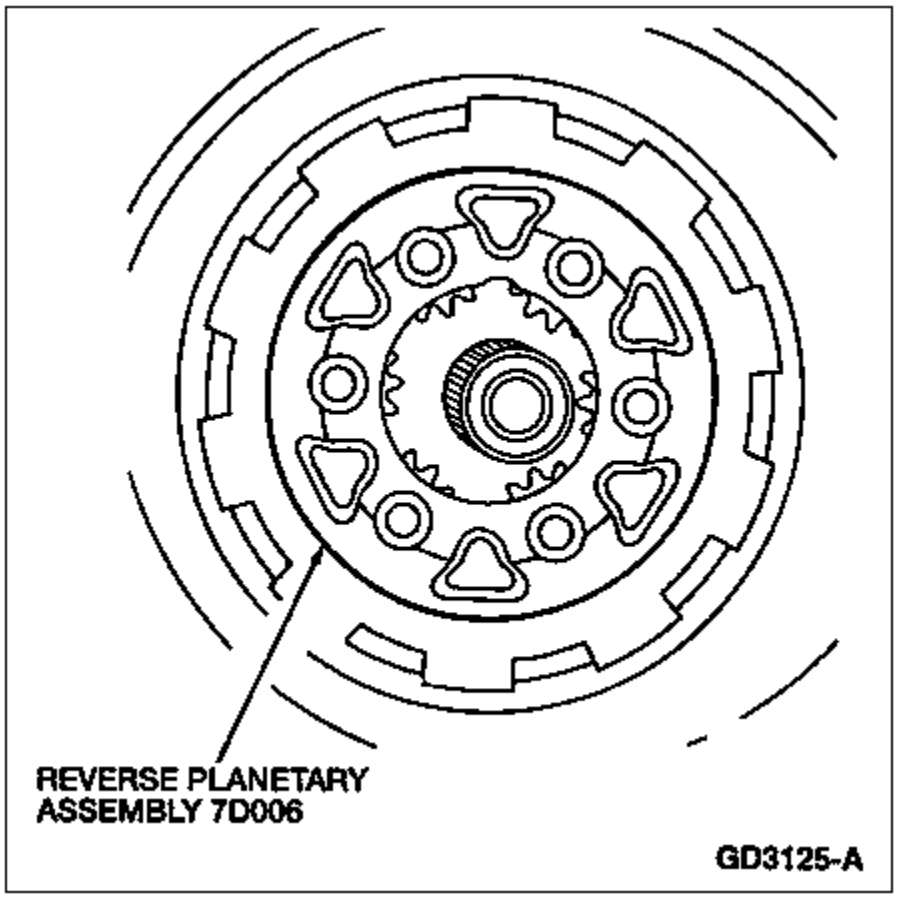
82. Remove the reverse planetary retaining ring.

tomsn048@gmail.com



83. Remove the reverse planetary assembly.

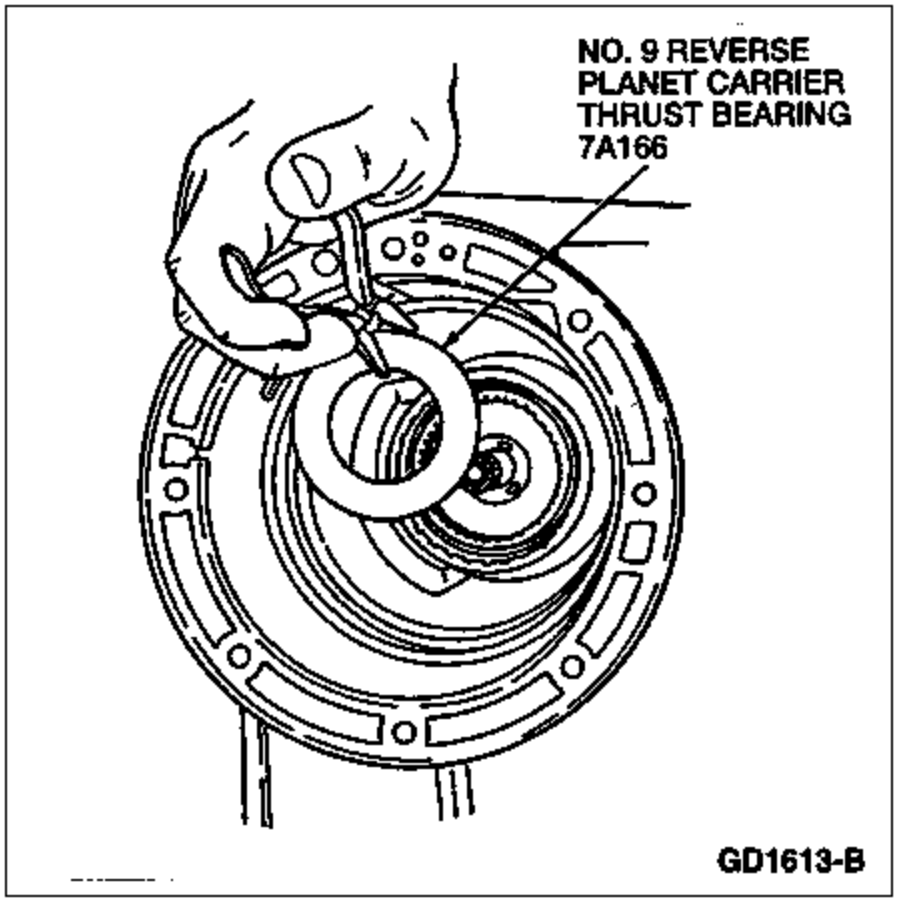
tomsn048@gmail.com



84. **NOTE: Tag and identify for reassembly.**

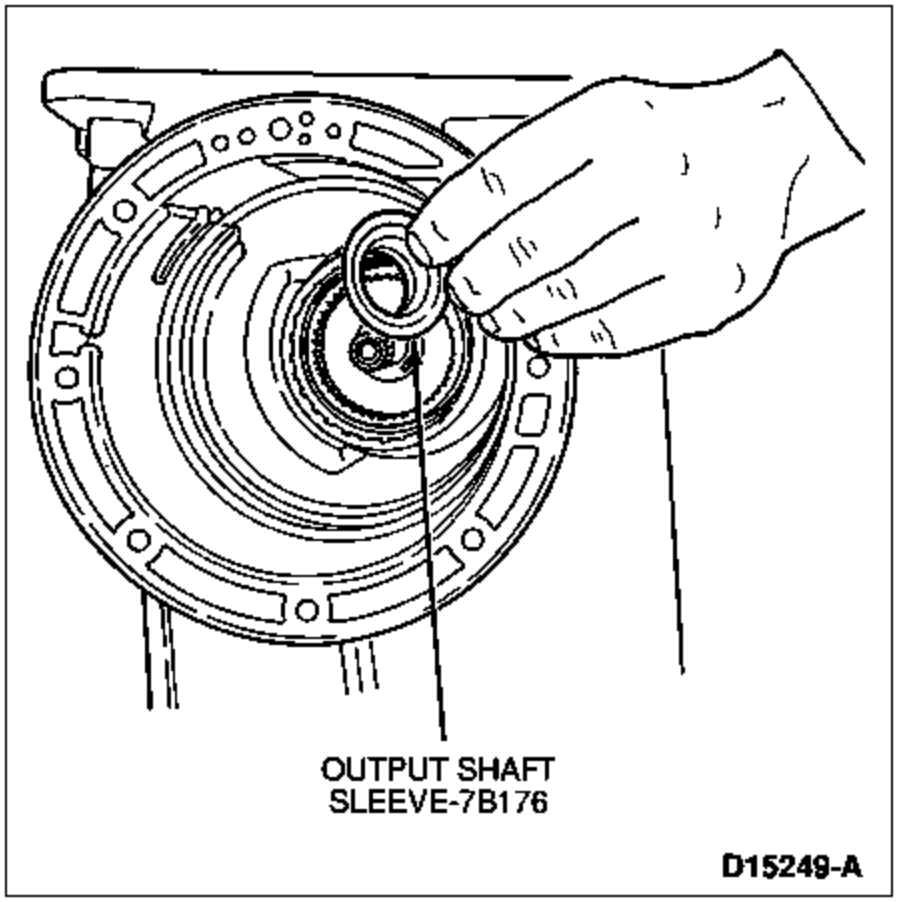
Remove the No. 9 reverse planetary carrier thrust bearing.

tomsn048@gmail.com



85. Remove the output shaft sleeve.

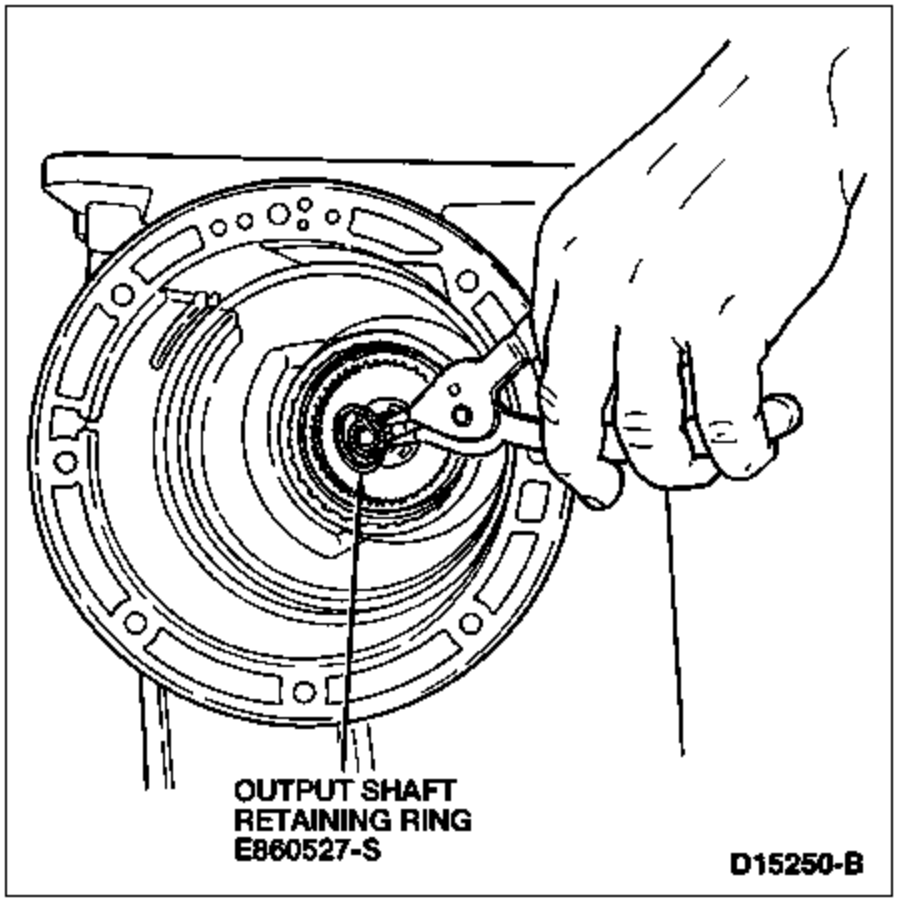
tomsn048@gmail.com



86. **CAUTION: Discard the output shaft retaining ring. A new retaining ring must be used for assembly.**

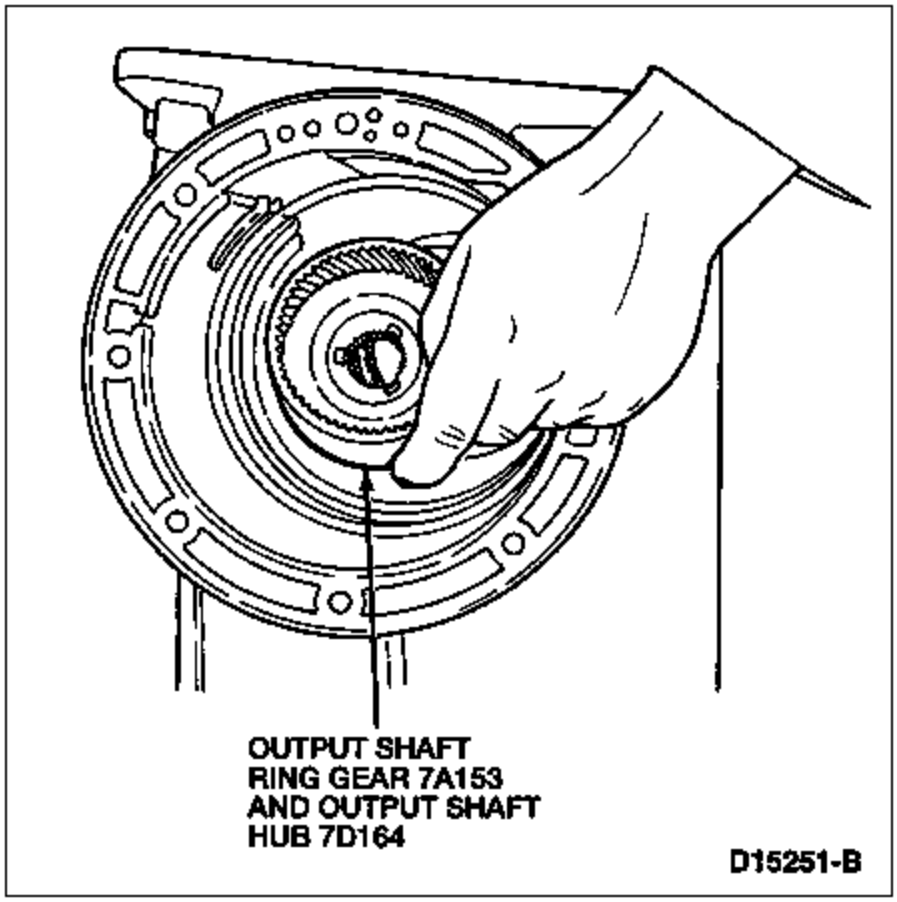
Remove the output shaft retaining ring from inside the case on the output shaft.

tomsn048@gmail.com



87. Remove the output shaft ring gear and output shaft hub.

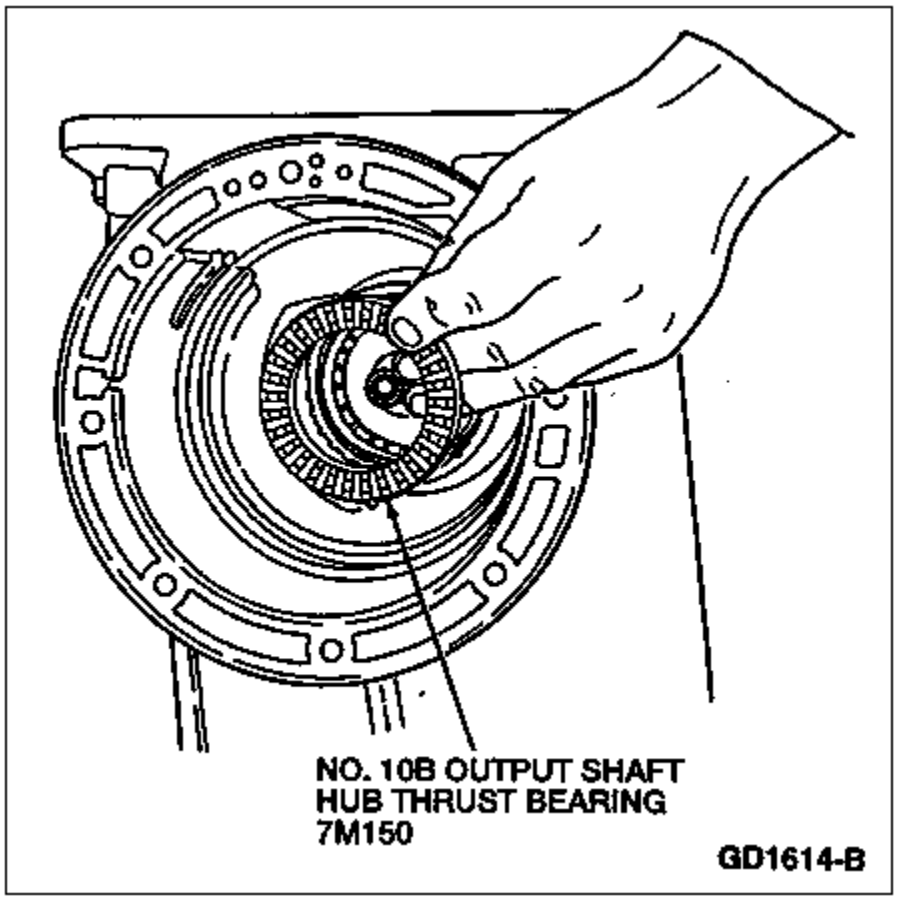
tomsn048@gmail.com



88. **NOTE: Tag and identify the No. 10B output shaft hub thrust bearing for assembly.**

Remove the No. 10B output shaft hub thrust bearing.

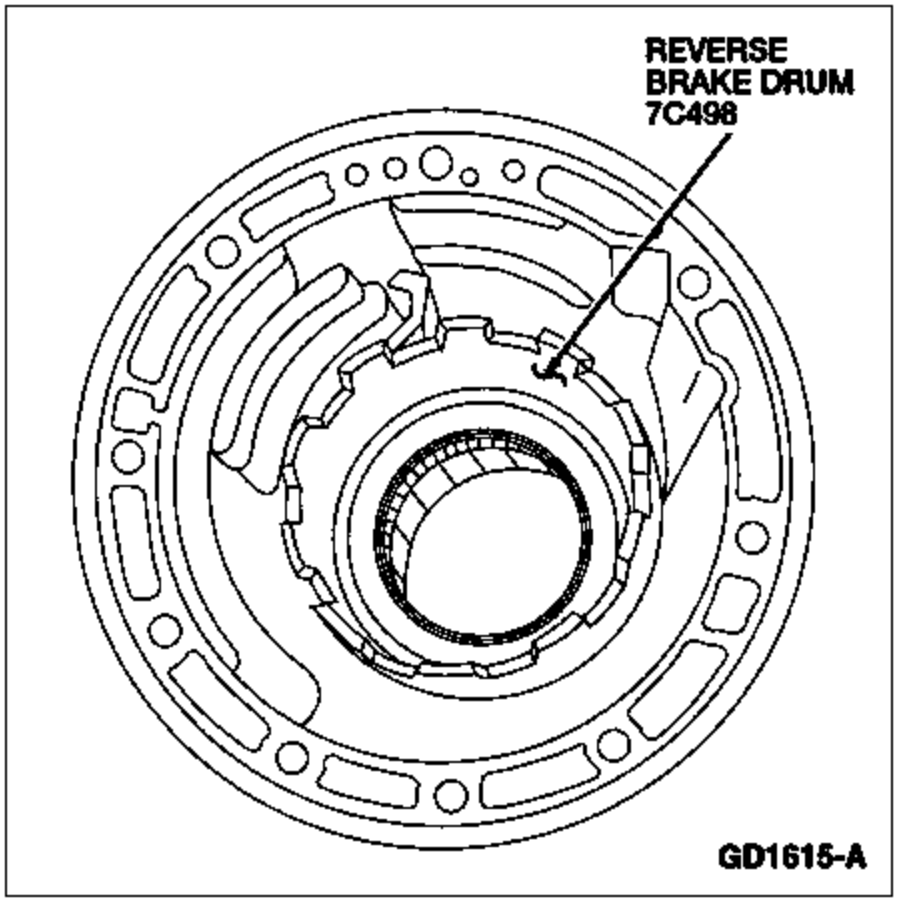
tomsn048@gmail.com



89. **NOTE: The inner race of the rear one-way clutch is not removable. It is serviced in the case.**

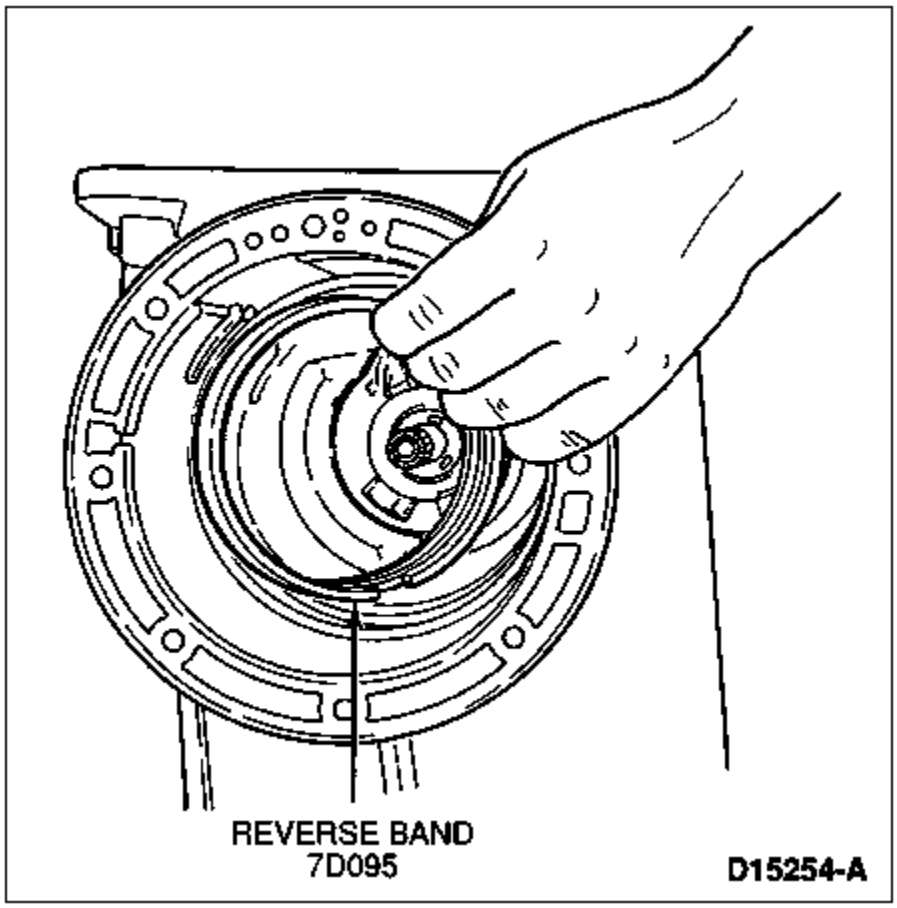
Remove the reverse brake drum and the one-way clutch assembly.

tomsn048@gmail.com



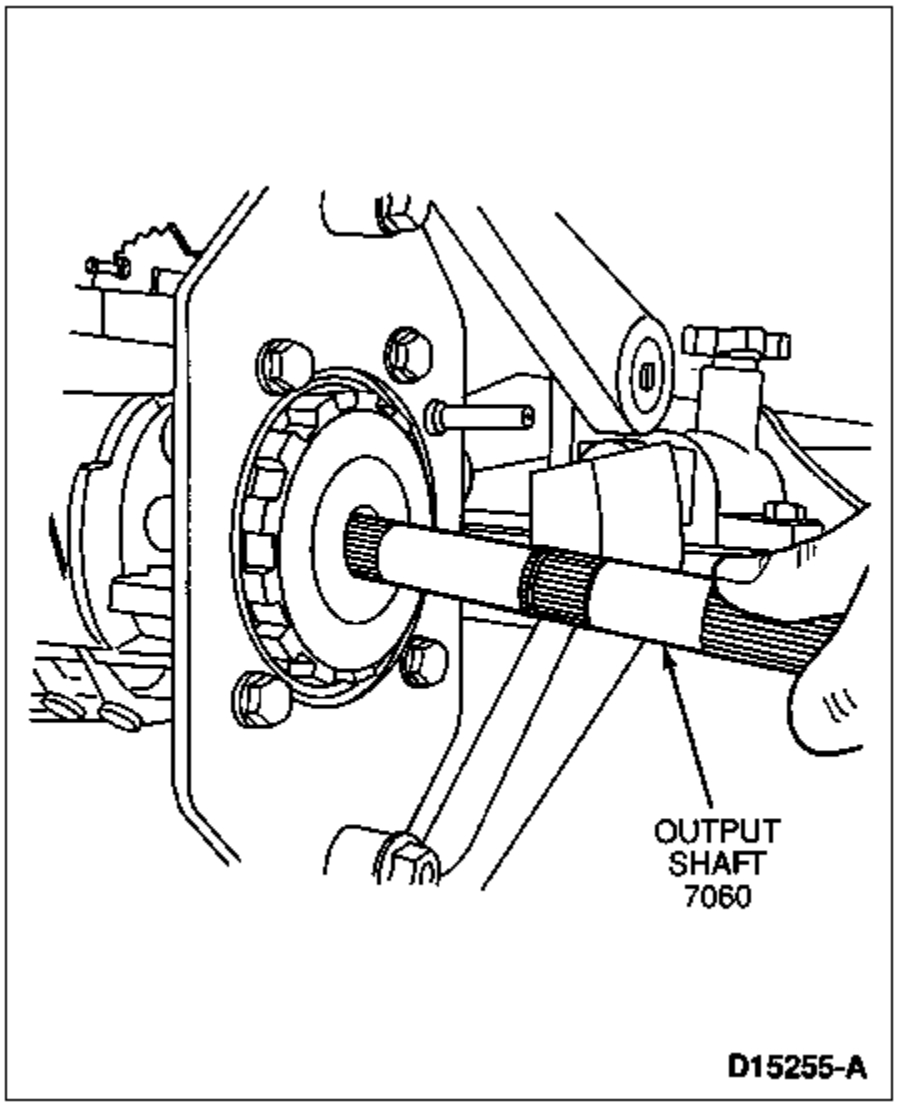
90. Remove the reverse band.

tomsn048@gmail.com



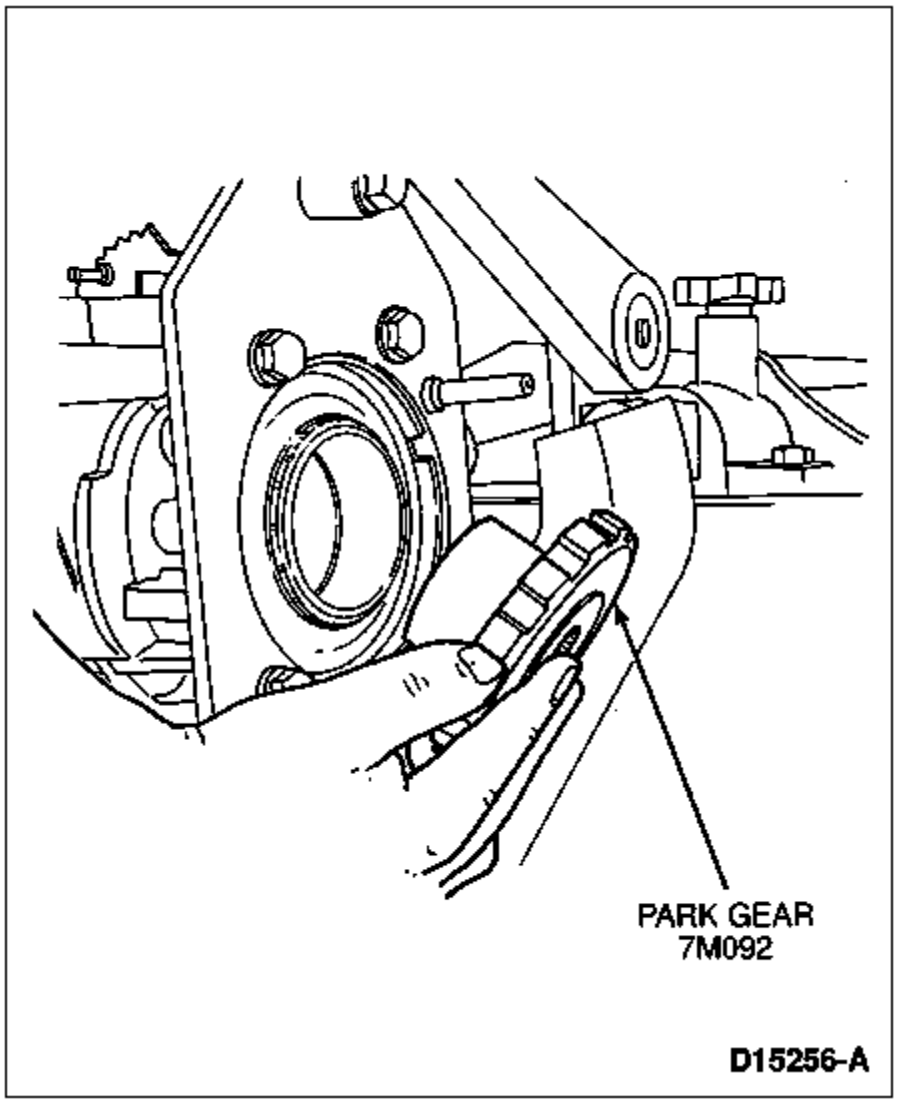
91. Remove the output shaft.

tomsn048@gmail.com



92. Remove the park gear.

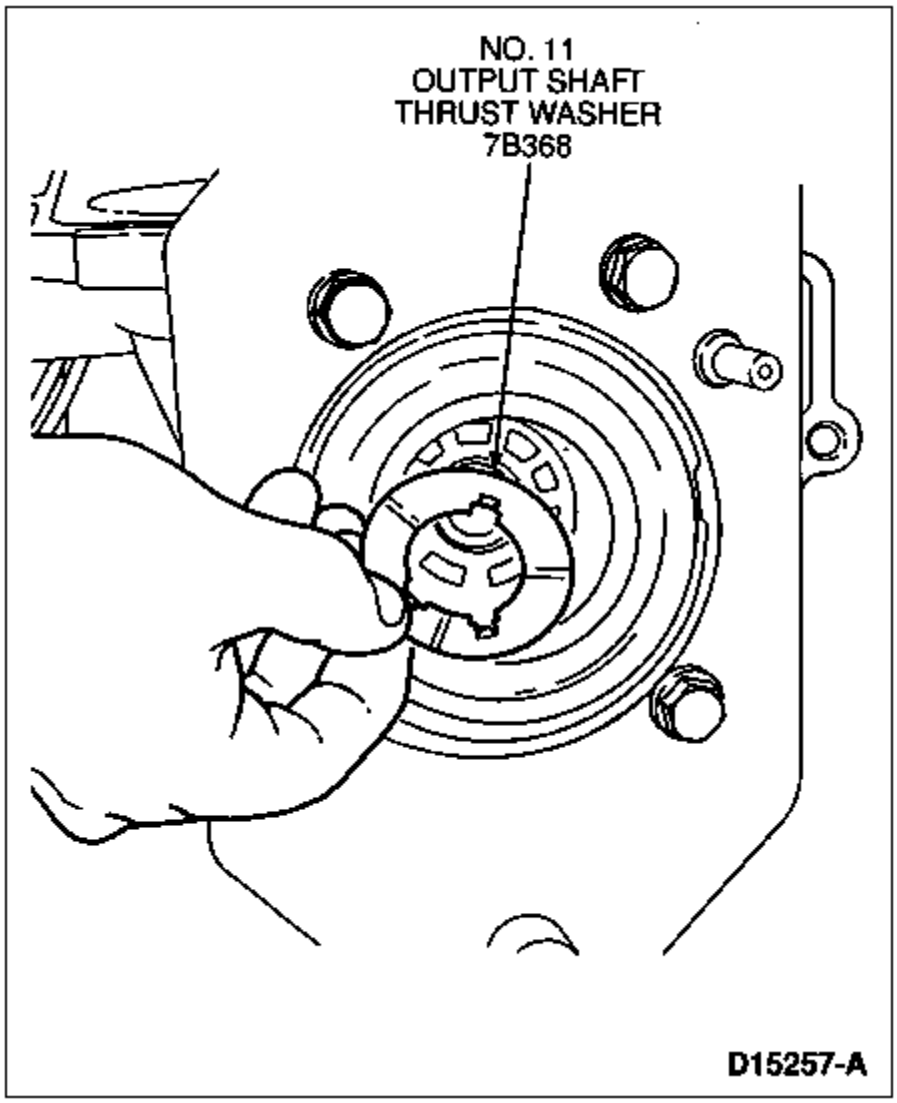
tomsn048@gmail.com



93. **NOTE: Tag and identify the No. 11 output shaft thrust washer for assembly.**

Remove the No. 11 output shaft thrust washer.

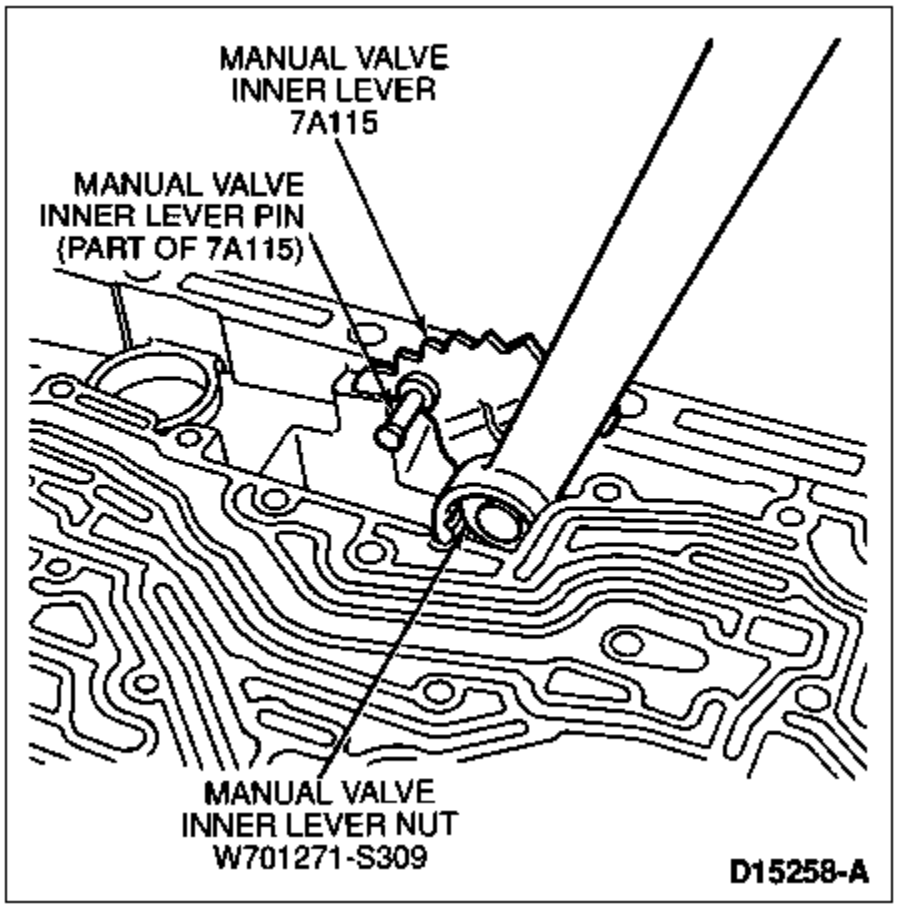
tomsn048@gmail.com



94. **CAUTION: To avoid damage, make sure wrench does not strike the manual valve inner lever pin.**

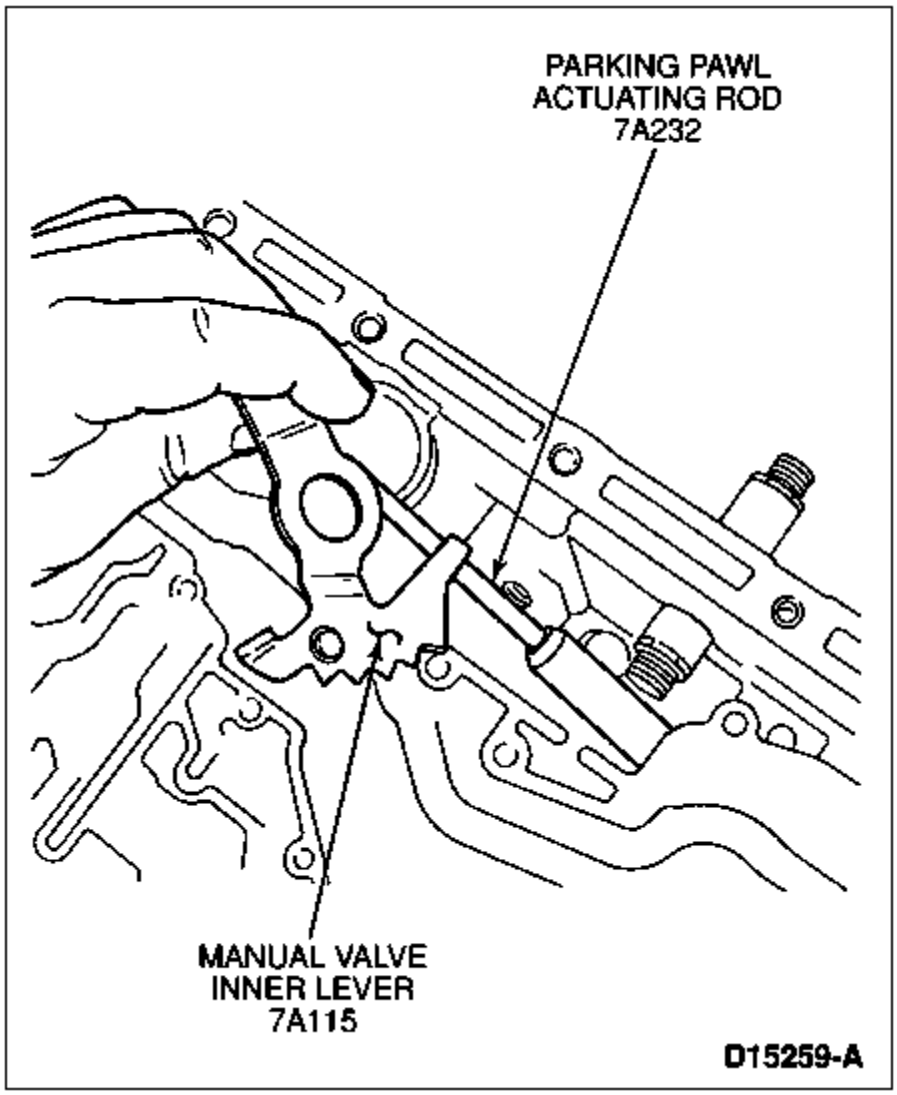
Remove the manual valve inner lever nut.

tomsn048@gmail.com



95. Remove the manual valve inner lever and parking pawl actuating rod assembly.

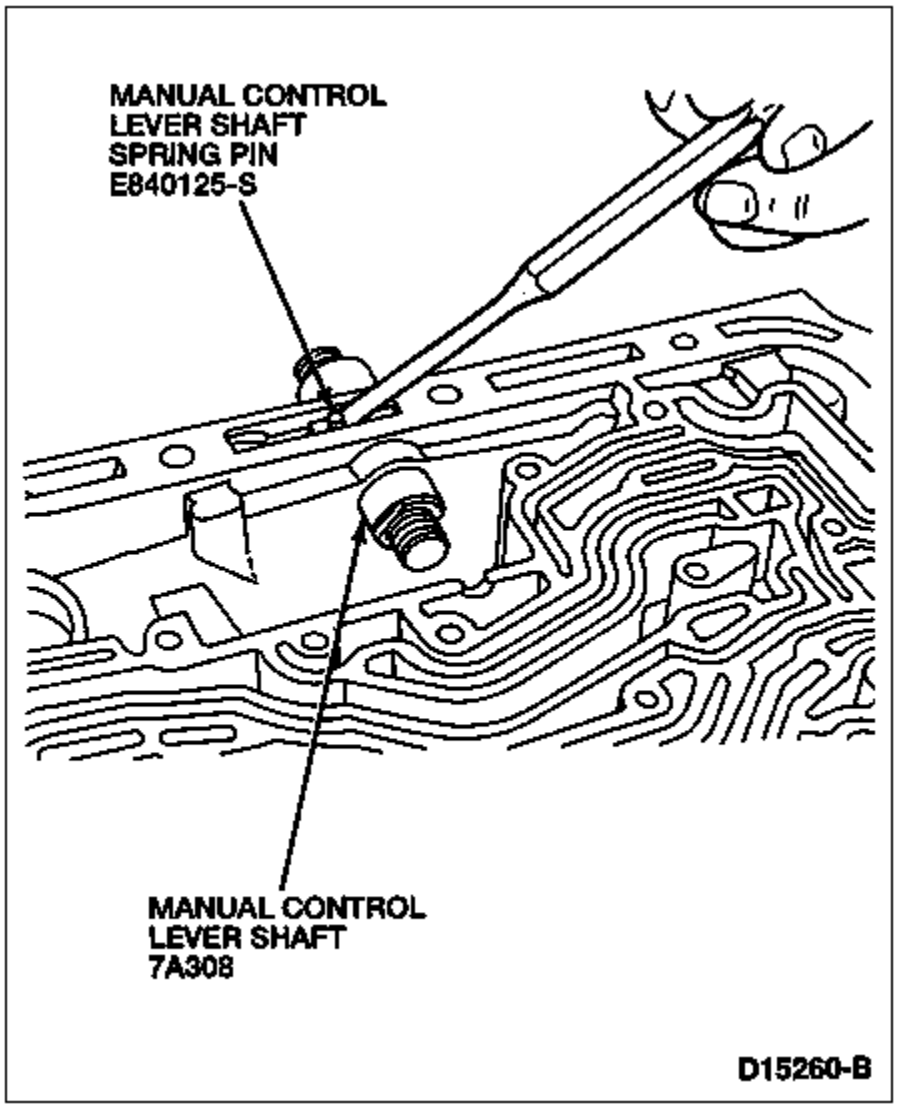
tomsn048@gmail.com



96. **CAUTION: Do not damage the case fluid pan rail.**

Using a small hammer and drift, tap lightly on each side of the manual control lever shaft retaining pin (two or three times). This will loosen the pin prior to removal.

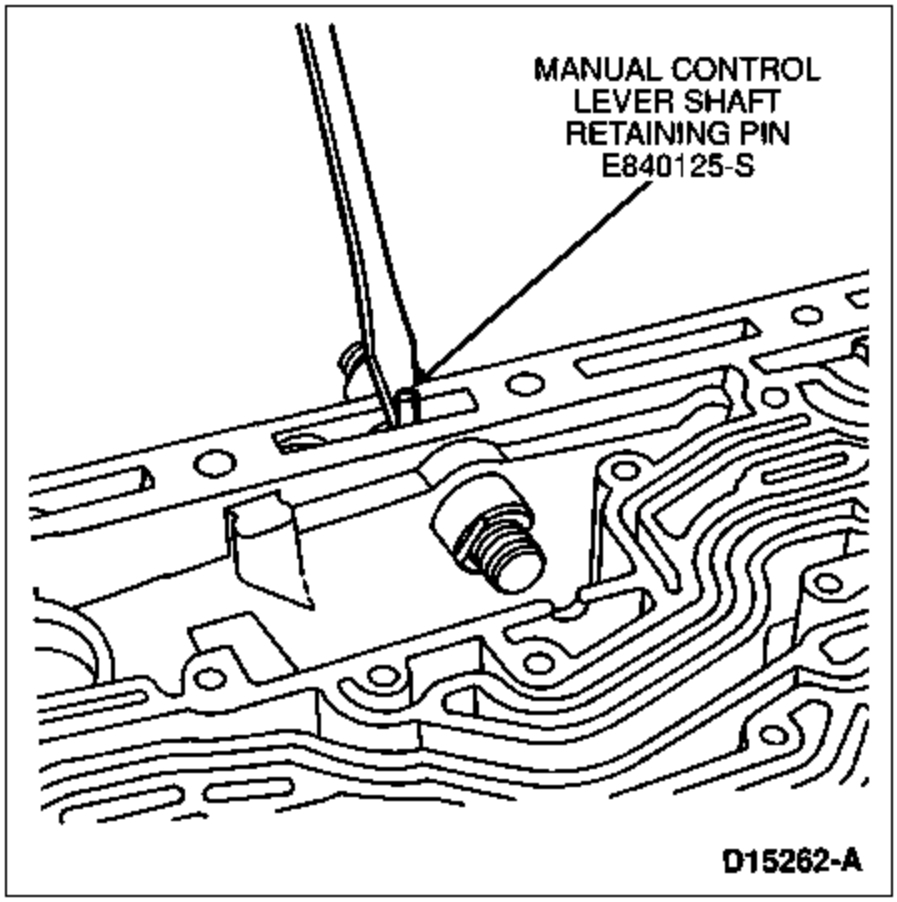
tomsn048@gmail.com



97. **CAUTION: Do not damage the case fluid pan rail.**

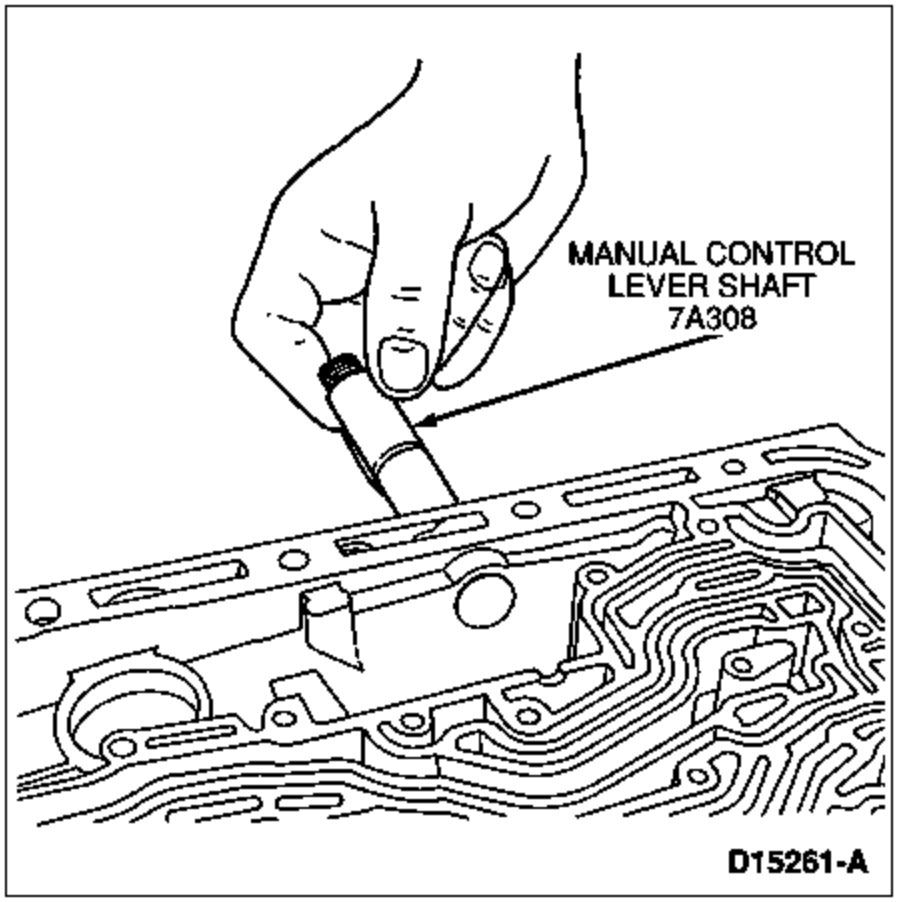
Remove the manual control lever shaft retaining pin with a narrow, sharp edged screwdriver from the side as shown.

tomsn048@gmail.com



98. Remove the manual control lever shaft.

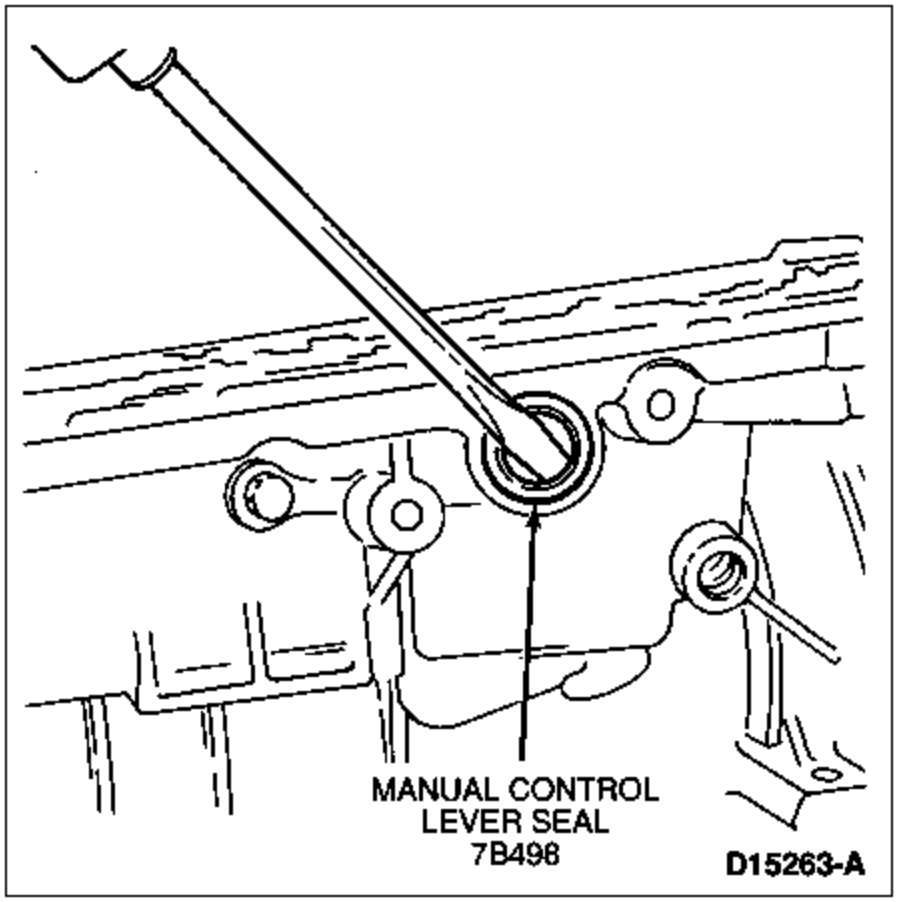
tomsn048@gmail.com



99. **CAUTION: Do not damage the bore.**

Remove the manual control lever seal.

tomsn048@gmail.com



tomsn048@gmail.com

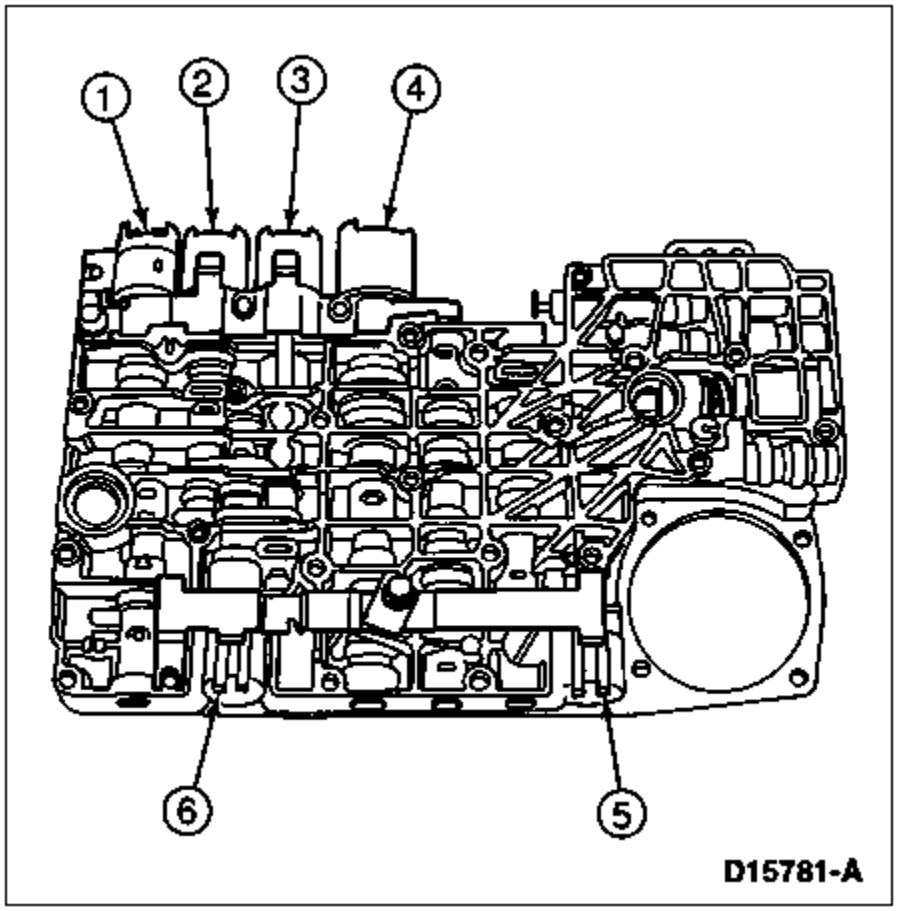
Disassembly

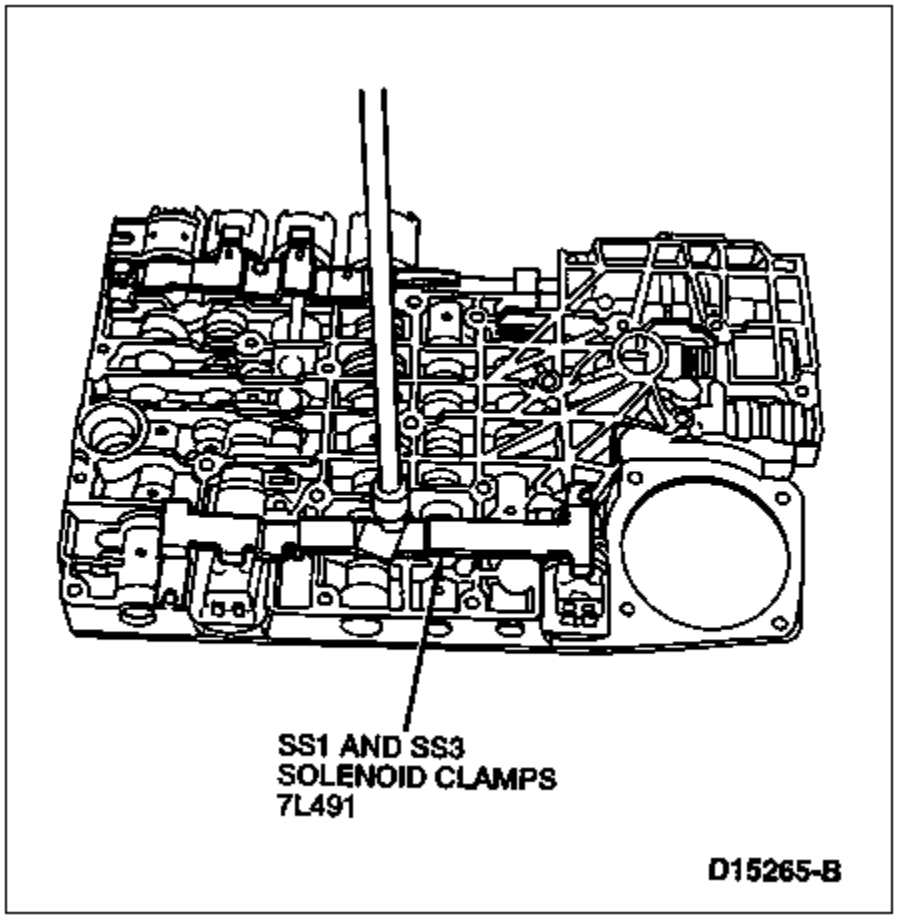


Item	Part Number	Description
1	7F037	Torque Converter Clutch Solenoid Assembly
2	7G484	Coast Clutch Solenoid Assembly
3	7G484	Shift Solenoid 2 Assembly
4	7H144	EPC Solenoid Assembly
5	7G484	Shift Solenoid 1 Assembly
6	7G484	Shift Solenoid 3 Assembly

1. **CAUTION: SS3 may pop out of its bore. This may damage the solenoid.**

   Use a 10 mm socket to remove the SS1 and SS3 solenoid clamp screws. Remove the solenoid clamp and the solenoids.

tomsn048@gmail.com

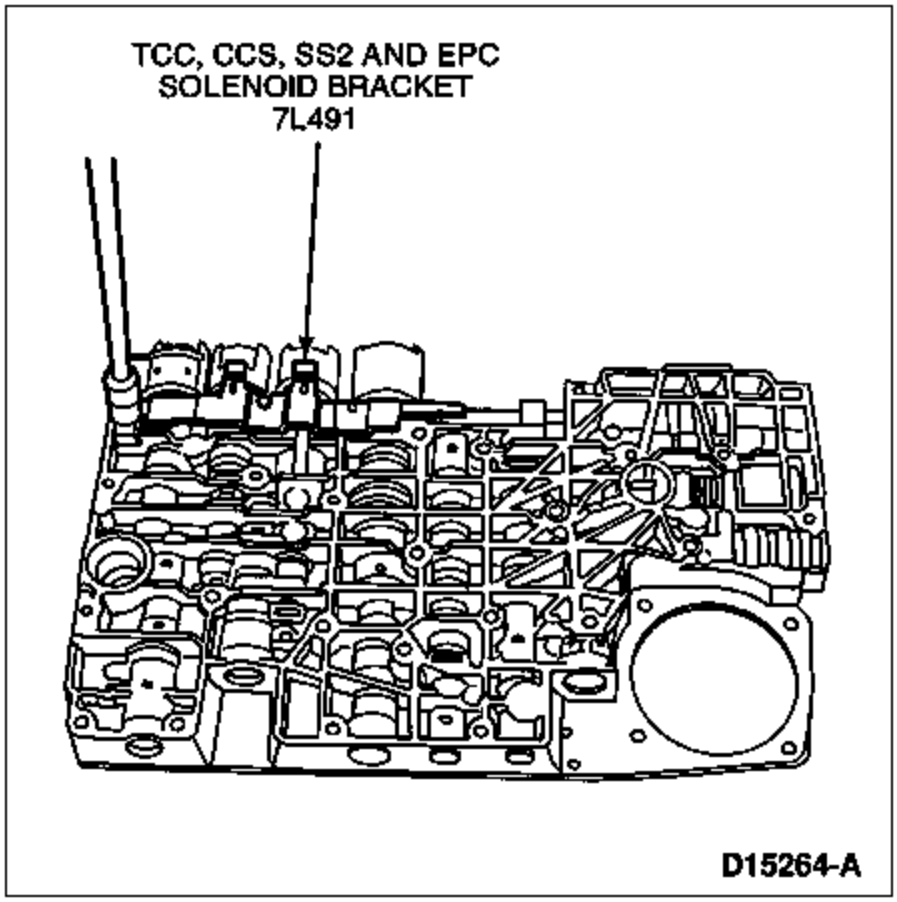


2. **NOTE: The TCC solenoid may pop out of its bore.**

   The converter modulator valve may come out after the TCC solenoid has been removed. This may damage the solenoid or converter modulator valve.

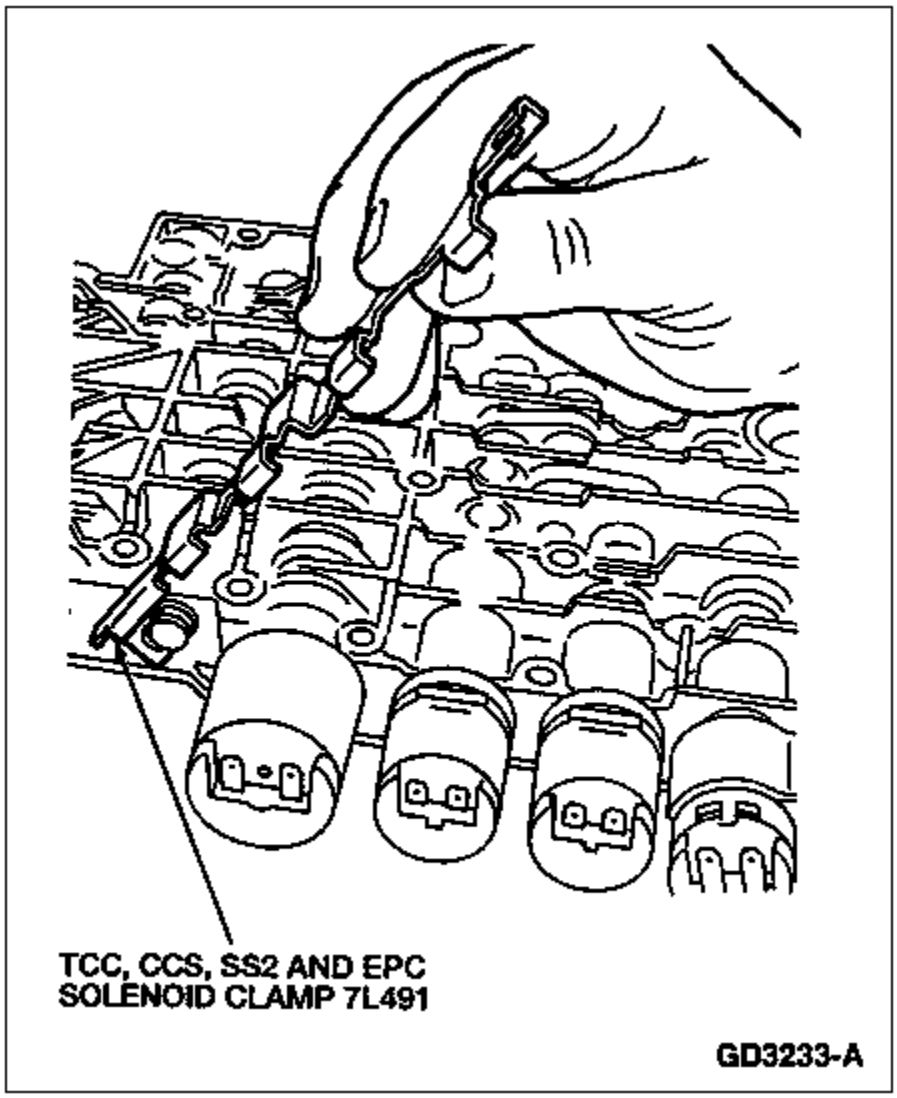
   Remove the TCC, CCS, SS2 and EPC solenoid clamp screw.

tomsn048@gmail.com



3. Remove the solenoid clamp and the solenoids.

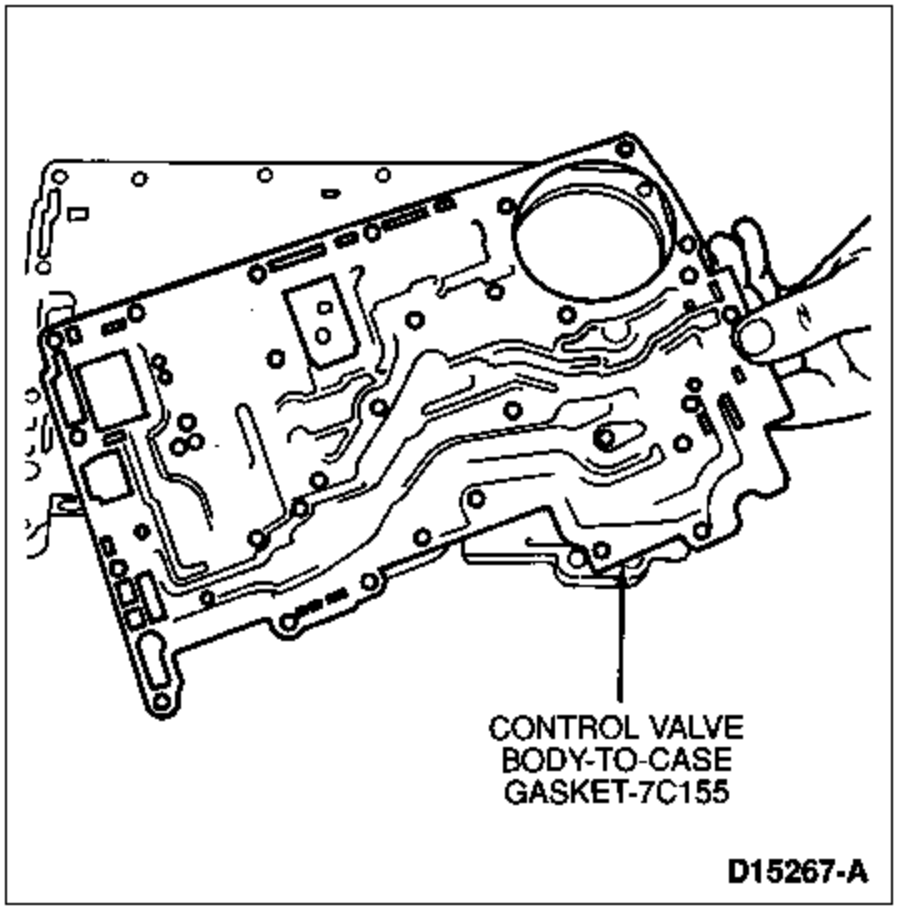
tomsn048@gmail.com



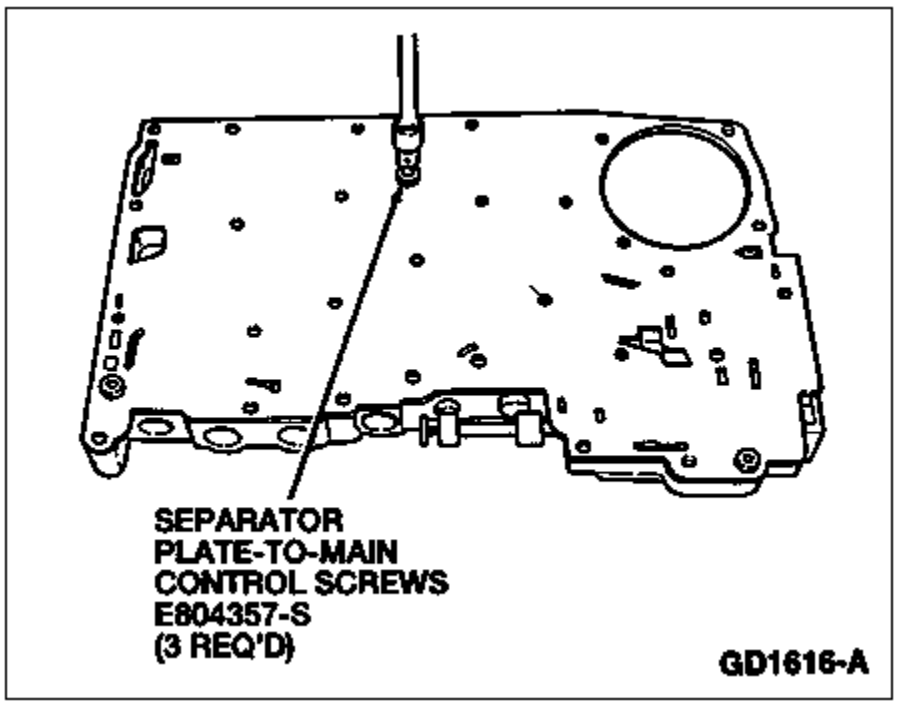
4. **CAUTION: Valves may come out when rotating the main control.**

   Carefully rotate the main control assembly so that the control valve body-to-case gasket is facing up. Remove and discard the control valve body-to-case gasket.

tomsn048@gmail.com



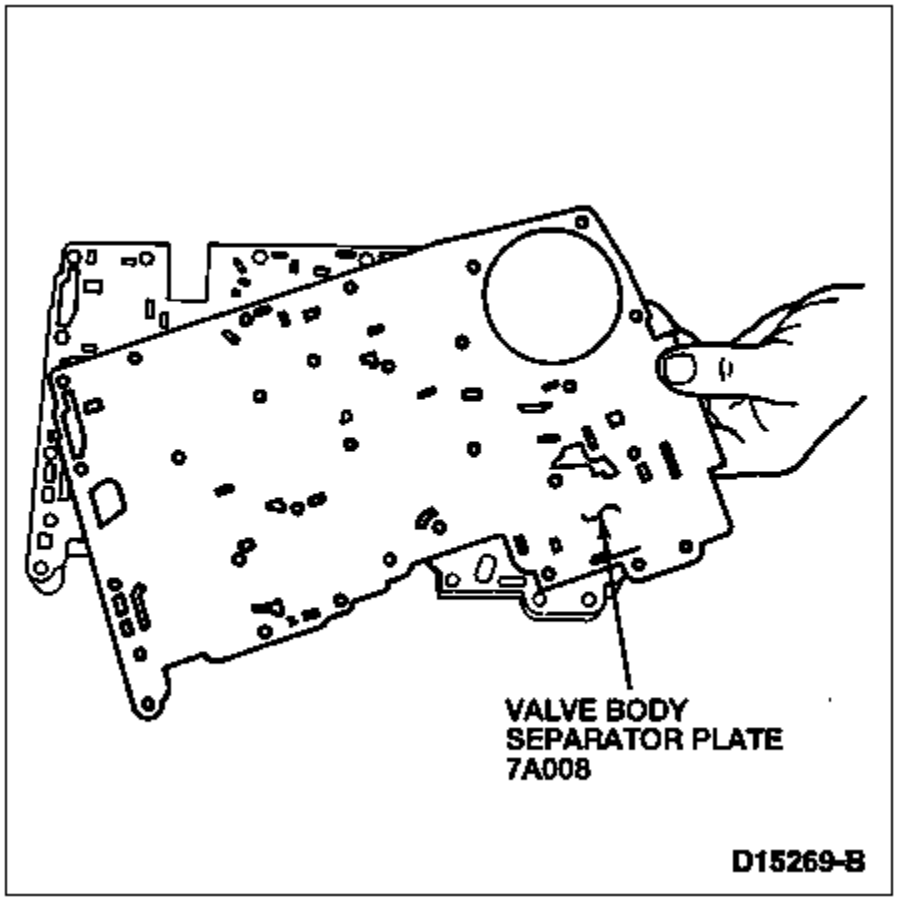
5. Use a T30 Torx® bit to remove the three separator plate-to-main control screws.



tomsn048@gmail.com

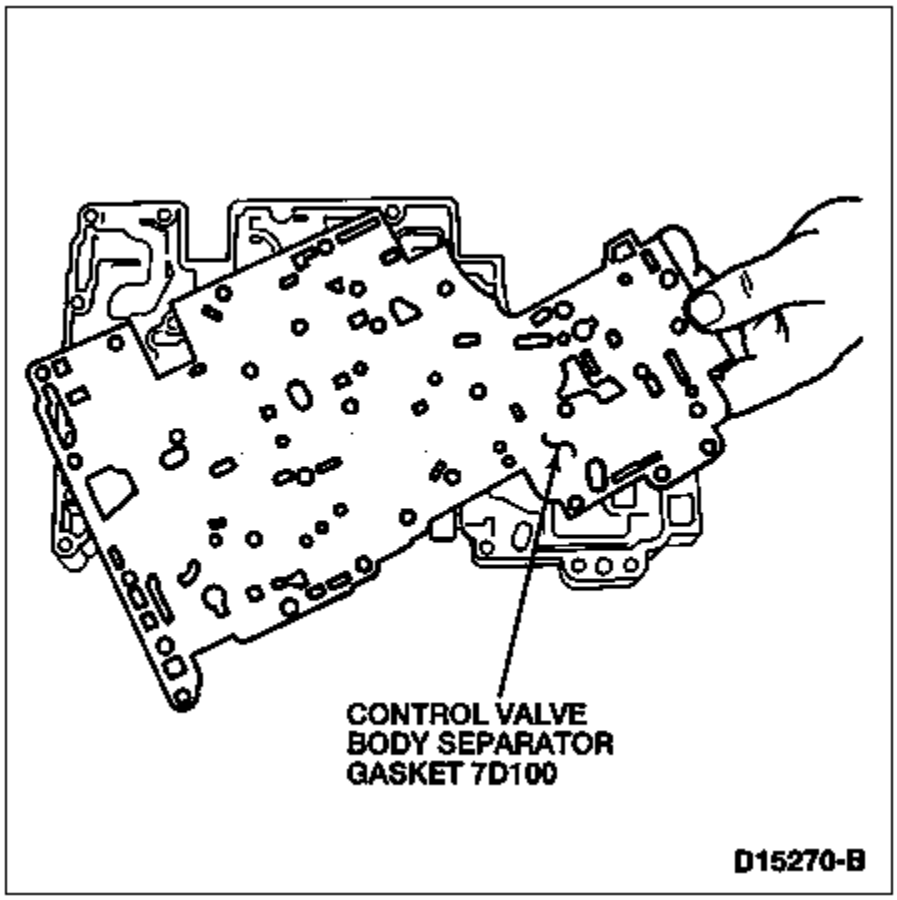
6. **CAUTION: The extension housing lube orifice and relief valves may stick to the separator plate.**

   Remove the valve body separator plate.



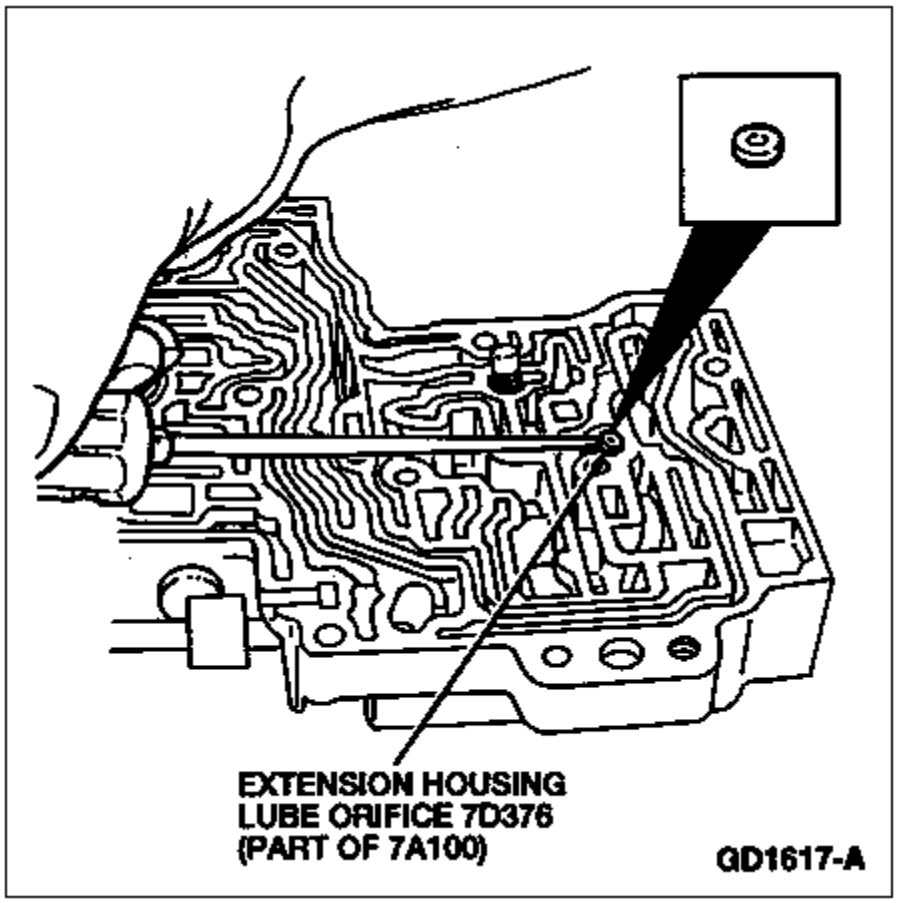
7. Remove and discard the control valve body separator gasket.

tomsn048@gmail.com

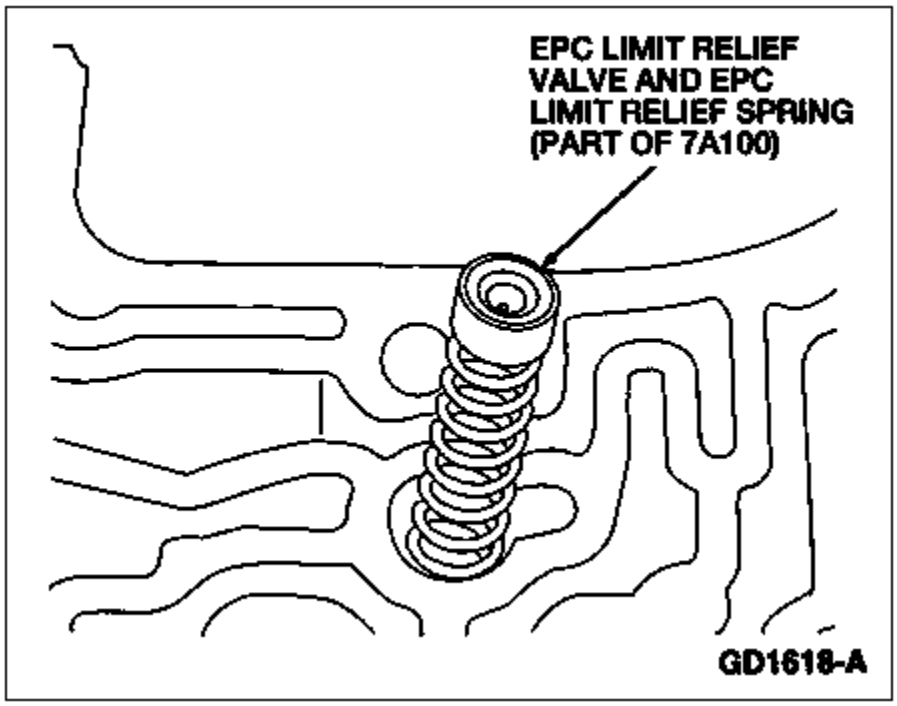


8. Carefully remove the extension housing lube orifice.

tomsn048@gmail.com

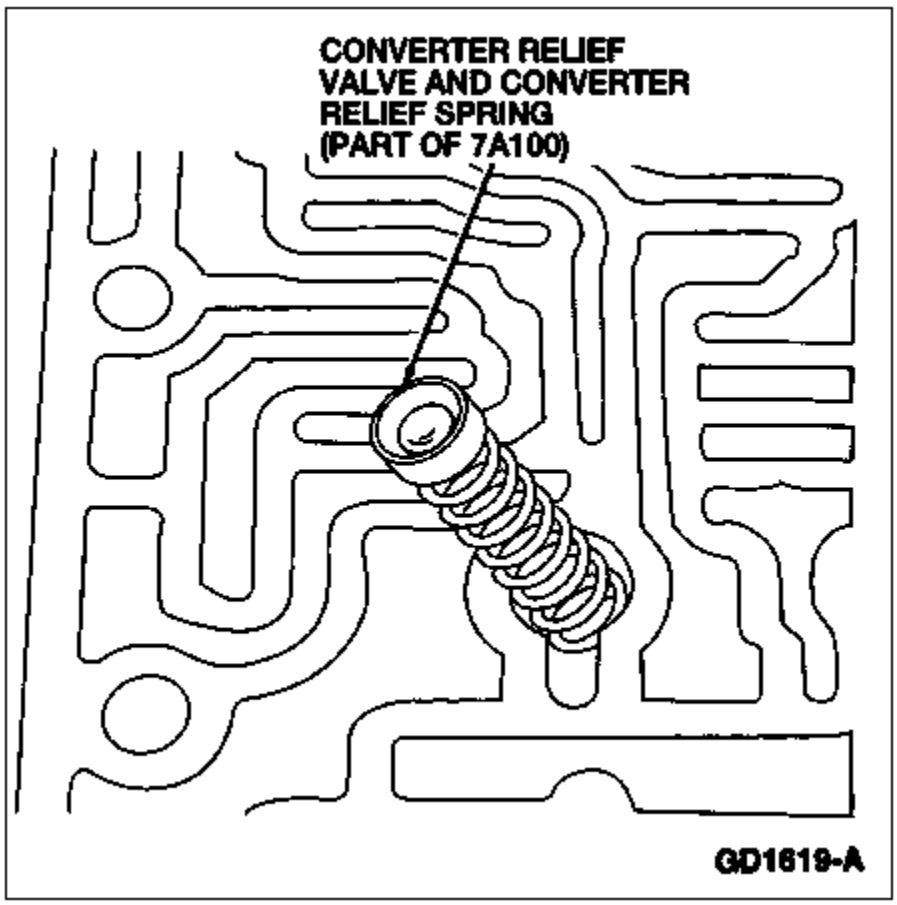


9. Remove the electronic pressure control (EPC) limit relief valve (metal-silver color) and spring.



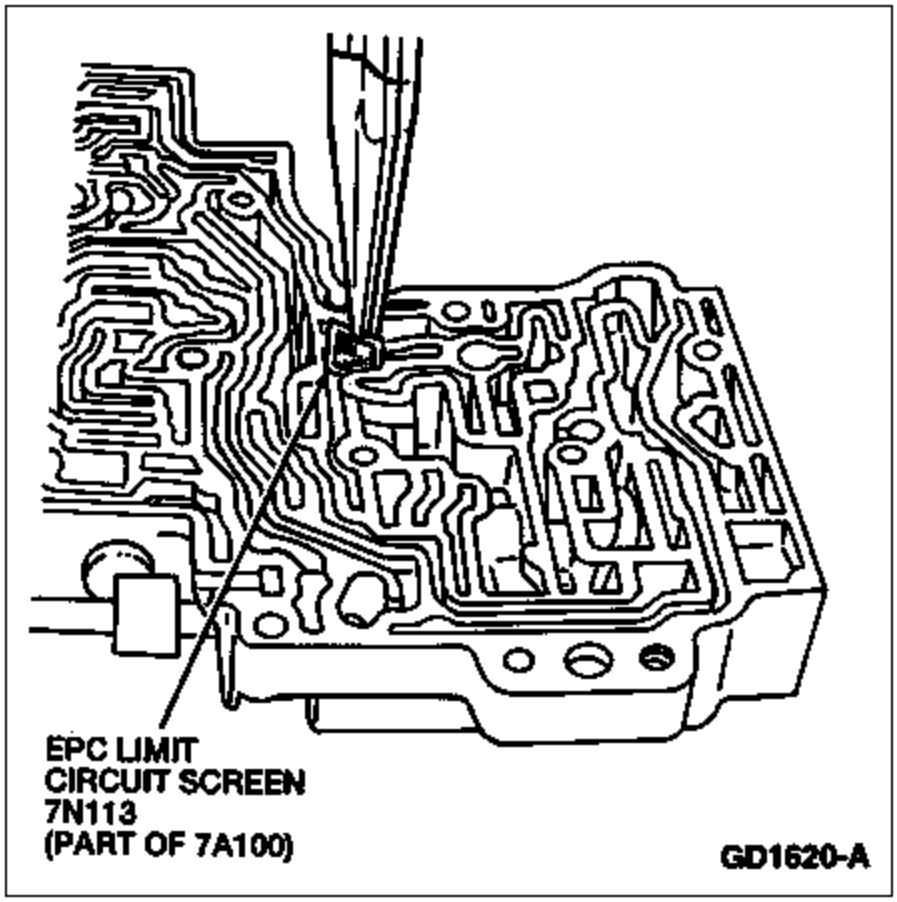
tomsn048@gmail.com

10. Remove the converter relief valve (plastic-dark color) and spring.



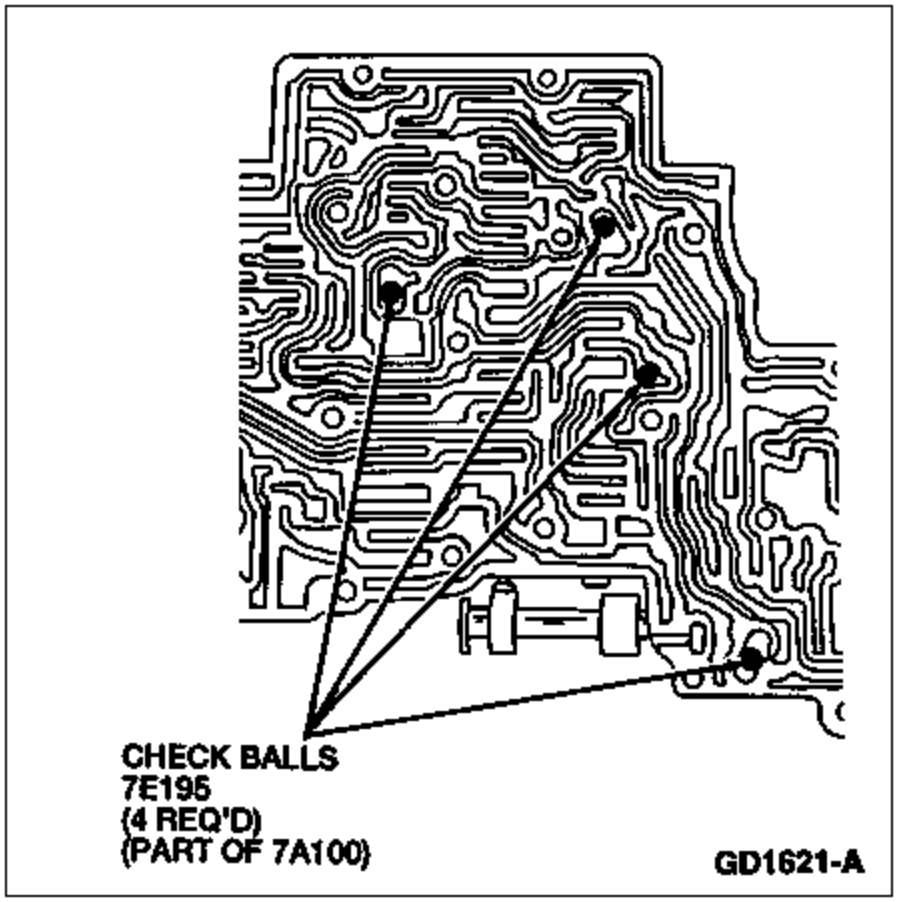
11. Remove the EPC limit circuit screen.

tomsn048@gmail.com



12. Remove the four check balls.

tomsn048@gmail.com



13. **CAUTION: Do not lose parts when cleaning or servicing.**

    Thoroughly clean all parts in solvent and blow dry with moisture-free compressed air.

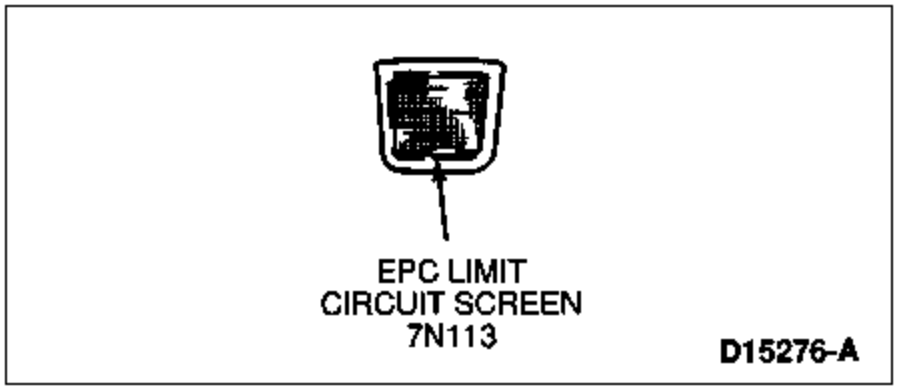
14. Inspect all valve and plug bores for scores. Check all fluid passages for obstructions. Inspect the check valve for free movement. Inspect all mating surfaces for burrs or distortion. Inspect all plugs and valves for burrs or scores. Replace the control valve body if the bores are scored or if the valves are scored beyond the point of being able to be cleaned.

15. Inspect all springs for distortion. Check all valves and plugs for free movement in their respective bores. Valves and plugs, when dry, must fall from their own weight in their respective bores.

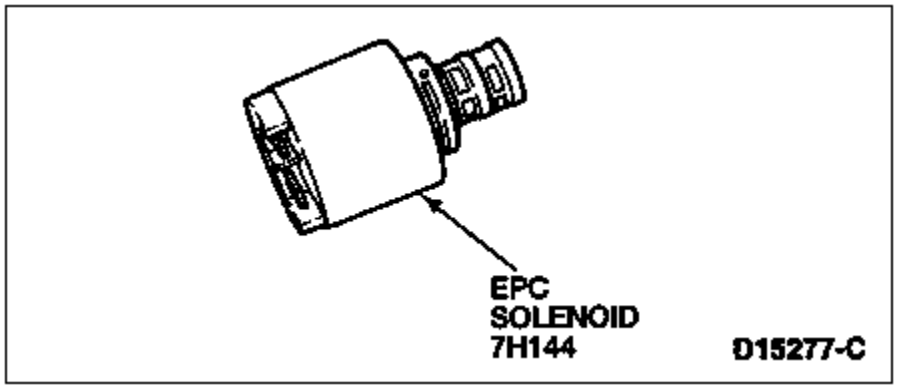
16. Roll the manual valve on a flat surface to check for a bent condition.

17. Clean and inspect the EPC limit circuit screen.

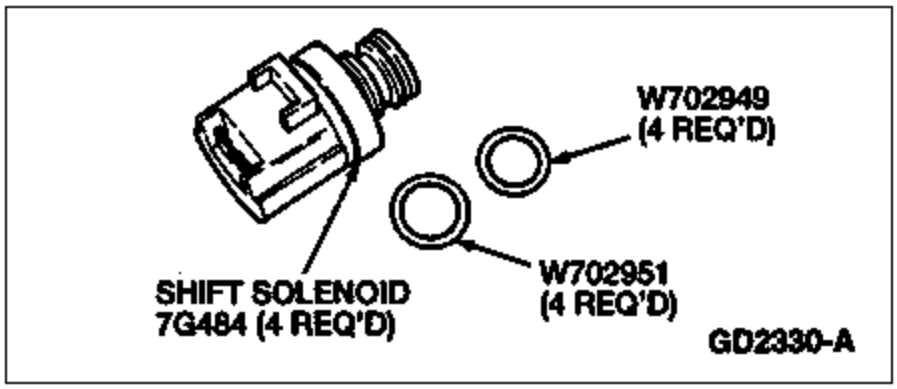
tomsn048@gmail.com



18. Clean and inspect the EPC solenoid screens.

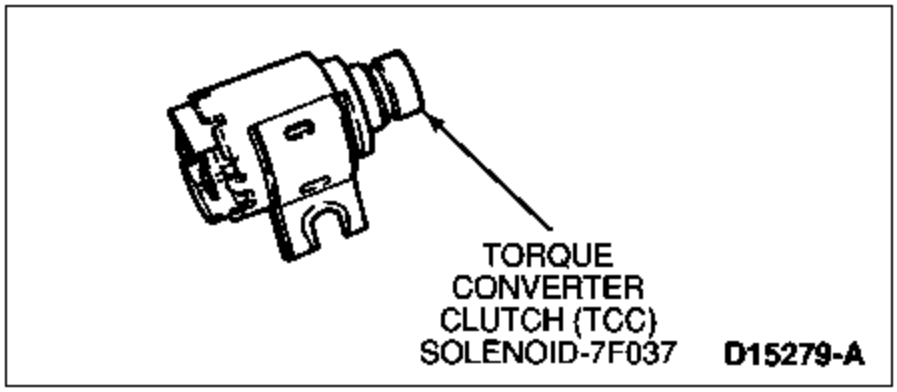


19. Remove and replace all shift and coast clutch solenoid O-rings.



20. Clean and inspect the torque converter clutch (TCC) solenoid.

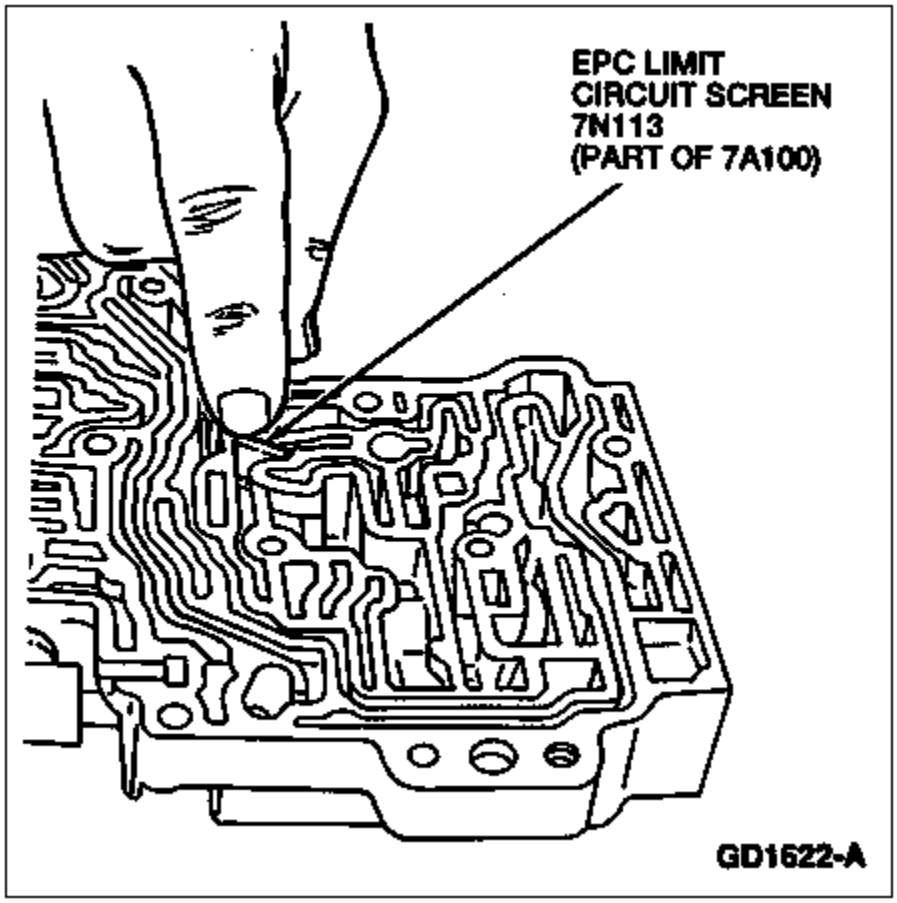
tomsn048@gmail.com



Assembly

1. **CAUTION: Make sure that the screen is properly located.**

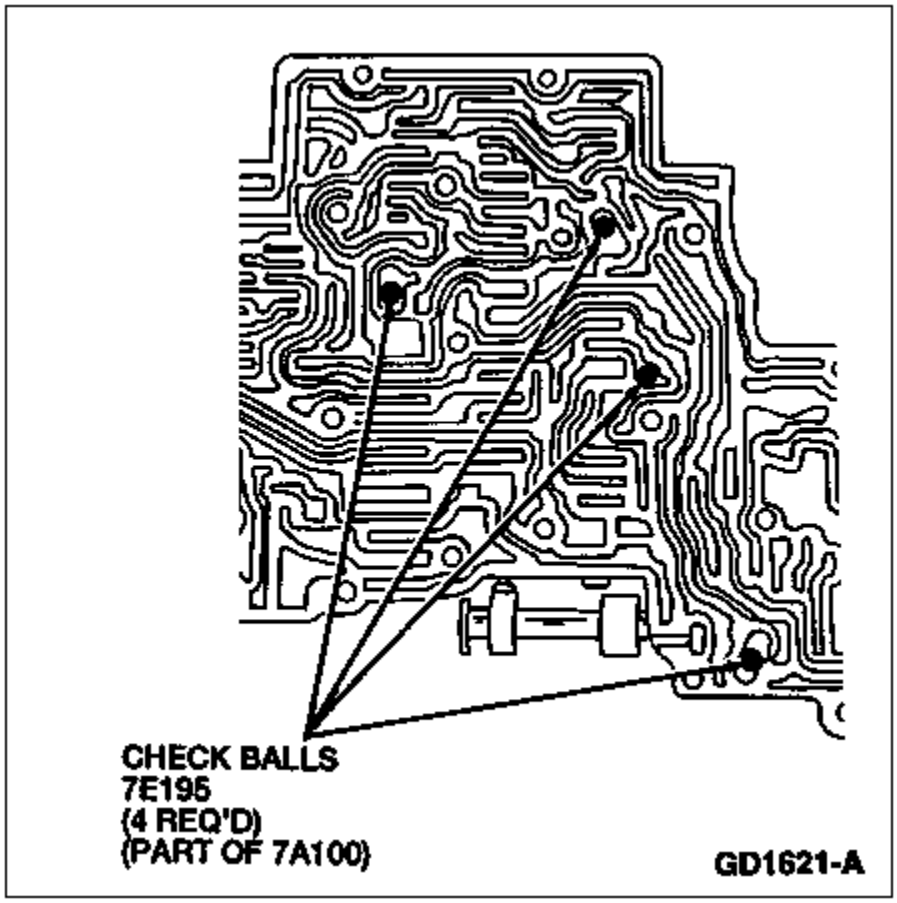
   Install the EPC limit circuit screen. Push down on the EPC limit circuit screen to make sure it is fully seated.



2. Install the four check balls in proper locations as shown.

tomsn048@gmail.com

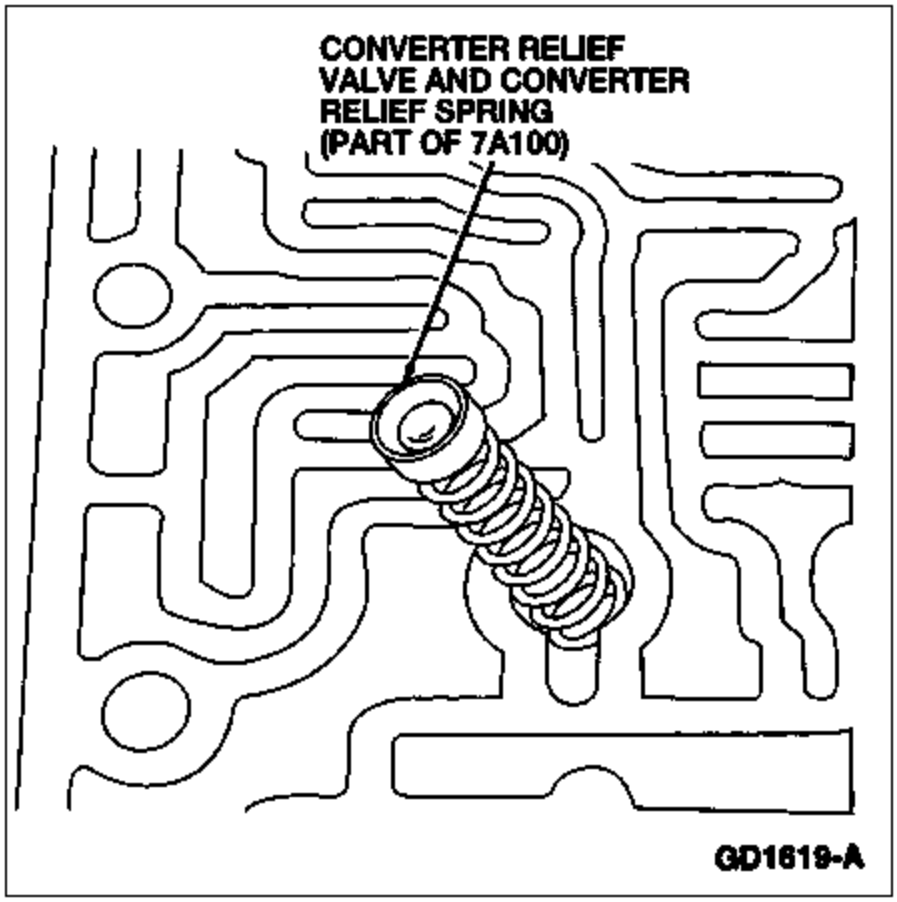
Check Ball Installation



3. **CAUTION: The springs and valves are not interchangeable.**

   Install the converter relief valve (plastic-dark color) and spring.

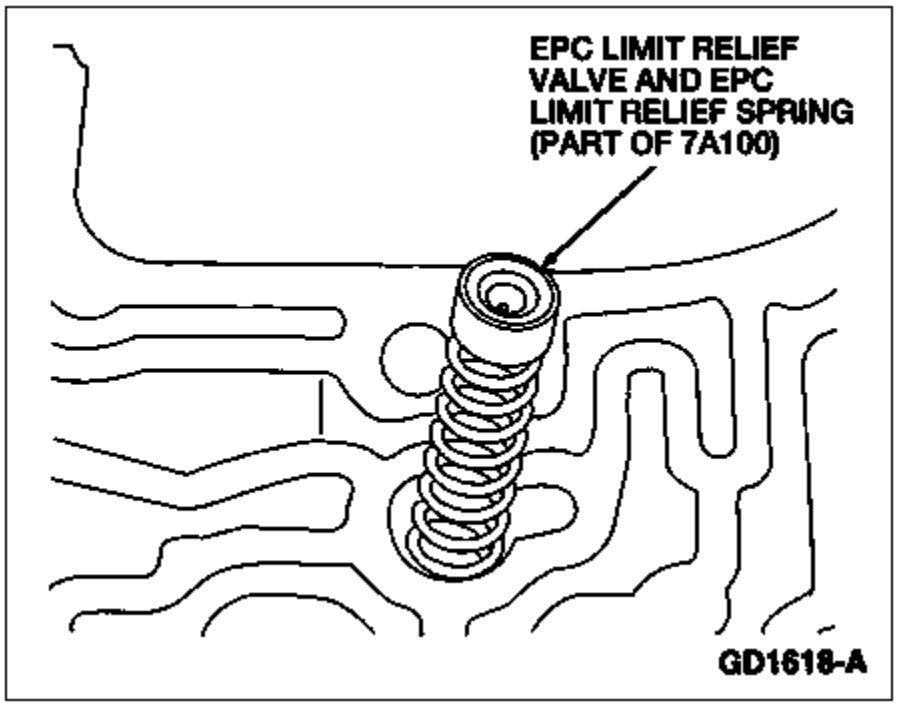
tomsn048@gmail.com



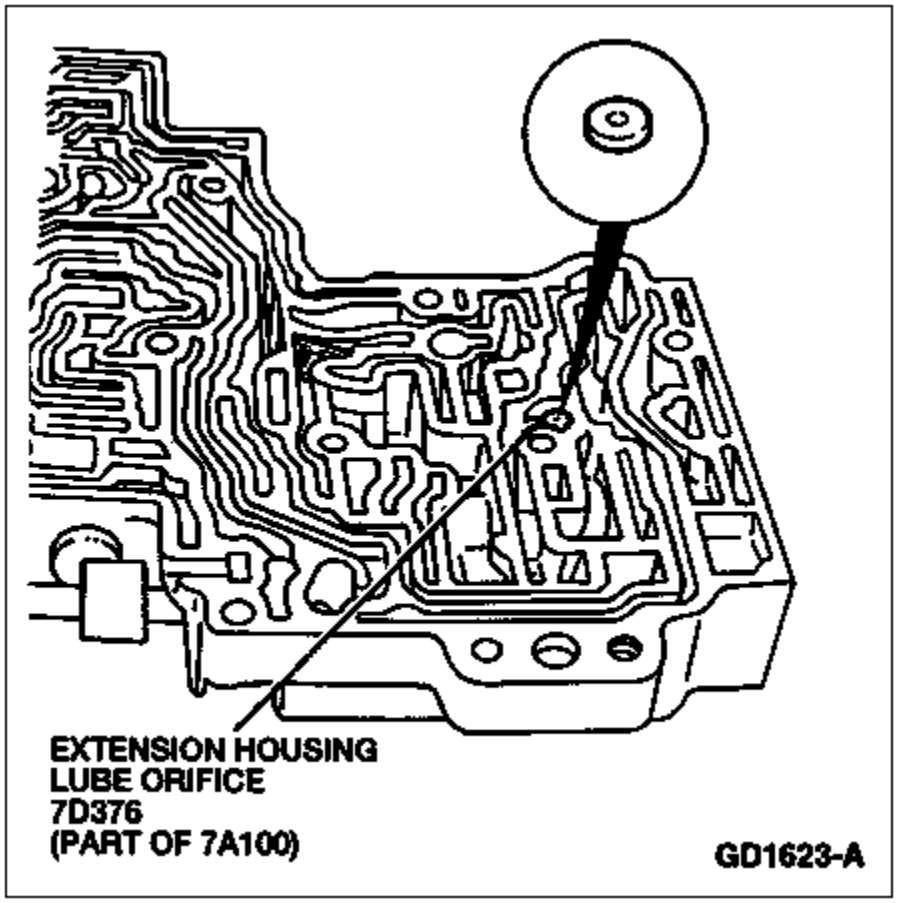
4. **CAUTION: The springs and valves are not interchangeable.**

   Install the EPC limit relief valve (metal-silver color) and spring.

tomsn048@gmail.com

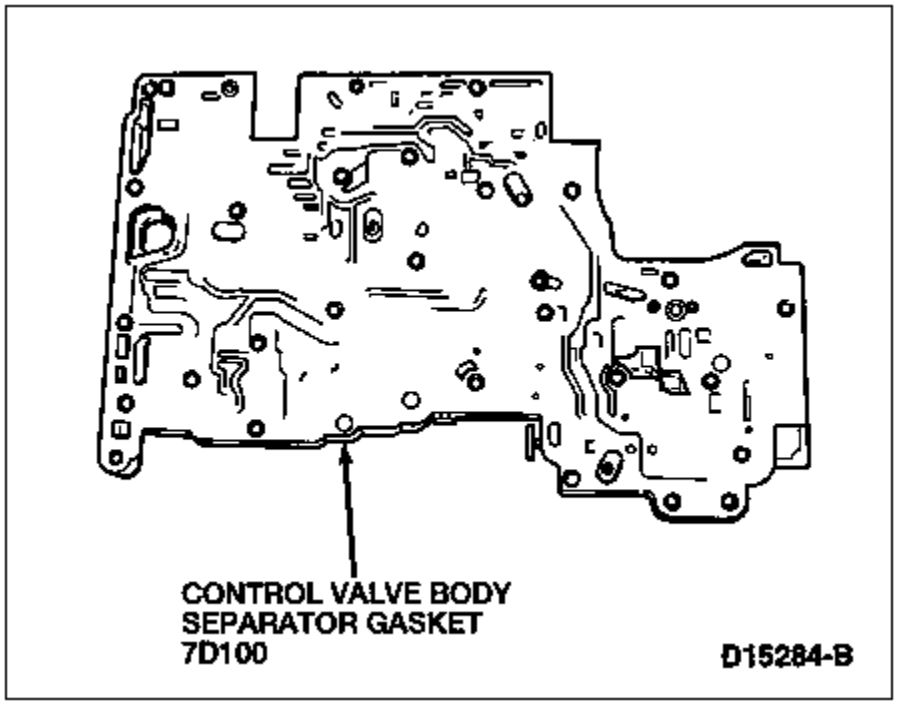


5. Install the extension housing lube orifice.

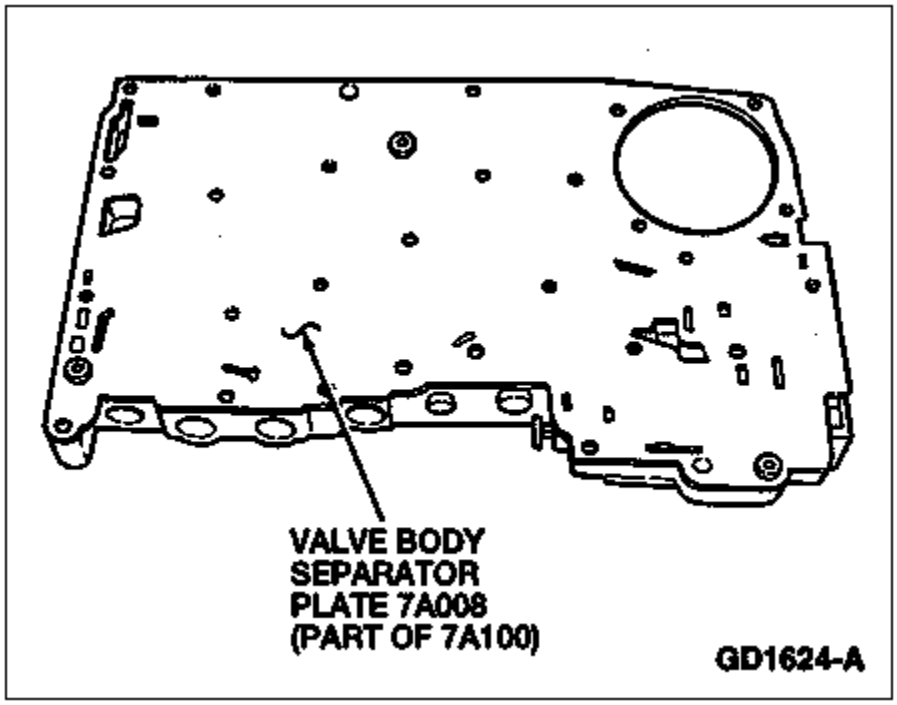


tomsn048@gmail.com

6. Install and align the control valve body separator gasket.

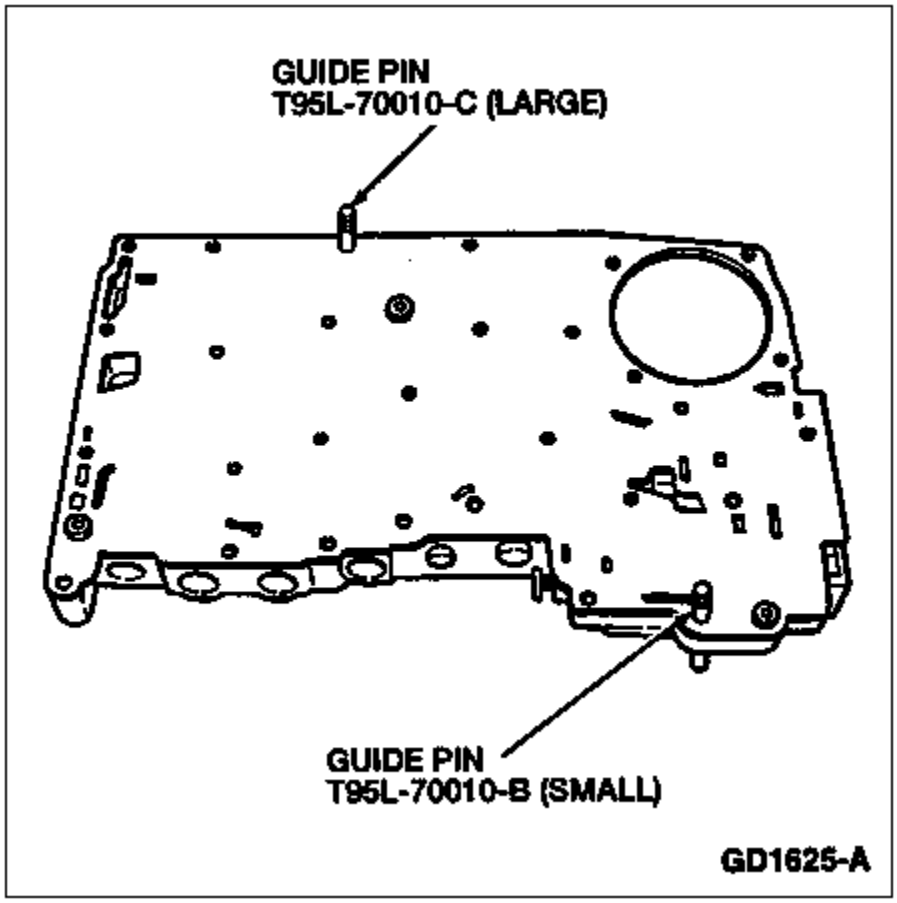


7. Install the valve body separator plate. Install the three (3) separating plate-to-main control screws fingertight.



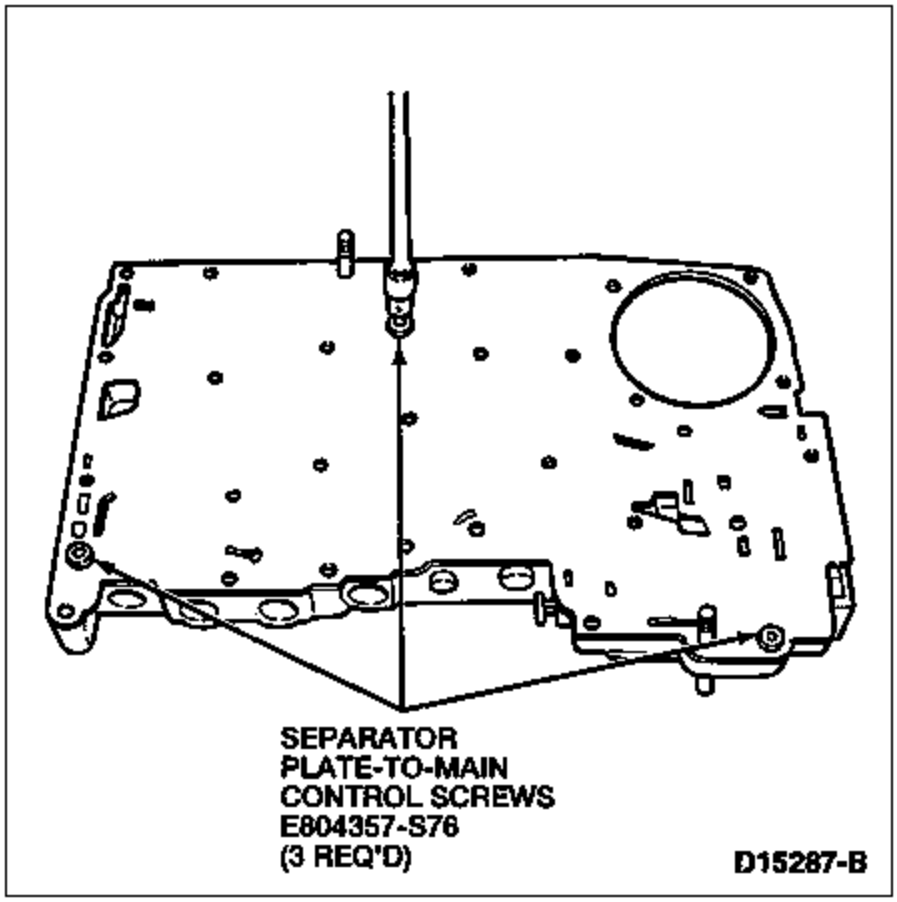
tomsn048@gmail.com

8. Install the alignment pins in the locations shown.



9. Tighten the separator plate-to-main control screws to 6-8 Nm (53-71 lb-in).

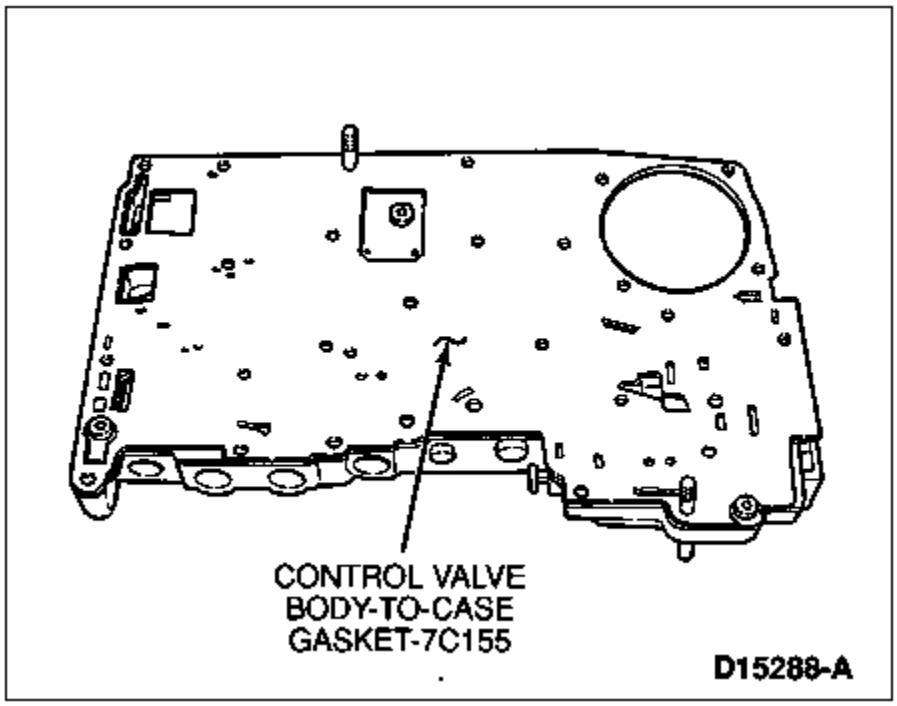
tomsn048@gmail.com



10. **NOTE: Apply petroleum jelly on the separator surface to hold the gasket in place.**

    Install the control valve body-to-case gasket.

tomsn048@gmail.com



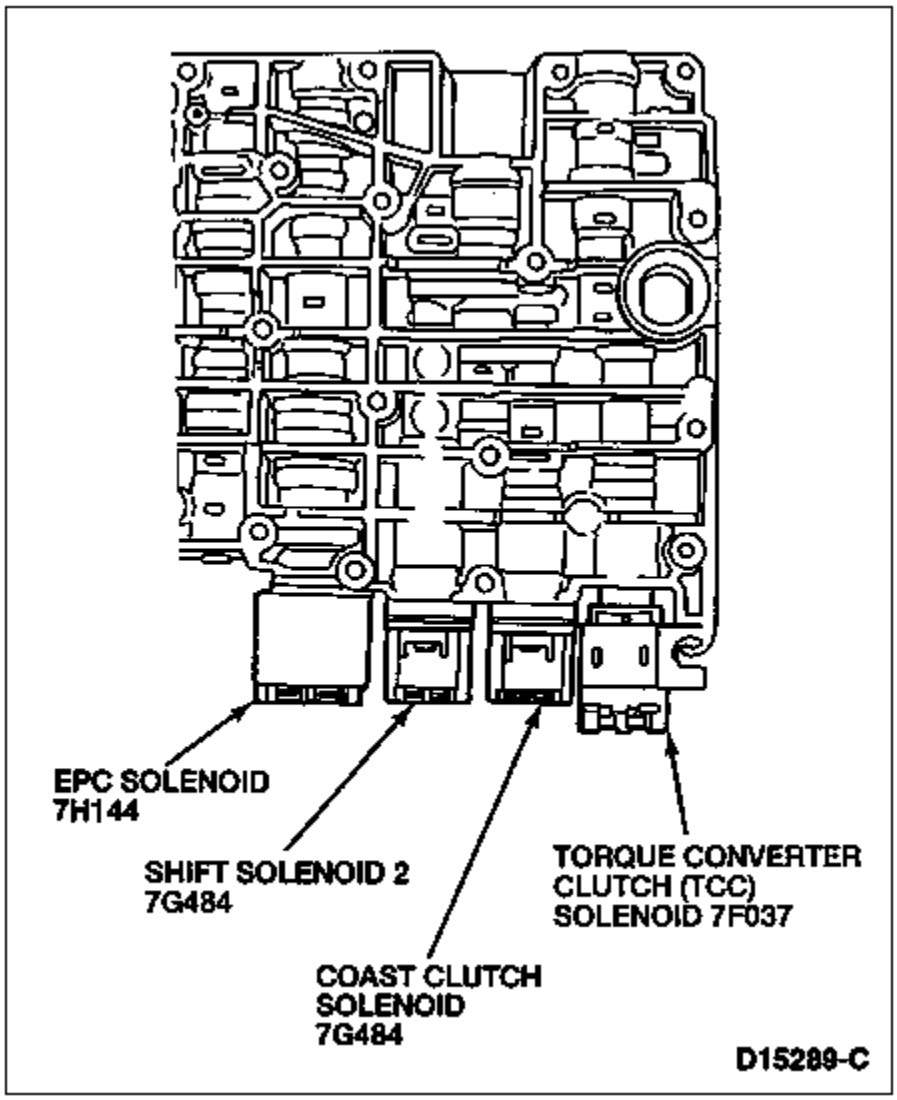
11. Remove the alignment pins.
12. Rotate the main control so that the separator plate is facing down.
13. **CAUTION: The shift and coast clutch solenoid terminals must face upward.**

    NOTE: The shift and CCS solenoids are interchangeable.

    NOTE: If the TCC valve came out, use caution when installing the TCC solenoid.

    Install the solenoids.

tomsn048@gmail.com

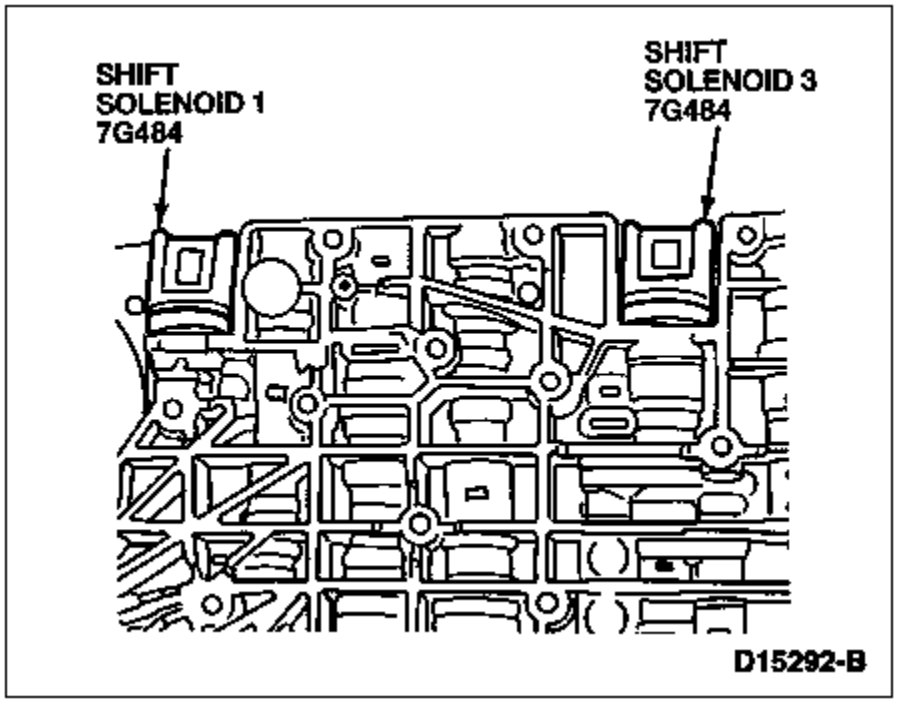


14. **CAUTION: The solenoid clamp must be installed in the TCC and EPC solenoid grooves, shift solenoid pockets and the No. 204 plug.**

    Install the solenoid clamp. Tighten the solenoid clamp screw to 6-8 Nm (53-71 lb-in).

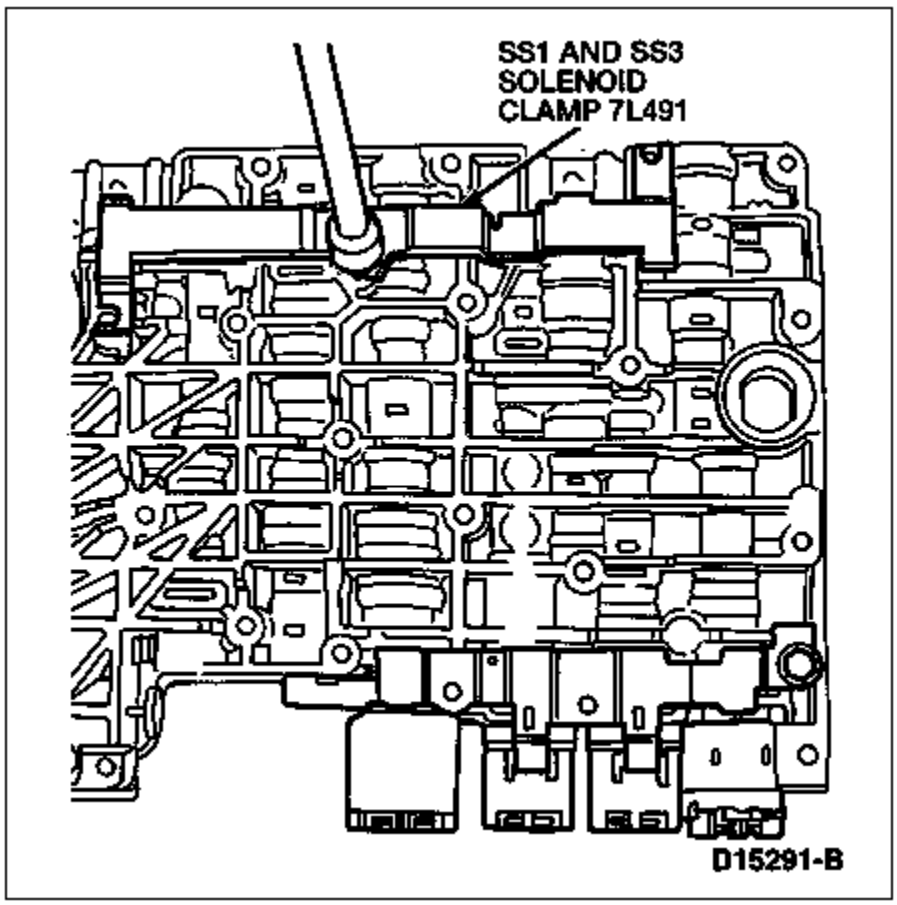
tomsn048@gmail.com

15. Install shift solenoids 1 and 3.



tomsn048@gmail.com

16. Install the solenoid clamp. Tighten the clamp screw to 6-8 Nm (53-71 lb-in).



tomsn048@gmail.com

tomsn048@gmail.com

Converter Housing and Fluid Pump

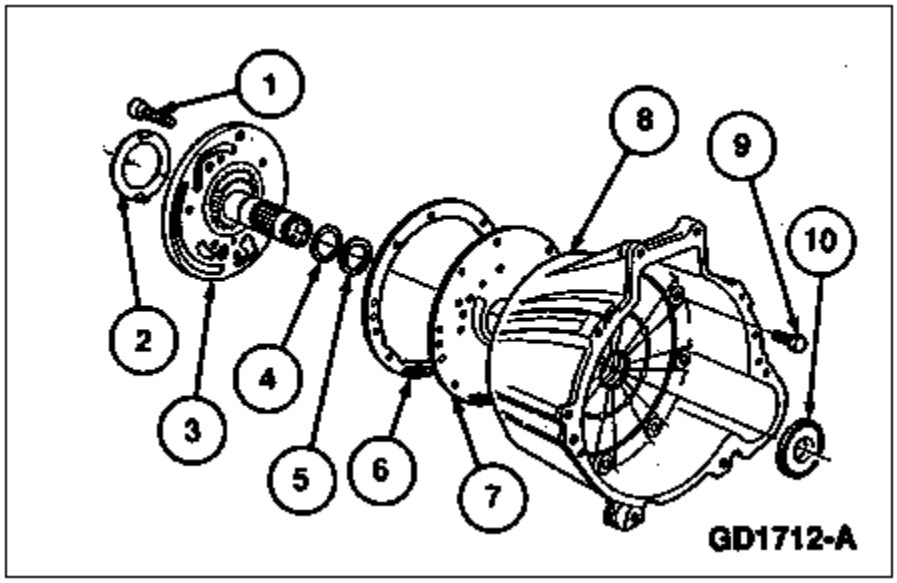
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Converter Housing Seal Replacer	T97T-77000-A

SPECIAL SERVICE TOOLS DESIRED

Tool Number	Description
TOOL-1175-AC	Seal Remover

Converter Housing and Fluid Pump



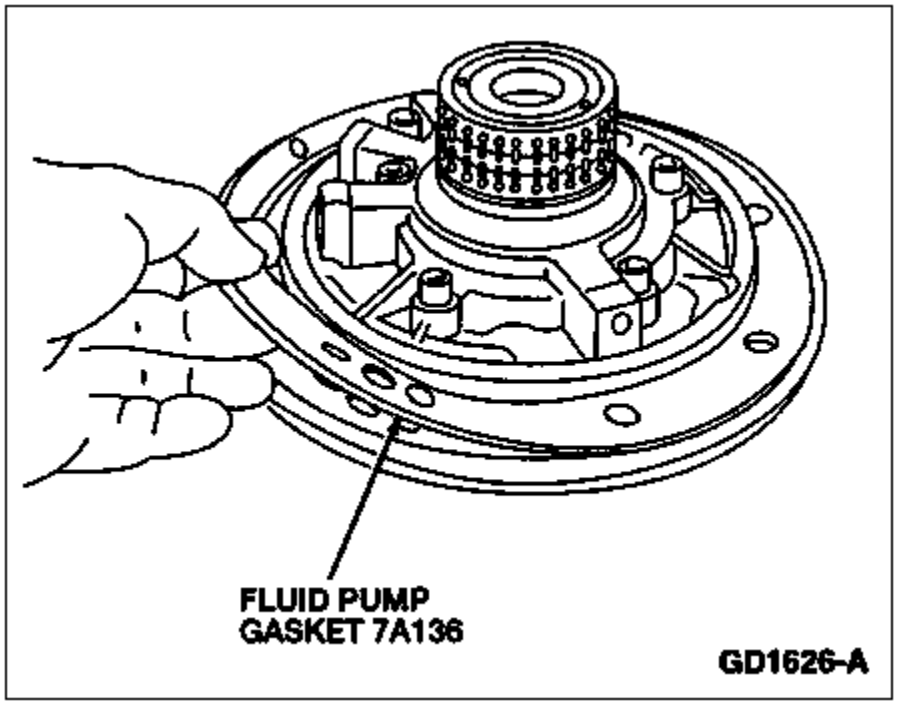
Item	Part Number	Description
1	W701429-S309M	Fluid Pump-to-Converter Housing Screws (6 Req'd)
2	7D014	No. 1 Fluid Pump Input Thrust Washer
3	7A103	Fluid Pump Support and Gear Assembly

tomsn048@gmail.com

4	W701431-S300	Fluid Pump Shaft-to-Inner Gear O-Ring
5	7L323	Fluid Pump Support Seal Ring
6	7A136	Fluid Pump Gasket
7	7B472	Fluid Pump Adapter Plate
8	7976	Converter Housing Assembly
9	E804595-S200	Converter Housing-to-Case Screw and Seal Assembly (8 Req'd)
10	7A248	Converter Hub-to-Converter Housing Seal Assembly

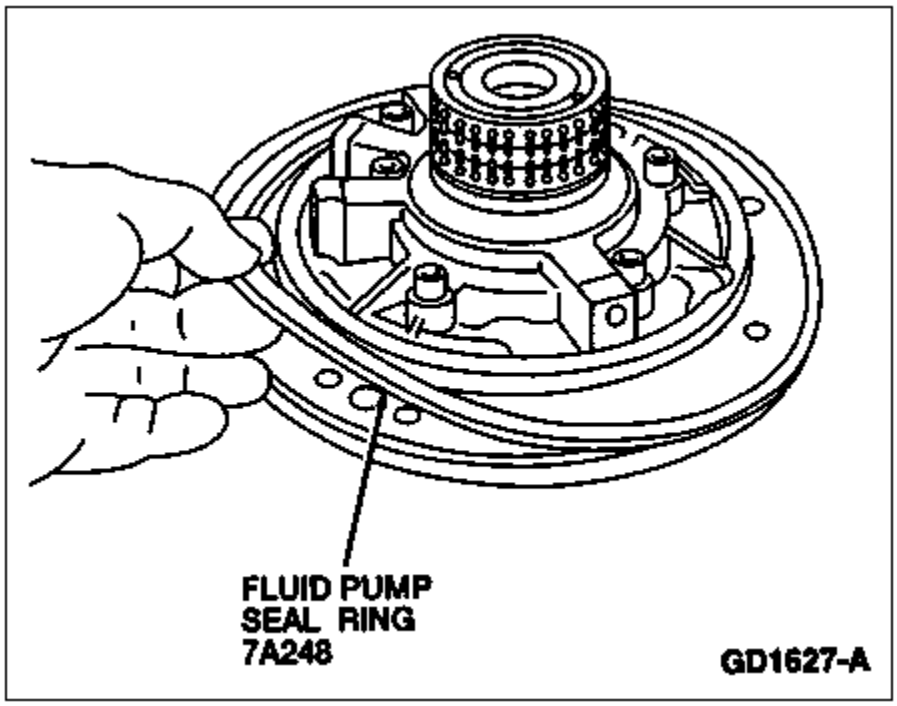
Disassembly

1. Remove and discard the fluid pump gasket.

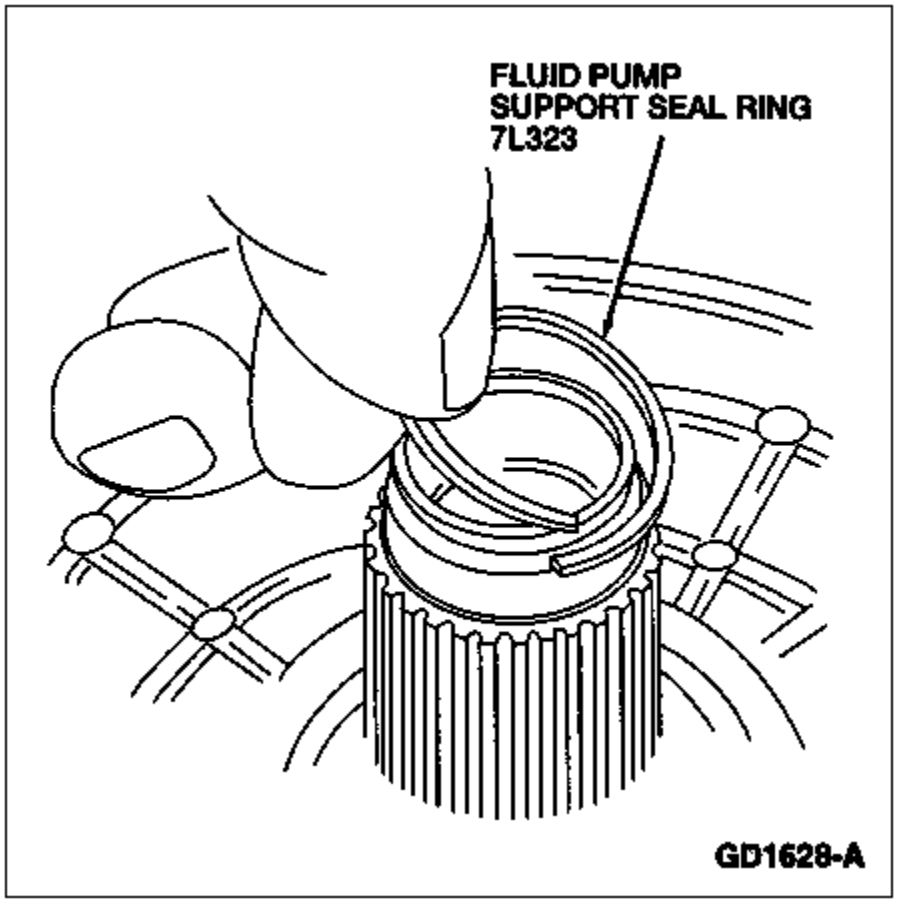


2. Remove and discard the fluid pump square cut seal ring.

tomsn048@gmail.com

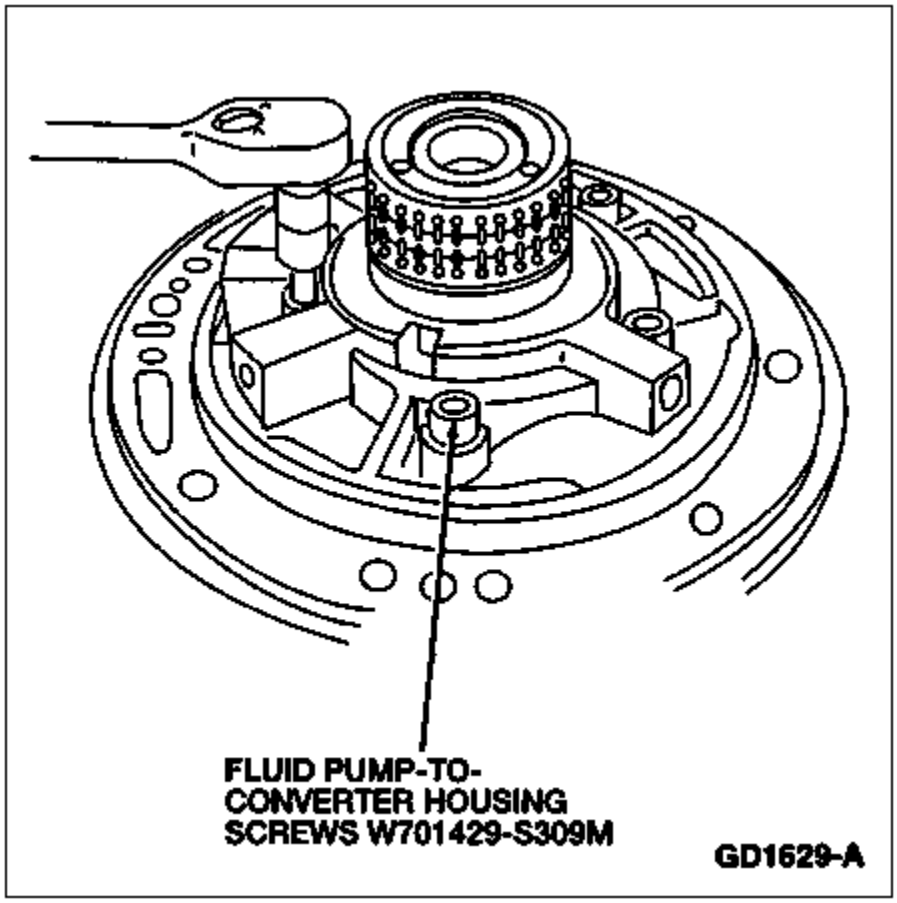


3. Remove the fluid pump support seal ring.



tomsn048@gmail.com

4. Use a Torx® 40 wrench to remove the six M8 x 35 mm front pump-to-converter housing screws. Remove the fluid pump support and gear and the fluid pump adapter plate.

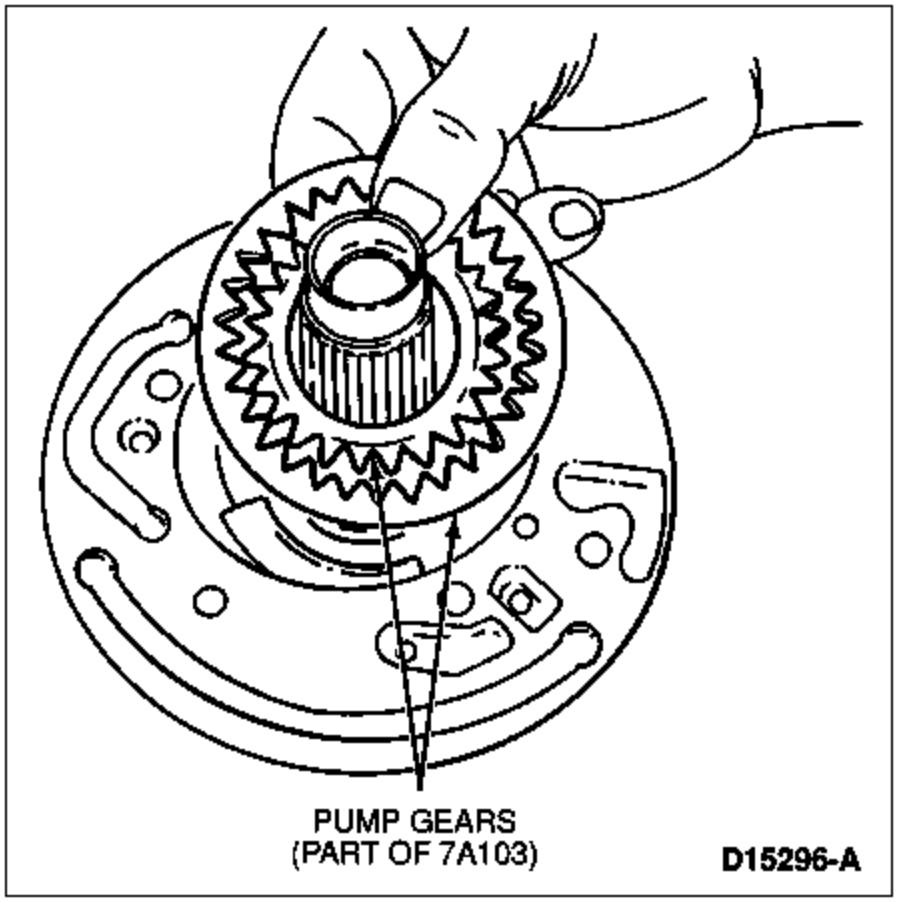


5. **NOTE: The pump gears are part of the pump assembly and are not serviced separately.**

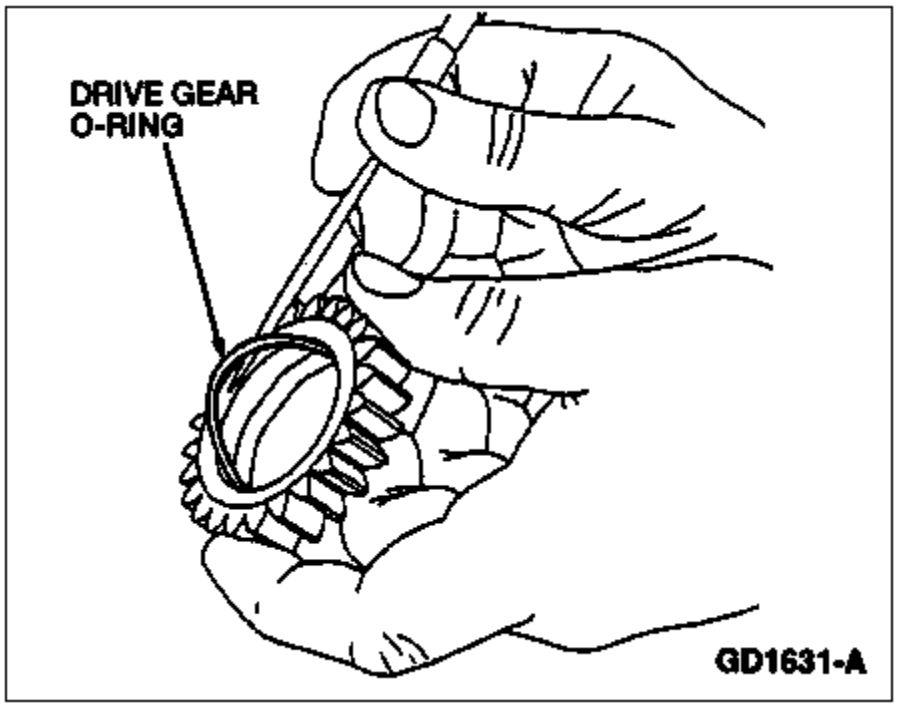
   NOTE: A rough casting on the pump surface crescent is not a flaw.

   Remove the pump gears.

tomsn048@gmail.com



6. Remove the drive gear O-ring and discard.

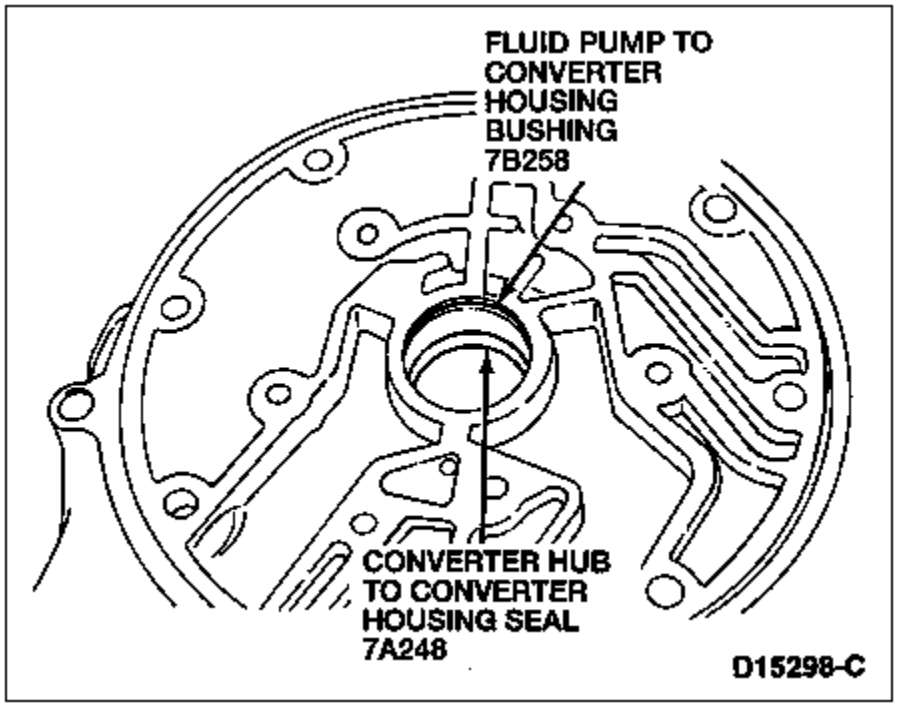


tomsn048@gmail.com

7. Inspect the pump gears for scoring and cracks. Replace pump assembly if damaged.

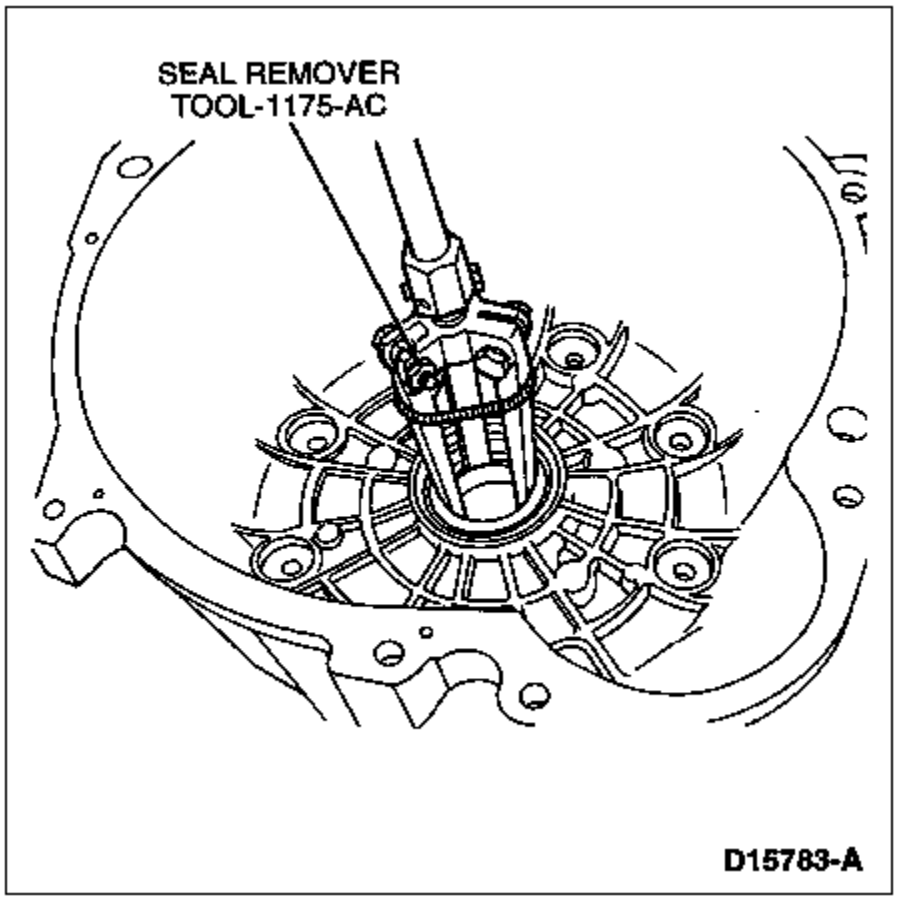
8. **NOTE: Fluid pump-to-converter housing bushing is not serviced separately. If service is required, the converter housing assembly must be replaced.**

   Inspect the fluid pump to converter housing bushing and converter hub to converter housing seal. Replace converter housing assembly if necessary.



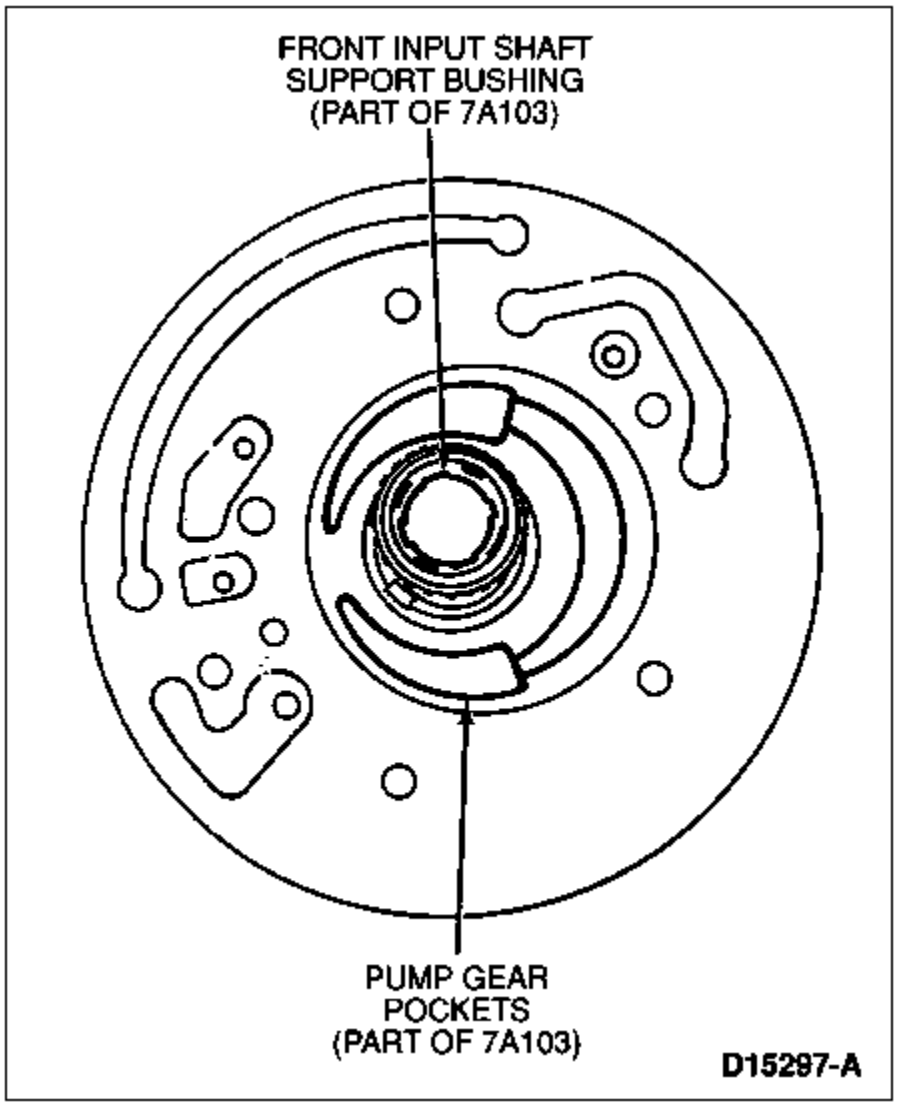
9. Remove and discard the converter hub-to-converter housing seal using Seal Remover TOOL-1175-AC or equivalent from the converter housing as shown.

tomsn048@gmail.com



10. Clean and inspect the front and rear input shaft support bushings. If bushings are worn, scored or damaged, replace the fluid pump support and gear assembly. Inspect the pump gear pockets for scoring and wear. Replace if necessary.

tomsn048@gmail.com



11. Inspect the mating surfaces of the pump body and case for burrs.

    Inspect the drive and driven gear bearing surface for scores and check the gear teeth for burrs.

    Inspect the fluid pump seal for cuts or nicks. Inspect the pump bushing for scoring.

    Check the fluid passages for obstruction.

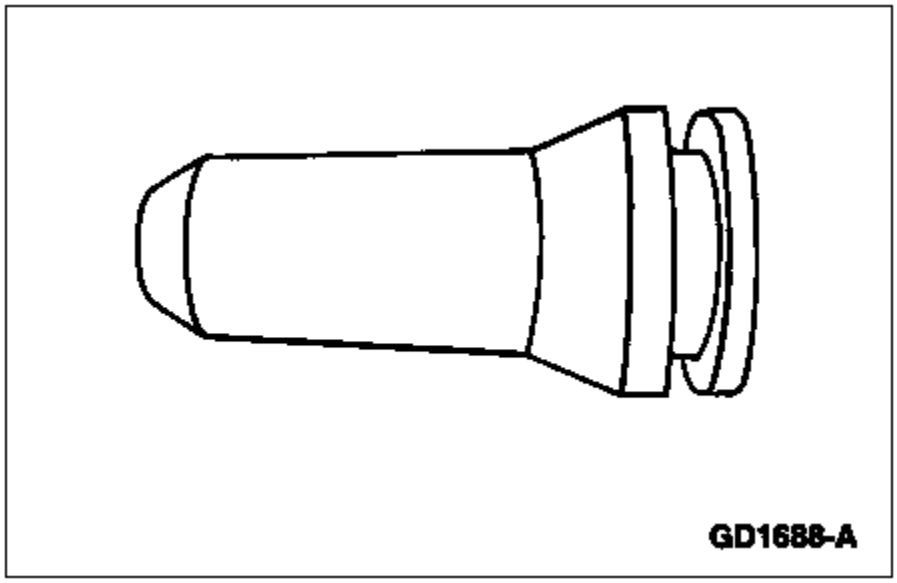
    If any parts are found to be damaged or worn, replace the pump as an assembly. Minor burrs and scores may be removed with a crocus cloth.

Assembly

1. **NOTE: Check and make sure that the garter spring has not popped off of the converter hub-to-converter housing seal.**

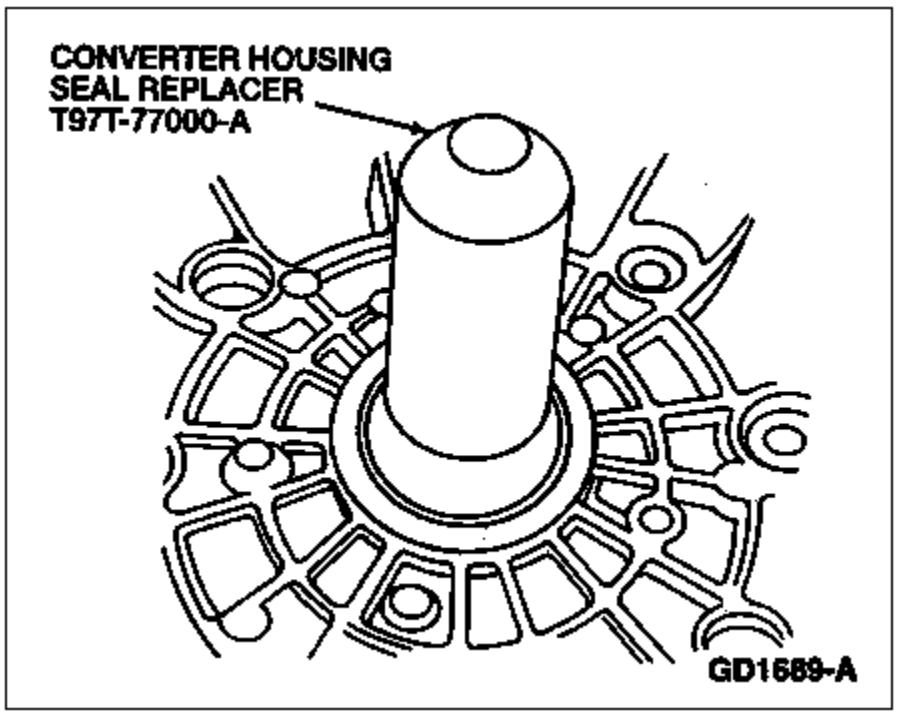
   Install new converter hub to housing seal onto Converter Housing Seal Replacer T97T-77000-A.

tomsn048@gmail.com



2. **CAUTION: Place the converter housing on a block of wood or equivalent to protect the converter hydraulic passages on the back side.**

   Install a new converter hub-to-converter housing seal until it bottoms in housing using Converter Housing Seal Replacer T97T-77000-A.



tomsn048@gmail.com

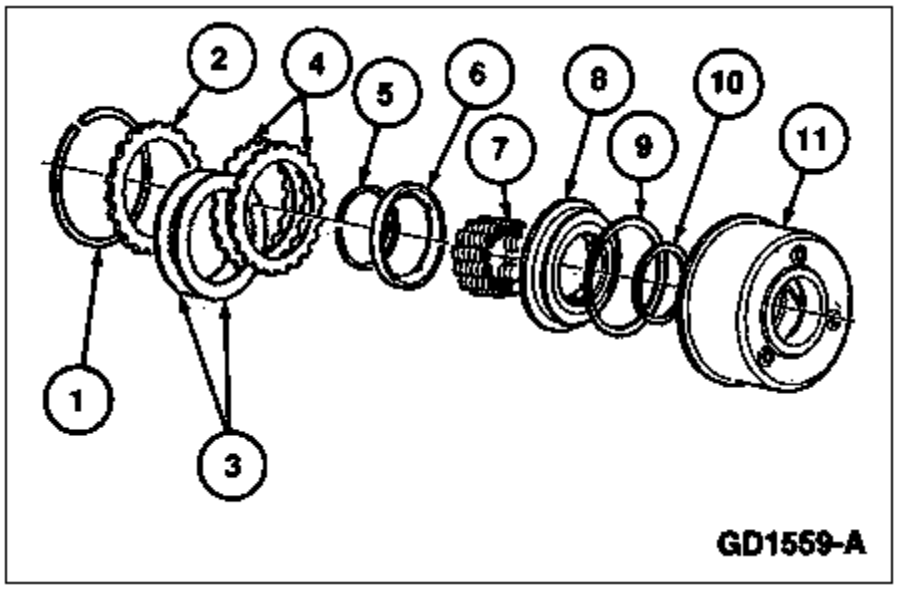
tomsn048@gmail.com

Coast Clutch

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Clutch Spring Compressor	T65L-77515-A
Coast Clutch Outer Seal Sizing Tool	T95L-70010-D

Overdrive Brake and Coast Clutch Drum Assembly



Item	Part Number	Description
1	E860126-S/129-S	Retaining Ring (Select Fit)
2	7B066	Coast Clutch Pressure Plate
3	7B164	Coast Clutch Internal Plate — Friction (2 Req'd)
4	7B442	Coast Clutch External Plate — Steel (2 Req'd)
5	E860125-S	Retaining Ring
6	7A527	Coast Clutch Piston Spring Retainer
7	7A480	Coast Clutch Piston Springs (20 Req'd)
8	7A258	Coast Clutch Piston
9	7D548	Coast Clutch Piston Outer Seal Ring

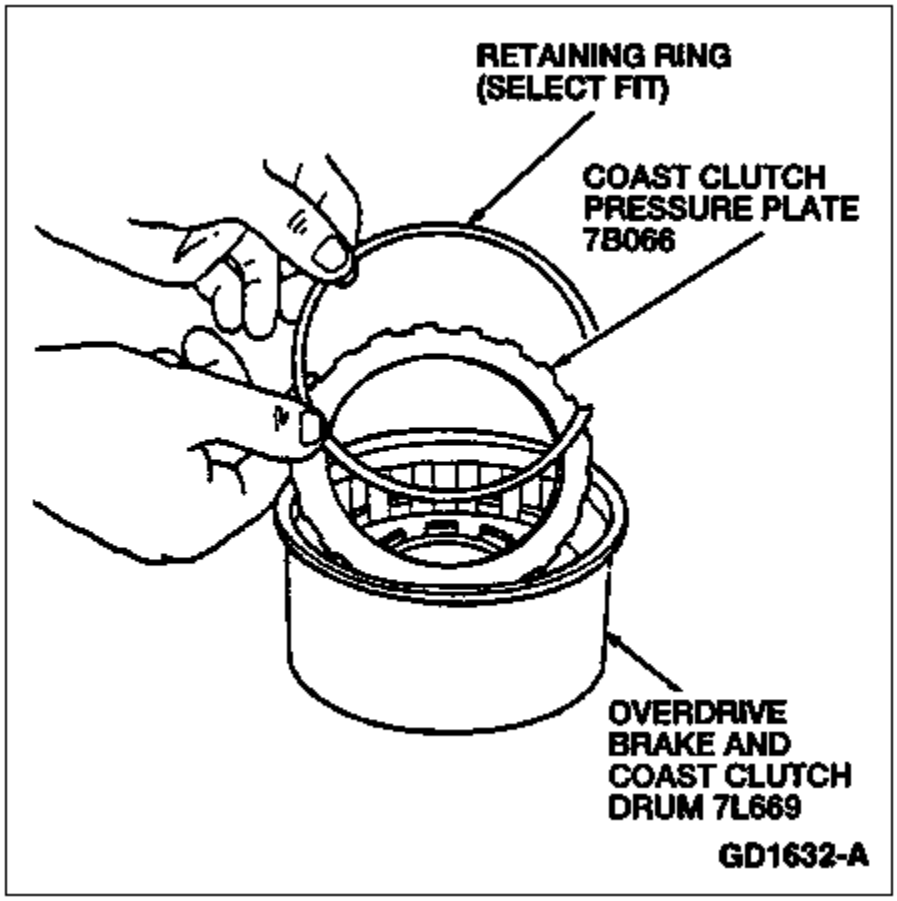
tomsn048@gmail.com

10	7D404	Coast Clutch Piston Inner Seal Ring
11	7L669	Overdrive Brake and Coast Clutch Drum Assembly

Disassembly

1. **CAUTION: This is a select fit ring. See assembly procedure if the ring or clutch plate pack is replaced.**

   Remove the retaining ring and coast clutch pressure plate from the overdrive brake and coast clutch drum.

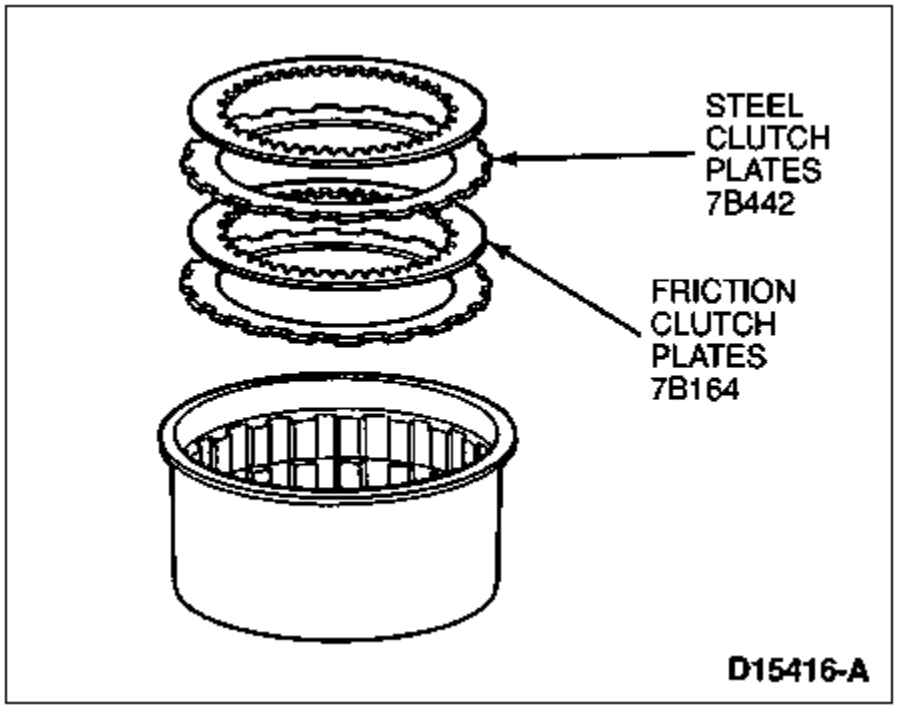


2. **CAUTION: Coast clutch friction plates are directional. Note direction of grooves for installation.**

   CAUTION: If new clutch plates are being used, they should be soaked in clean transmission fluid for at least 30 minutes before assembly.

   Remove the coast clutch pack. Inspect for wear, damage or overheating. Replace as necessary.

tomsn048@gmail.com

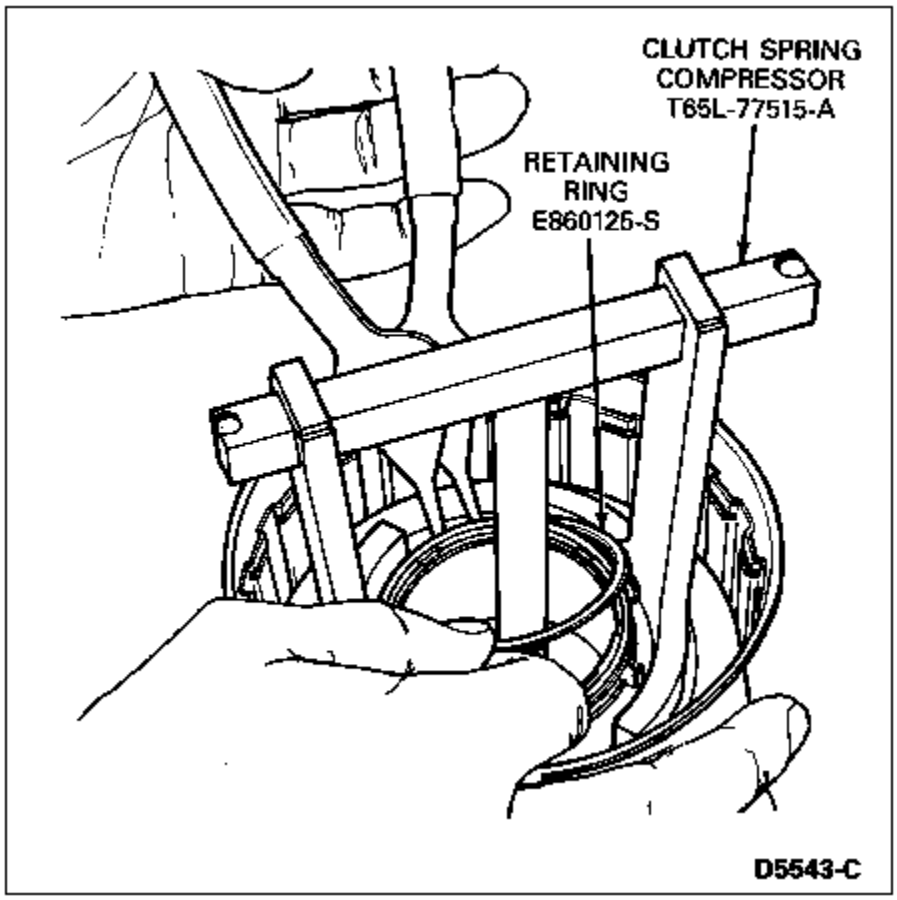


3. **WARNING: USE CAUTION WHEN RELEASING TOOL PRESSURE ON THE REAR CLUTCH PISTON SPRINGS.**

   CAUTION: Do not fully compress the clutch spring compressor or damage to the spring retainer may occur.

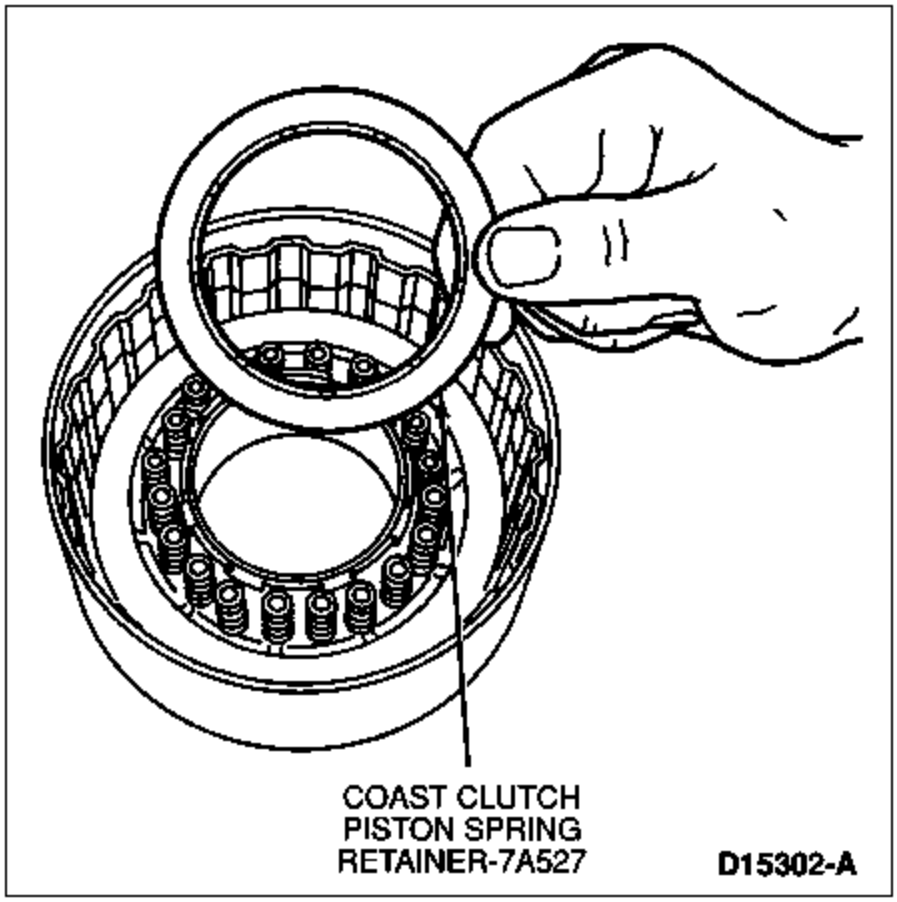
   Compress the clutch piston springs with Clutch Spring Compressor T65L-77515-A. Remove the retaining ring.

tomsn048@gmail.com



4. Remove the clutch piston spring retainer and 20 clutch piston springs.

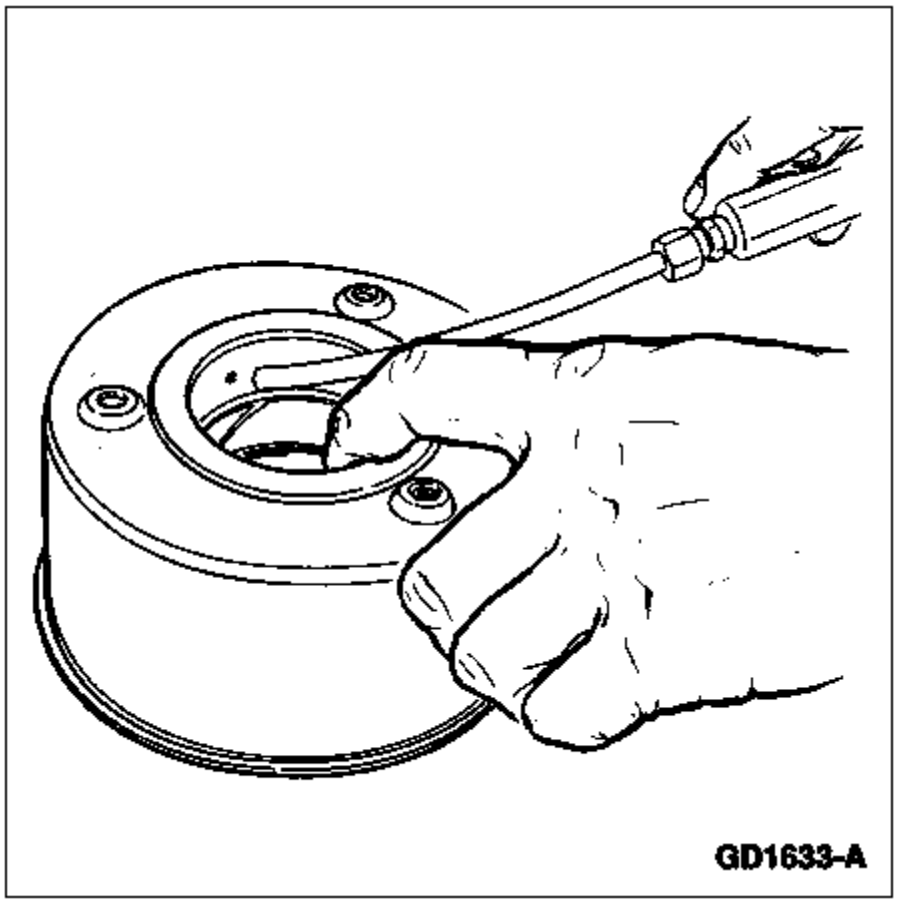
tomsn048@gmail.com



5. **WARNING: AIR PRESSURE MUST NOT EXCEED 138 KPA (20 PSI). WEAR SAFETY GLASSES WHEN USING COMPRESSED AIR, AND MAKE SURE DRUM IS FACING DOWN AS SHOWN.**

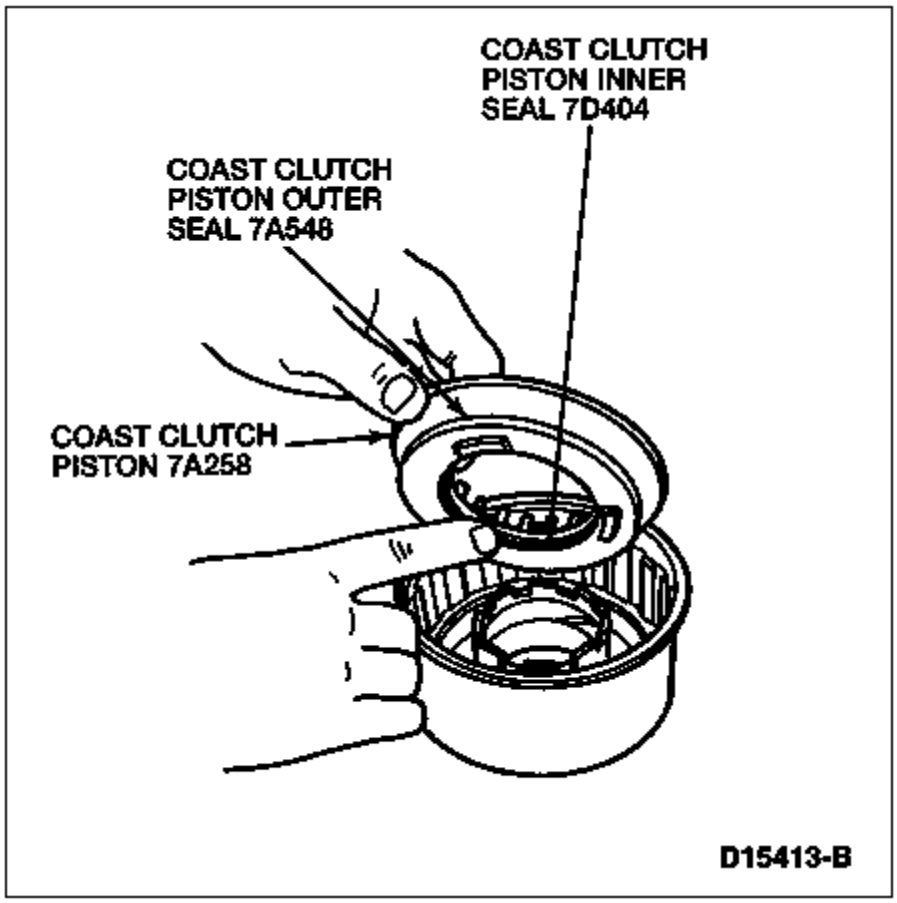
   Remove the coast clutch piston by using air pressure. Apply air pressure to one hole on the inside diameter of the overdrive brake and coast clutch drum while blocking the other hole with a finger.

tomsn048@gmail.com



6. Remove the coast clutch piston inner and outer seal. Clean and replace as necessary.

tomsn048@gmail.com

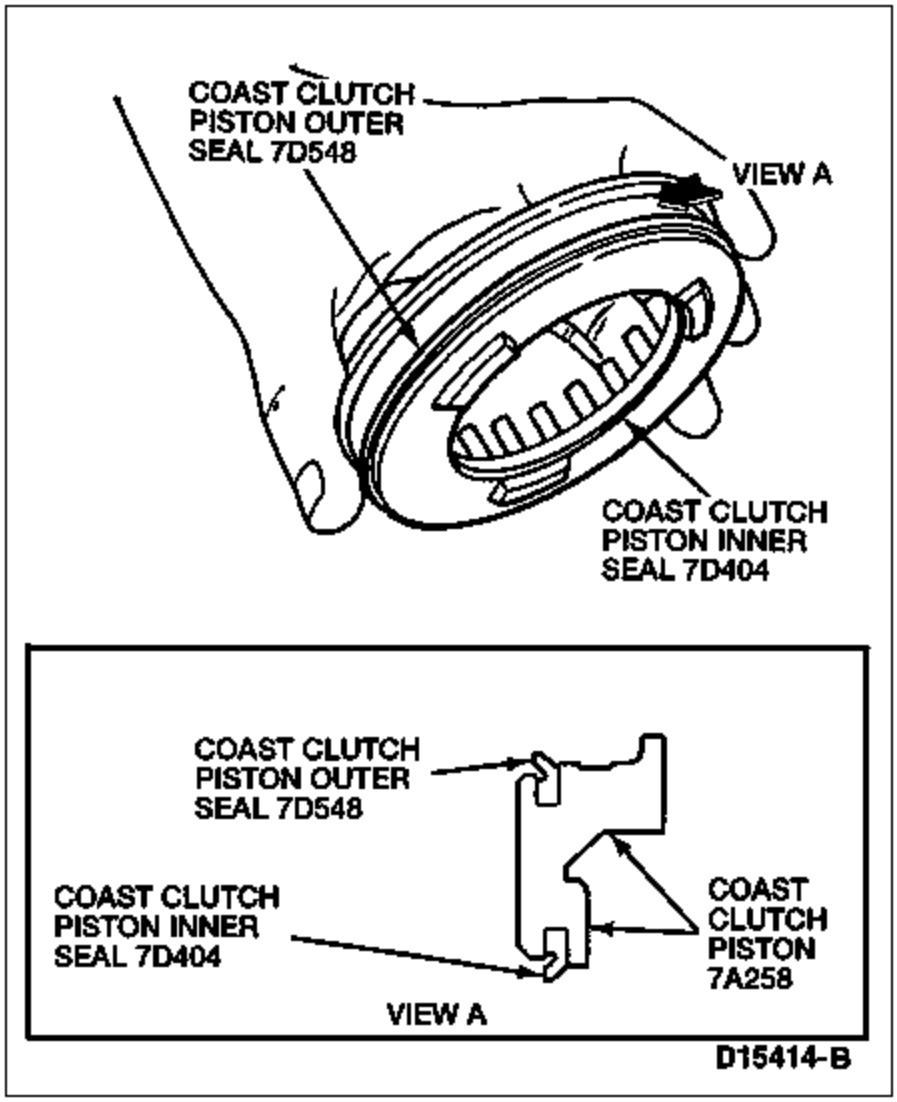


Assembly

1. **CAUTION: The lip seals must be positioned as shown. Care must be taken to prevent roll over of the lip seal.**

   Install new coast clutch piston inner and outer seal on the coast clutch piston.

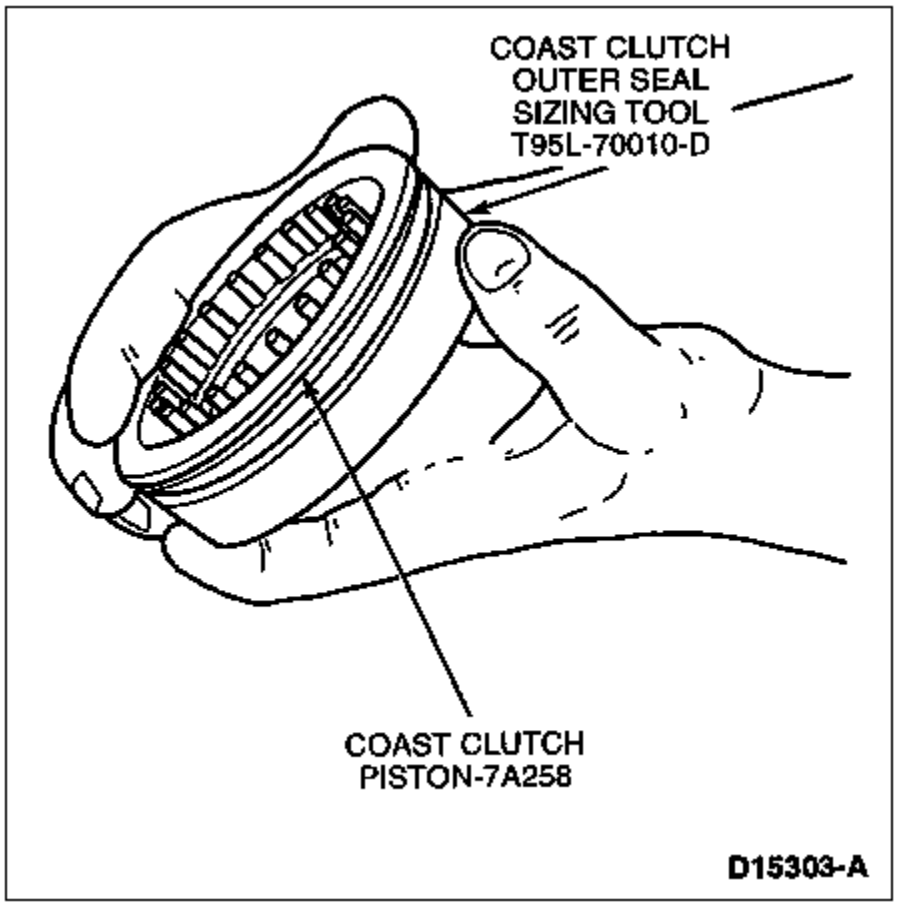
tomsn048@gmail.com



2. **CAUTION: Lubricate the coast clutch piston inner and outer seal.**

   Carefully press the coast clutch piston into Coast Clutch Outer Seal Sizing Tool T95L-70010-D.

tomsn048@gmail.com



3. Inspect the drum band surface, bushing, and thrust surfaces for scores. Minor scores may be removed with a crocus cloth. Badly scored parts must be replaced.

4. Inspect the clutch piston bore and the piston and the piston inner and outer bearing surfaces for scores.

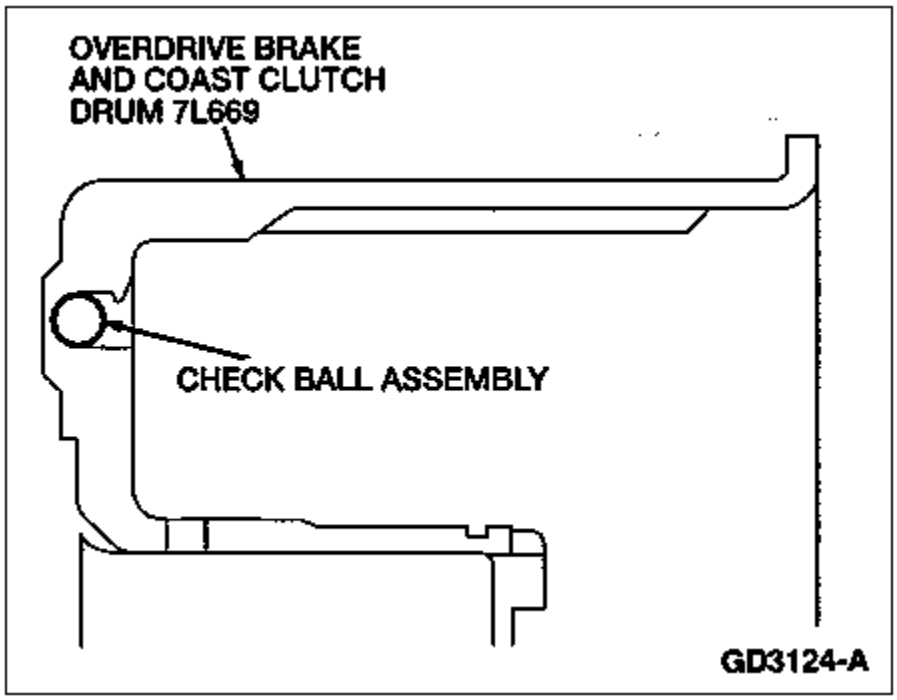
5. Check the fluid passages for obstructions. All fluid passages must be clean and free of obstructions.

6. Inspect the clutch plates for wear, scoring and fit on the clutch hub serrations. Replace all plates that are badly scored, worn or do not fit freely in the hub serrations.

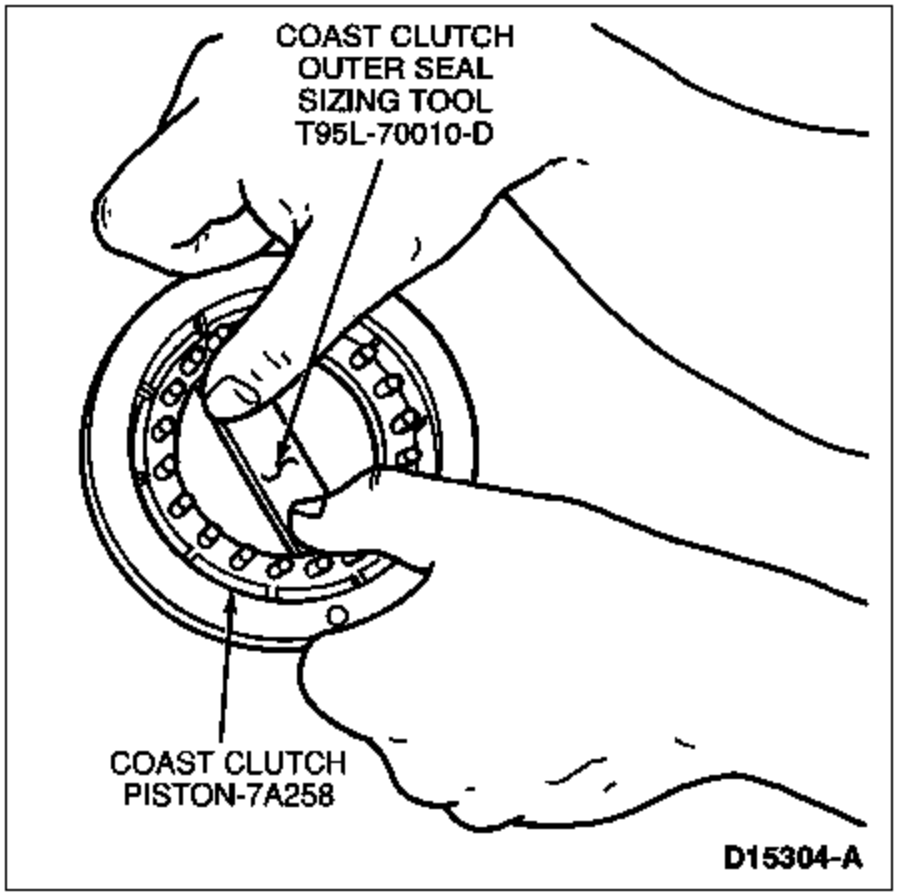
7. Inspect the clutch pressure plate for scores on the clutch plate surface. Check the clutch release spring(s) for distortion.

8. Make sure the check ball is free and clear of debris prior to installing piston. The check ball is located in the overdrive brake and coast clutch drum.

tomsn048@gmail.com



9. Carefully remove the coast clutch piston from Coast Clutch Outer Seal Sizing Tool T95L-70010-D.



tomsn048@gmail.com

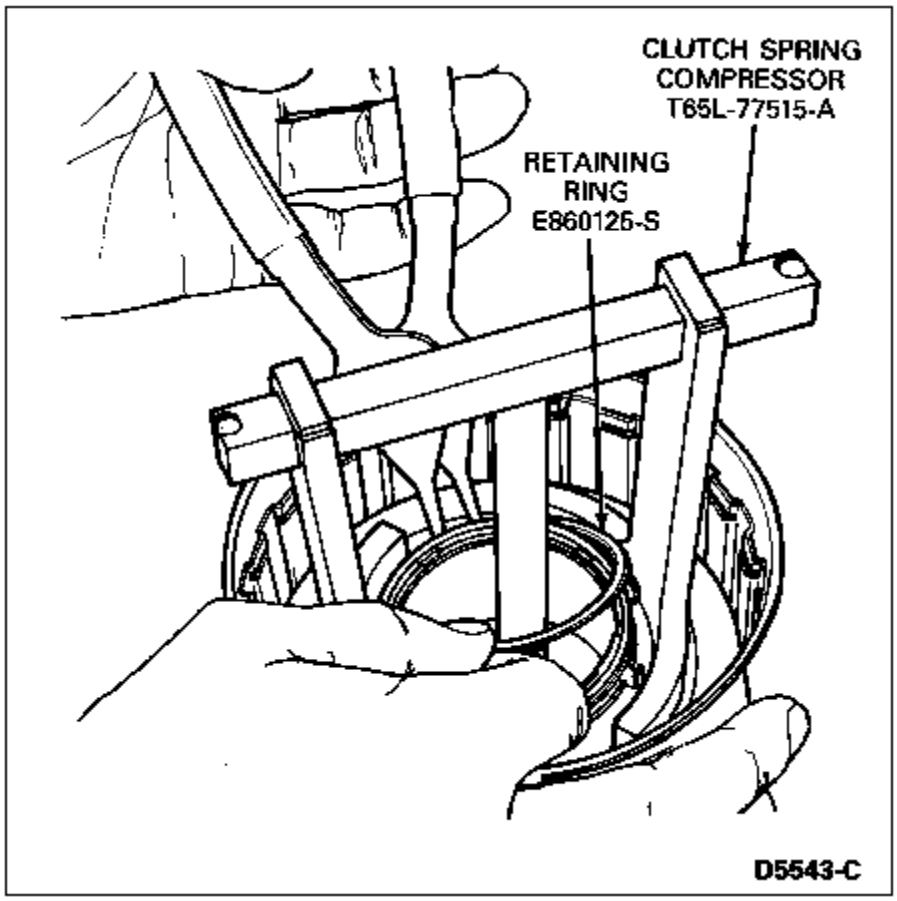
10. **CAUTION: Care must be taken to prevent damage to the seals during installation.**

    Carefully install the coast clutch piston into the overdrive brake and coast clutch drum.

11. Install the 20 coast clutch piston springs and coast clutch piston spring retainer onto the coast clutch piston.

12. **CAUTION: Do not fully compress the clutch spring compressor or damage to the coast clutch piston spring retainer may occur.**

    Compress the coast clutch piston springs with Clutch Spring Compressor T65L-77515-A. Install the retaining ring. Release the load on the springs applied by the tool. Remove the tool.



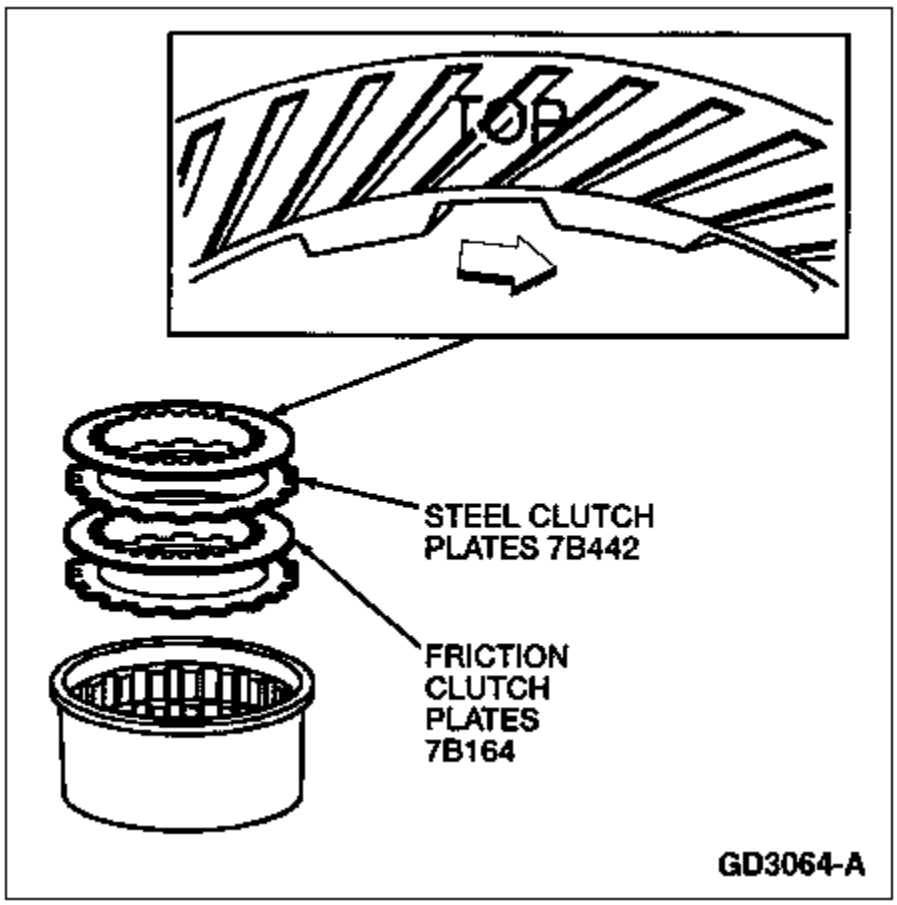
13. **CAUTION: Friction plates are directional and must be installed with grooves clockwise (I.D. to O.D.). The word "TOP" should face up.**

    CAUTION: If new clutch plates are being used, they should be soaked in clean transmission fluid for at least 30 minutes before assembly.

    NOTE: When installing friction plate, the word "TOP" should face up. If reusing plates, grooves must be installed clockwise.

tomsn048@gmail.com

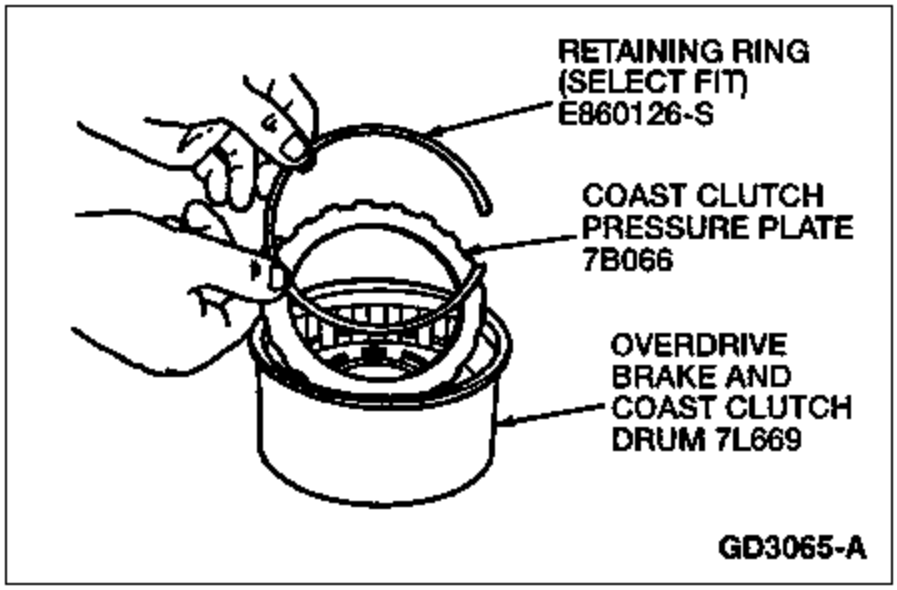
Install the two steel clutch plates and two friction clutch plates in alternating order, starting with a steel plate first.



14. **CAUTION: The retaining ring is select fit.**

Install the coast clutch pressure plate. Install the original retaining ring on top of the clutch pressure plate.

tomsn048@gmail.com

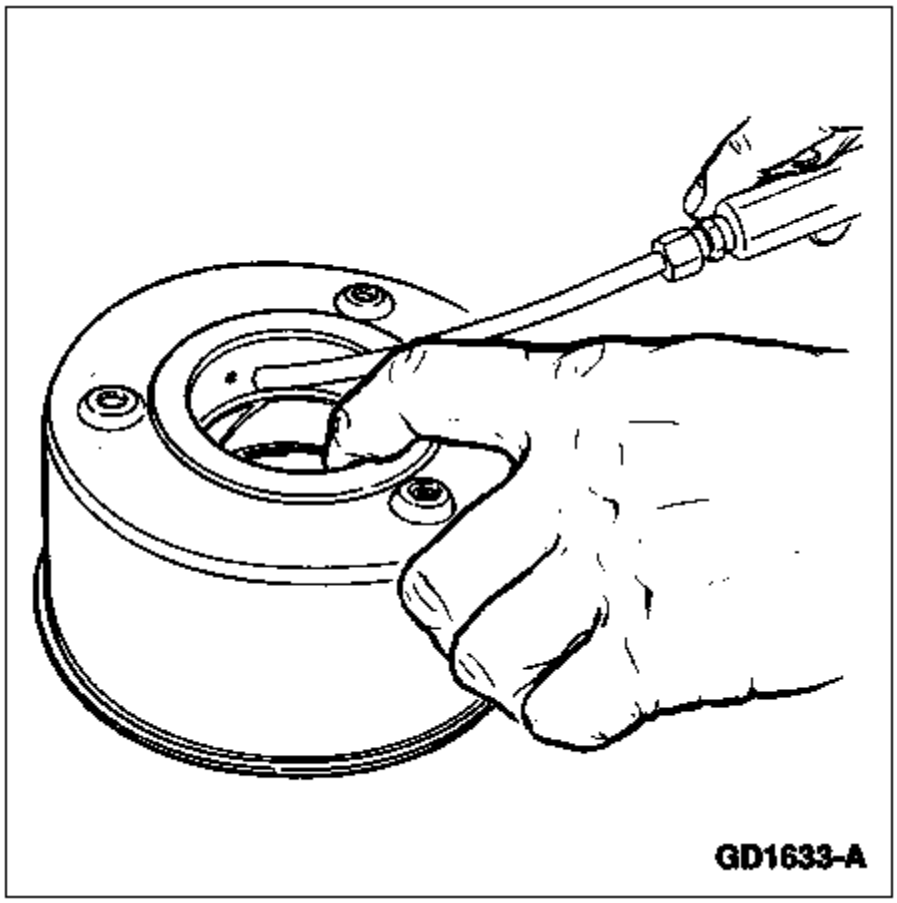


15. **WARNING: AIR PRESSURE MUST NOT EXCEED 138 KPA (20 PSI). WEAR SAFETY GLASSES WHEN USING COMPRESSED AIR. MAKE SURE DRUM IS FACING DOWN AS SHOWN.**

    NOTE: The coast clutch piston must apply with air pressure and release when the air is removed.

    Air check the assembly. Apply air to one hole on the inside diameter of the overdrive brake and coast clutch drum while blocking the other hole with a finger.

tomsn048@gmail.com



16. Check the free play of the clutch pack. Push down on the clutch pack. Use a feeler gauge to check the gap between the retaining ring and the pressure plate. Specification: 1.3 to 2.0 mm (.051 to .079 inch).

    If the reading is not within specification, remove the retaining ring and check the thickness. Replace it with a ring that will correct free play. Verify with a feeler gauge.

tomsn048@gmail.com

tomsn048@gmail.com

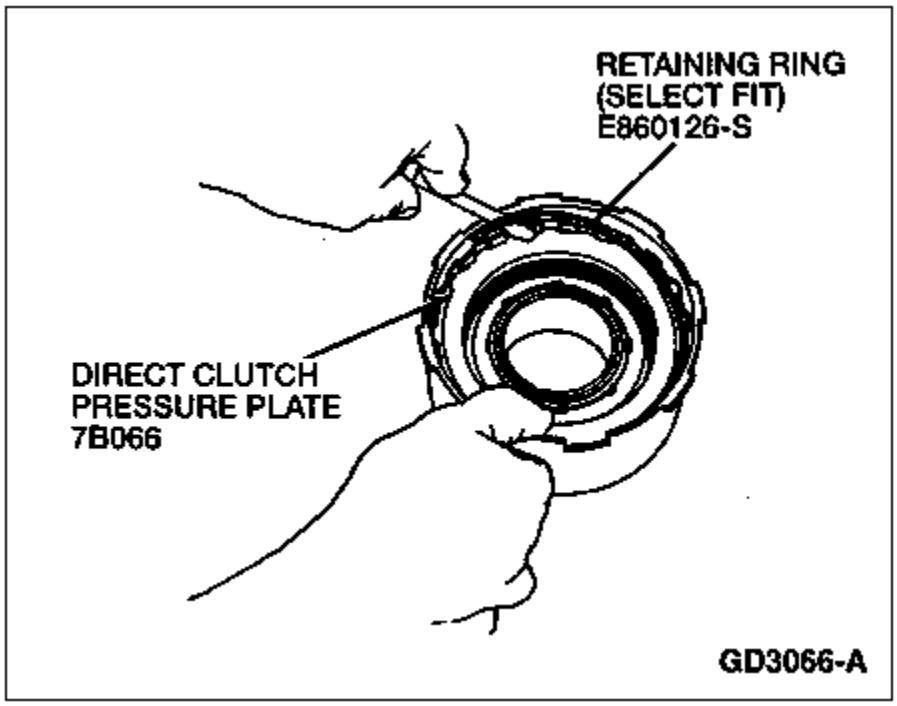
10	7D404	Direct Clutch Piston Inner Seal Ring
11	7D044	Intermediate Brake and Direct Clutch Drum Assembly

Disassembly

1. **CAUTION: The retaining ring is a select fit ring. See assembly procedure if the ring or clutch pack is replaced.**

   Remove the retaining ring and direct clutch pressure plate.

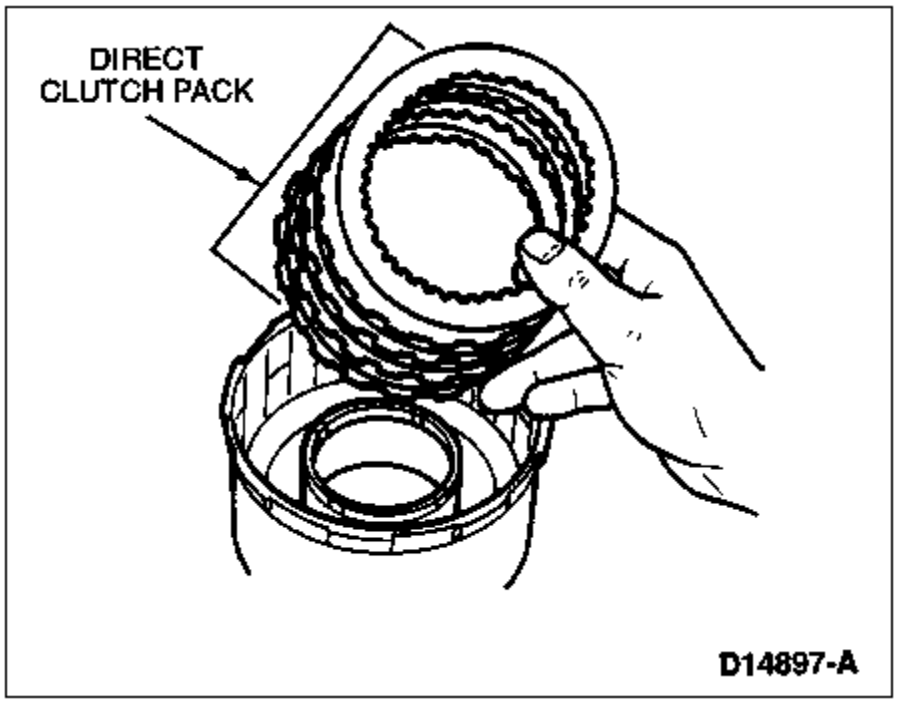


2. **CAUTION: Friction plates are directional and must be installed with grooves clockwise (I.D. to O.D.). The word "TOP" should face up.**

   CAUTION: If new clutch plates are being used, they should be soaked in clean transmission fluid for at least 30 minutes before assembly.

   Remove the direct clutch pack. Inspect for wear, damage or overheating. Replace the steel or friction plates as necessary.

tomsn048@gmail.com

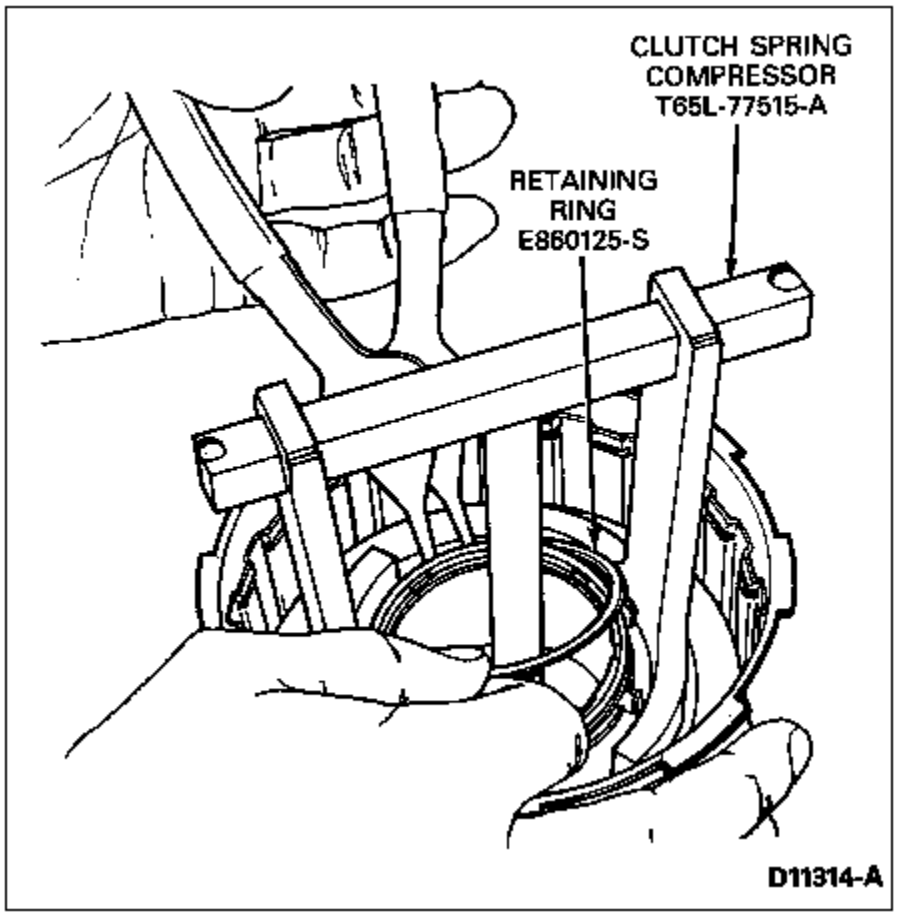


3. **WARNING: AFTER REMOVING THE RETAINING RING, USE CARE WHEN RELEASING THE PRESSURE ON THE SPRINGS.**

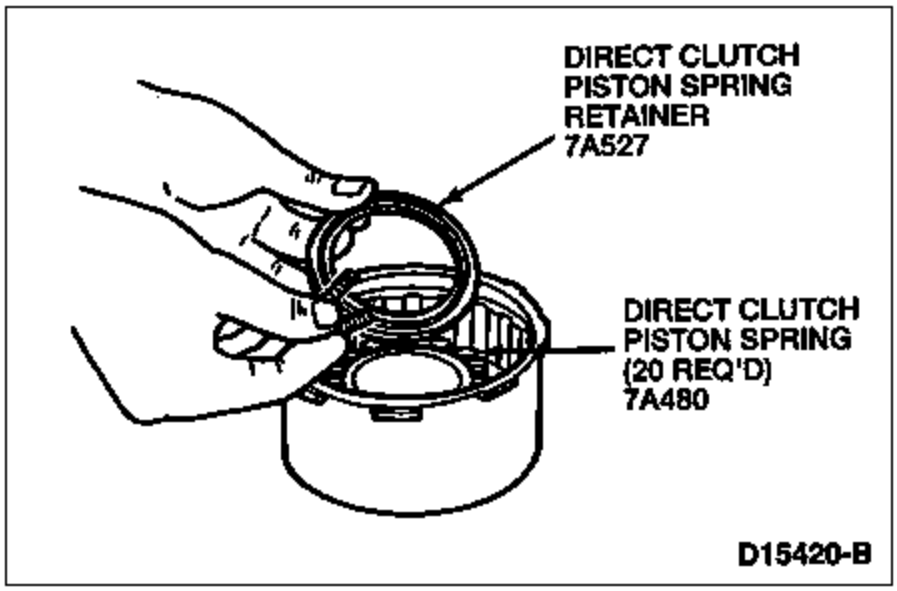
   CAUTION: Do not fully compress the clutch spring compressor or damage to the spring retainer may occur.

   Compress the direct clutch piston springs with Clutch Spring Compressor T65L-77515-A. Remove the retaining ring. Remove the tool.

tomsn048@gmail.com



4. Remove the direct clutch piston spring retainer and 20 direct clutch piston springs.

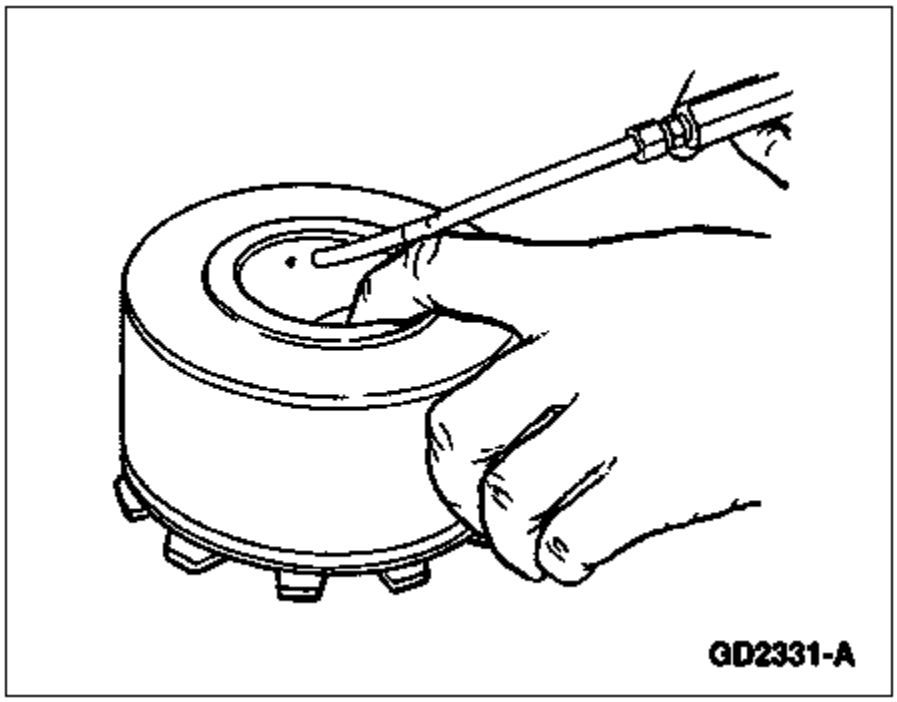


5. **WARNING: DO NOT EXCEED 138 KPA (20 PSI). WEAR SAFETY GLASSES WHEN USING**

tomsn048@gmail.com

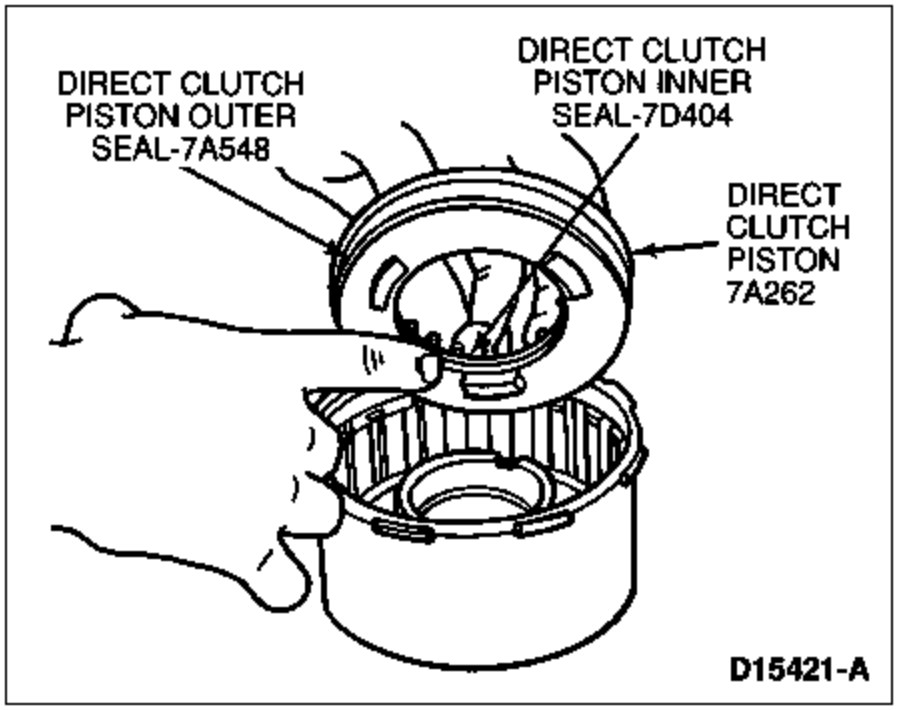
COMPRESSED AIR. MAKE SURE DRUM IS FACING DOWN AS SHOWN.

Remove the direct clutch piston using compressed air. Apply air pressure to one hole on the inside diameter of the intermediate brake and direct clutch drum while blocking the other hole with a finger.



6. Remove the direct clutch piston inner and outer seals. Clean and replace as necessary.

tomsn048@gmail.com

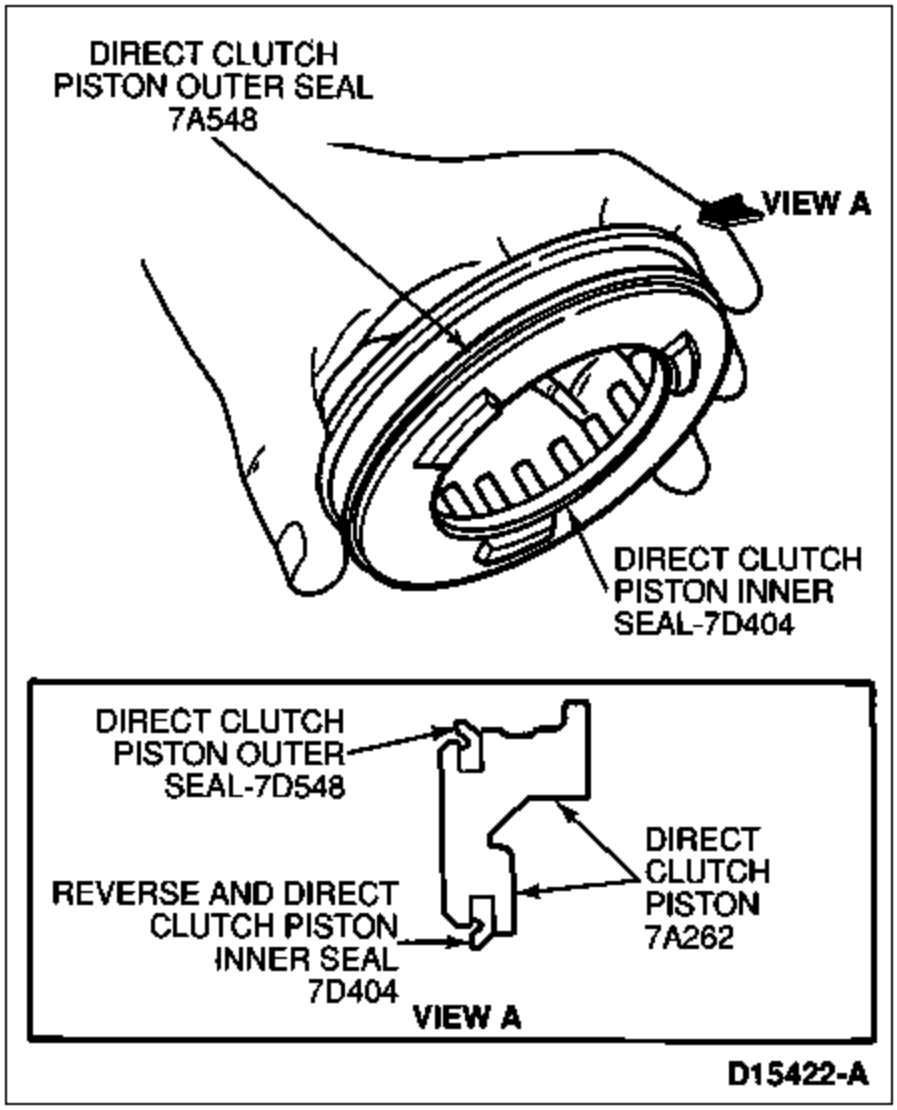


Assembly

1. **CAUTION: The lip seals must be positioned as shown. Care must be taken to prevent rollover of the lip seal.**

   Install new direct clutch piston inner and outer seals on the direct clutch piston.

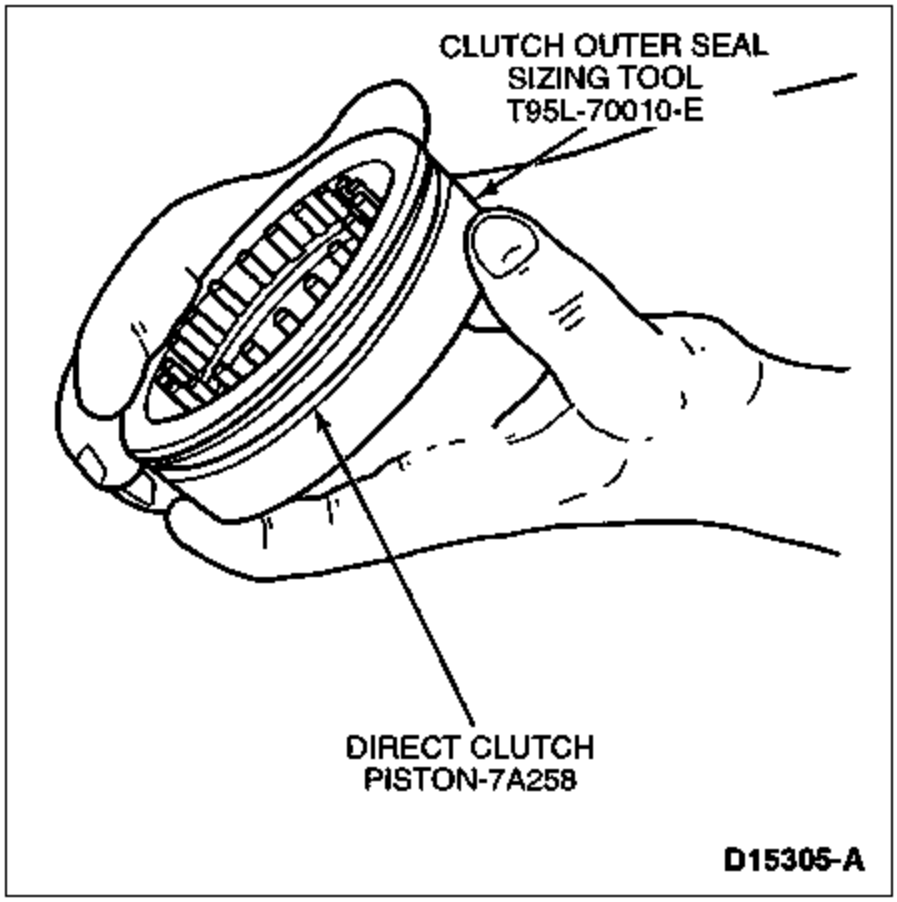
tomsn048@gmail.com



2. **CAUTION: Lubricate the direct clutch piston inner and outer seals with MERCON V® XT-5-QM transmission fluid.**

   Carefully press the direct clutch piston into Direct Clutch Outer Seal Sizing Tool T95L-70010-E.

tomsn048@gmail.com



3. Inspect the drum band surface, bushing and thrust surfaces for scores. Minor scores may be removed with a crocus cloth. Badly scored parts must be replaced.

4. Inspect the clutch piston bore and the piston and the piston inner and outer bearing surfaces for scores.

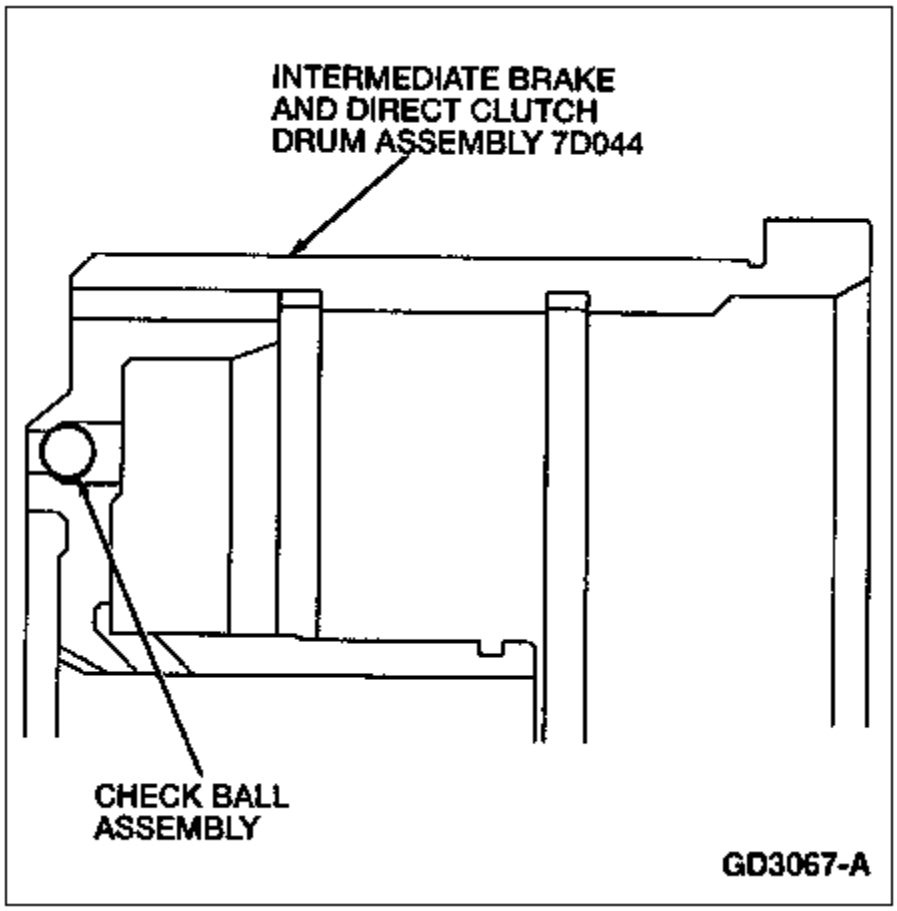
5. Check the fluid passages for obstructions. All fluid passages must be clean and free of obstructions.

6. Inspect the clutch plates for wear, scoring and fit on the clutch hub serrations. Replace all plates that are badly scored, worn or do not fit freely in the hub serrations.

7. Inspect the direct clutch pressure plate for scores on the clutch plate bearing surface. Check the clutch release springs for distortion.

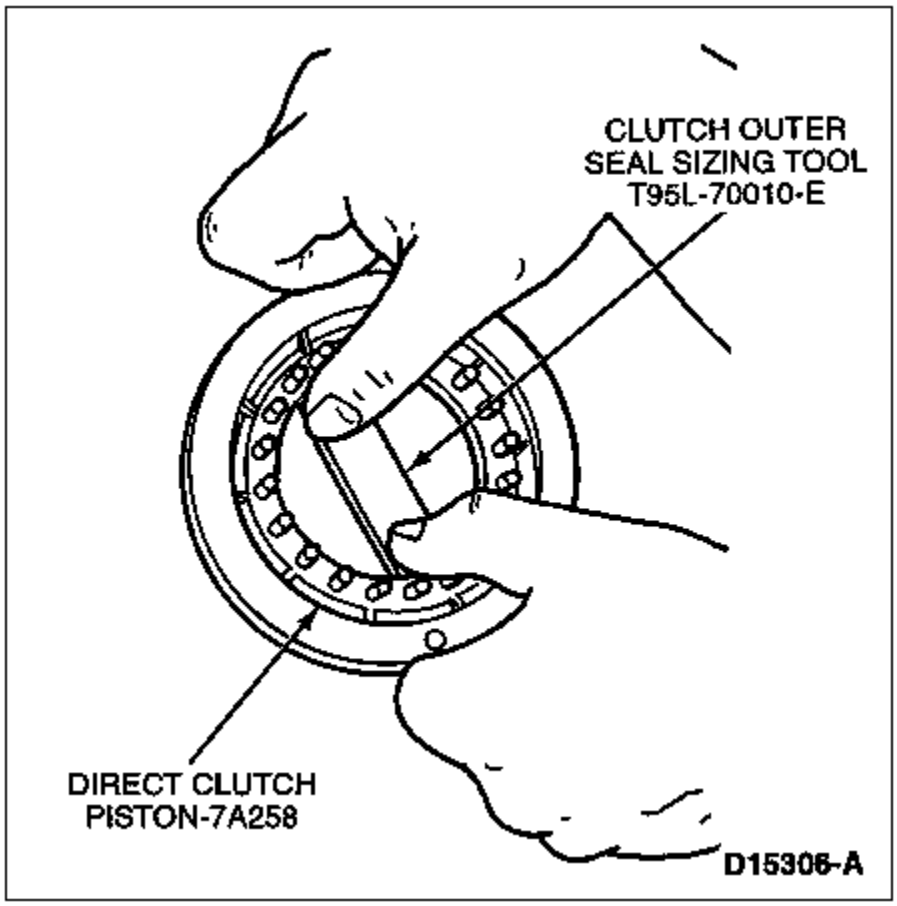
8. Make sure the check ball is free and clear of debris prior to installing piston. The check ball is located in the intermediate brake and direct clutch drum assembly.

tomsn048@gmail.com



9. Carefully remove the direct clutch piston from Direct Clutch Outer Seal Sizing Tool T95L-70010-E.

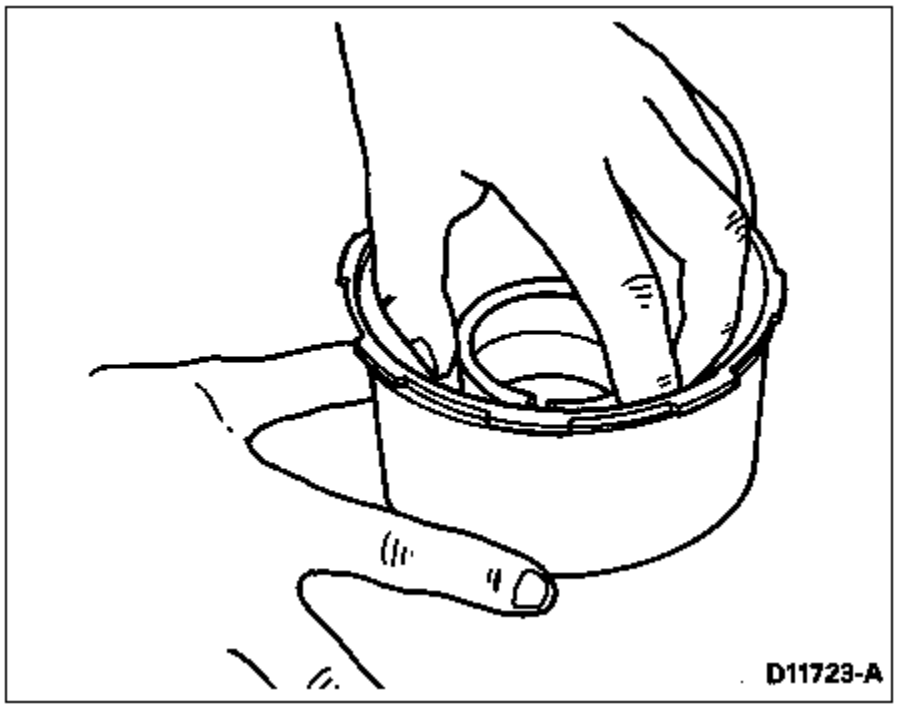
tomsn048@gmail.com



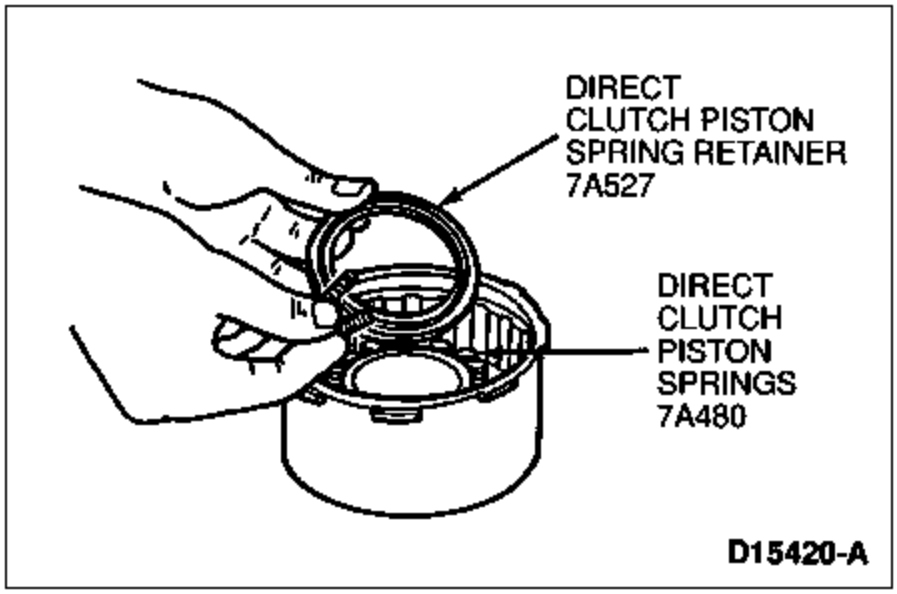
10. **CAUTION: Care must be taken to prevent damage to the seals during installation.**

Carefully install the clutch piston into the intermediate brake and direct clutch drum.

tomsn048@gmail.com



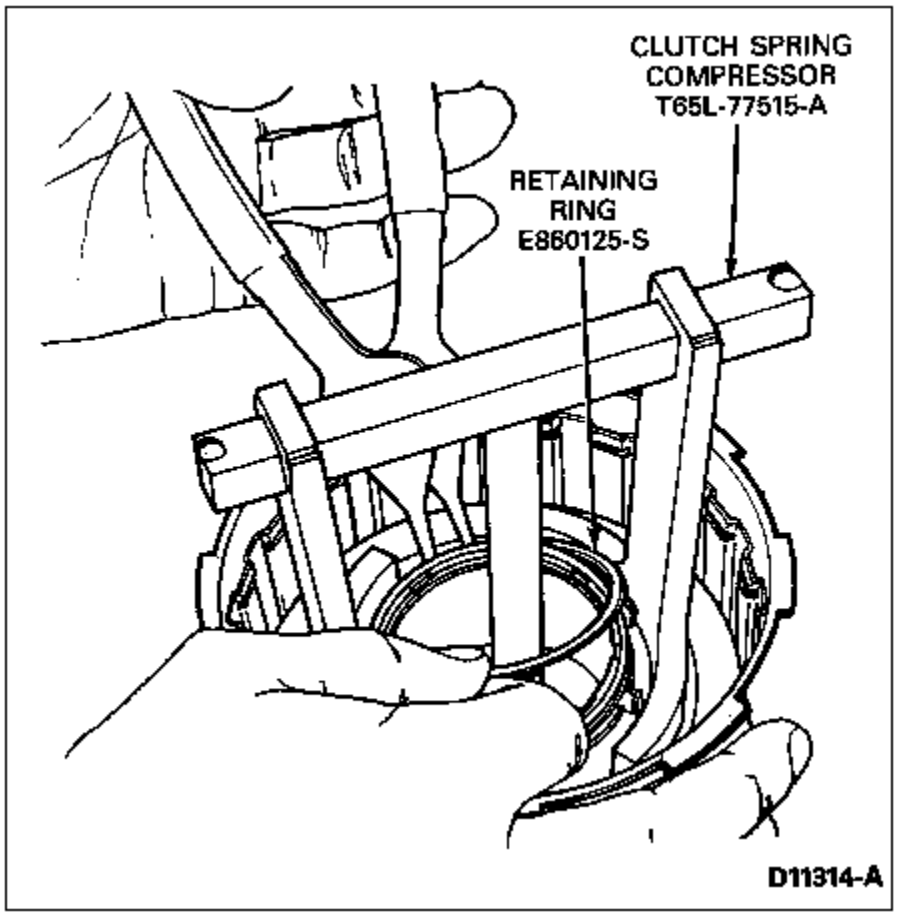
11. Install the direct clutch piston spring retainer and 20 direct clutch piston springs.



12. **CAUTION: Do not fully compress the clutch spring compressor damage to the spring retainer may occur.**

Compress the direct clutch piston springs with Clutch Spring Compressor T65L-77515-A. Install the retaining ring. Remove the tool.

tomsn048@gmail.com



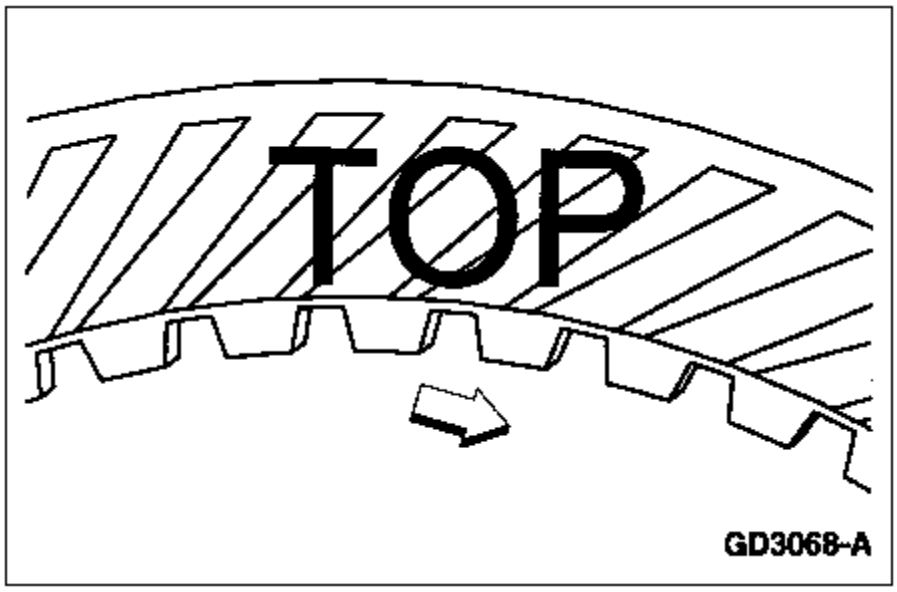
13. **CAUTION: Friction plates are directional and must be installed with grooves clockwise (I.D. to O.D.). The word "TOP" should face up.**

CAUTION: The number of plates is model dependent. See Specifications at the end of this section. If new plates are being used, they should be soaked in clean transmission fluid for at least 30 minutes before assembly.

NOTE: When installing friction plates, the word "TOP" should face up. If reusing plates, grooves must be installed clockwise.

Install the steel clutch plates and friction clutch plates in alternating order, starting with a steel plate and finishing with a friction plate.

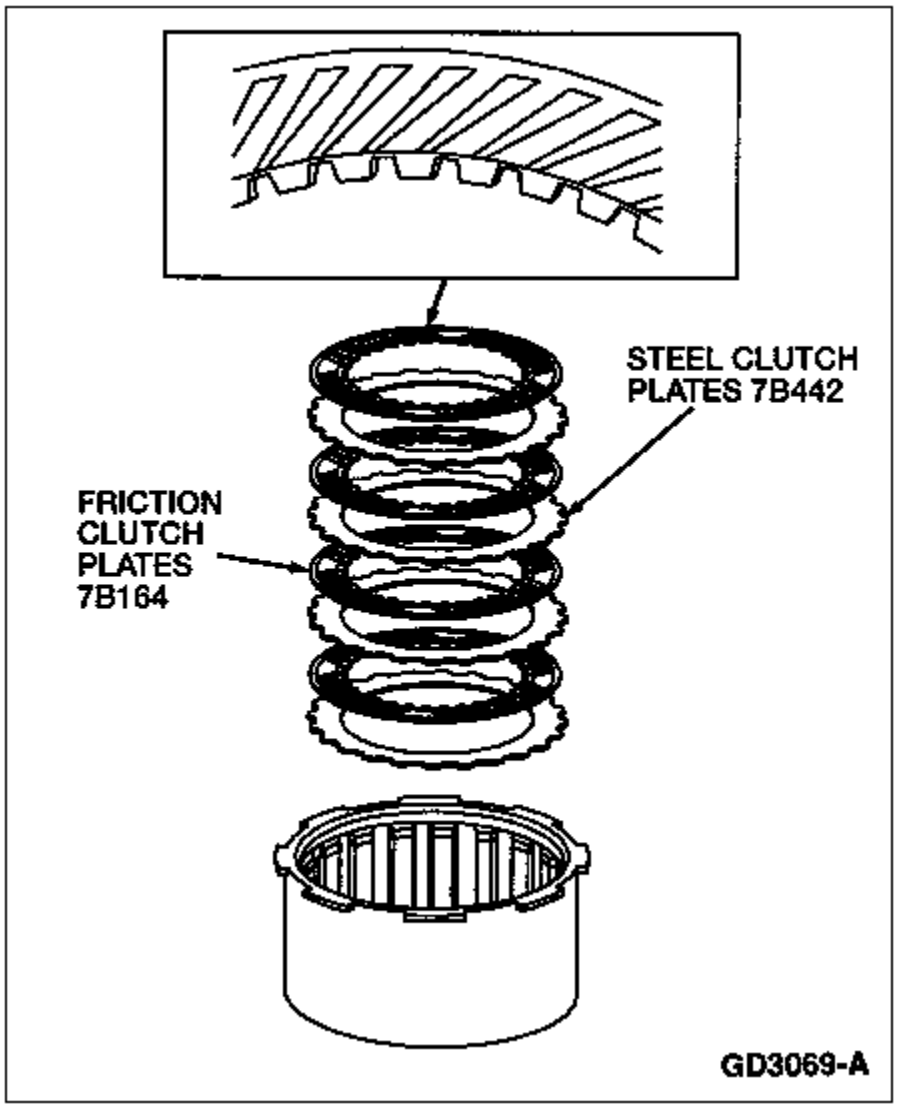
tomsn048@gmail.com



CLUTCH PACK

Steel	Friction
4	4

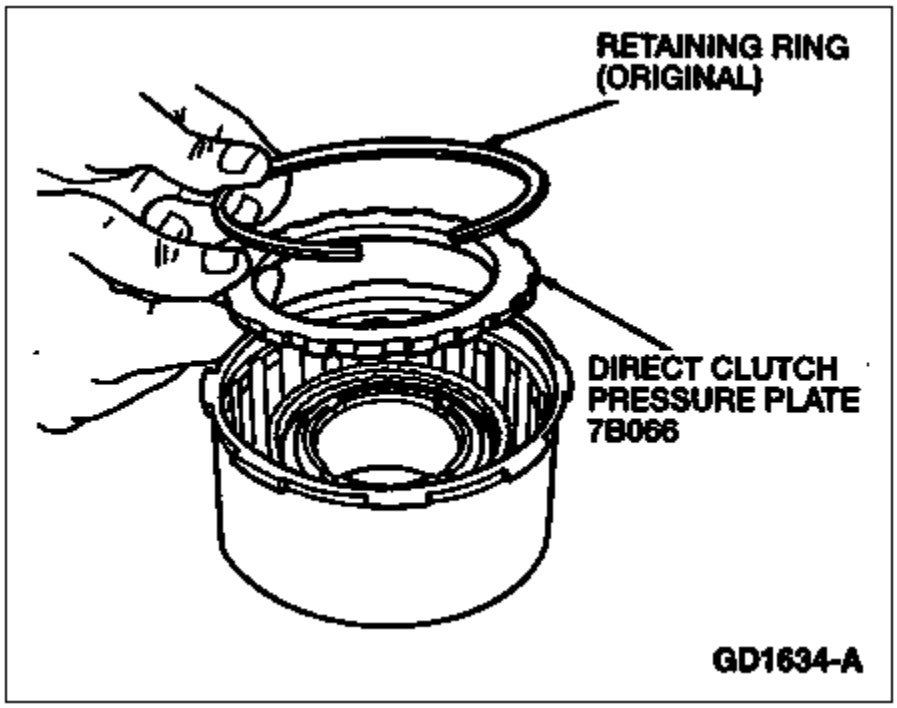
tomsn048@gmail.com



14. **CAUTION: The retaining ring is a select fit.**

Install the direct clutch pressure plate and original retaining ring on the clutch stack.

tomsn048@gmail.com

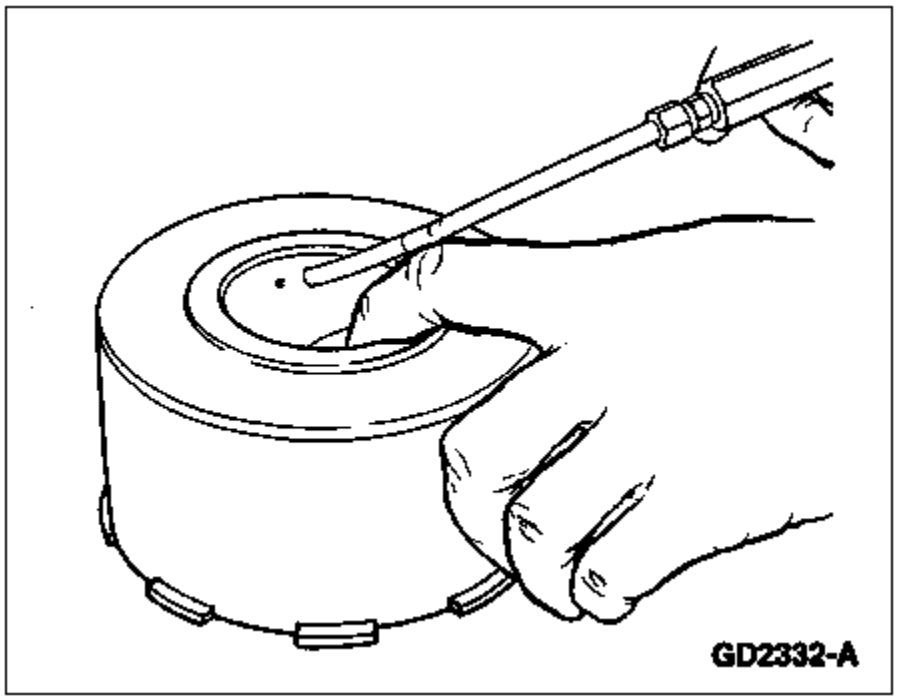


15. **WARNING: AIR PRESSURE MUST NOT EXCEED 138 KPA (20 PSI). WEAR SAFETY GLASSES WHEN USING COMPRESSED AIR. MAKE SURE THE DRUM IS FACING DOWN AS SHOWN.**

    NOTE: The direct clutch piston must apply with air pressure and release when the air is removed.

    Air check the assembly. Apply air to one hole on the inside diameter of the intermediate brake and direct clutch drum while blocking the other hole with a finger.

tomsn048@gmail.com



16. Push down on the clutch pack. Use a feeler gauge to check the gap between the retaining ring and the clutch pressure plate. Specification: 1.3 to 2.0 mm (0.051 to 0.079 inch).

    If the reading is not within specification, remove the retaining ring and check thickness. Replace with a ring that will correct free play, and verify with a feeler gauge.

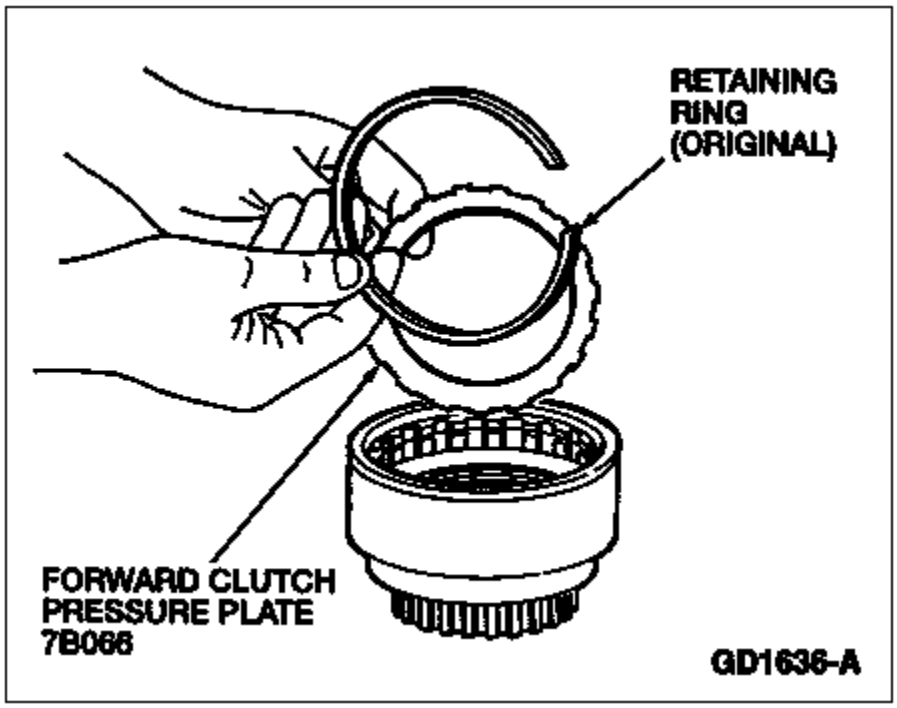
11	7A548	Forward Clutch Piston Inner Seal Ring
12	7A360	Forward Clutch Cylinder Assembly
13	7M153	No. 5 Forward Clutch Cylinder Thrust Bearing

Disassembly

1. **CAUTION: The retaining ring is a select fit ring. See assembly procedure if the retaining ring or clutch pack is replaced.**

   CAUTION: If new plates are being used, they should be soaked in clean transmission fluid for at least 30 minutes before assembly.

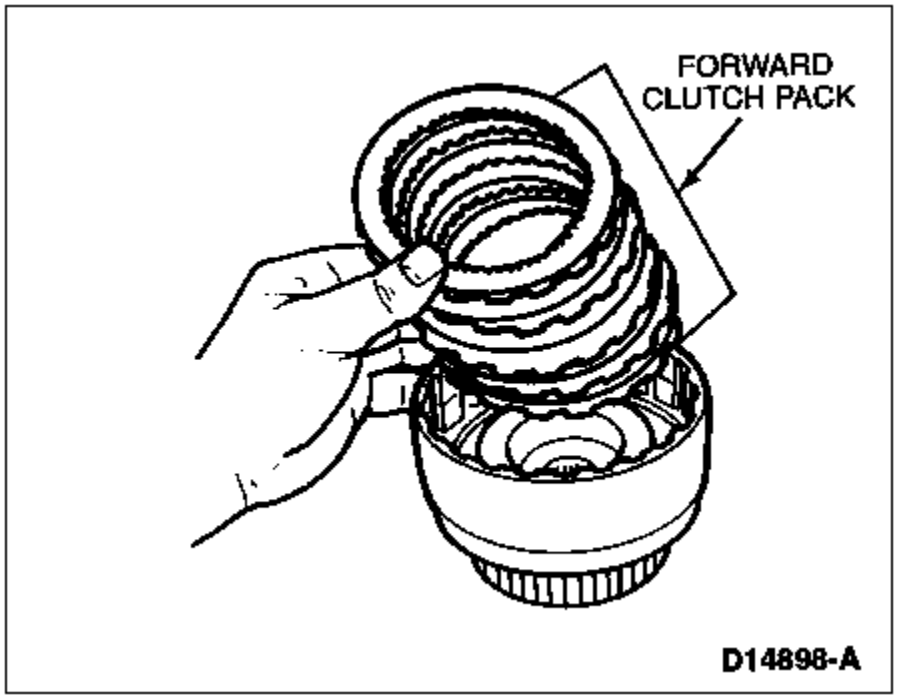
   Remove the retaining ring and forward clutch pressure plate.



tomsn048@gmail.com

2. **CAUTION: Friction plates are directional and must be installed with grooves counterclockwise (I.D. to O.D.). The word "TOP" should face up.**

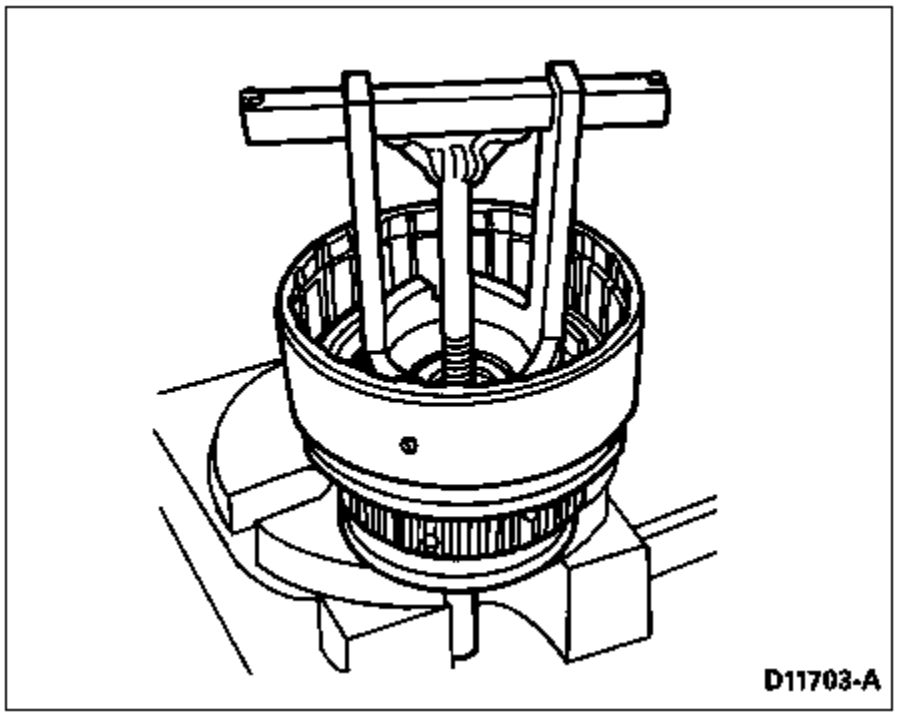
   Remove the forward clutch pack. Inspect for wear, damage or overheating. Replace as necessary.



3. **CAUTION: Do not fully compress the clutch spring compressor or damage to the spring retainer may occur.**

   Compress the forward clutch piston springs with Clutch Spring Compressor T65L-77515-A. Remove the retaining ring.

tomsn048@gmail.com

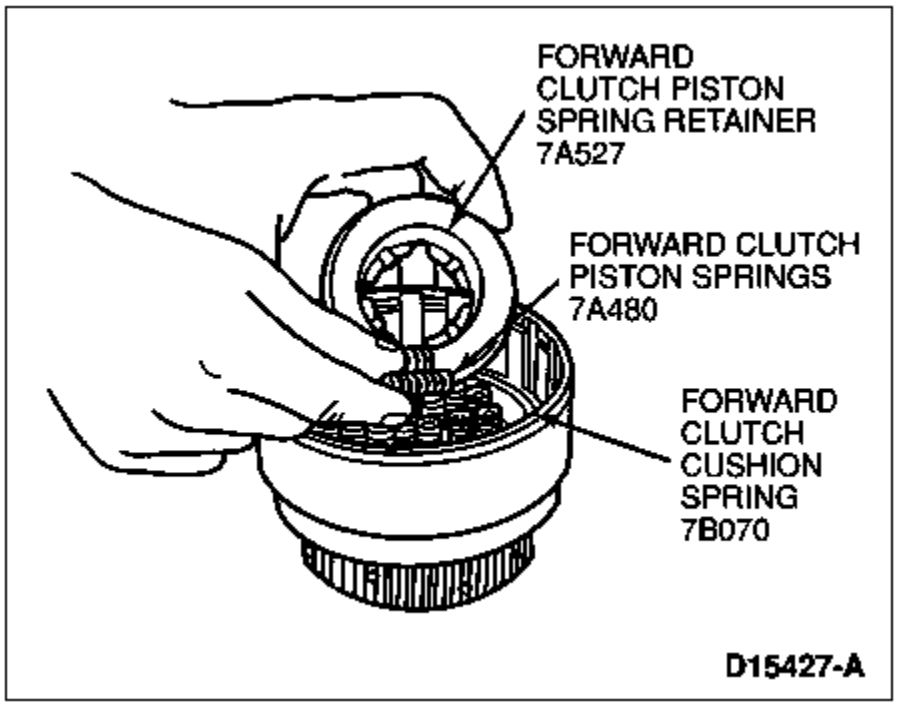


4. **WARNING: CAREFULLY RELEASE THE TOOL PRESSURE ON THE FORWARD CLUTCH PISTON SPRINGS AND REMOVE THE TOOL.**

   Remove the clutch spring compressor from the forward clutch cylinder.

5. Remove the forward clutch piston spring retainer and 15 forward clutch piston springs. Remove the rubber forward clutch cushion spring. Replace as necessary.

tomsn048@gmail.com

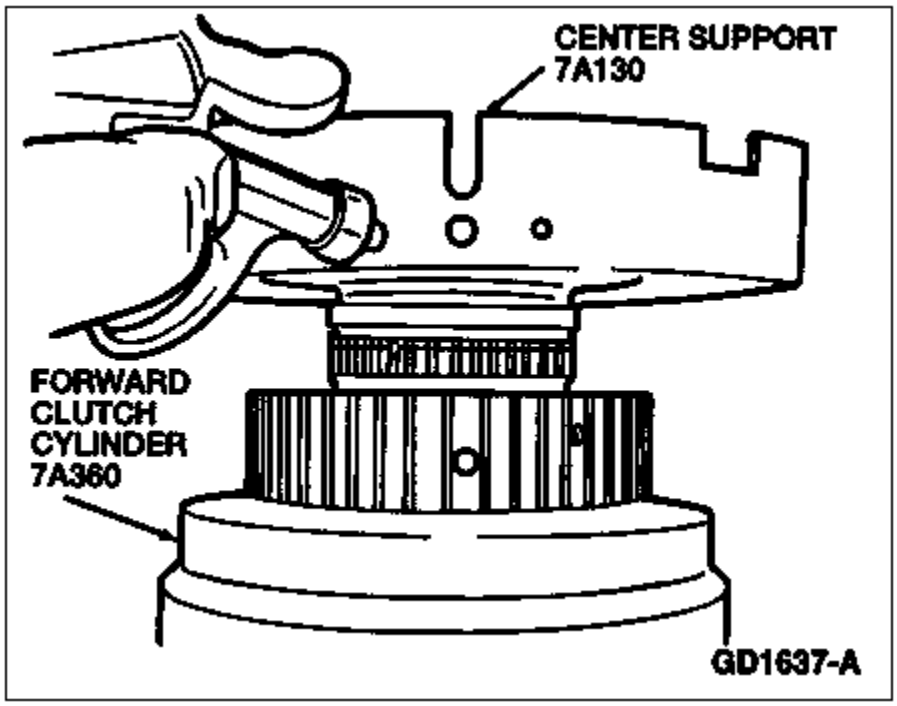


6. **WARNING: AIR PRESSURE MUST NOT EXCEED 138 KPA (20 PSI). WEAR SAFETY GLASSES WHEN USING COMPRESSED AIR. MAKE SURE THE CYLINDER IS FACING DOWN AS SHOWN.**

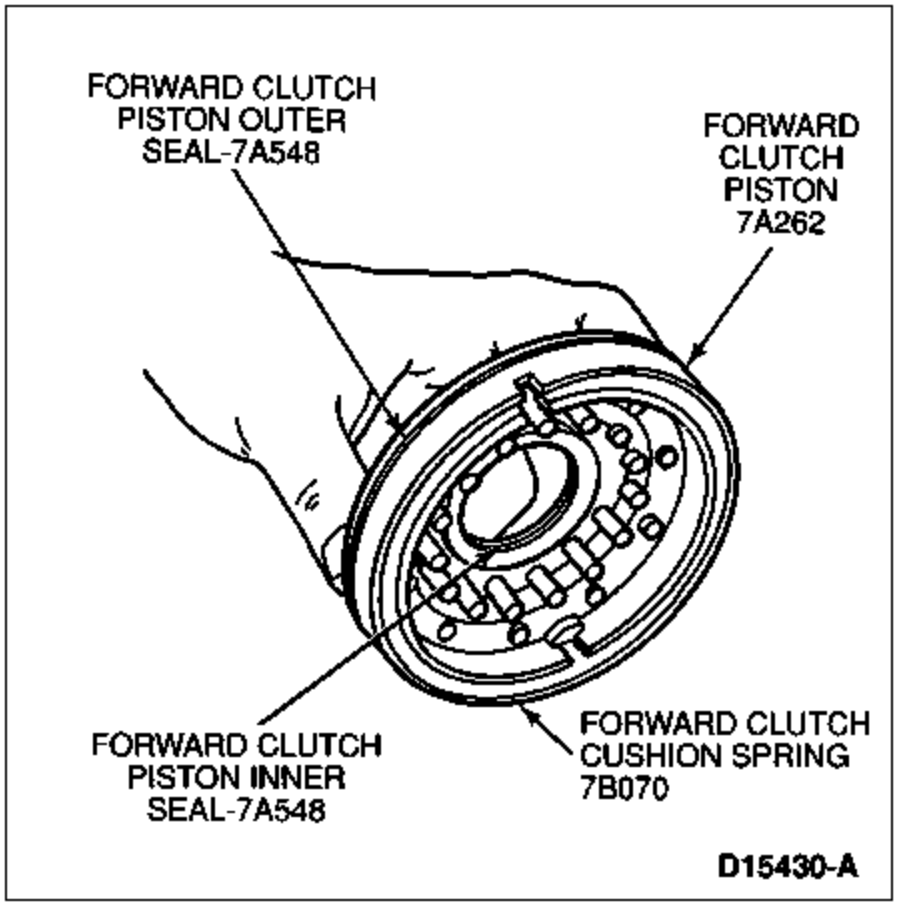
   NOTE: This is the middle-sized port.

   Use the center support to remove the forward clutch piston. Install the center support on the forward clutch cylinder. Apply air pressure to the far left port in the center support as shown.

tomsn048@gmail.com



7. Remove the forward clutch piston inner and outer seals. Clean and replace as necessary.



tomsn048@gmail.com

8. Inspect the forward clutch cylinder thrust surfaces, piston bore and clutch plate serration for scores or burrs. Minor scores or burrs may be removed with a crocus cloth. Replace the forward clutch cylinder if it is badly scored or damaged.

9. Check the fluid passages in the forward clutch cylinder for obstructions. Clean out all passages. Inspect the forward clutch piston for scores and replace if necessary. Inspect the piston check ball for freedom of movement and proper seating.

10. Check the clutch release springs for distortion and cracks. Replace the springs if they are distorted or cracked.

11. Inspect the friction clutch plates, steel clutch plates and clutch pressure plate for worn or scored bearing surface. Replace all parts that are deeply scored.

12. Check clutch plates for flatness and fit on the clutch hub serrations. Discard any plate that does not slide freely on the serrations or that is not flat.

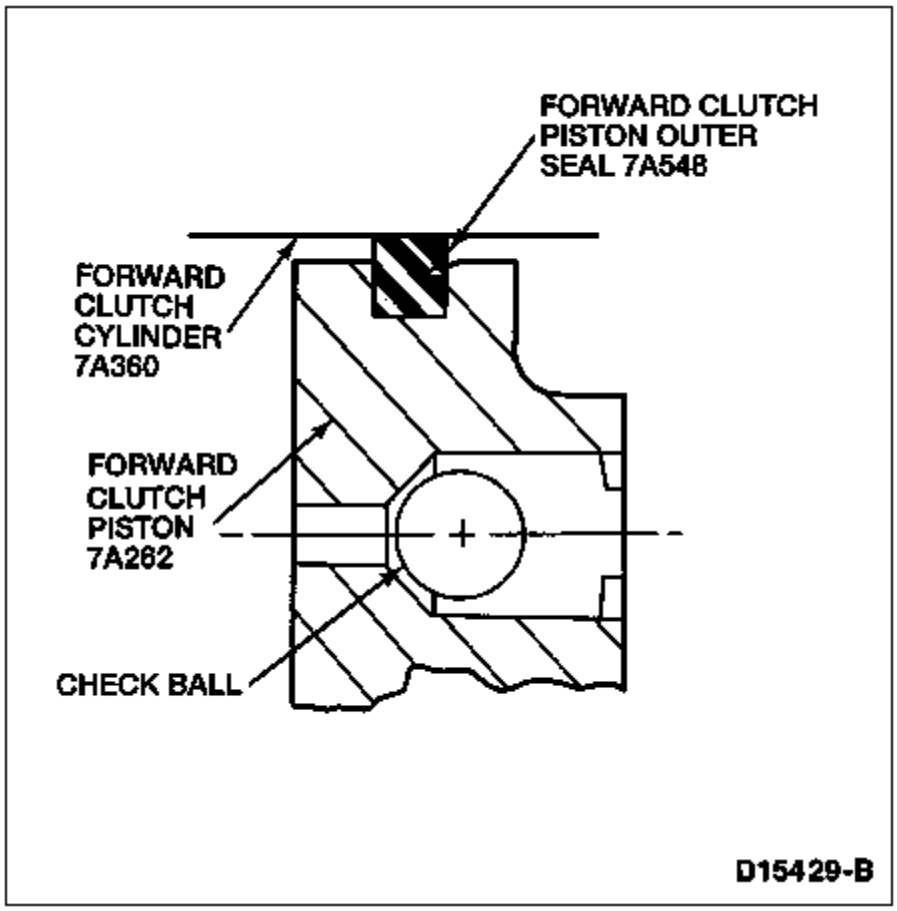
13. Check clutch hub thrust surfaces for scores and clutch hub splines for wear.

14. **NOTE: The check ball is located in the piston.**

    Make sure the check ball is free and clear of debris prior to installing the forward clutch piston.

15. Inspect bearing and seal rings for damage.

tomsn048@gmail.com

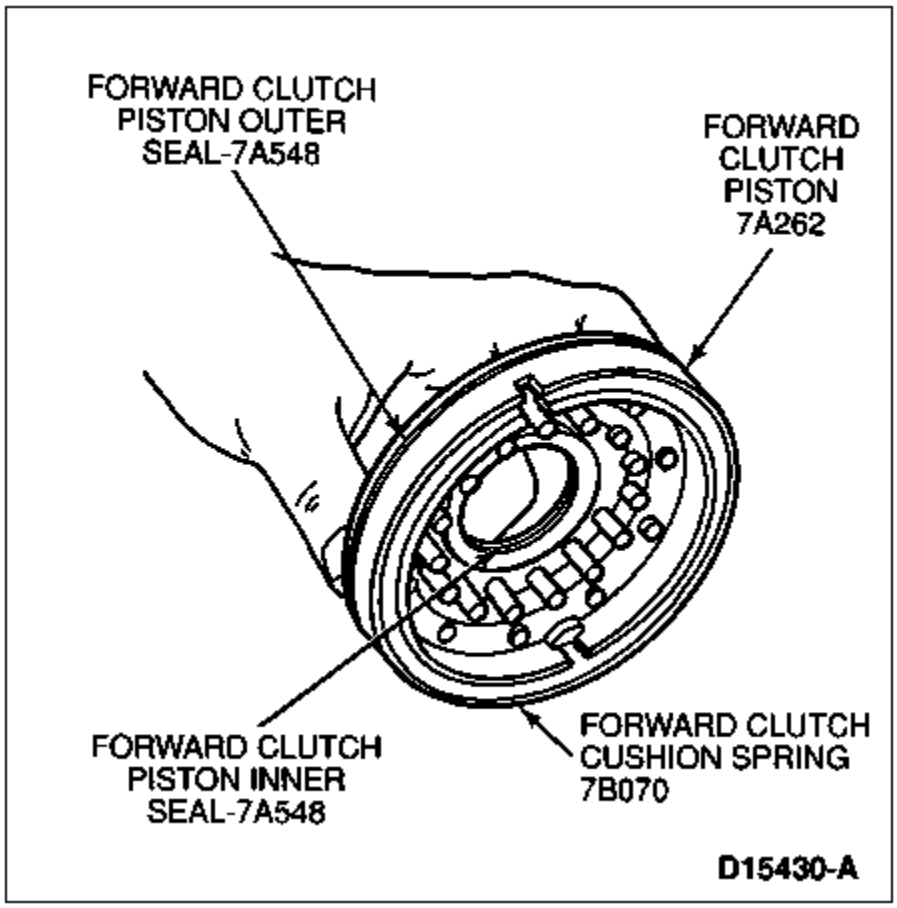


Assembly

1. **CAUTION: If there is evidence of clutch plate burning, replace the forward clutch cushion spring.**

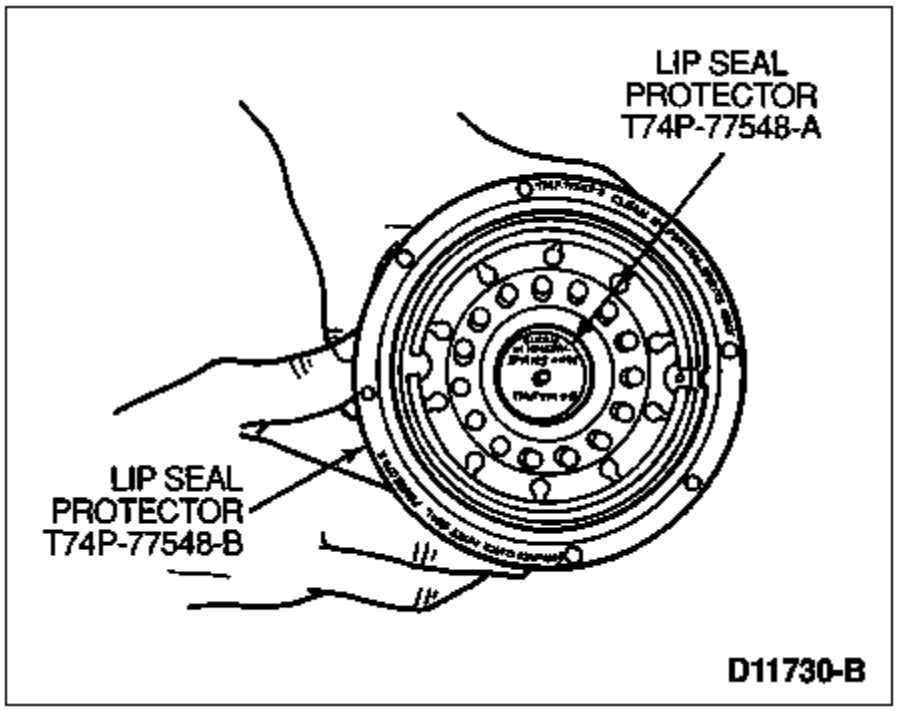
   Install new forward clutch piston inner and outer seals on the forward clutch piston. Install the forward clutch cushion spring.

tomsn048@gmail.com



2. To prevent damage to the forward clutch piston outer seal, install Lip Seal Protector T74P-77548-B. To prevent damage to the forward clutch piston inner seal install Lip Seal Protector T74P-77548-A into forward clutch cylinder.

tomsn048@gmail.com



3. **CAUTION: Care must be taken to prevent damage to the seals.**

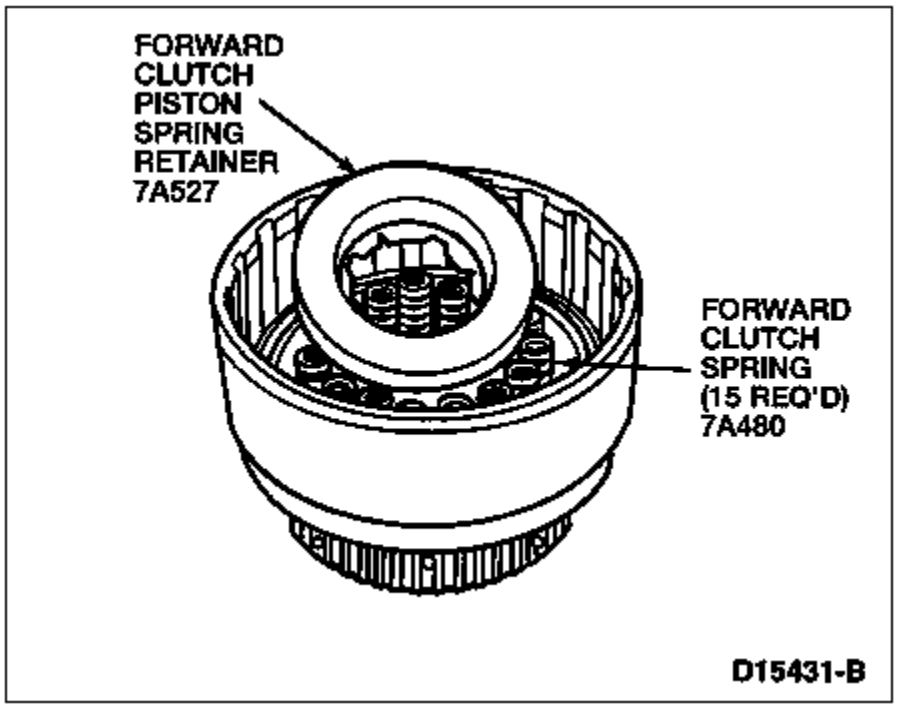
   NOTE: Apply petroleum jelly to the inner and outer seals.

   Carefully install the forward clutch piston into the forward clutch cylinder.

4. Carefully remove Lip Seal Protector T74P-77548-A and Lip Seal Protector T74P-77548-B from the forward clutch cylinder.

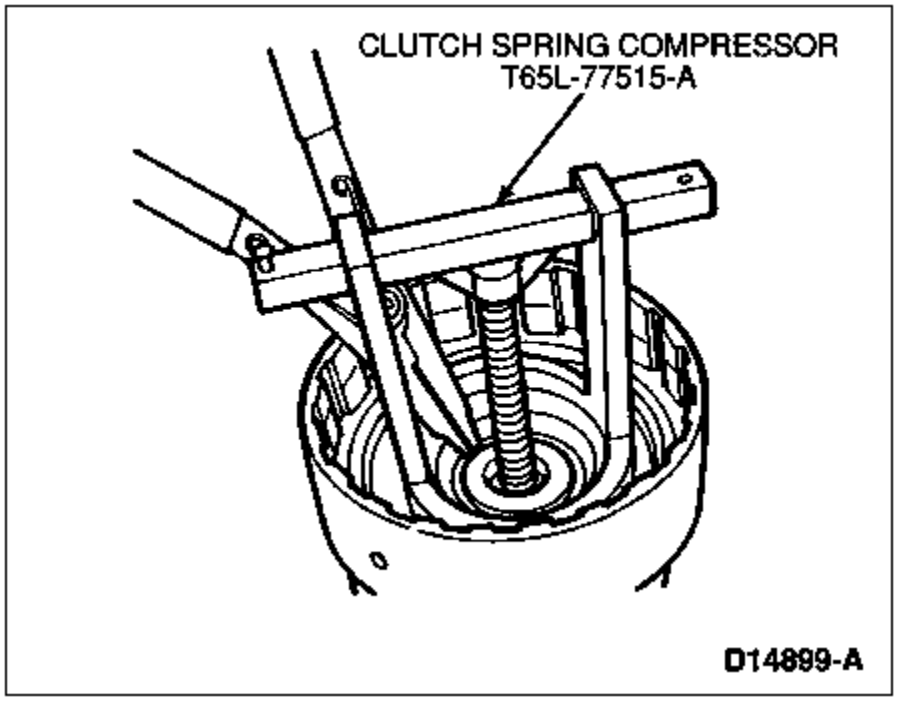
5. Install the 15 forward clutch piston springs and forward clutch piston spring retainer.

tomsn048@gmail.com



6. **CAUTION: Do not fully compress the clutch spring compressor or damage to the forward clutch piston spring retainer may occur.**

   Compress the clutch piston springs with Clutch Spring Compressor T65L-77515-A and install the retaining ring. Release the load on the forward clutch piston springs and remove the tool.



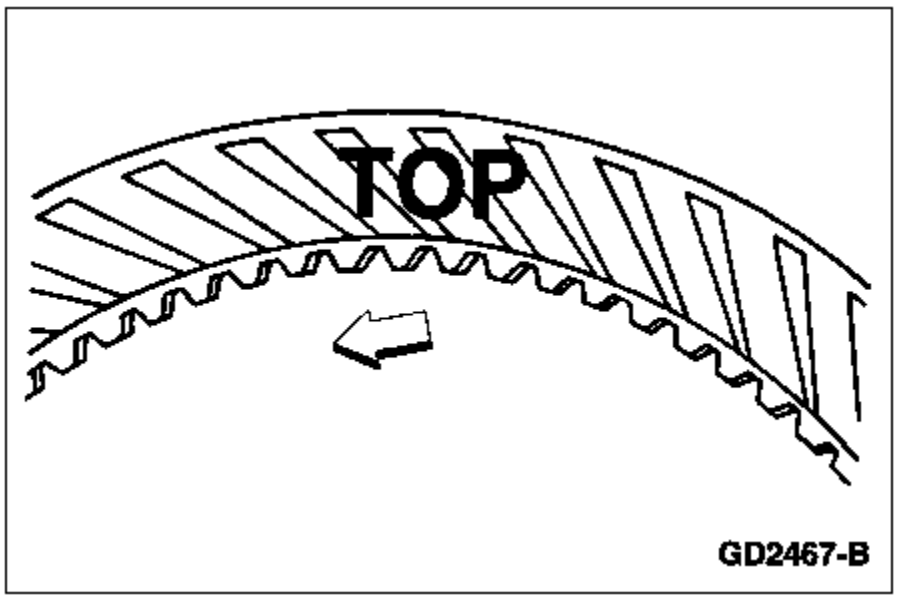
tomsn048@gmail.com

7. **CAUTION: Friction plates are directional and must be installed with grooves counterclockwise (I.D. to O.D.). The word "TOP" should face up.**

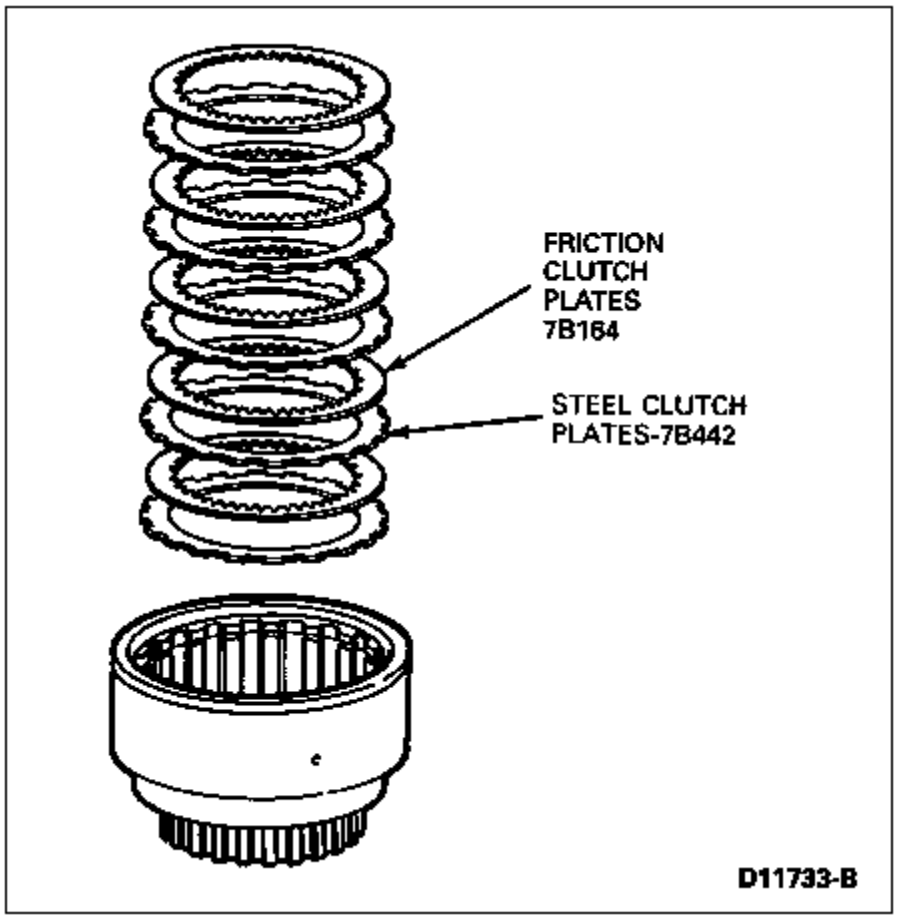
   CAUTION: If new plates are being used, they should be soaked in clean transmission fluid for at least 30 minutes before assembly.

   NOTE: When installing friction plates, the word "TOP" should face up. If reusing plates, grooves must be installed counterclockwise.

   Install the steel clutch plates and friction clutch plates in alternating order, starting with a steel plate and finishing with a friction plate.



tomsn048@gmail.com



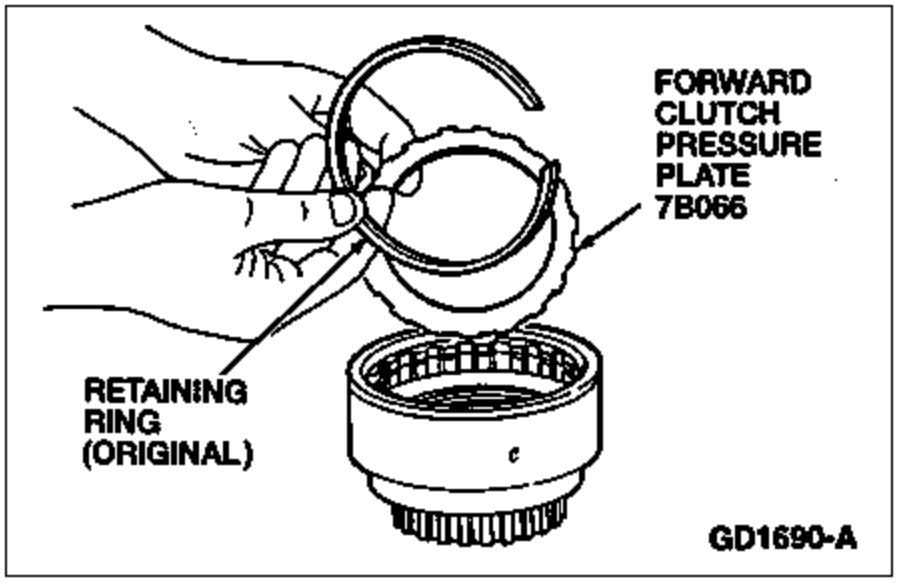
CLUTCH PACK

Steel	Friction
5	5

8. **CAUTION: The retaining ring is a select fit.**

   Install the forward clutch pressure plate on the clutch pack. Install the original retaining ring.

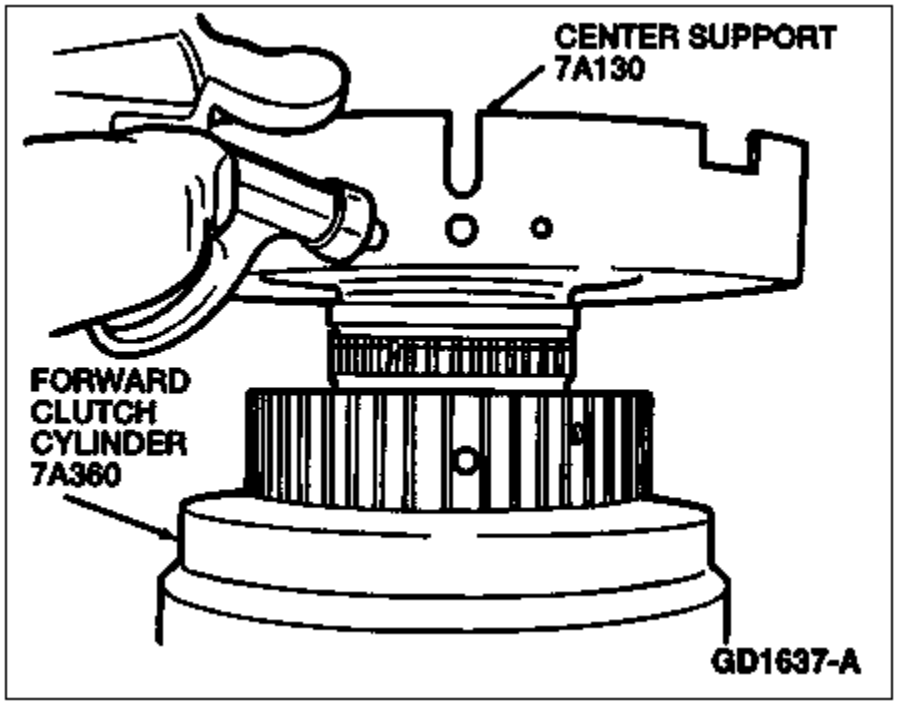
tomsn048@gmail.com



9. **WARNING: DO NOT EXCEED 138 KPA (20 PSI). WEAR SAFETY GLASSES WHEN USING COMPRESSED AIR. MAKE SURE THE DRUM IS FACING DOWN AS SHOWN.**

   NOTE: The forward clutch piston must apply with air pressure and release when the air is removed.

   Install the center support on the forward clutch cylinder. Apply air pressure to the far left port in the center support as shown.



10. Push down on the clutch pack. Use a feeler gauge to check the gap between the retaining ring and

tomsn048@gmail.com

the clutch pressure plate. Specification: 1.4 to 2.1 mm (.055 to .083 inch). If the reading is not within specifications, remove the retaining ring and check the thickness. Replace the retaining ring with one that will provide correct free play. Verify free play with a feeler gauge.

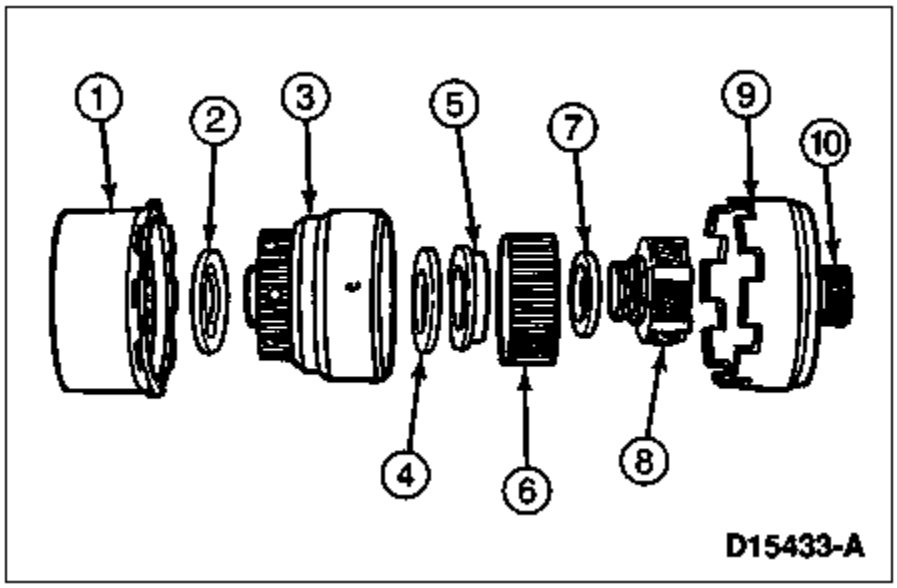
Forward Geartrain Assembly

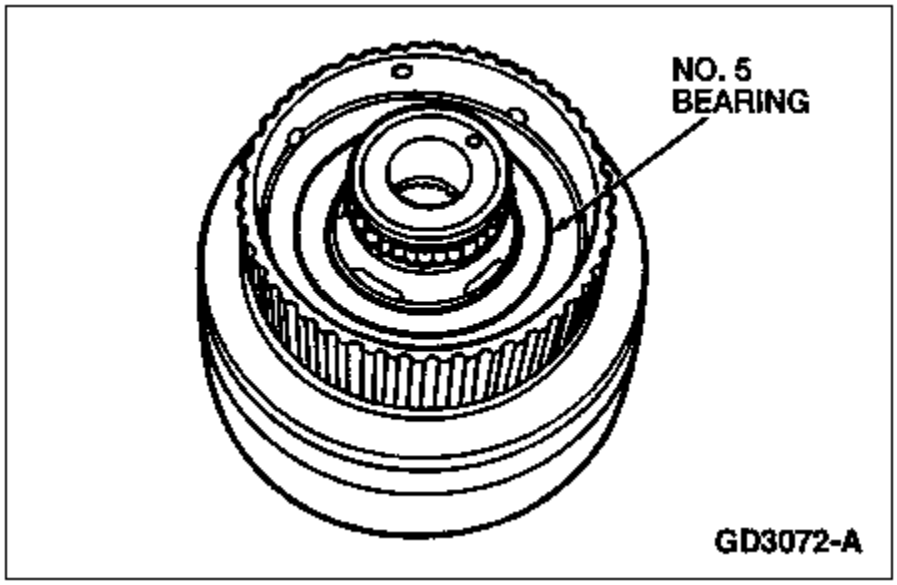
Assembly



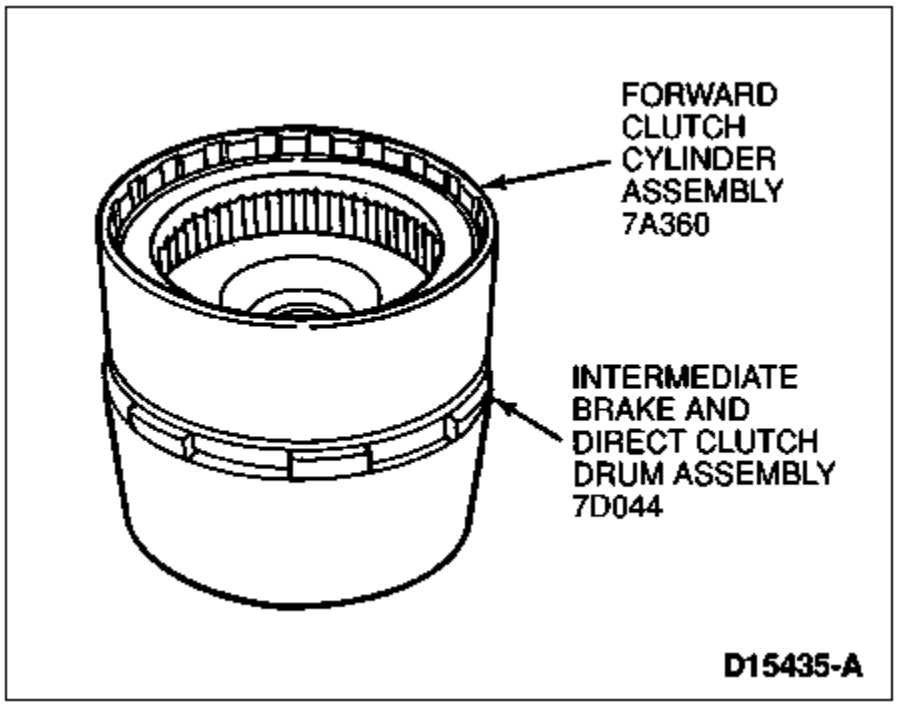
Item	Part Number	Description
1	—	Intermediate Brake and Direct Clutch Drum Assembly
2	7M153	No. 5 Forward Clutch Cylinder Thrust Bearing
3	—	Forward Clutch Cylinder Assembly
4	7D234	No. 6A Forward Ring Gear Hub Thrust Bearing Assembly
5	7D090	No. 6B Forward Clutch Thrust Washer
6	7D392	Forward Ring Gear
7	7F374	No. 7 Forward Planetary Thrust Bearing Assembly
8	7A398	Forward Planetary Assembly
9	7D064	Input Shell
10	7D063	Forward Sun Gear Assembly

1. Install the No. 5 forward clutch cylinder thrust bearing on the forward clutch cylinder assembly. Use petroleum jelly to hold the bearing in place.

tomsn048@gmail.com

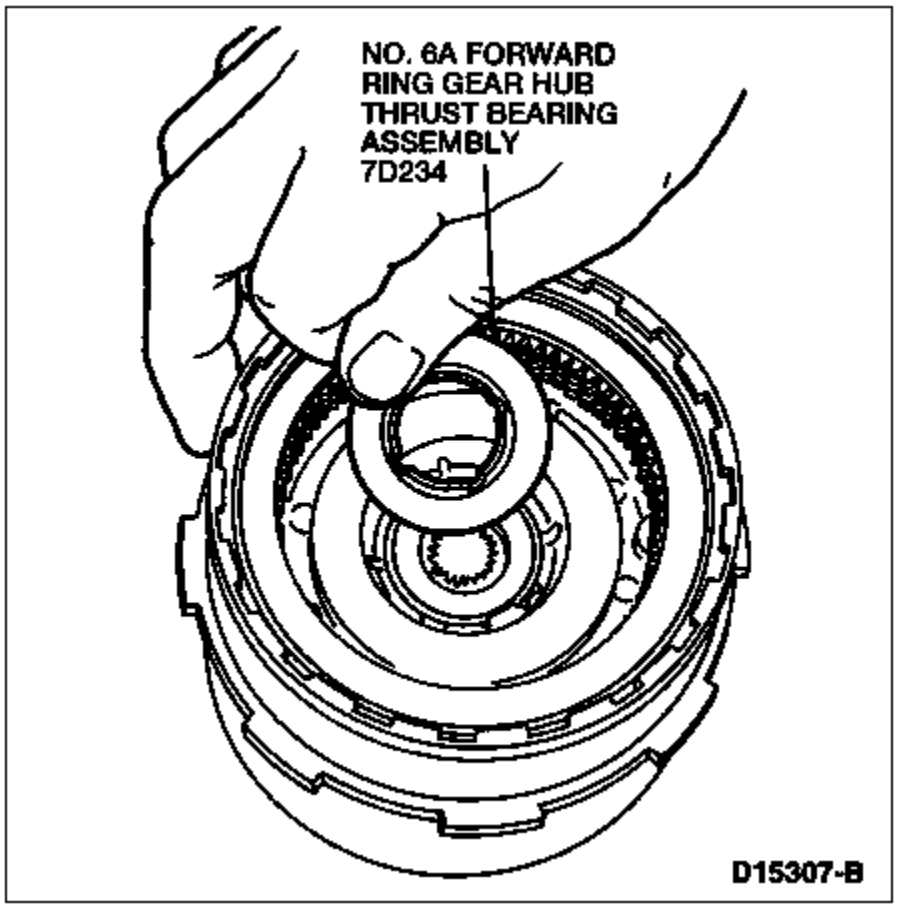


2. Install the forward clutch cylinder assembly into the intermediate brake and direct clutch drum assembly as shown.



3. Install the No. 6A forward ring gear hub thrust bearing into the forward clutch cylinder with tabs facing up as shown.

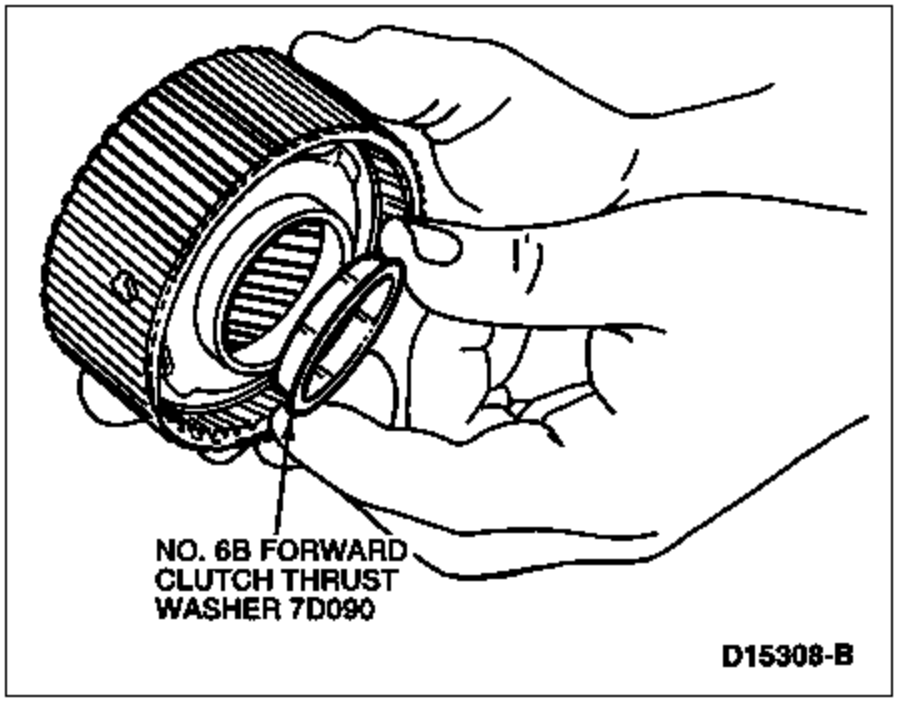
tomsn048@gmail.com



4. **NOTE: Use petroleum jelly to hold the washer in place.**

   Install the No. 6B forward clutch thrust washer into the forward ring gear hub.

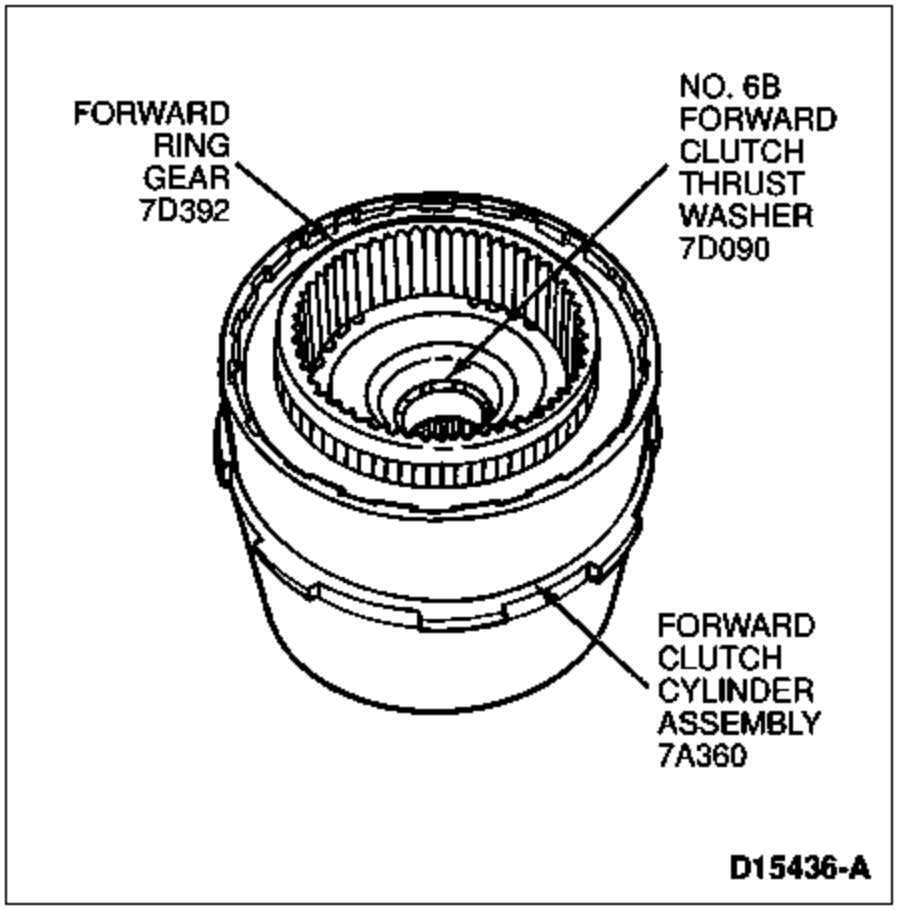
tomsn048@gmail.com



5. **NOTE: Make sure the No. 6A bearing and No. 6B forward clutch thrust washer assembly are inside the forward ring gear.**

   Install the forward ring gear and forward clutch thrust washer into the forward clutch cylinder assembly as shown.

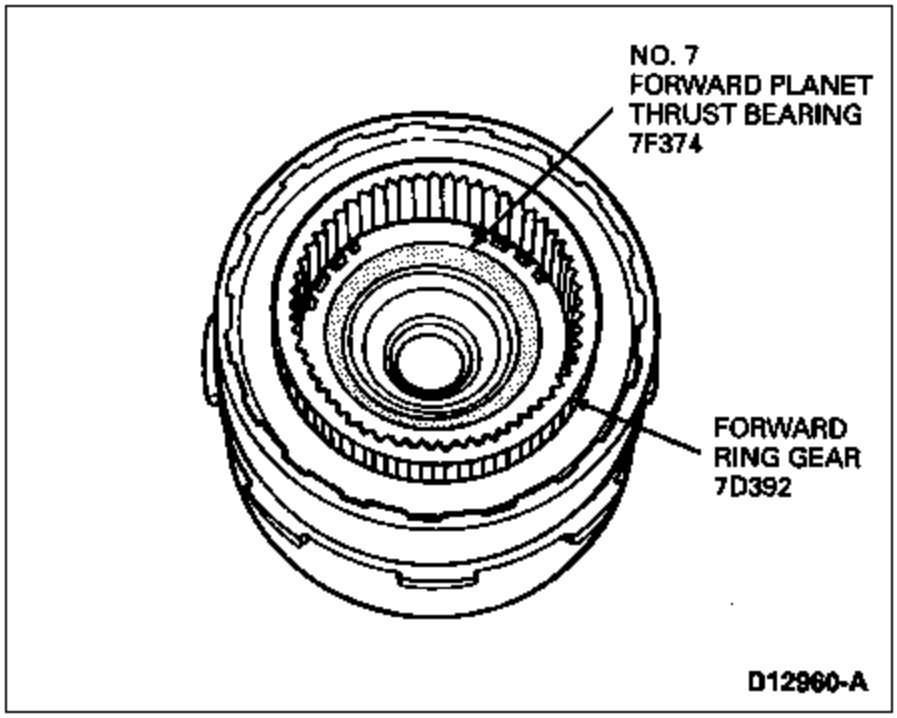
tomsn048@gmail.com



6. **CAUTION: Black oxidized color of thrust bearing must face up toward planetary assembly.**

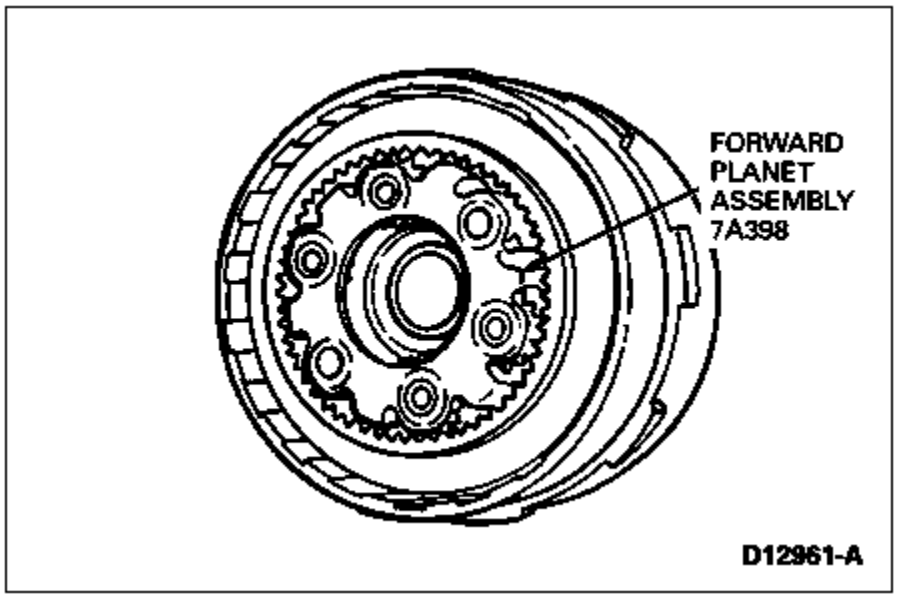
   Install the No. 7 forward planetary thrust bearing into the forward ring gear as shown.

tomsn048@gmail.com



7. **NOTE: All service replacements are 6 pinion only.**

   Install the forward planetary assembly into the forward ring gear as shown.

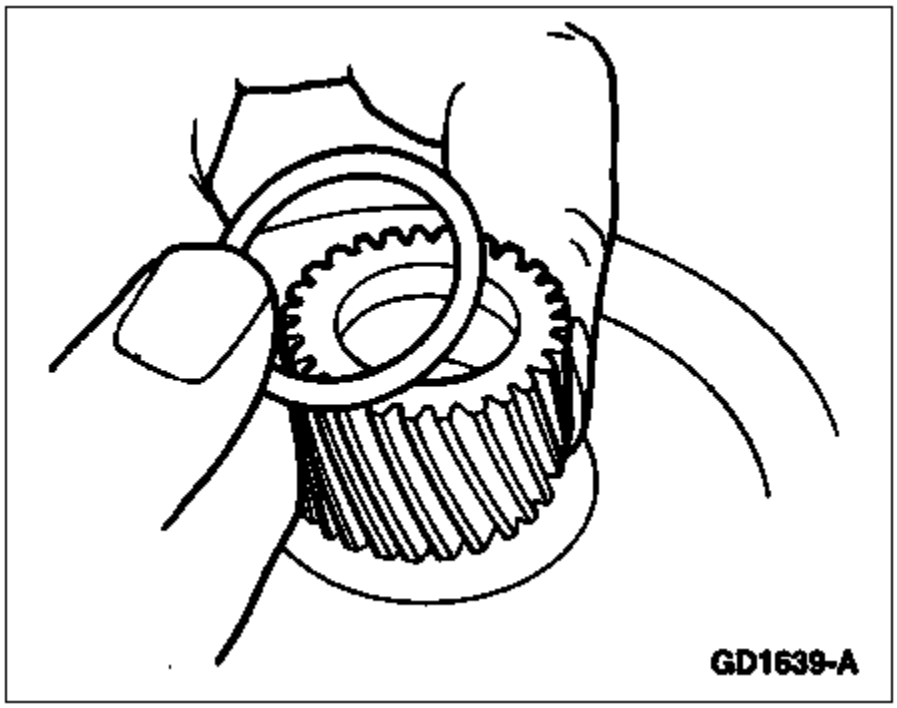


8. **NOTE: If sun gear, retaining rings or input shell require service, perform steps a-e.**

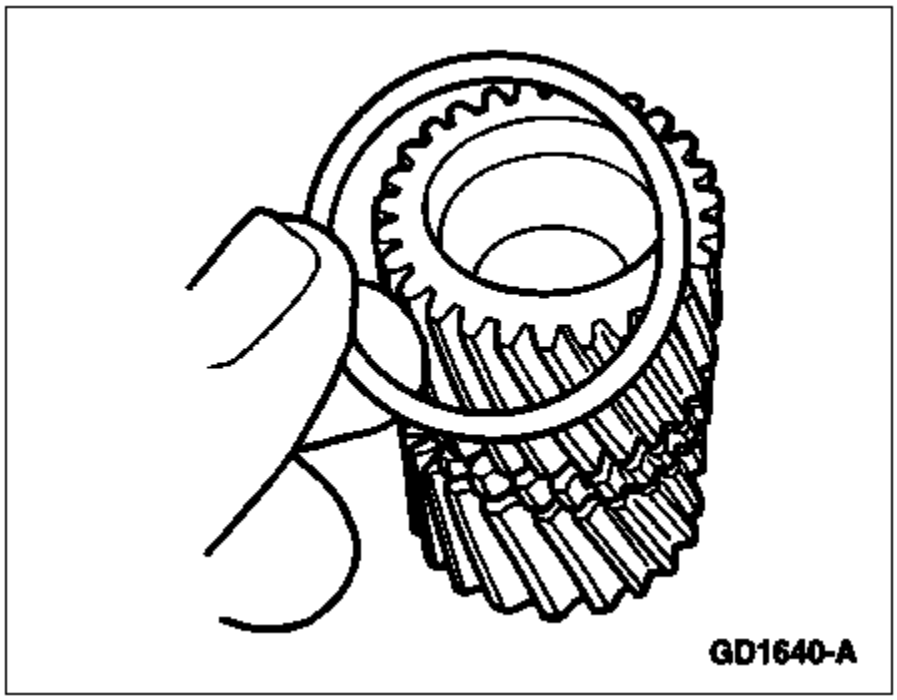
   Inspect the drum gear, bushing and washer for scoring, wear or damage. Replace as required.

   a. Remove rear retaining ring and sun gear from input shell.

tomsn048@gmail.com

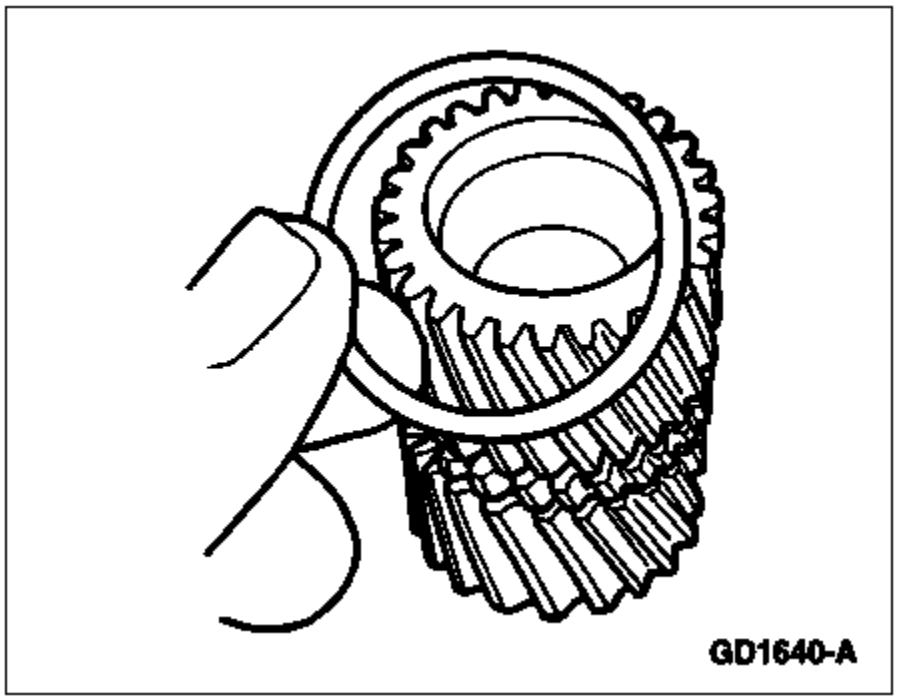


b. Remove front retaining ring from sun gear.

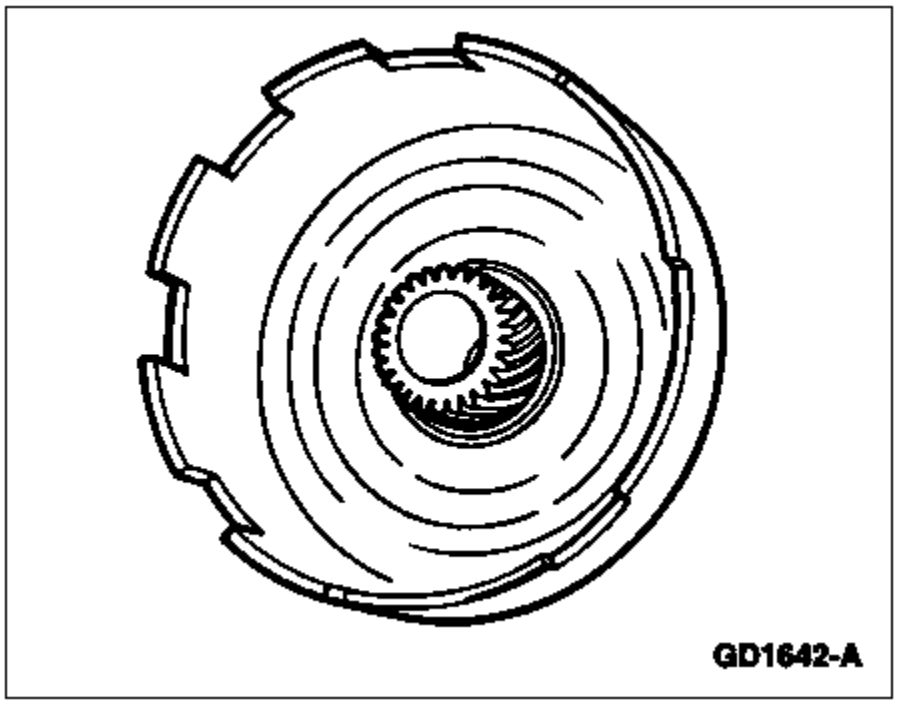


c. Install new retaining ring onto sun gear.

tomsn048@gmail.com

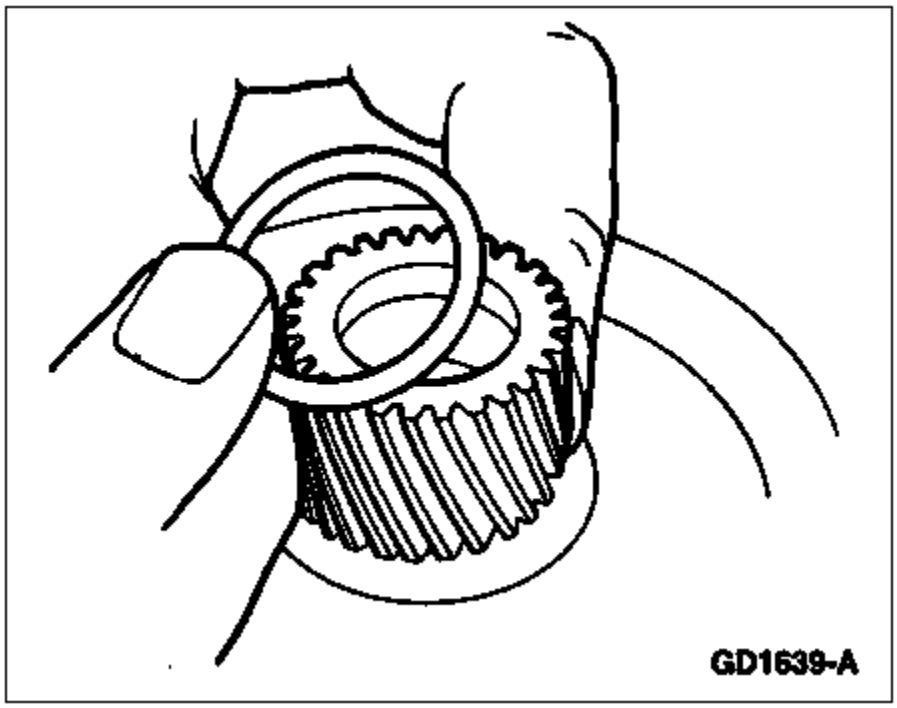


d. Install forward sun gear into input shell.



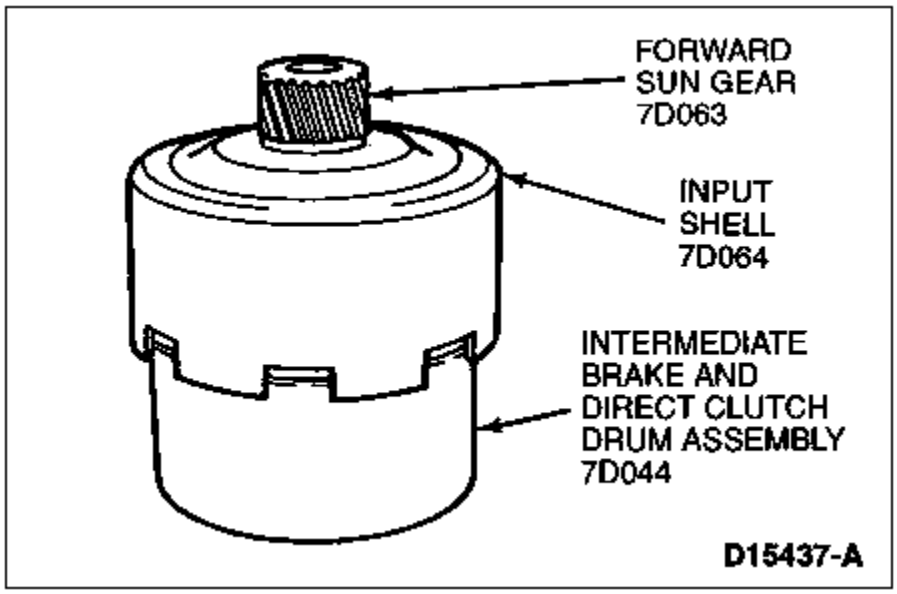
e. Install new rear retaining ring onto sun gear.

tomsn048@gmail.com



9. **NOTE: Make sure the forward sun gear aligns with the forward planetary assembly. Make sure the input shell aligns with the intermediate brake and direct clutch drum assembly as shown.**

   Install the input shell with forward sun gear assembly as shown.

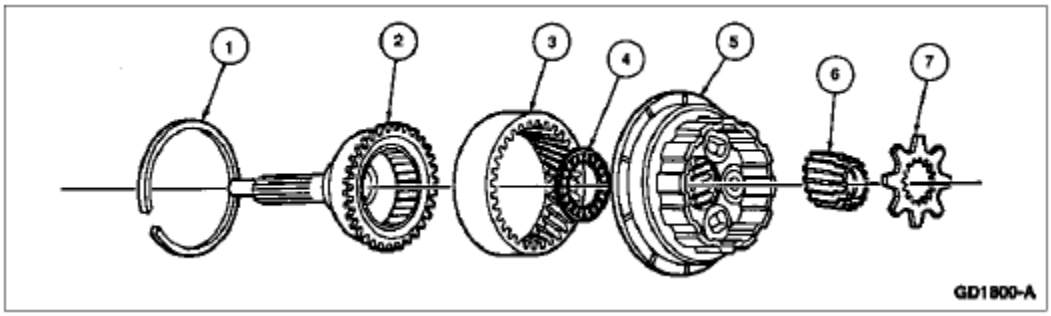


tomsn048@gmail.com

tomsn048@gmail.com

Overdrive Planetary and One-Way Clutch Assembly

Overdrive Planetary and One-Way Clutch Assembly

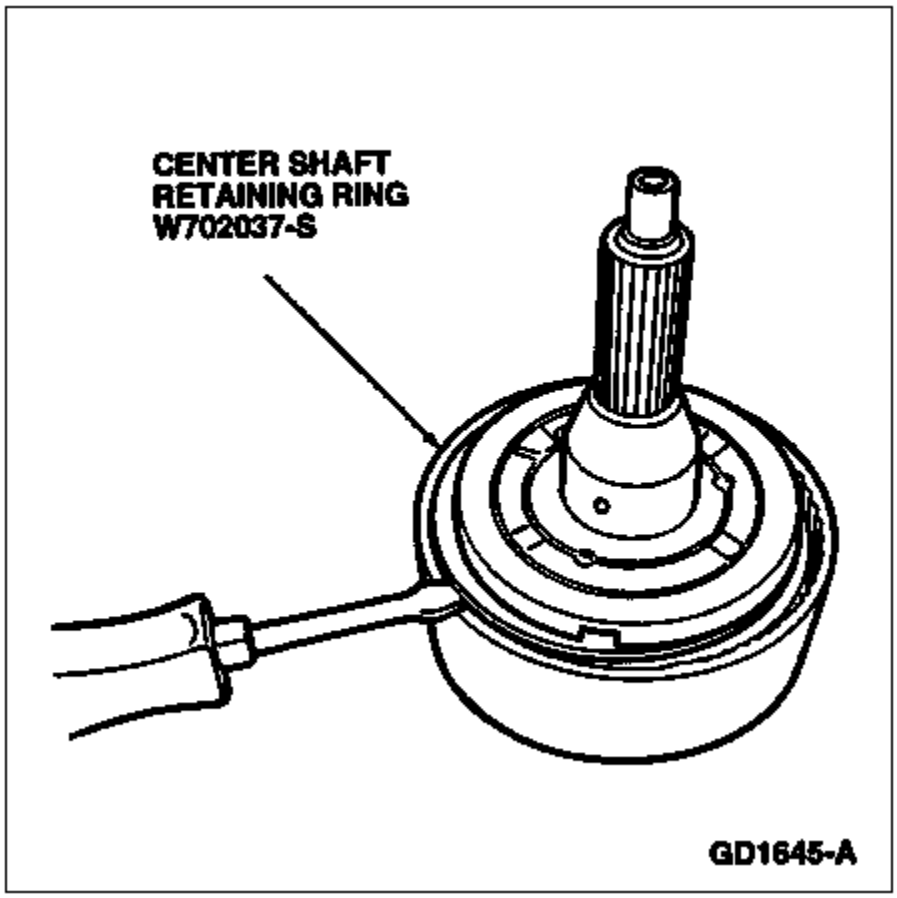


Item	Part Number	Description
1	W702037-S	Retaining Ring
2	7A658	Overdrive Center Shaft Assembly
3	7653	Overdrive Ring Gear
4	7L495	No. 2 Overdrive Planetary Thrust Bearing
5	7B446	Overdrive Planetary Gear Carrier Assembly
6	7D063	Overdrive Sun Gear Assembly
7	7660	Coast Clutch Adapter

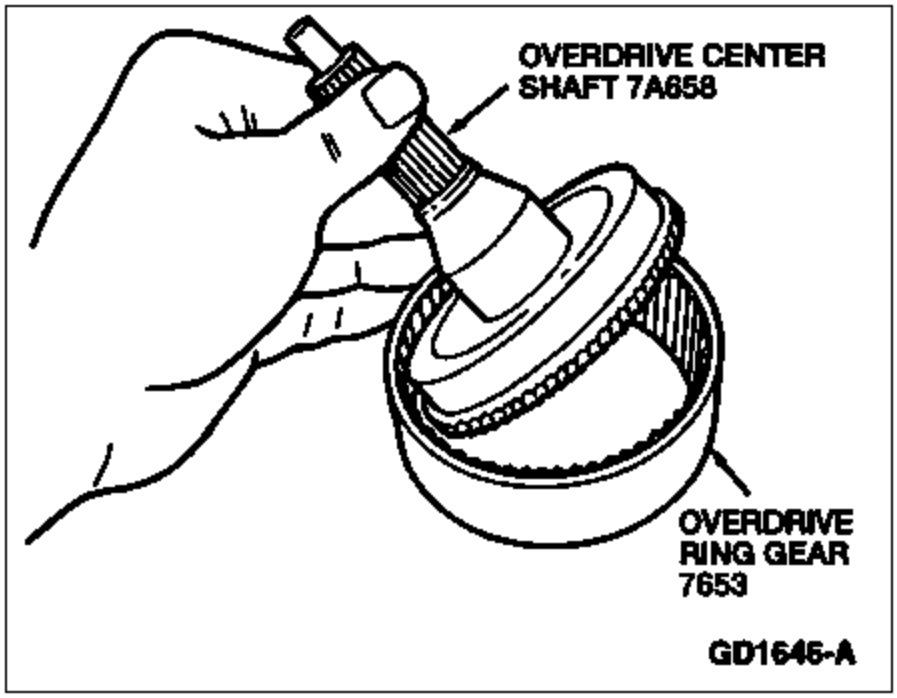
Disassembly

1. Remove the overdrive center shaft retaining ring from the overdrive ring gear.

tomsn048@gmail.com



2. Remove the overdrive center shaft from the overdrive ring gear.



tomsn048@gmail.com

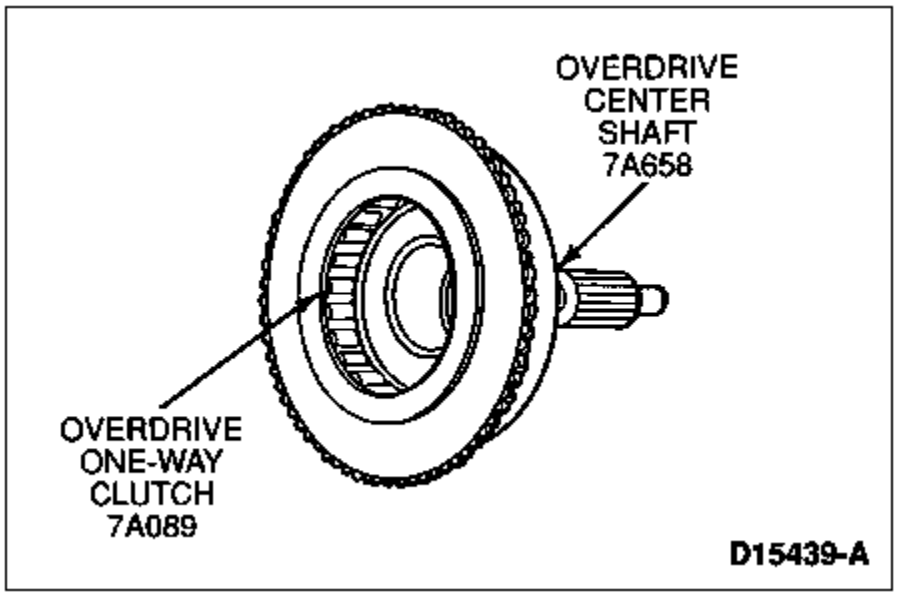
3. **CAUTION: Do not remove the overdrive one-way clutch. Damage to the clutch may occur if it is removed.**

   NOTE: The overdrive one-way clutch is serviced with the overdrive center shaft.

   Clean and inspect the overdrive one-way clutch and overdrive center shaft assembly. Check for cracks in the roller cage and wear on the roller clutch. Inspect the press fit of the one-way roller clutch to the overdrive center shaft.

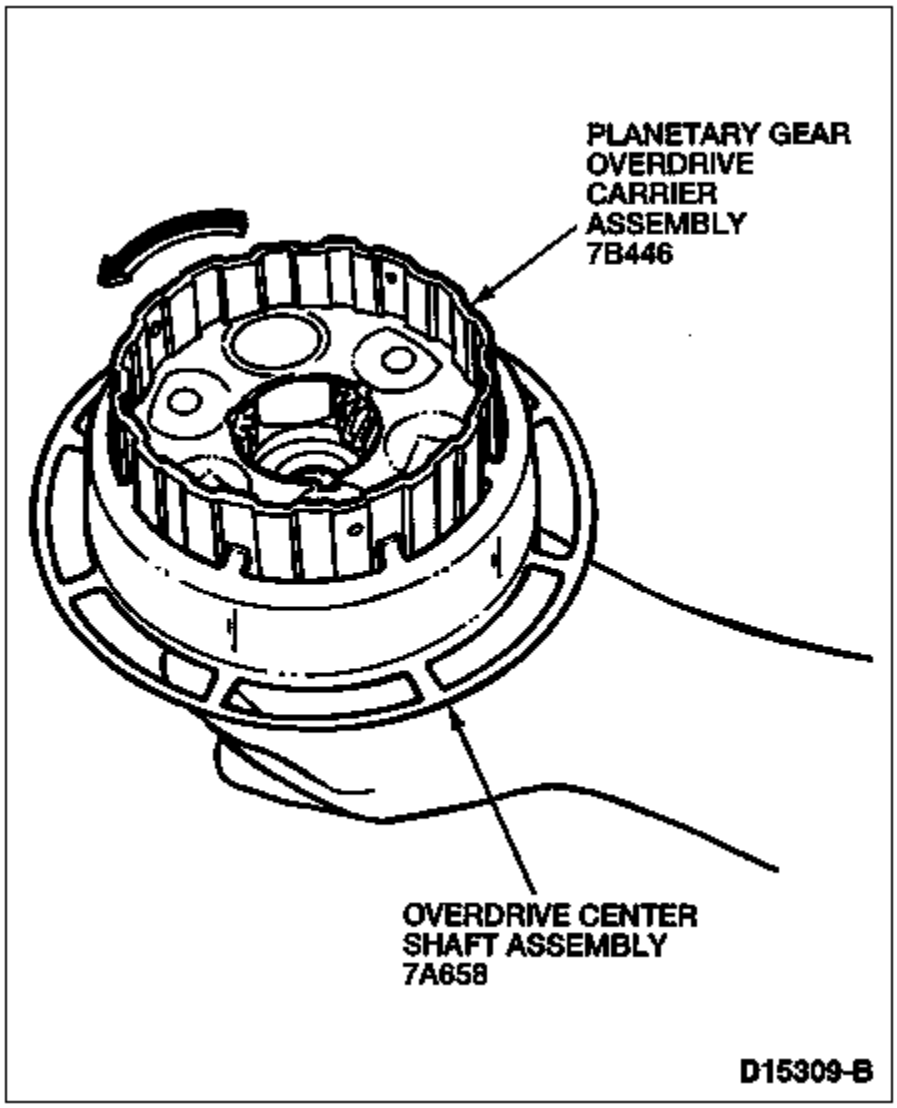
   Inspect the rollers and springs for excessive wear or damage.

   Inspect the spring and roller cage for bent or damaged spring retainers.



4. Temporarily insert the overdrive planetary gear carrier assembly into the one-way clutch rollers for verification of the one-way clutch. The planetary must rotate counterclockwise and hold clockwise as shown. Remove the overdrive planetary gear carrier assembly.

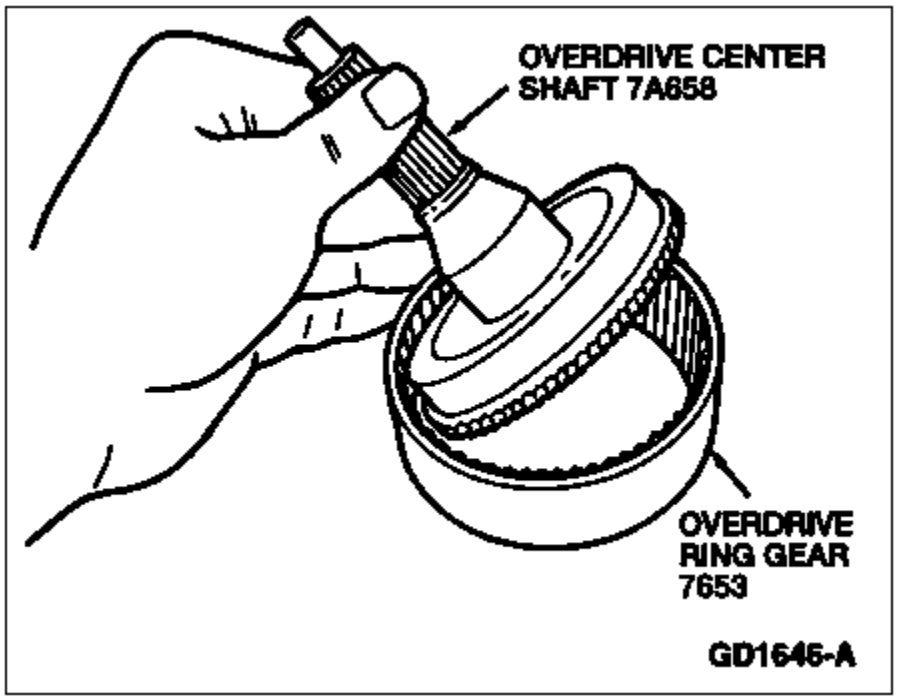
tomsn048@gmail.com



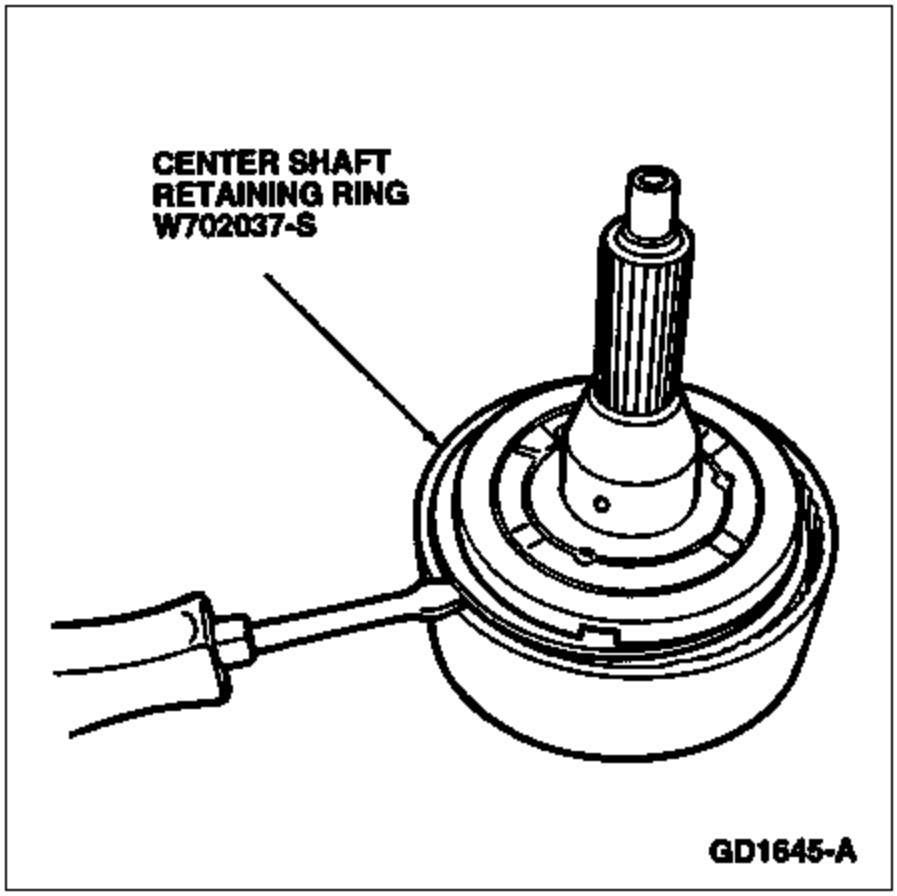
Assembly

1. Install the overdrive center shaft and overdrive one-way clutch into the overdrive ring gear.

tomsn048@gmail.com



2. Install the center shaft retaining ring.



tomsn048@gmail.com

3. **CAUTION: Planetary's must be replaced. Do not restake.**

   NOTE: Individual parts of the planetary carriers are not serviceable.

   Check the pins and shafts in the planetary assemblies for loose fit and/or complete disengagement. Use a new planetary assembly if either condition exists. Before installing a planetary assembly, the shaft retaining pins should be checked for adequate staking.

   Inspect the pinion gears for damaged or excessively worn teeth.

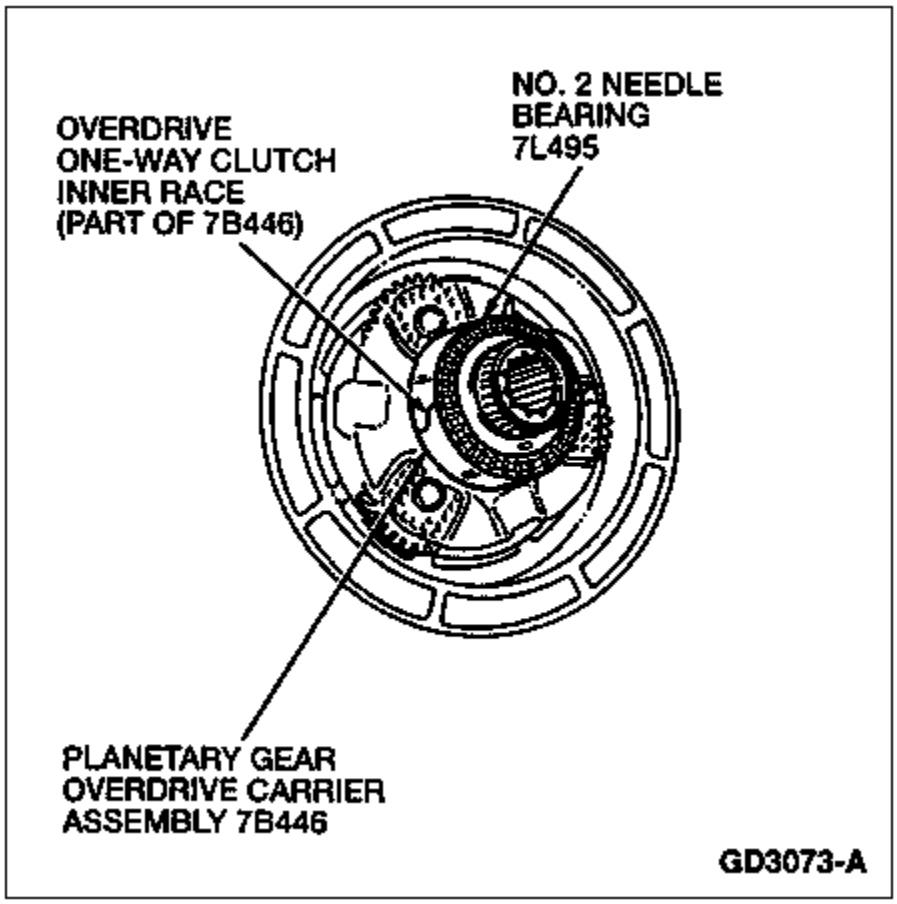
   Check for free rotation of the pinion gears.

   Inspect the overdrive one-way clutch inner race for scoring.

   Check pinion bearing and gears.

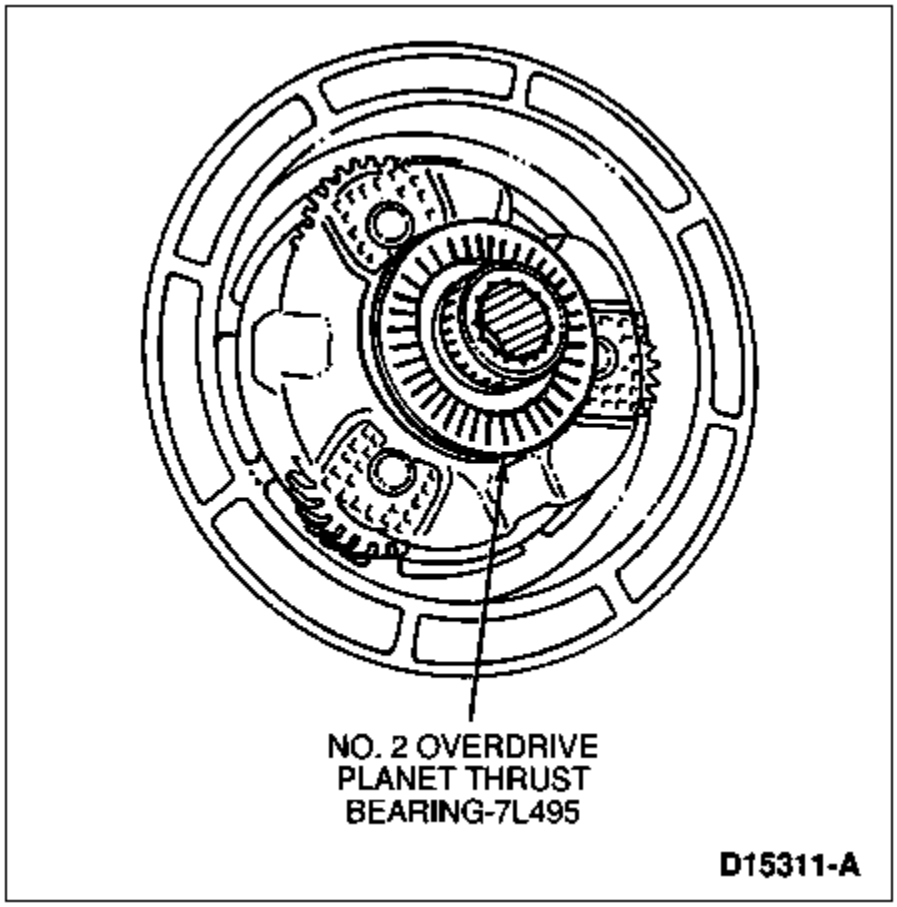
   Inspect the inner and outer races for scored or damaged surface areas where the rollers contact the races.

   Inspect the needle bearing on the nose of the overdrive planetary gear carrier assembly.



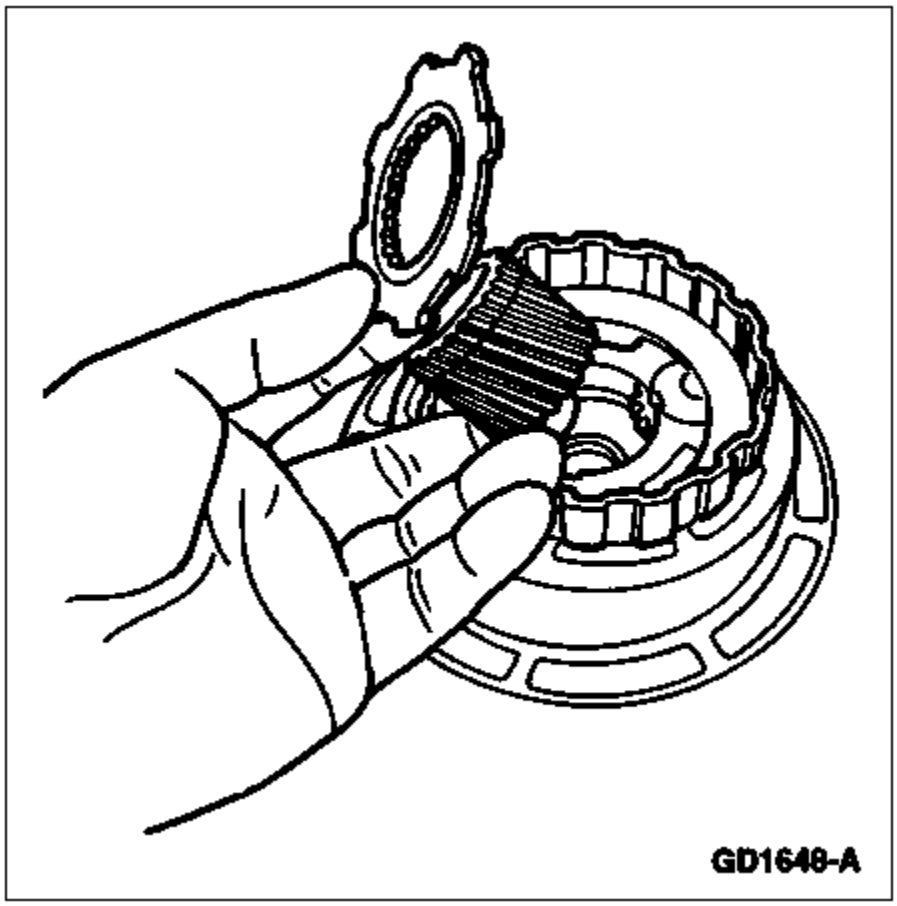
4. Remove and inspect the No.2 planetary thrust bearing.

tomsn048@gmail.com



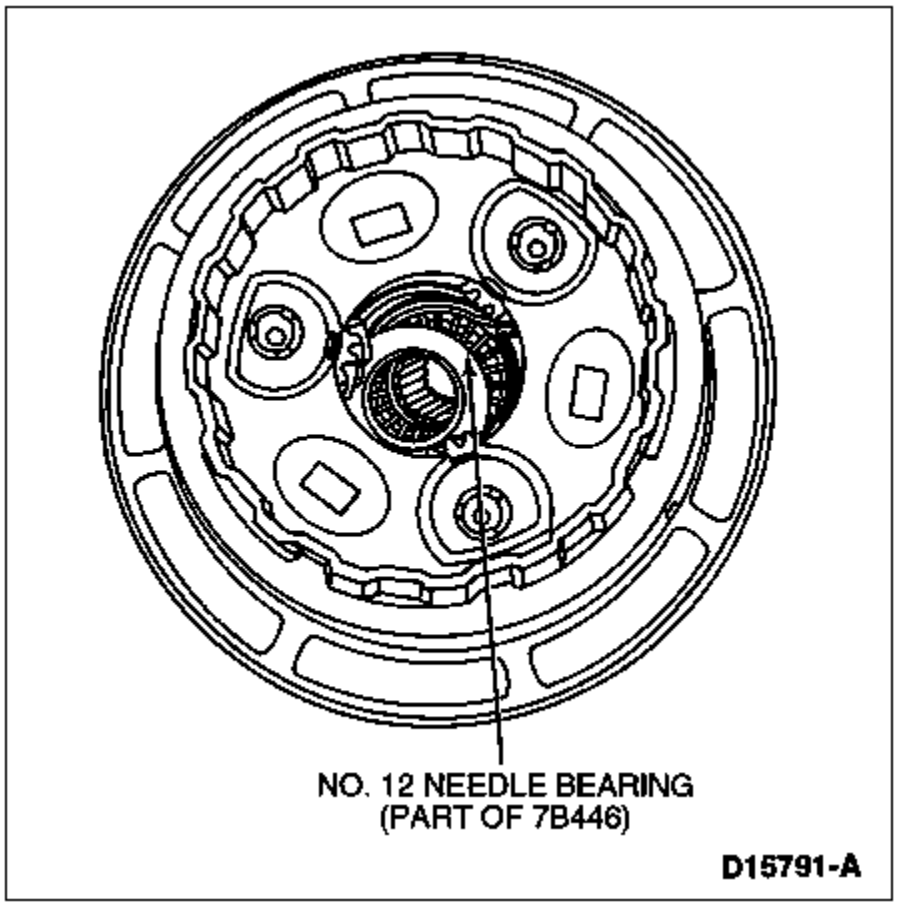
5. Remove coast clutch to O/D carrier adapter and O/D sun gear.

tomsn048@gmail.com



6. Inspect the No. 12 needle bearing inside the overdrive planetary gear carrier.

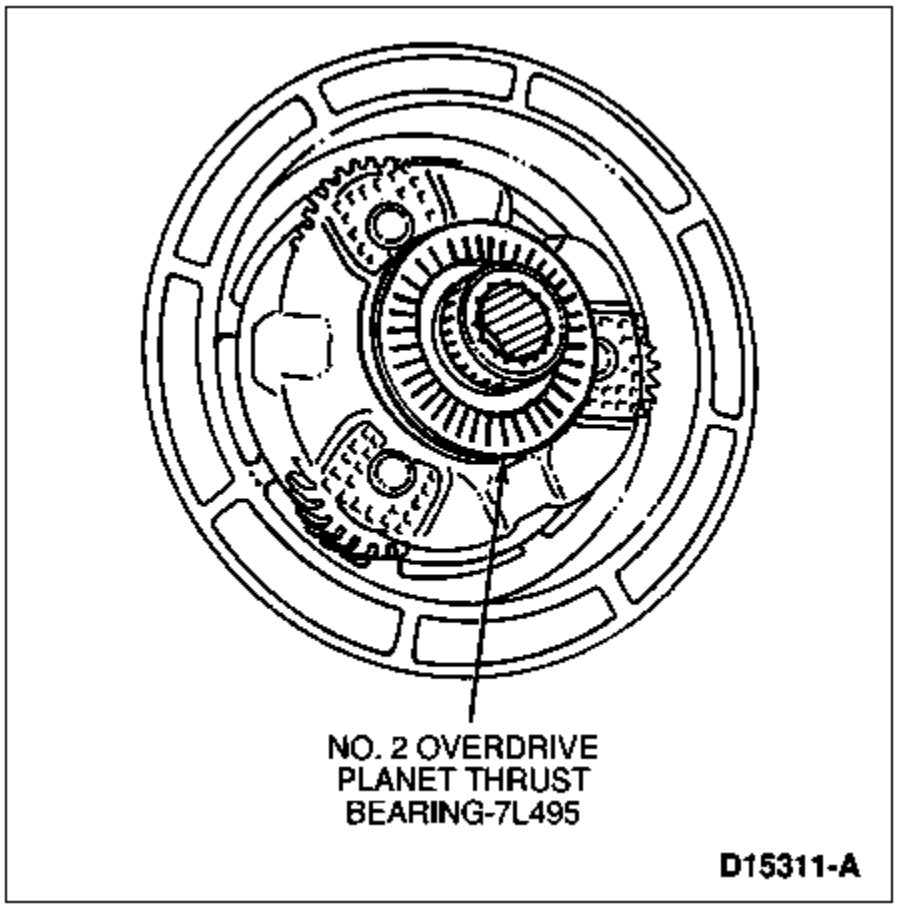
tomsn048@gmail.com



7. **NOTE: Use petroleum jelly to hold the No. 2 overdrive planetary thrust bearing in place.**

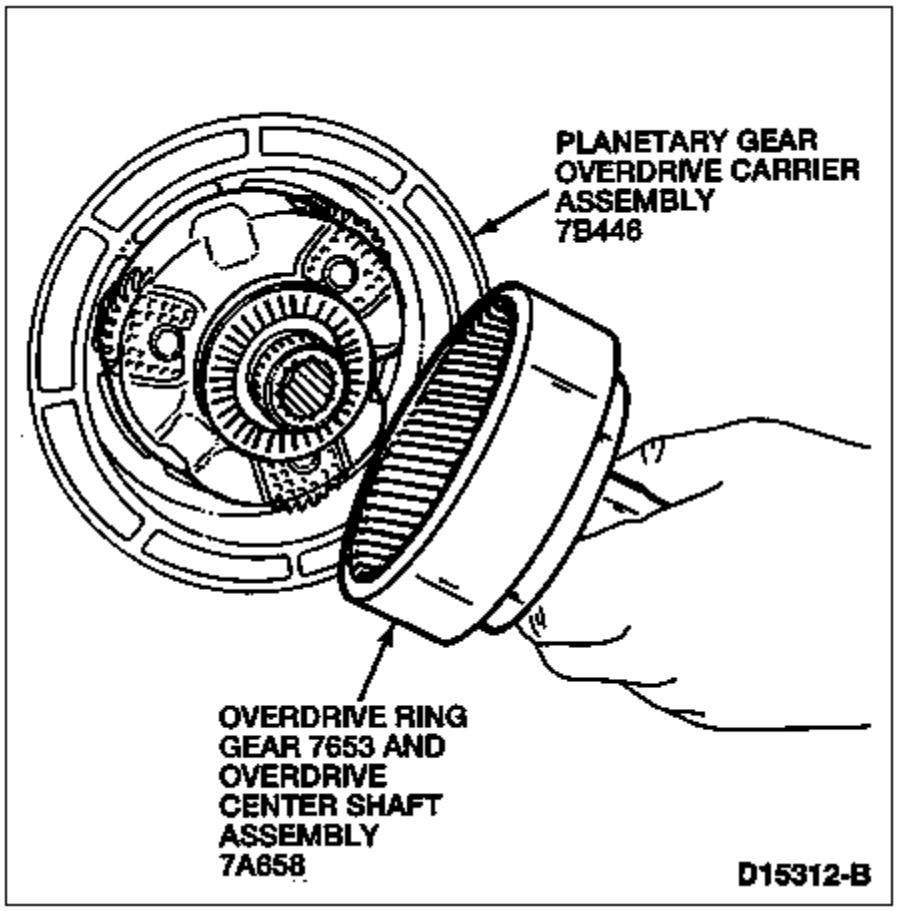
   Install the No. 2 overdrive planetary thrust bearing between the overdrive center shaft face and the overdrive planetary gear carrier assembly.

tomsn048@gmail.com



8. Install the overdrive planetary gear carrier into the overdrive center shaft and overdrive ring gear.

tomsn048@gmail.com

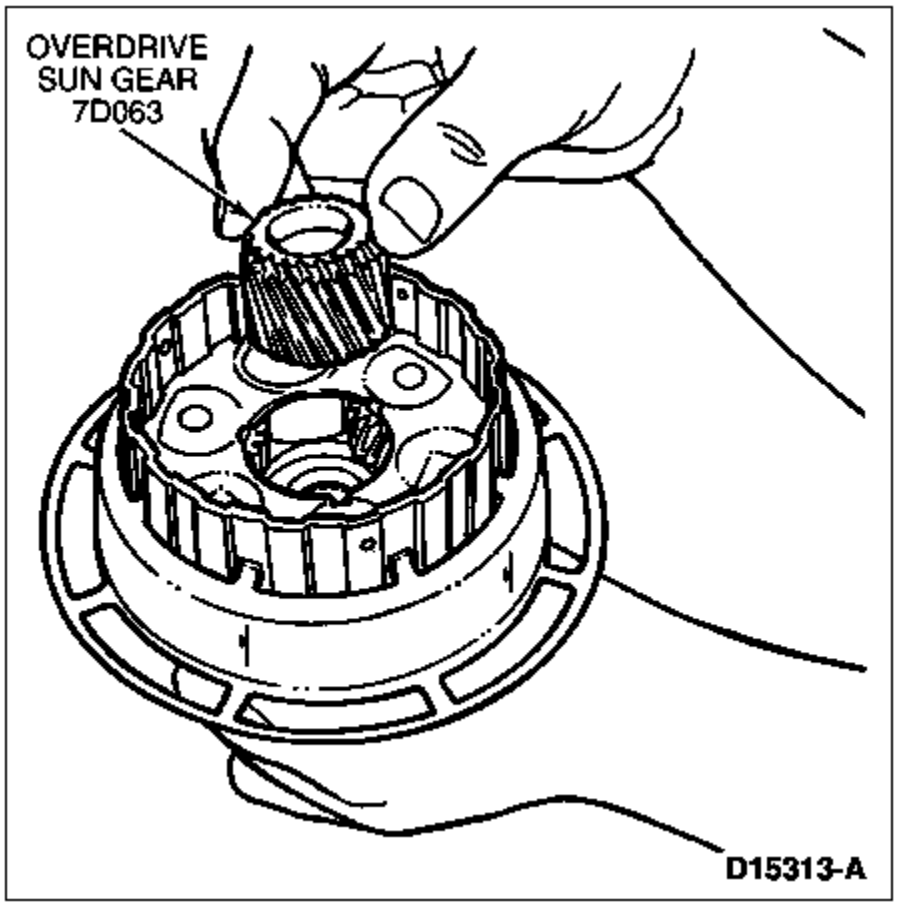


9. **CAUTION: Use care not to bend or damage the exciter wheel.**

CAUTION: Before installing the overdrive sun gear into the overdrive planetary gear carrier, make sure the No. 12 sun gear thrust bearing race is aligned with the needle bearing inside the overdrive planetary gear carrier. The overdrive sun gear will not seat properly if the No. 12 sun gear thrust bearing race is not aligned in the center of the overdrive sun gear.

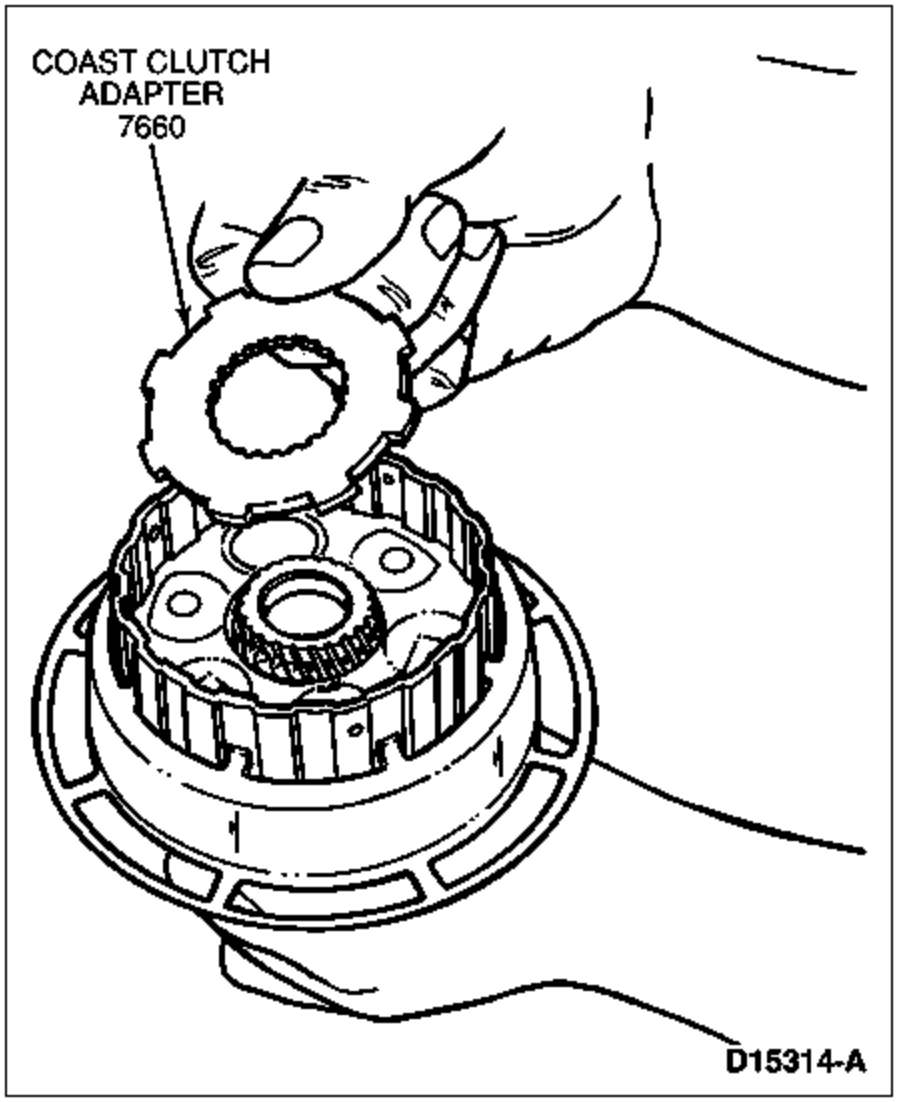
Install the overdrive sun gear into the overdrive planetary gear carrier.

tomsn048@gmail.com



10. Install the coast clutch adapter on the overdrive sun gear.

tomsn048@gmail.com

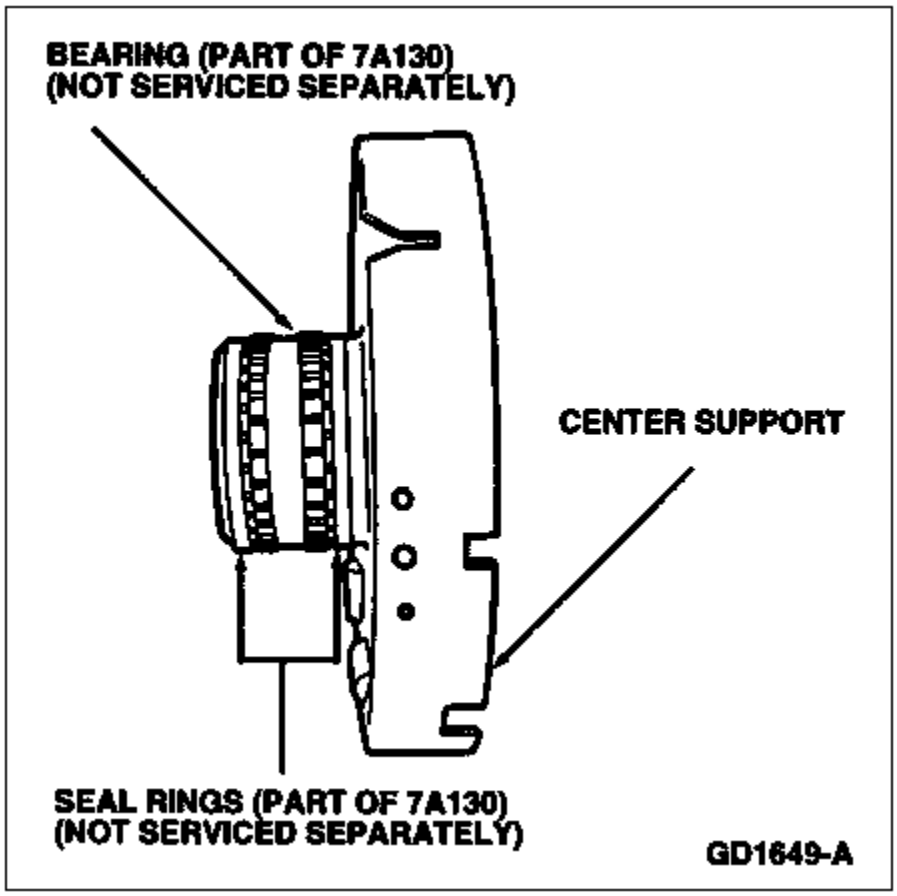


tomsn048@gmail.com

tomsn048@gmail.com

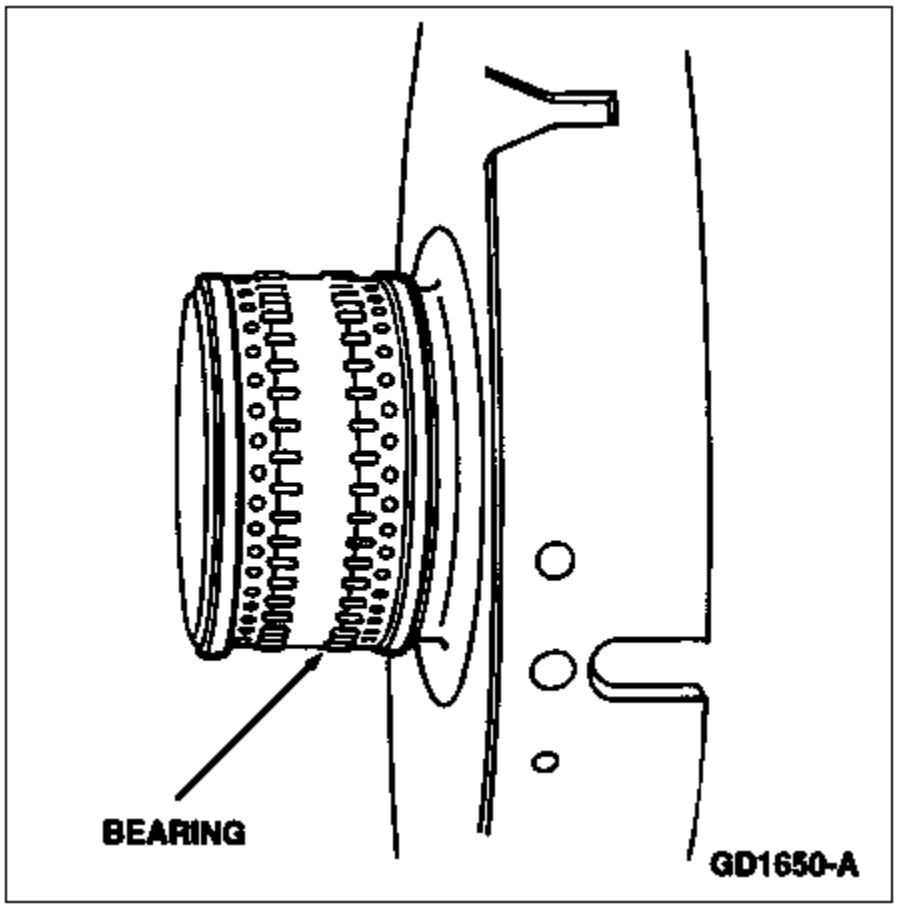
Center Support

Inspection

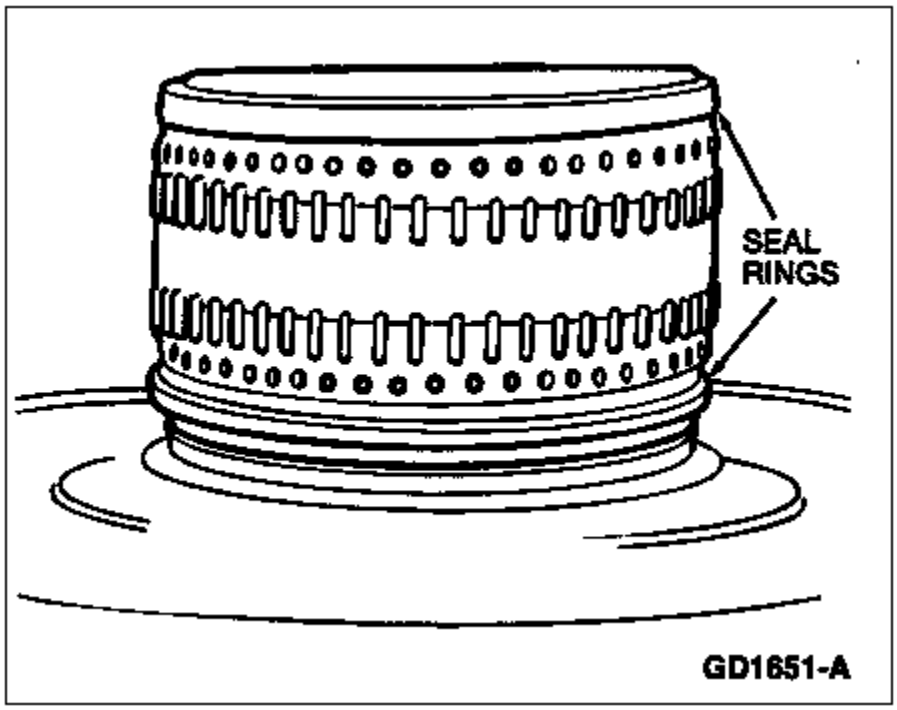


1. Inspect center support for damage. If damaged, replace center support assembly.

tomsn048@gmail.com

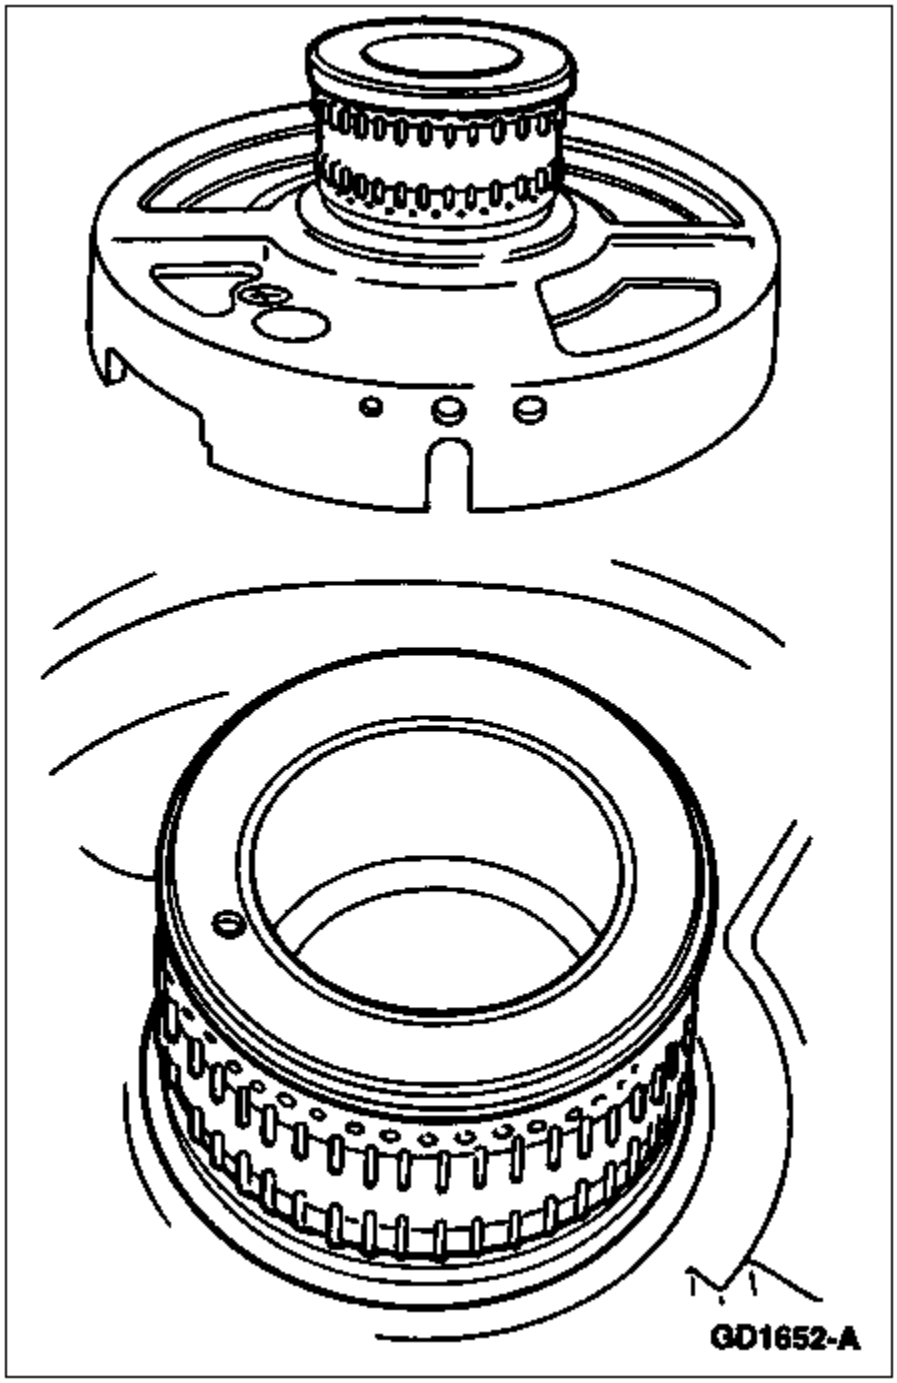


2. Inspect seal rings for damage. If damaged, replace center support.



tomsn048@gmail.com

3. Inspect thrust surface for wear, scoring or damage. Inspect forward clutch sealing surface for scoring or damage. Inspect hydraulic passages for damage or restrictions.



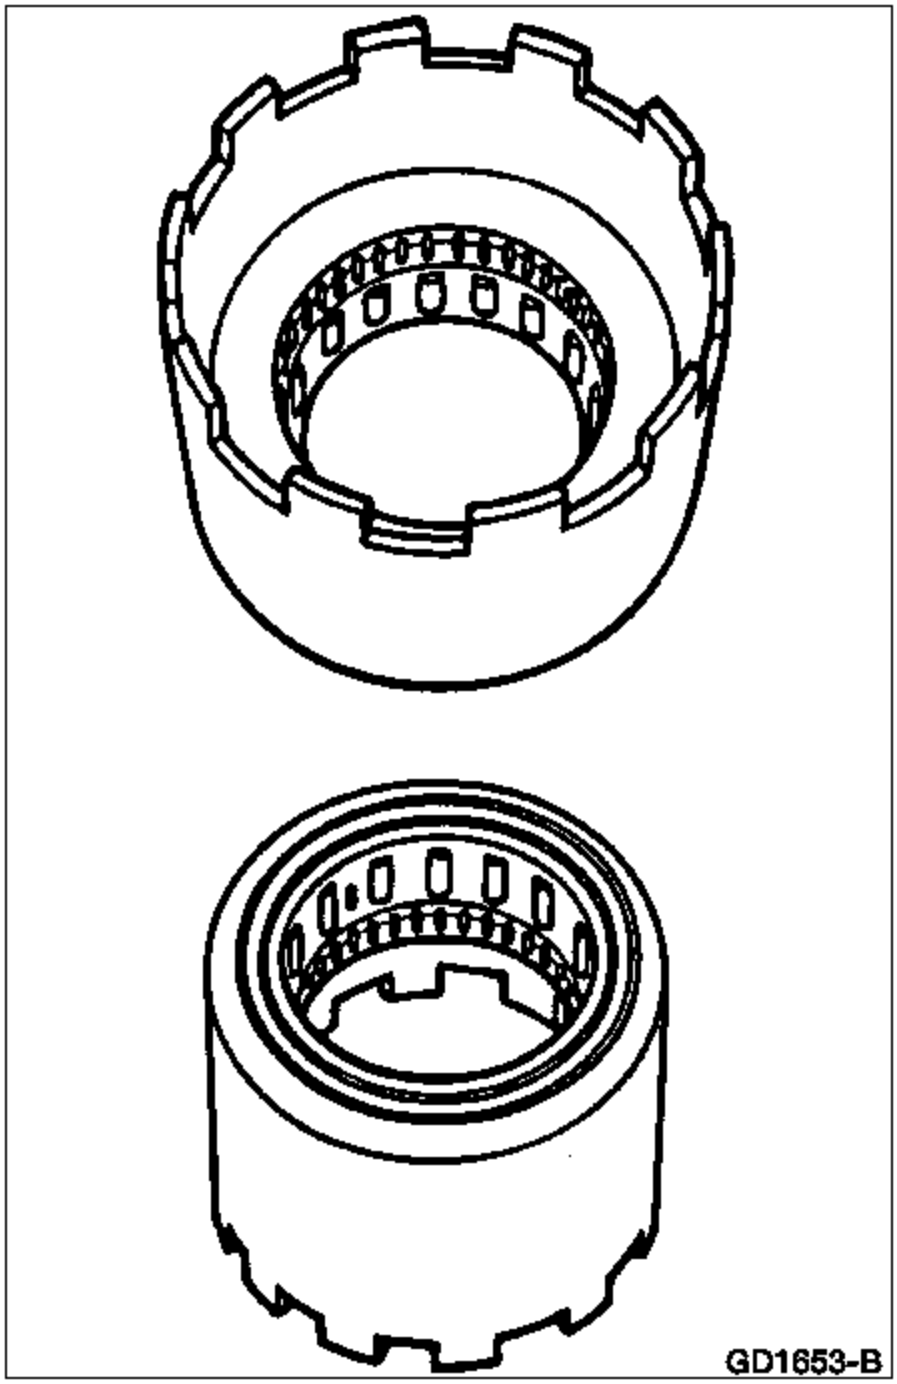
tomsn048@gmail.com

tomsn048@gmail.com

Low/Reverse Brake Drum

Low/Reverse Brake Drum Assembly

tomsn048@gmail.com

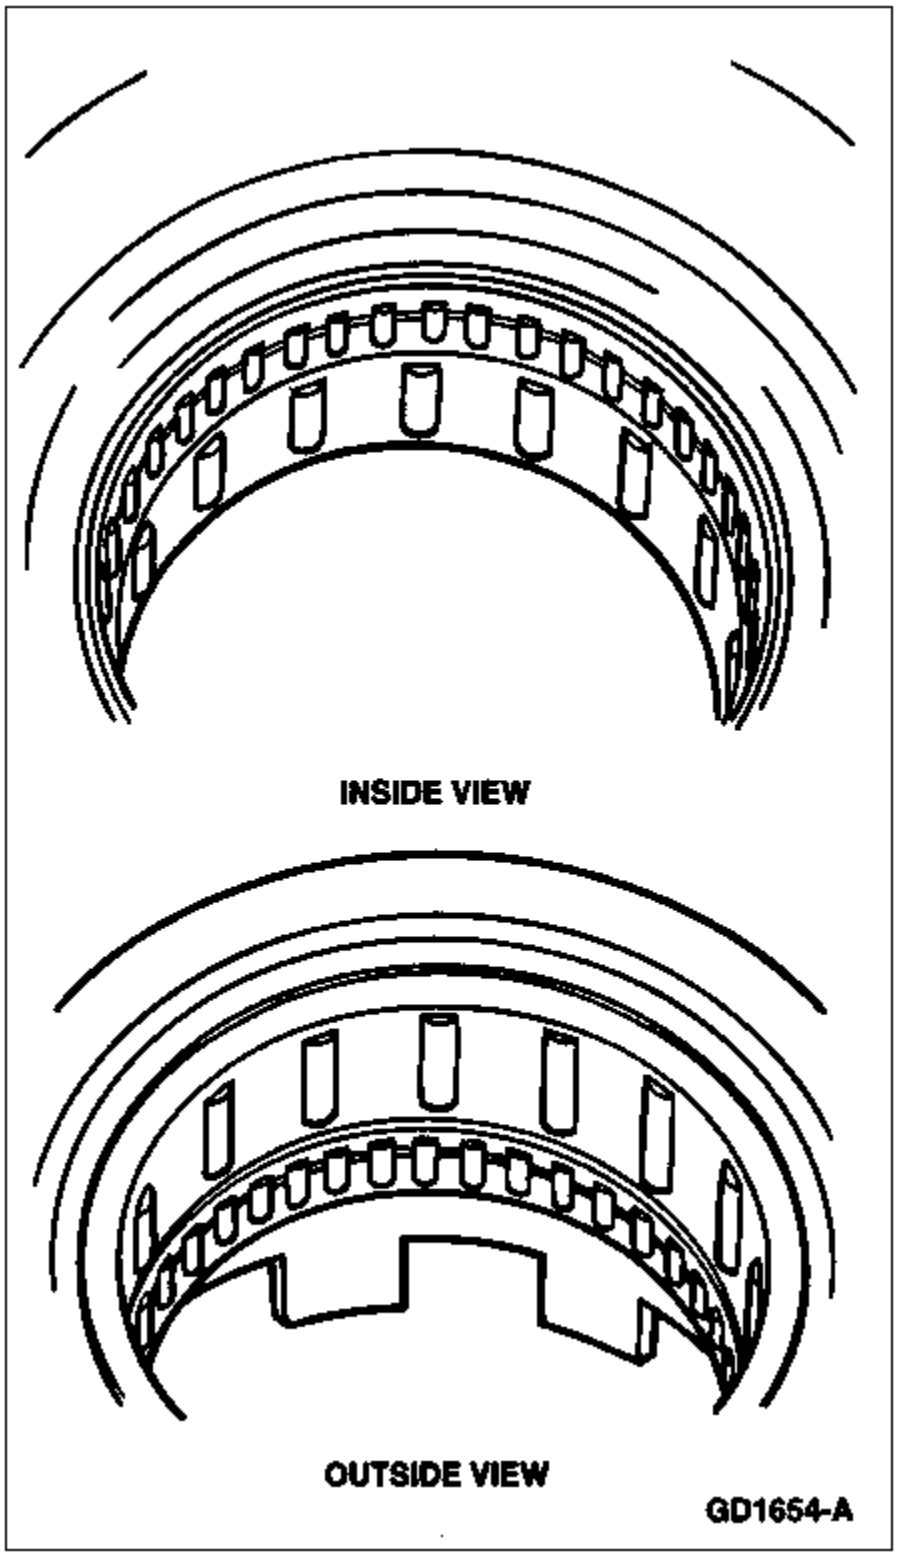


Inspection

1. **NOTE: The rear one-way clutch is part of the low/reverse drum assembly.**

   Inspect rollers, sprags, and reverse drum for damage. If damaged, replace drum assembly.

tomsn048@gmail.com

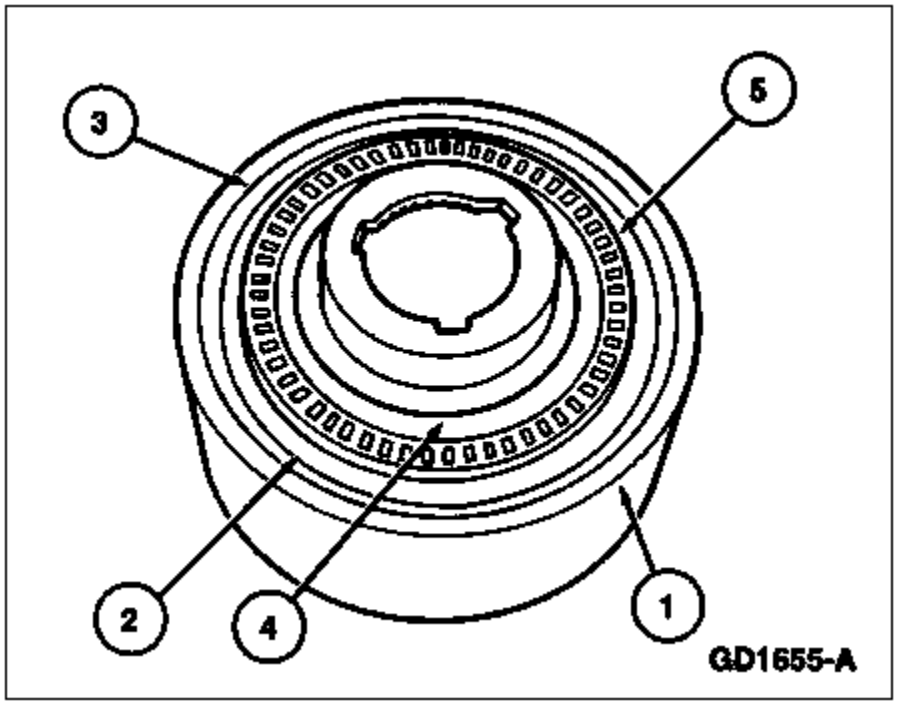


tomsn048@gmail.com

tomsn048@gmail.com

Output Shaft Ring Gear and Hub Assembly

Output Shaft Ring Gear and Hub Assembly



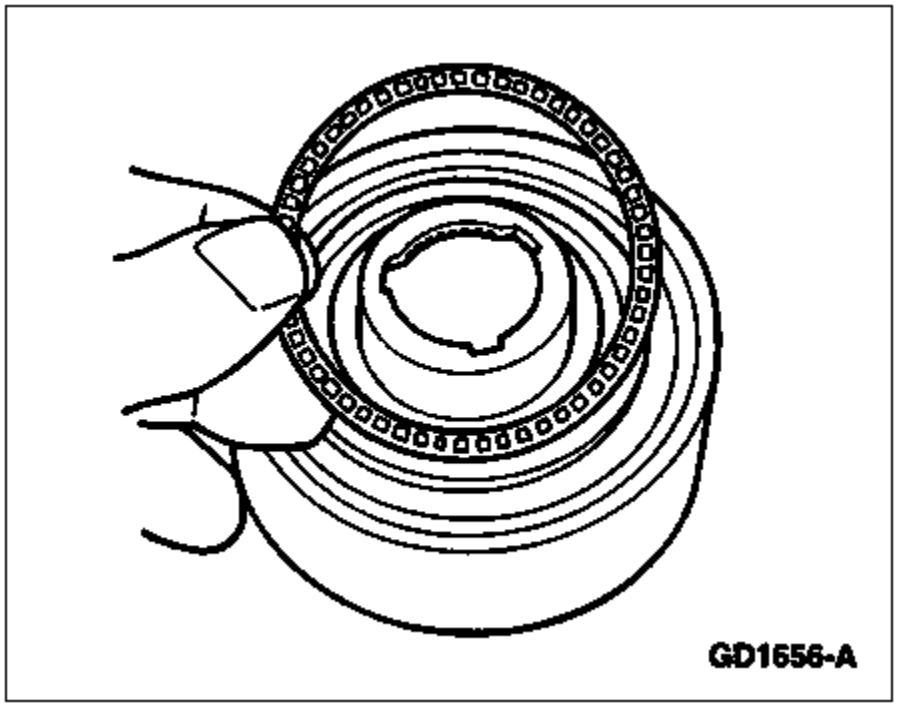
Item	Part Number	Description
1	7A153	Output Shaft Ring Gear
2	7D164	Output Shaft Hub
3	E860122-S	Retaining Ring
4	7M150	No. 10A Bearing Race Assembly
5	7M150	No. 10B Needle Bearing

Disassembly

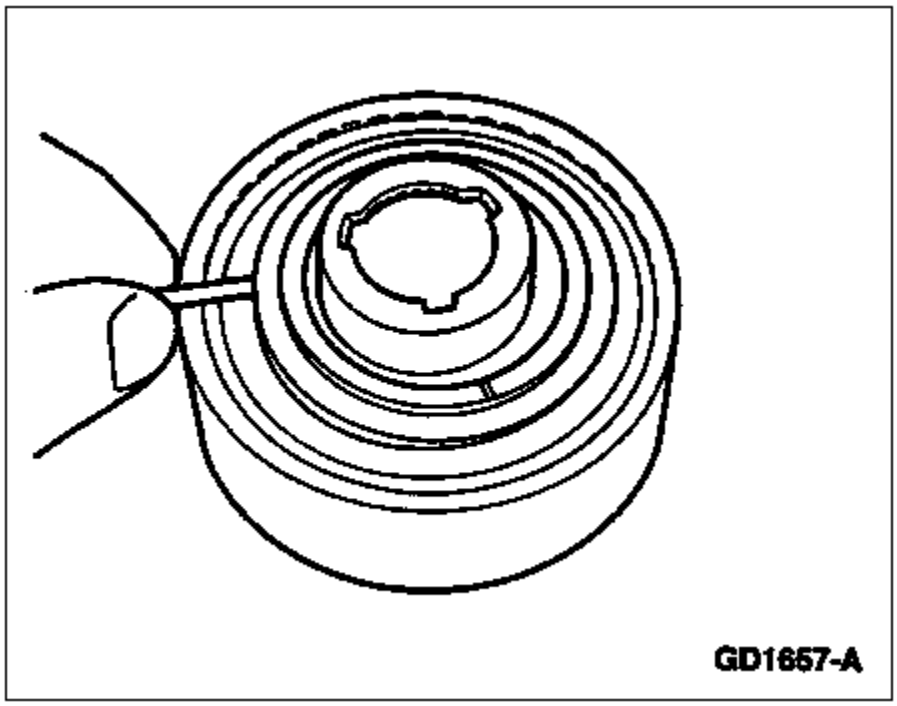
1. Inspect the ring gear, hub, No. 10B needle bearing and No. 10A bearing race assembly for damage. If service is required, use the following procedures.

2. Remove No. 10B needle bearing, if not already removed.

tomsn048@gmail.com

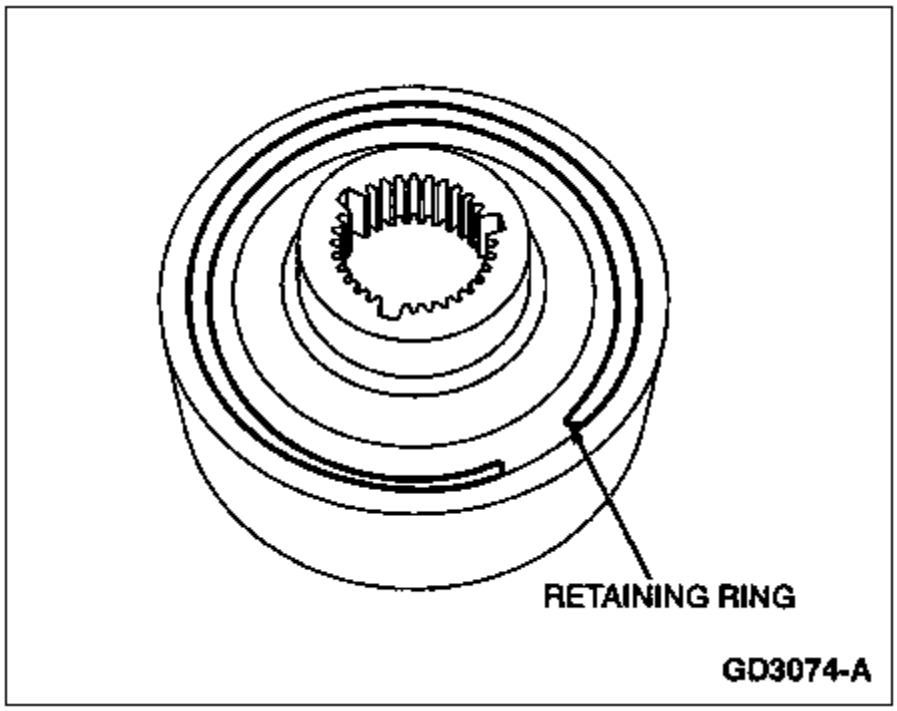


3. Remove No. 10A bearing race assembly.



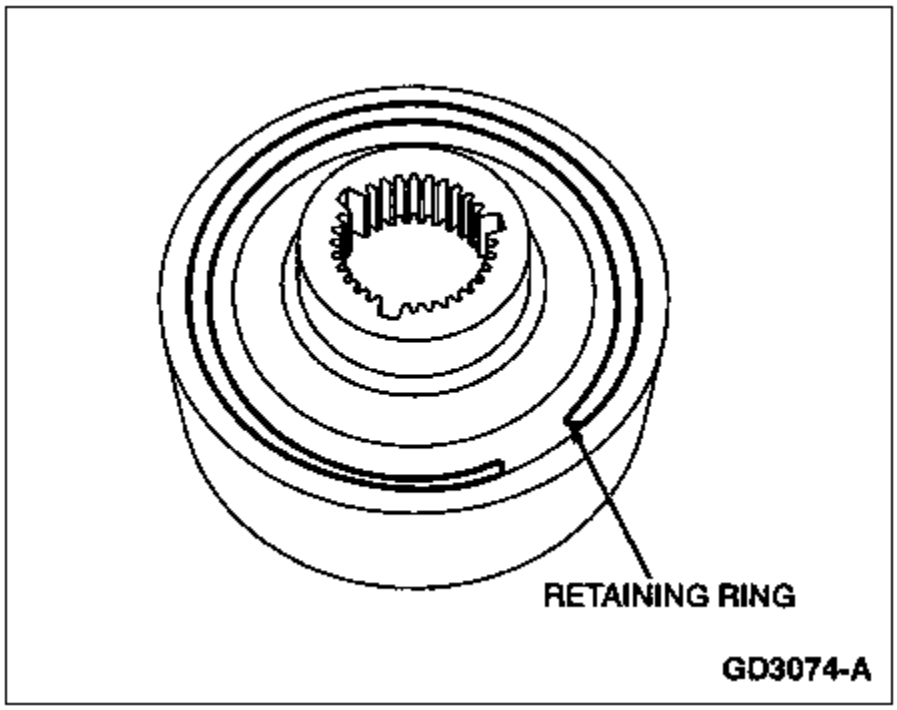
4. Separate ring gear from hub by removing retaining ring.

tomsn048@gmail.com



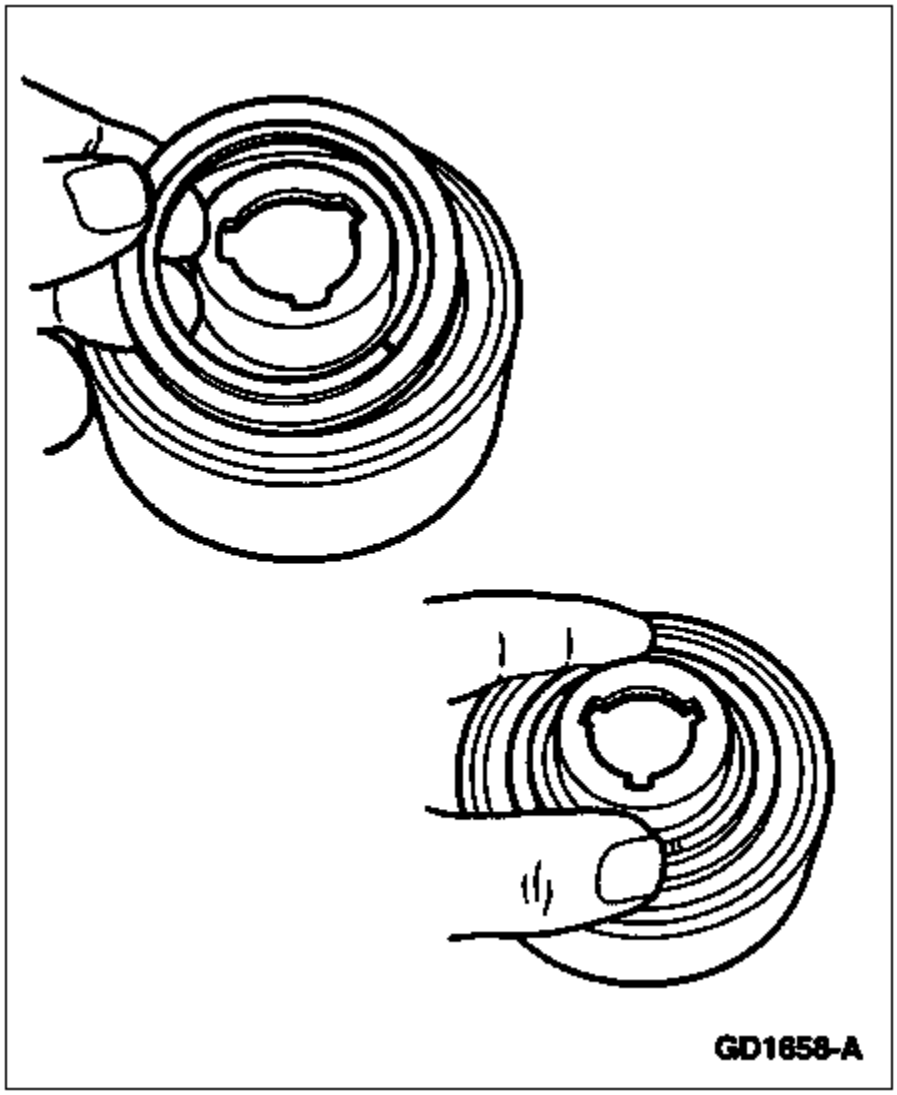
Assembly

1. Install output shaft hub into ring. Install retaining ring.



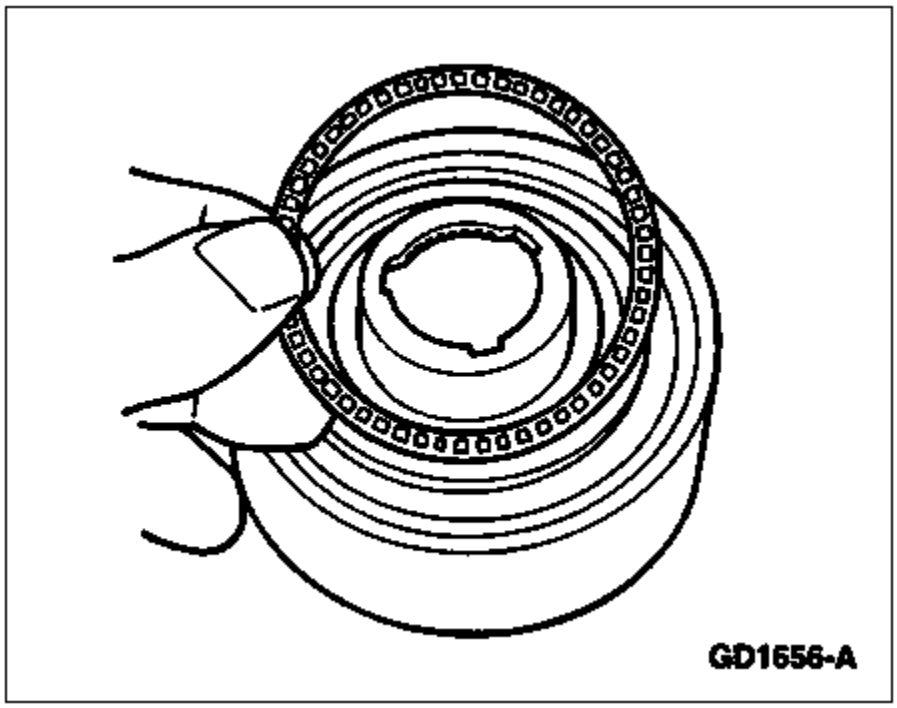
2. Install No. 10A bearing race assembly onto outshaft hub. Press on-snap fit.

tomsn048@gmail.com



3. Use petroleum jelly and install No. 10B needle bearing onto output shaft ring gear and hub assembly.

tomsn048@gmail.com



tomsn048@gmail.com

Torque Converter Service Procedures

Cleaning/Inspection

When internal wear or damage has occurred in the transmission, metal particles, clutch plate material, or band material may have been carried into the torque converter. These contaminates are a major cause of recurring transmission troubles and MUST be removed from the system before the transmission is put back into the vehicle.

Whenever a transmission has been disassembled to replace worn or damaged parts, or because the valve body sticks repeatedly from foreign material, the torque converter MUST be cleaned using a mechanical agitated cleaner, such as Rotunda Torque Converter/Transmission Oil Cooler Cleaner 014-00028 or equivalent.

Torque Converter Flushing

NOTE: Mineral spirits used to clean the torque converter must be fresh, non-chlorinated and non-halogenated.

Following the instructions included with the Torque Converter/Transmission Oil Cooler Cleaner 014-00028, flush out the converter.

After flushing the torque converter, follow these steps:

- Thoroughly drain the remaining solvent through the impeller hub.
- Add 1.9L (2.0 quarts) of clean MERCON V® Automatic Transmission Fluid into fluid filler tube.
- Agitate the solution inside the torque converter by hand.
- Thoroughly drain the torque converter through the impeller hub.

Torque Converter Leak Check

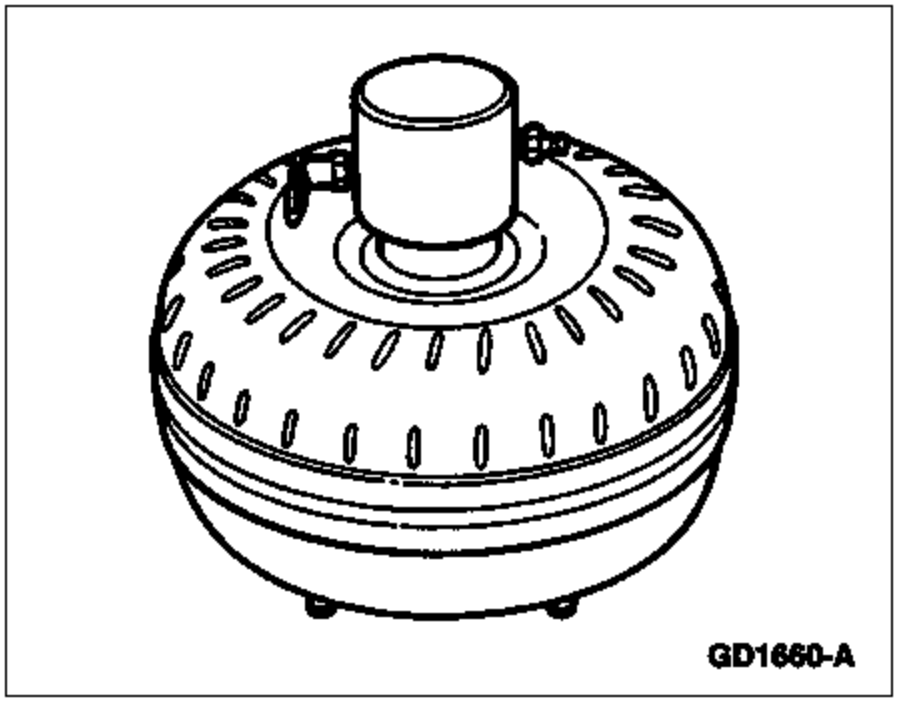
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Torque Converter Leak Check Tool and Gasket	014-R1075

1. Clean the outside surface of the torque converter.

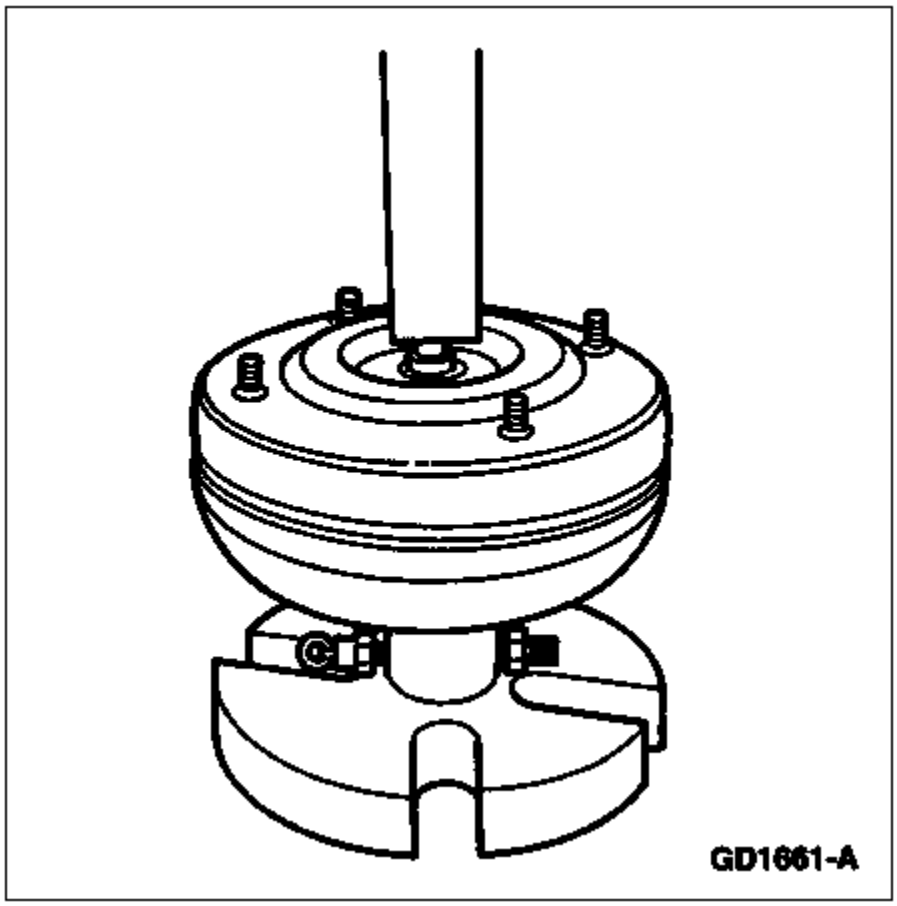
2. Install Torque Converter Leak Check Tool and Gasket 014-R1075 into converter hub.

tomsn048@gmail.com



3. Install torque converter with installed Torque Converter Leak Check Tool and Gasket 014-R1075 into press.

tomsn048@gmail.com



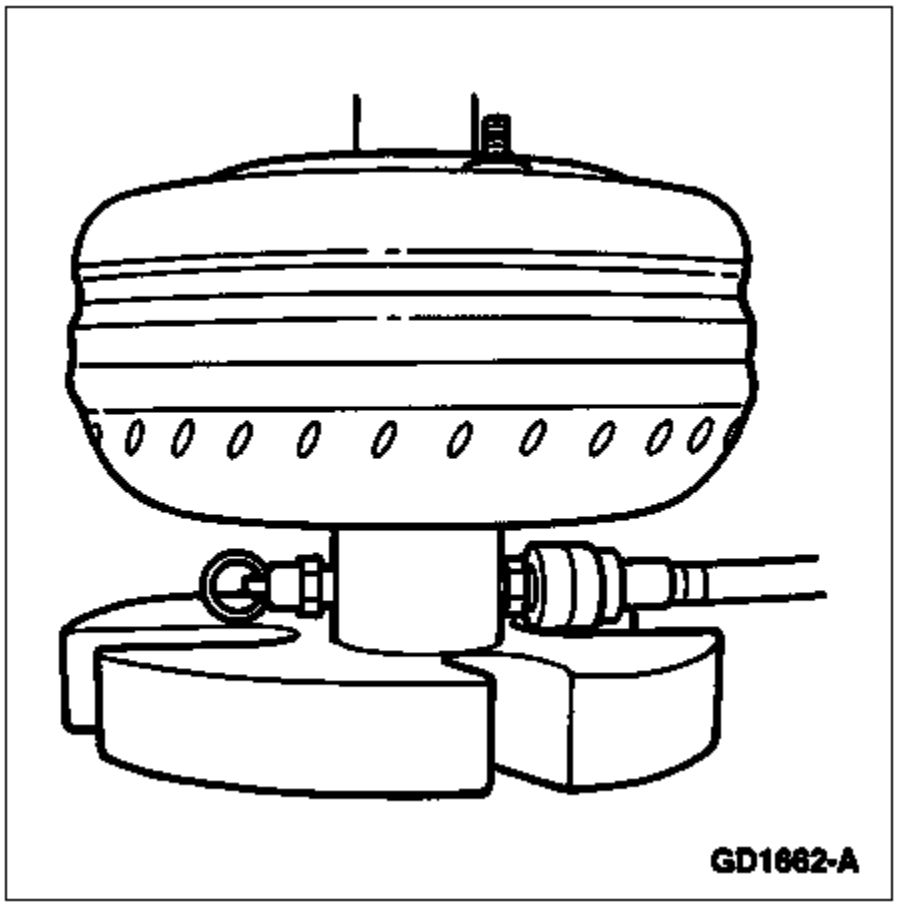
4. **WARNING: ALWAYS FOLLOW PROPER SAFETY PROCEDURES WHILE USING PRESS.**

   Secure press. Apply enough force from press to seal tool into torque converter.

5. **NOTE: Use clean dry shop air.**

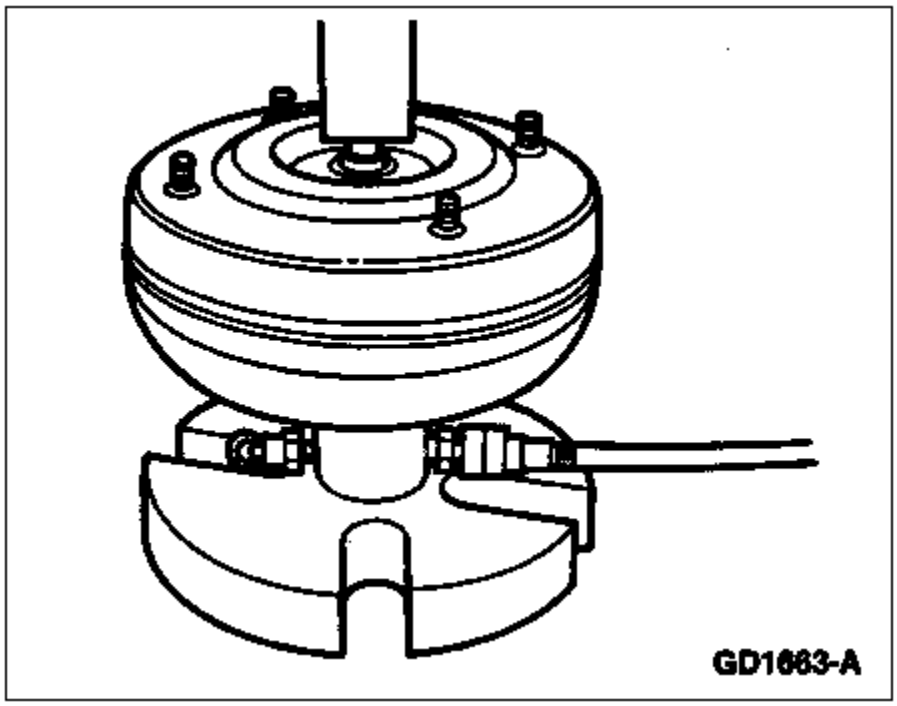
   Apply air pressure 80 psi (MAX) to valve on Torque Converter Leak Check Tool and Gasket 014-R1075.

tomsn048@gmail.com



6. With air pressure applied to valve, inspect for leaks at studs, seams and pilot hub. A soap bubble solution may be applied around those areas to aid in diagnosis. If leaks are present, replace converter.

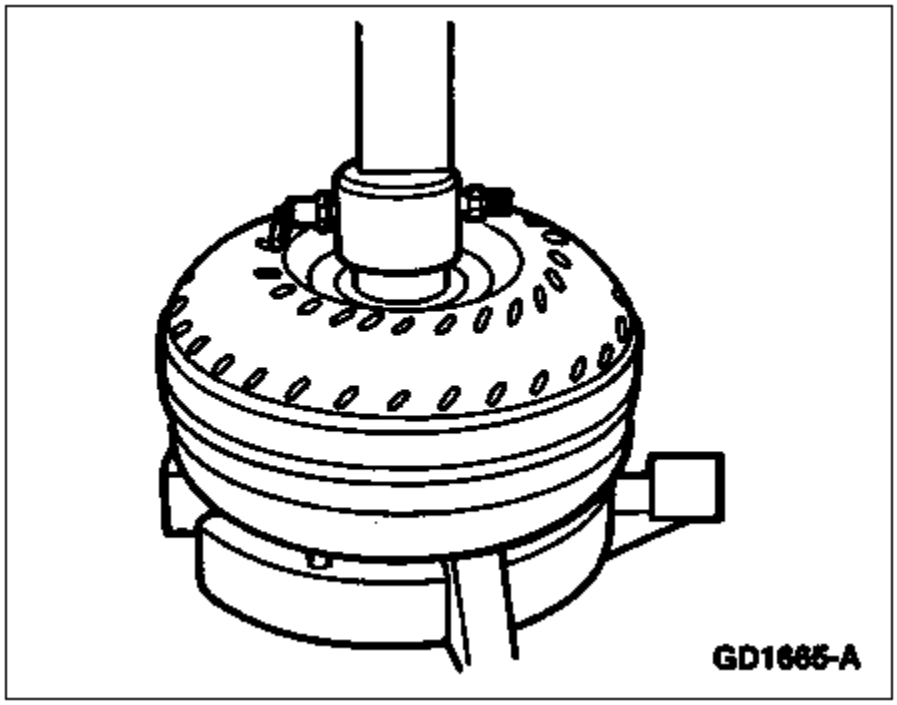
tomsn048@gmail.com



7. Release pressure and then slowly release press. Remove air hose.

tomsn048@gmail.com

8. Rotate torque converter and tool then reinstall into press with tool up.



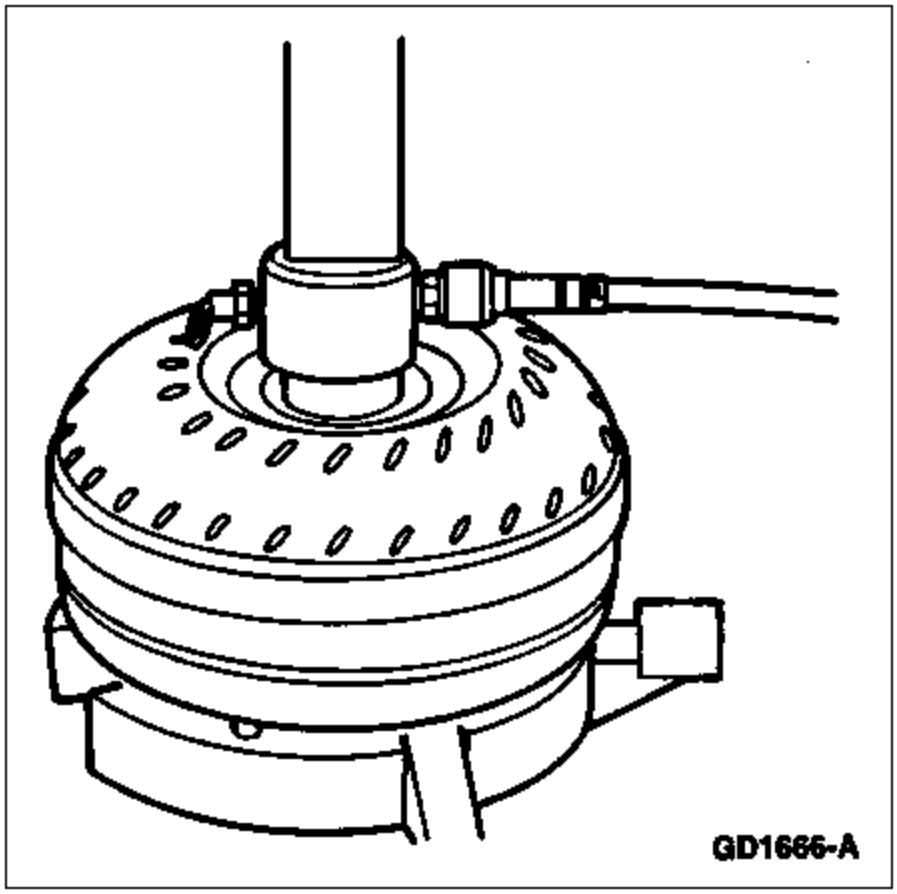
9. **WARNING: ALWAYS FOLLOW PROPER SAFETY PROCEDURES WHILE USING PRESS.**

   Secure press. Apply enough force from press to seal tool into torque converter.

10. **NOTE: Use clean dry shop air.**

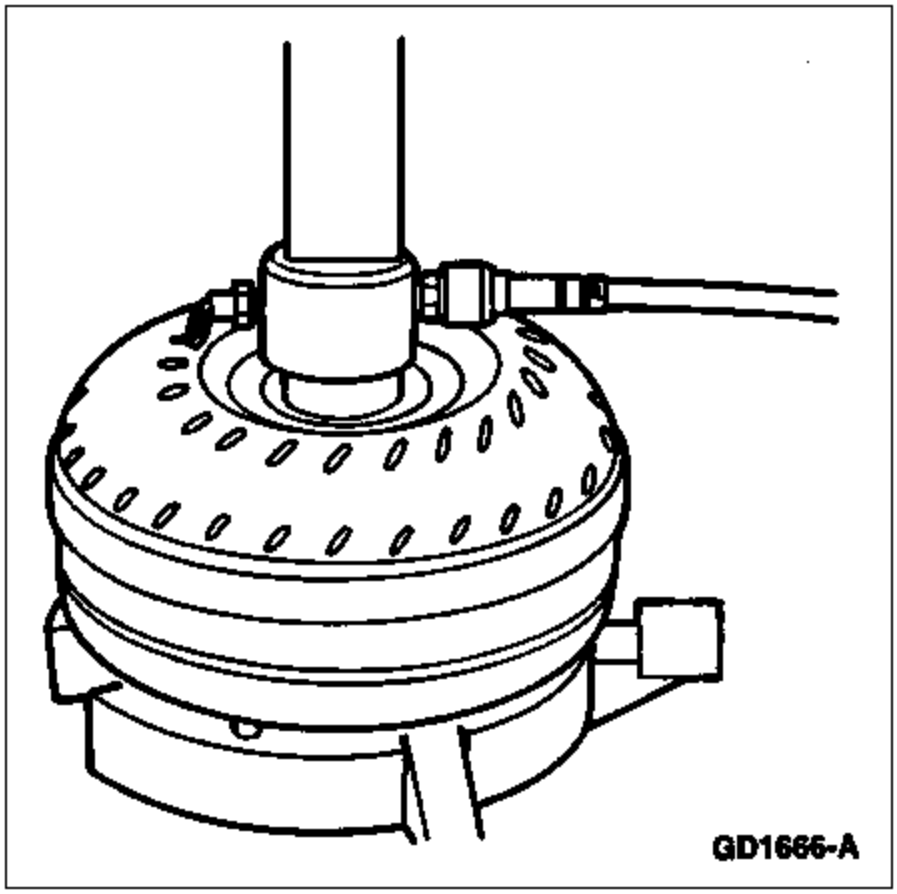
    Apply air pressure 80 psi (MAX) to valve on leak check tool.

tomsn048@gmail.com



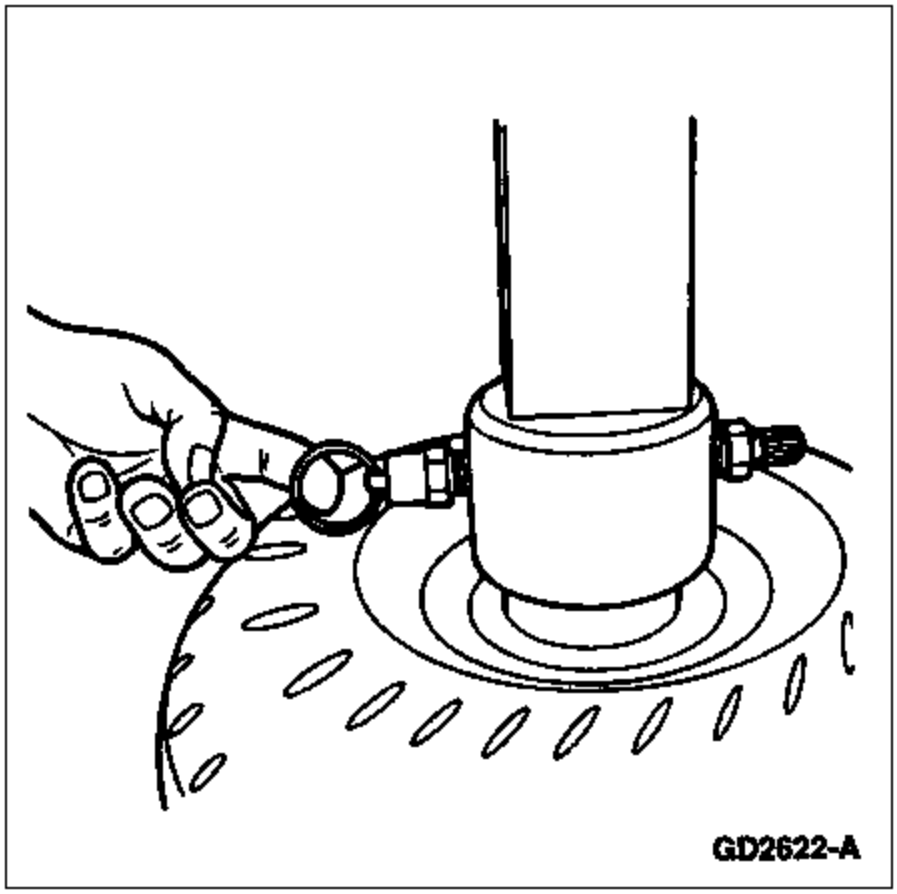
11. With air pressure applied to valve, inspect for leaks at converter hub, seams and studs. A soap bubble solution may be applied around those areas to aid in diagnosis. If leaks are present, replace converter.

tomsn048@gmail.com



12. Remove air hose. Release pressure and then slowly release press. Remove the converter. Remove the tool.

tomsn048@gmail.com



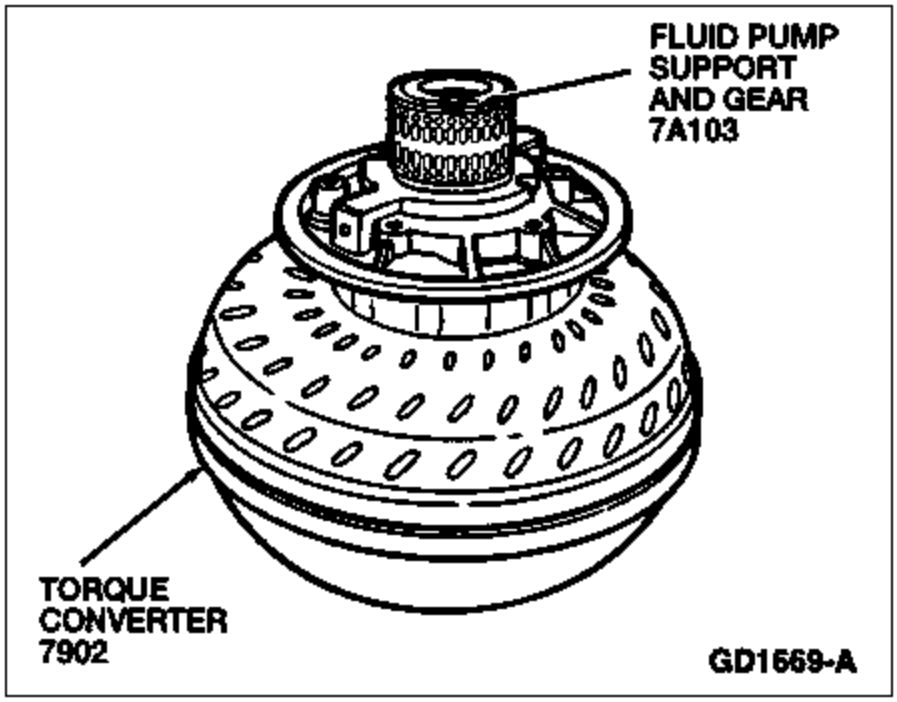
Stator to Impeller Interference Check

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
End Play Checking Tool	T80L-7902-A

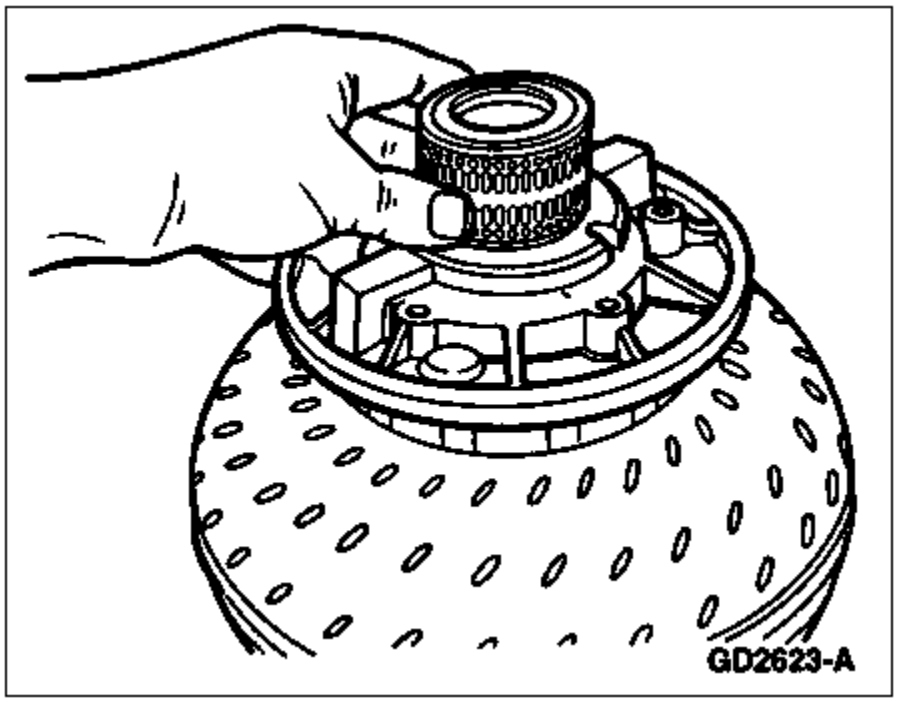
1. Install the fluid pump support into torque converter. Engage the splines of the one-way clutch inner race with the mating splines of the stator support.

tomsn048@gmail.com



2. Rotate the torque converter both clockwise and counterclockwise. The fluid pump support should rotate freely without any signs of interference or scraping within the torque converter.

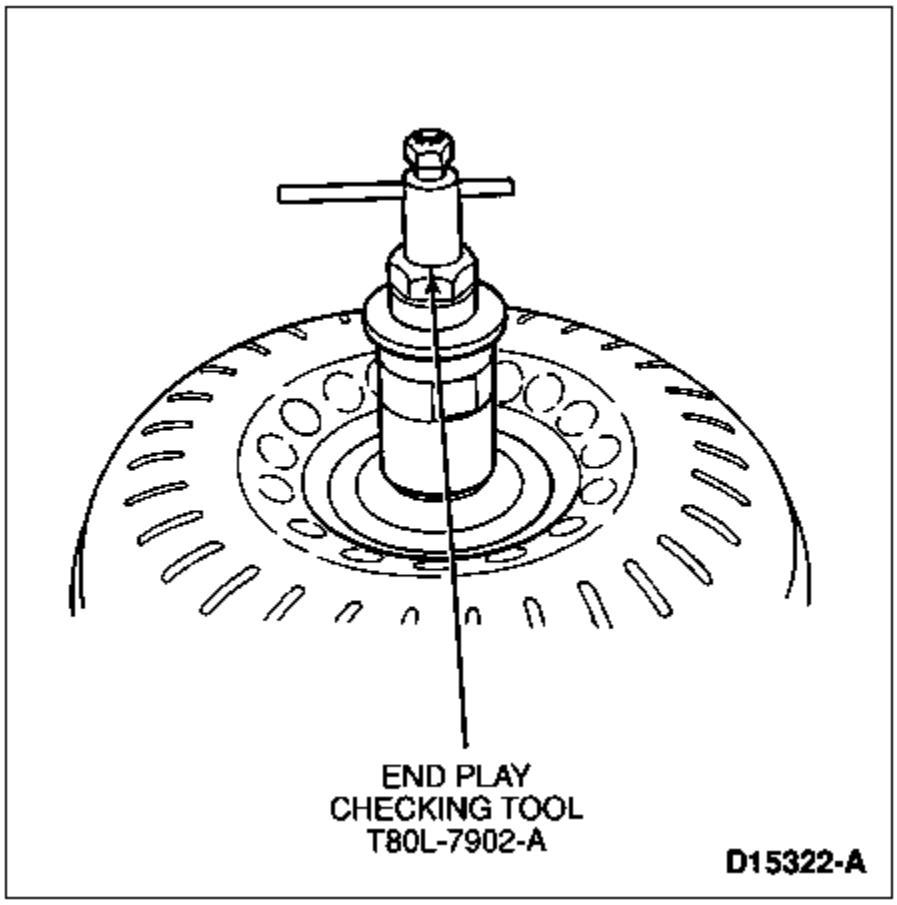
   If there is an indication of scraping, the trailing edges of the stator blades may be interfering with the leading edges of the impeller blades. In such cases, replace the torque converter.



tomsn048@gmail.com

Torque Converter End Play Check

1. Install End Play Checking Tool T80L-7902-A into the converter turbine hub until it bottoms.

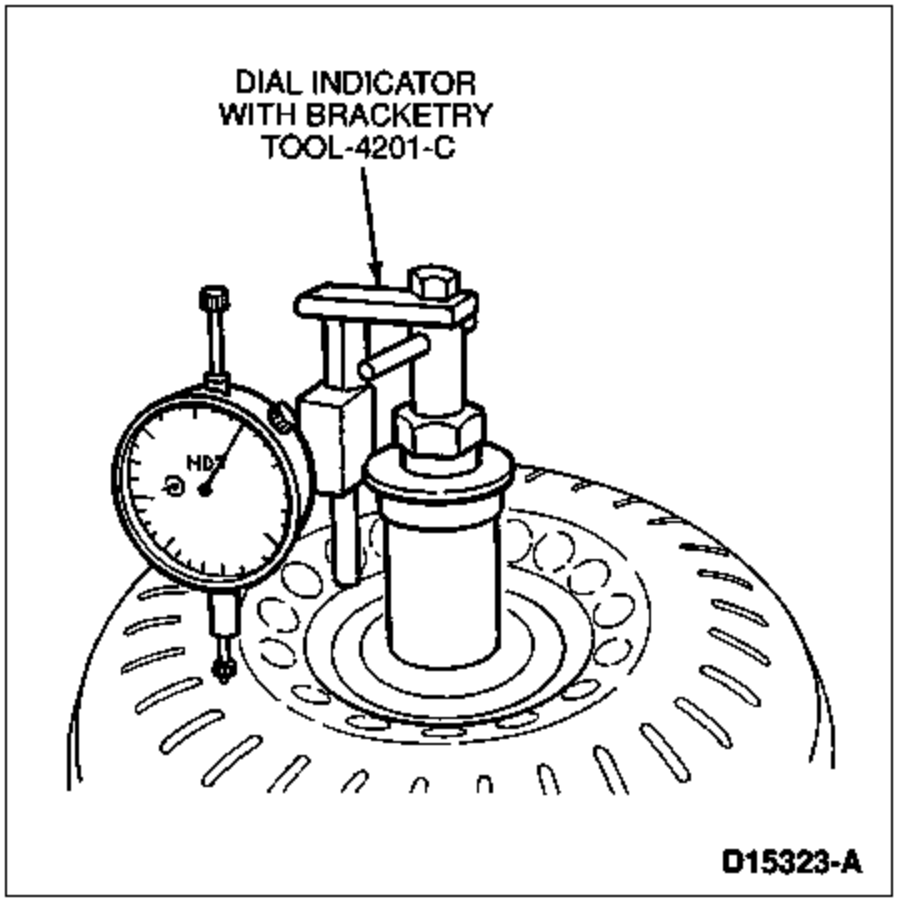


2. Expand the sleeve in the turbine spline by tightening the threaded inner post until the tool is securely locked in the spline.

tomsn048@gmail.com

3. Attach Dial Indicator with Bracketry TOOL-4201-C or equivalent to End Play Checking Tool T80L-7902-A. Position the indicator button on the converter impeller housing and set the dial face to zero (0).

tomsn048@gmail.com



4. Lift the tool upwards as far as it will go and note the indicator reading. The indicator reading is the total end play which the turbine and stator share. Replace the torque converter if the total end play exceeds the specifications.

CONVERTER END PLAY

New or Rebuilt Converter		Used Converter	
mm	Inch	mm	Inch
0.58 Max.	0.023 Max.	1.27 Max.	0.050 Max.

5. Loosen the threaded inner post to remove the tool from the torque converter (7902).

tomsn048@gmail.com

tomsn048@gmail.com

Transmission

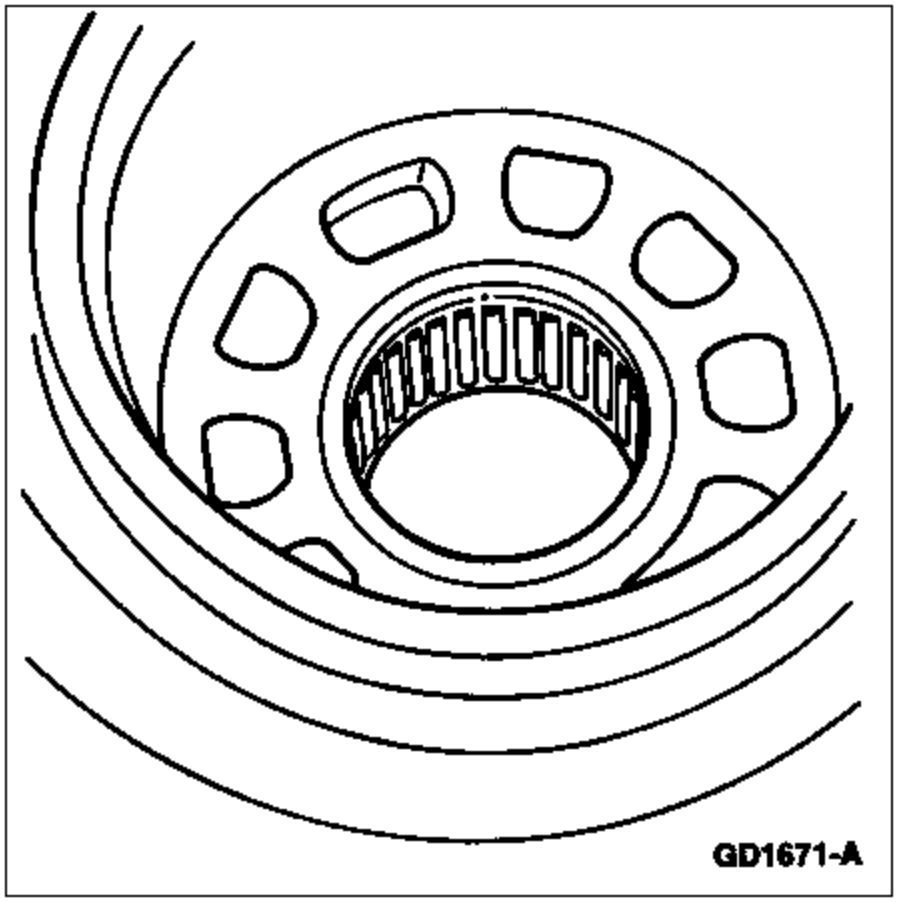
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Bench-Mounted Holding Fixture	T57L-500-B
Shift Lever Seal Replacer	T74P-77498-A
Gauge Bar	T93T-77003-AH
Front Pump Alignment Set	T74P-77103-X
Band Adjustment Torque Wrench Set	T71P-77370-A
Servo Rod Selecting Gauge	T74P-77190-A
Extension Housing Bushing Replacer	T77L-7697-F
Extension Housing Seal Replacer	T74P-77052-A
TR Sensor Alignment Tool	T97L-70010-A
Drive Handle	T80T-4000-W
Case Bearing Installation Tool	T97T-77110-A
Bearing Cup Puller	T77F-1102-A
Impact Slide Hammer	T50T-100-A
Turbine Shaft Speed Sensor Gauge	T95L-70010-F
Valve Body Guide Pin (.235)	T95L-70010-B
Valve Body Guide Pin (.248)	T95L-70010-C
Torque Converter Handles	T81P-7902-C
Servo Cover Compressor	T95L-77028-A
Converter Guide Pins	T95L-7902-A

1. Inspect the case for cracks and stripped threads. Inspect the gasket surfaces and mating surfaces for burrs. Check the vent for obstructions and check all fluid passages for obstructions and leakage.

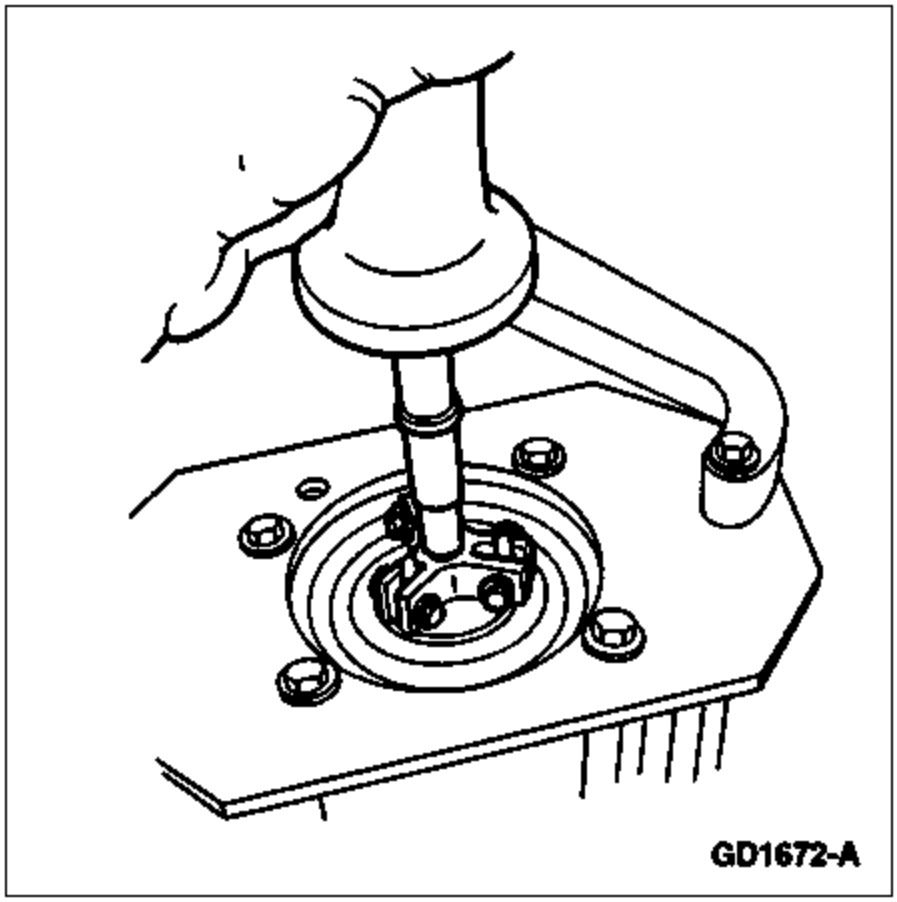
2. Inspect case bearing for damage. If damaged, replace bearing. Refer to steps a-d.

tomsn048@gmail.com

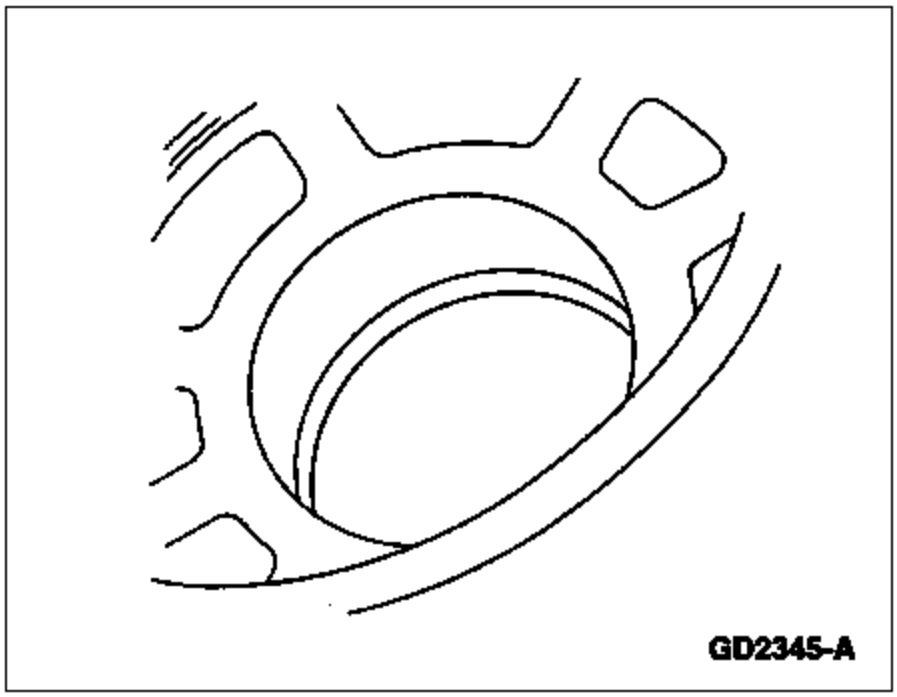


a. Install Bearing Cup Puller T77F-1102-A with Impact Slide Hammer T50T-100-A onto case bearing. Remove bearing.

tomsn048@gmail.com



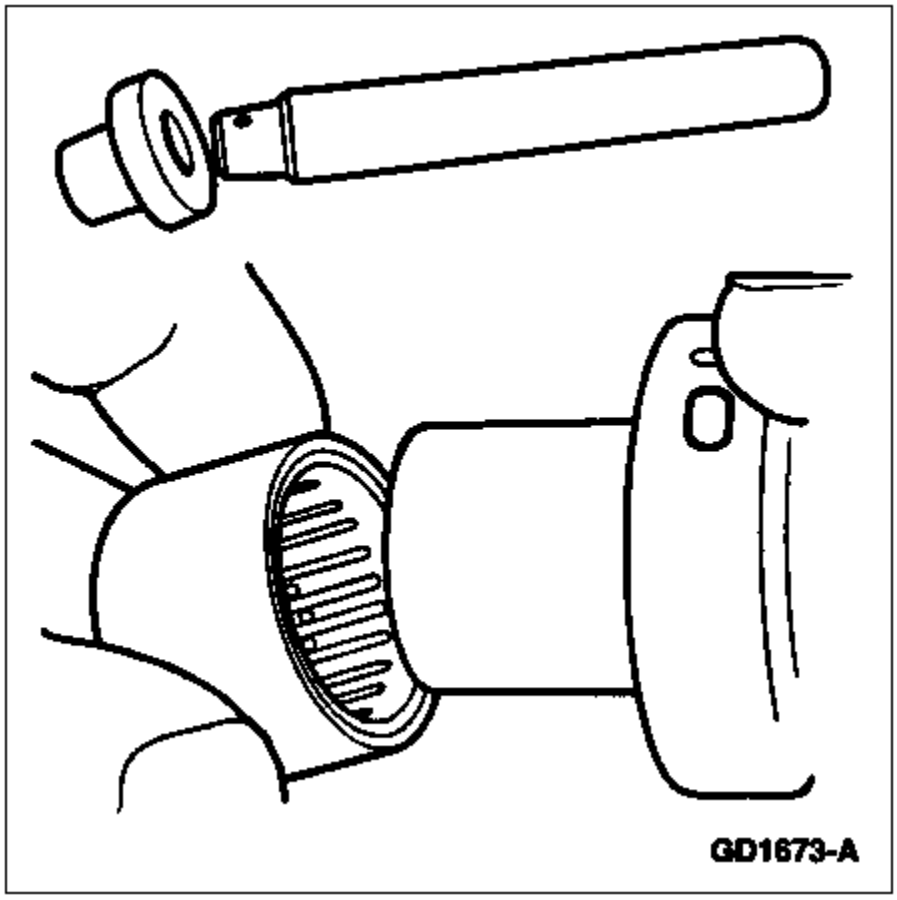
b. Inspect case bore for nicks and burrs. Remove with oil stone prior to installation of new bearing.



c. Install Drive Handle T80T-4000-W into Case Bearing Installation Tool T97T-77110-A. Install

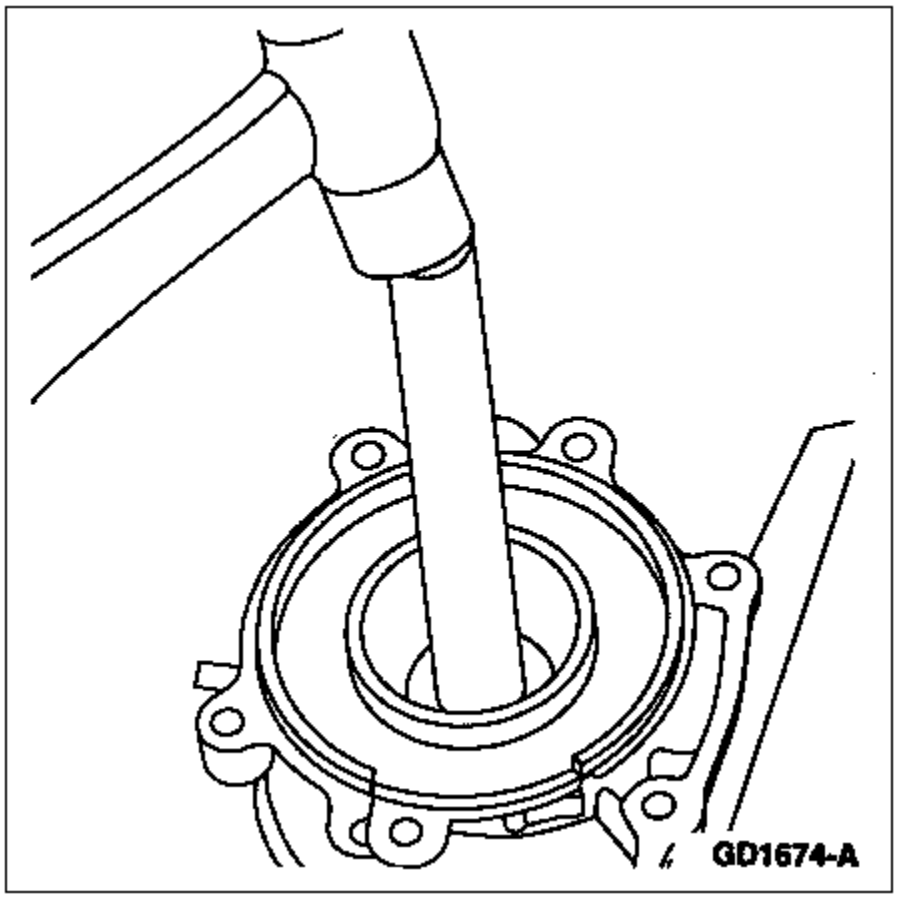
tomsn048@gmail.com

new bearing on Case Bearing Installation Tool T97T-77110-A. Make sure bearing seal ring is facing Drive Handle T80T-4000-W.



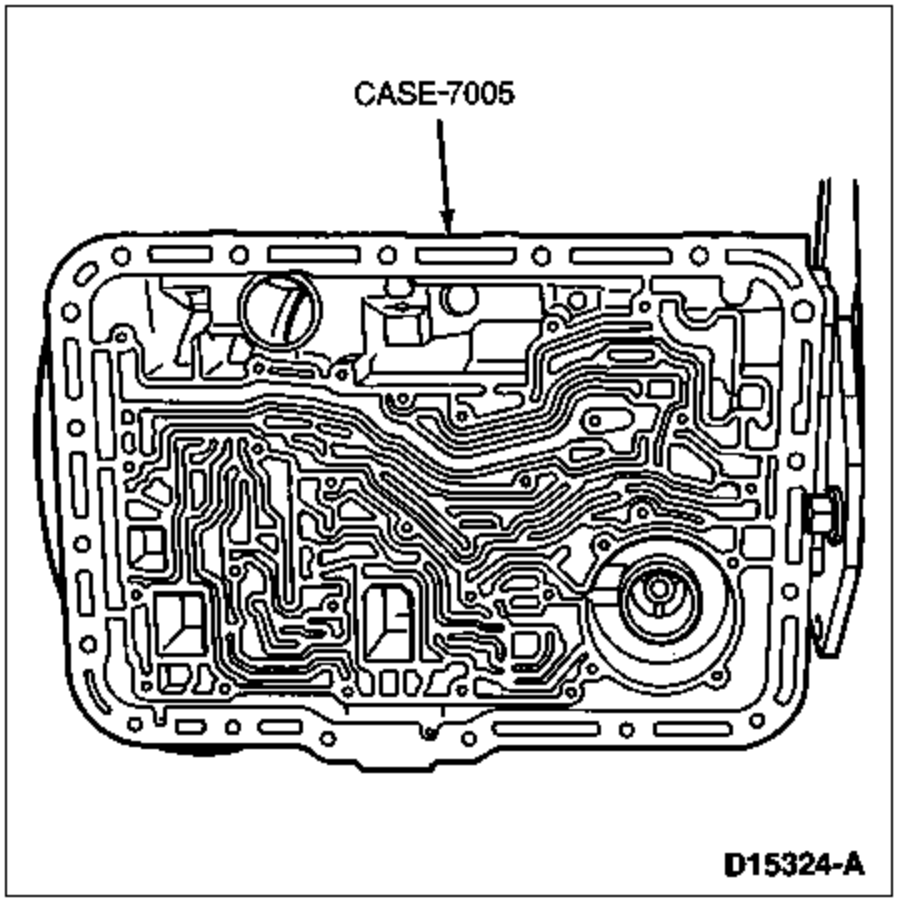
d. Using a hammer, tap bearing into place with Case Bearing Installation Tool T97T-77110-A.

tomsn048@gmail.com

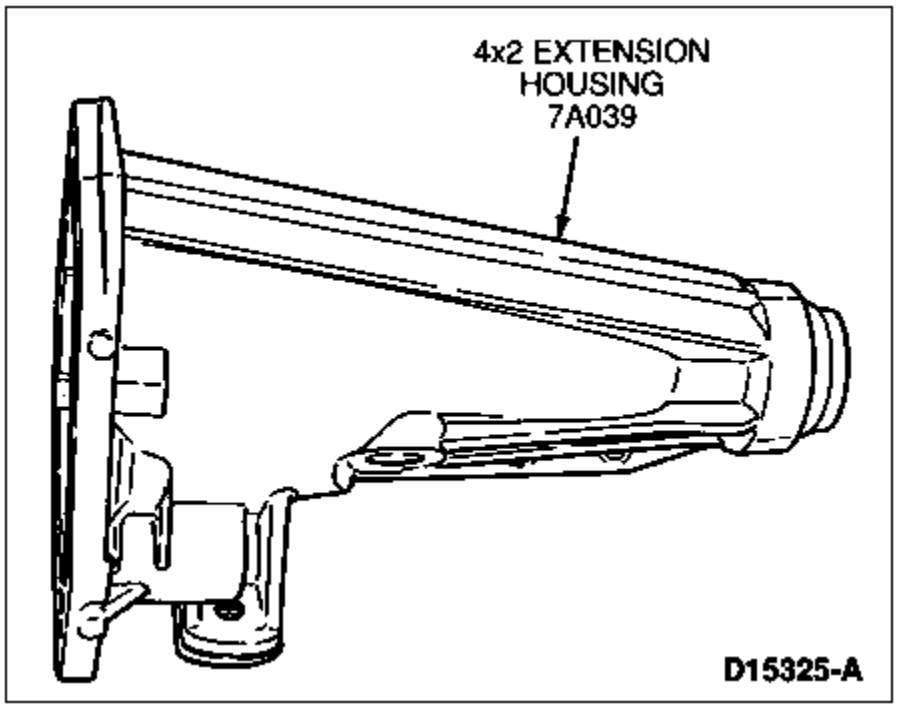


3. Check all parking linkage for wear or damage.
4. Inspect all case threads for damage.

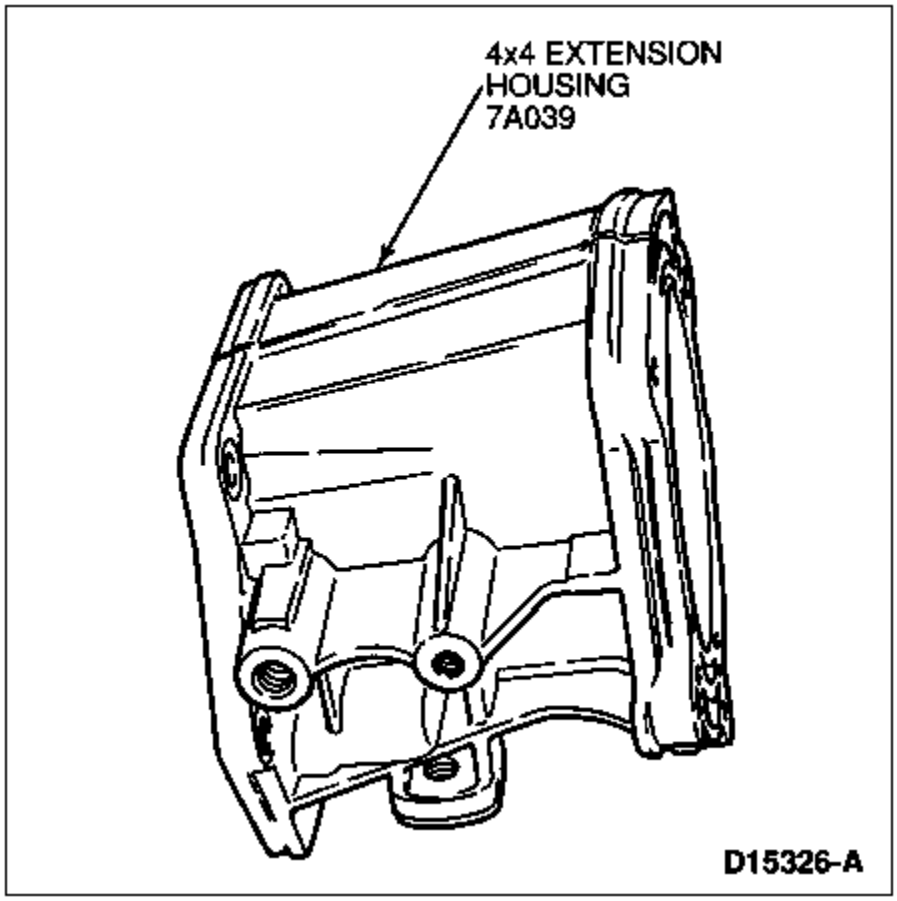
tomsn048@gmail.com



5. Inspect the extension housing for cracks. Inspect the gasket surfaces for burrs or warpage.



tomsn048@gmail.com



6. Inspect the bushing for scores or wear. Replace if required.

7. Inspect the rear seal for hardness, cracks or wear. If the seal shows wear or deterioration, replace the seal.

8. Inspect the seal counterbore and remove all burrs and scores with a crocus cloth.

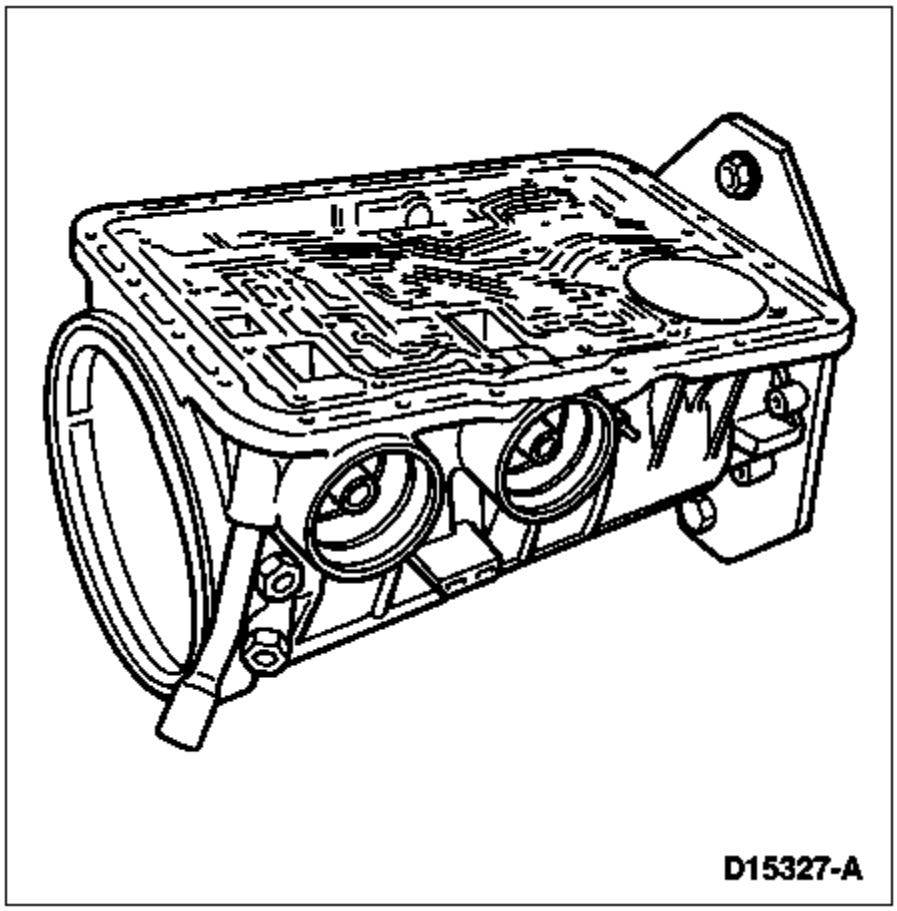
9. **NOTE: Bench-Mounted Holding Fixture T57L-500-B should still be attached to the adapter plate. If it is not, reattach the fixture arm at this time.**

   Reattach the adapter plate to the extension housing face using four M10 x 30 mm screws.

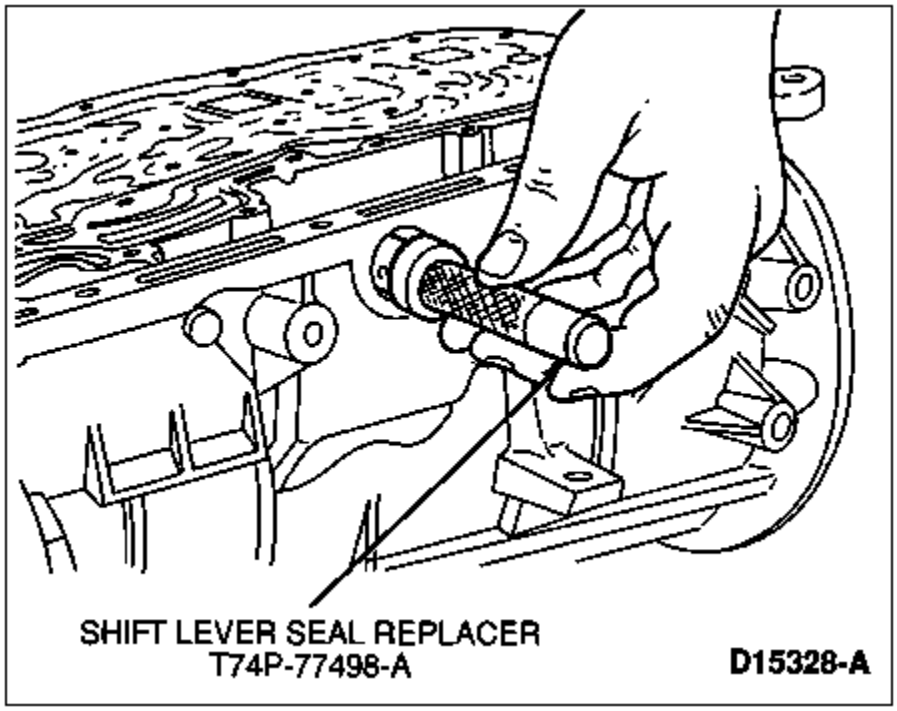
10. **WARNING: MAKE SURE THE LOCK PIN ON BENCH-MOUNTED HOLDING FIXTURE T57L-500-B IS SECURE.**

    Install the transmission case in the Bench-Mounted Holding Fixture T57L-500-B and rotate so the transmission fluid pan rail is facing up.

tomsn048@gmail.com

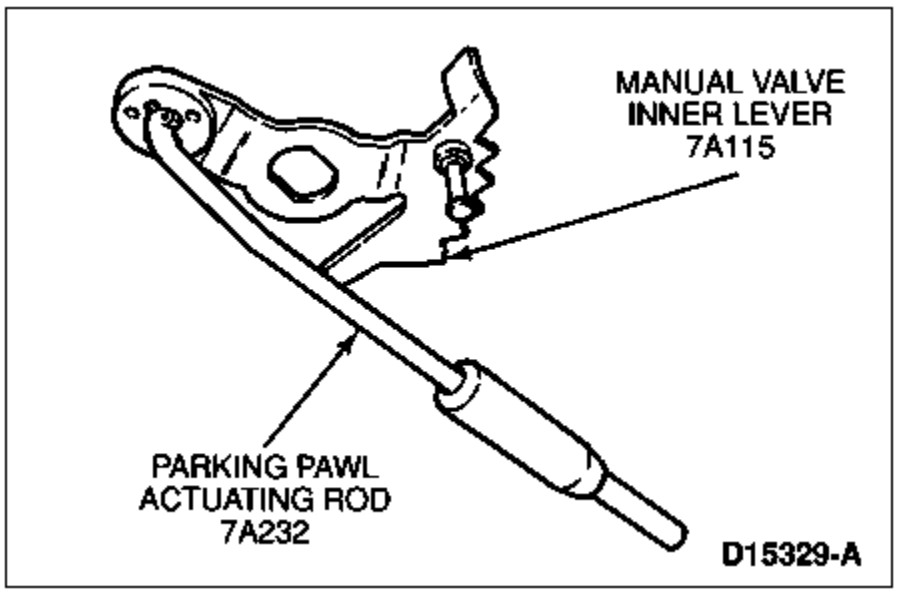


11. Lubricate and install the main control lever seal using Shift Lever Seal Replacer T74P-77498-A.



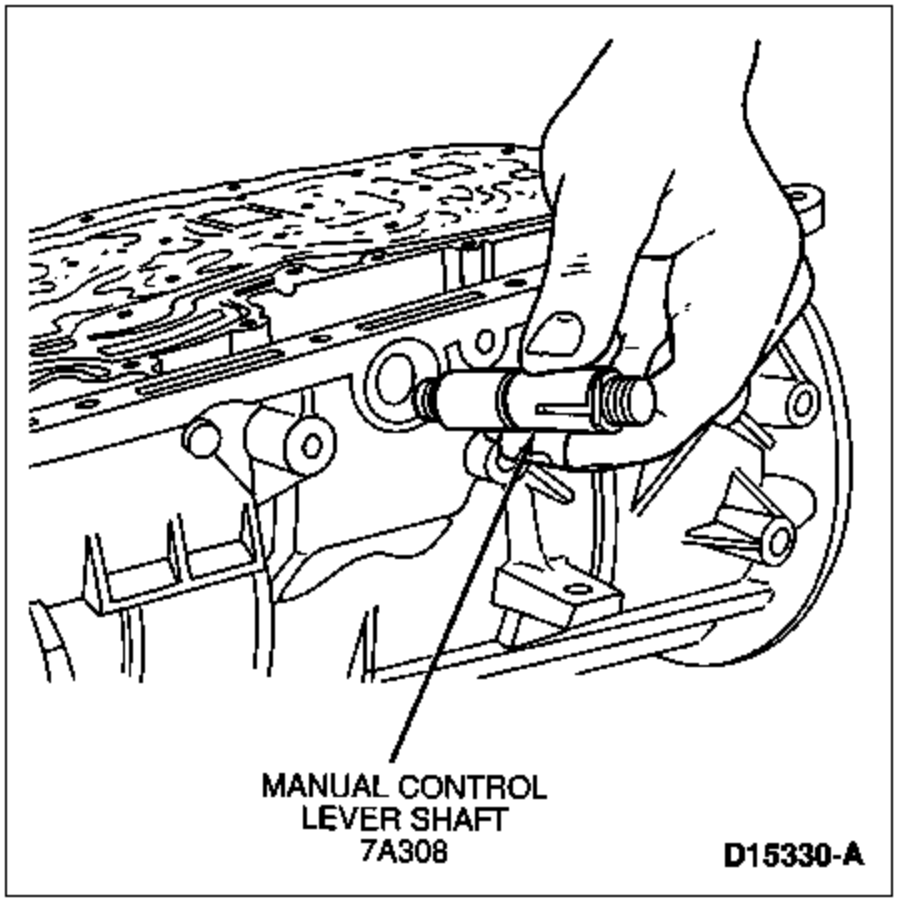
tomsn048@gmail.com

12. Assemble the manual valve inner lever and parking pawl actuating rod as shown.



13. Install the manual control lever shaft into the case.

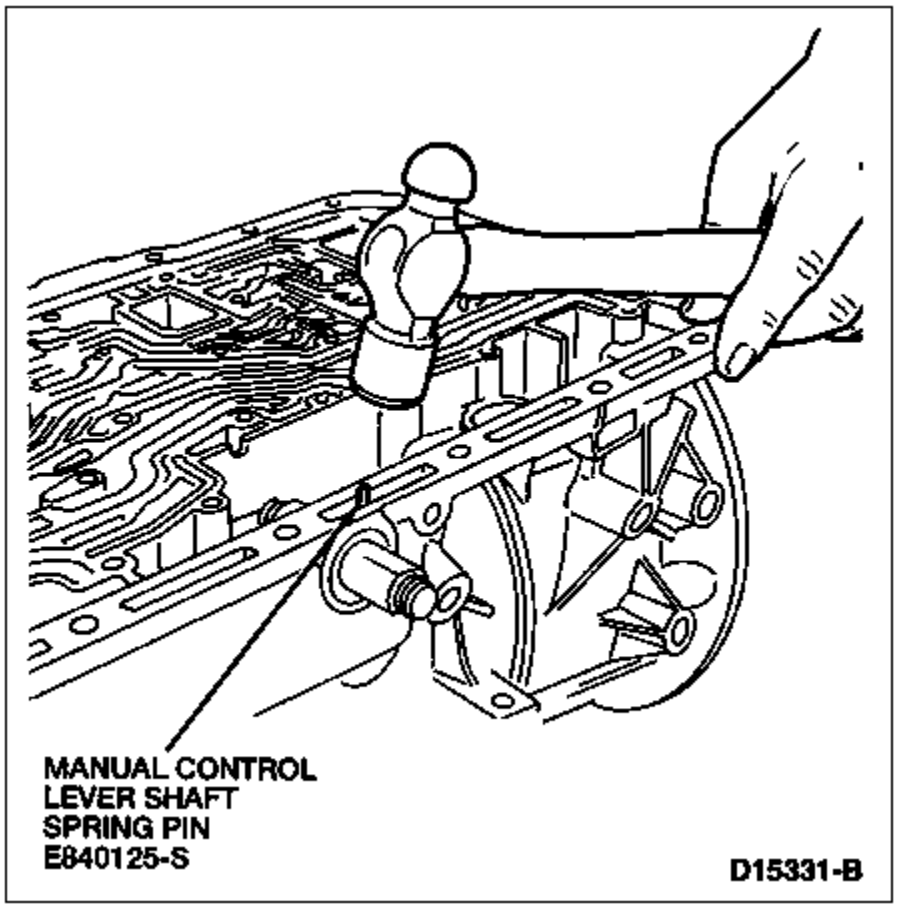
tomsn048@gmail.com



14. **CAUTION: Use care not to damage the fluid pan rail surface when installing the retaining pin.**

    Align the manual control lever shaft with the manual control lever shaft retaining pin. Install the retaining pin.

tomsn048@gmail.com

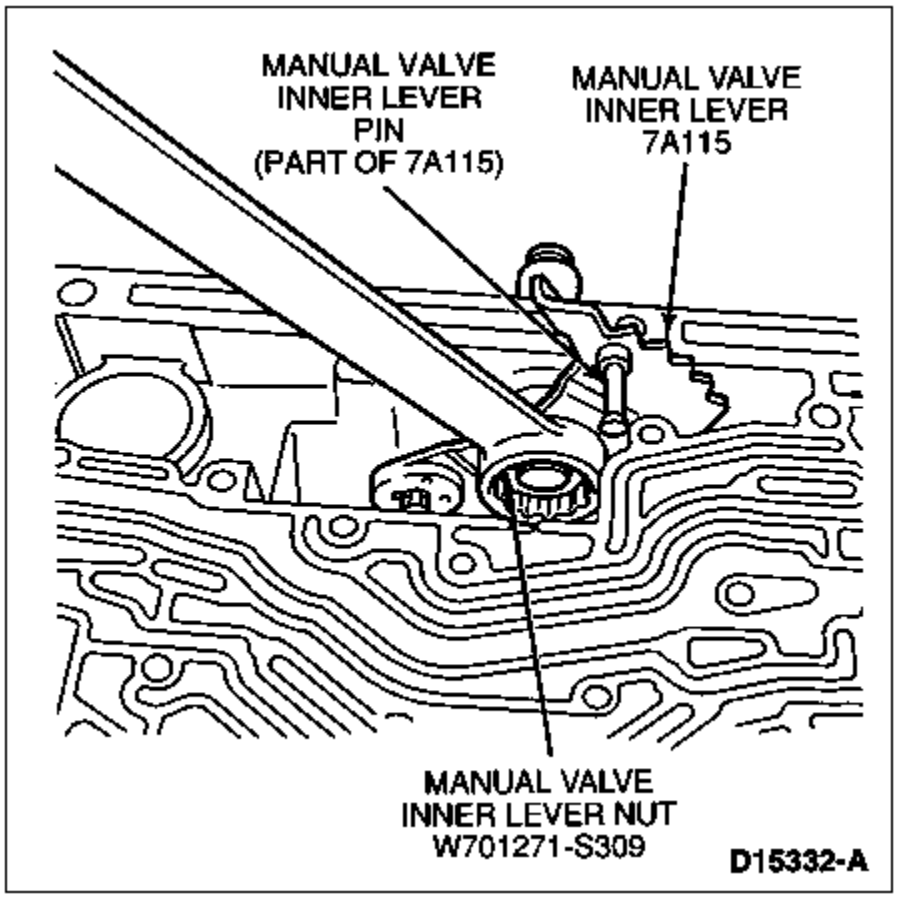


15. Install the manual valve inner lever and parking pawl actuating rod into the case. Align the flats of the manual valve inner lever with the flats on the manual control lever shaft.

16. **CAUTION: To avoid damage, do not allow wrench to strike the manual valve inner lever pin.**

    Install manual valve inner lever nut and tighten to 41-54 Nm (30-40 lb-ft).

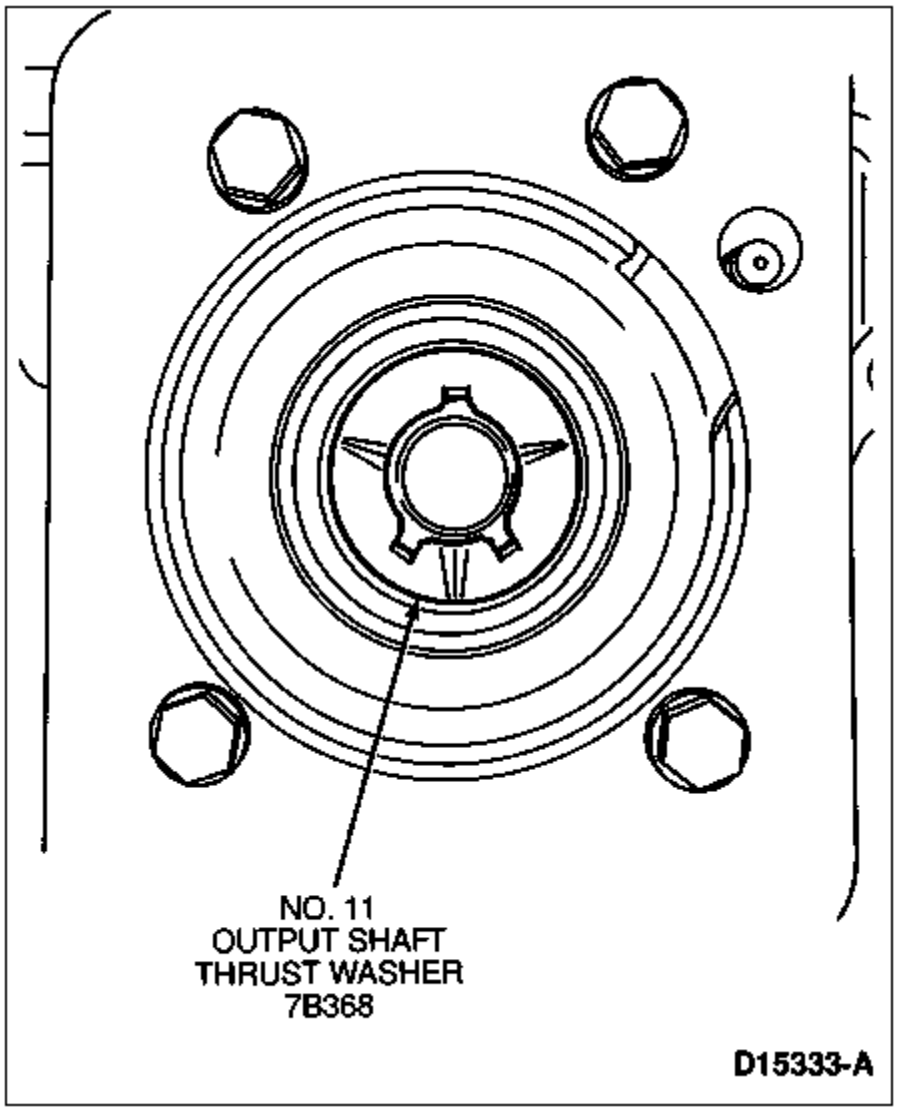
tomsn048@gmail.com



17. **CAUTION: The tabs on the No. 11 output shaft thrust washer point into the case. Ensure that the thrust washer is properly seated.**

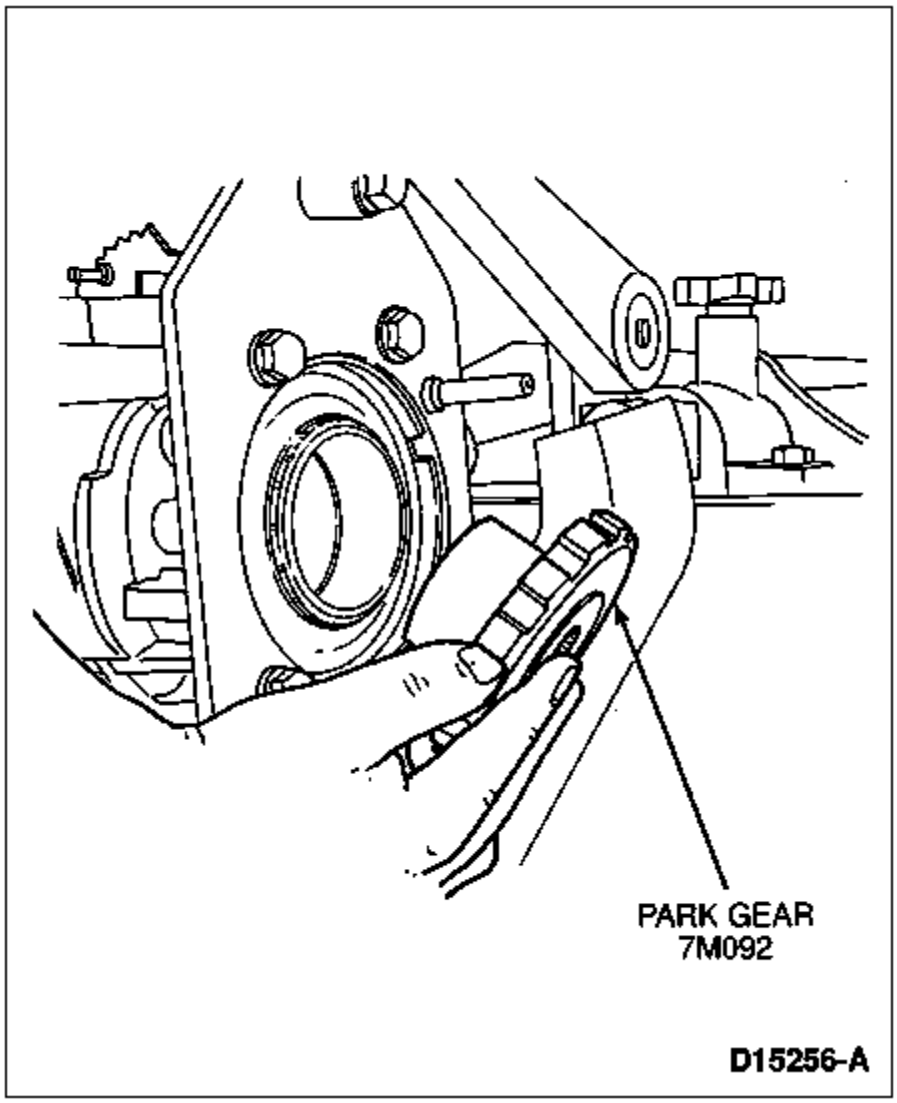
    Apply petroleum jelly to the No. 11 output shaft thrust washer and install into the rear of the case bore.

tomsn048@gmail.com



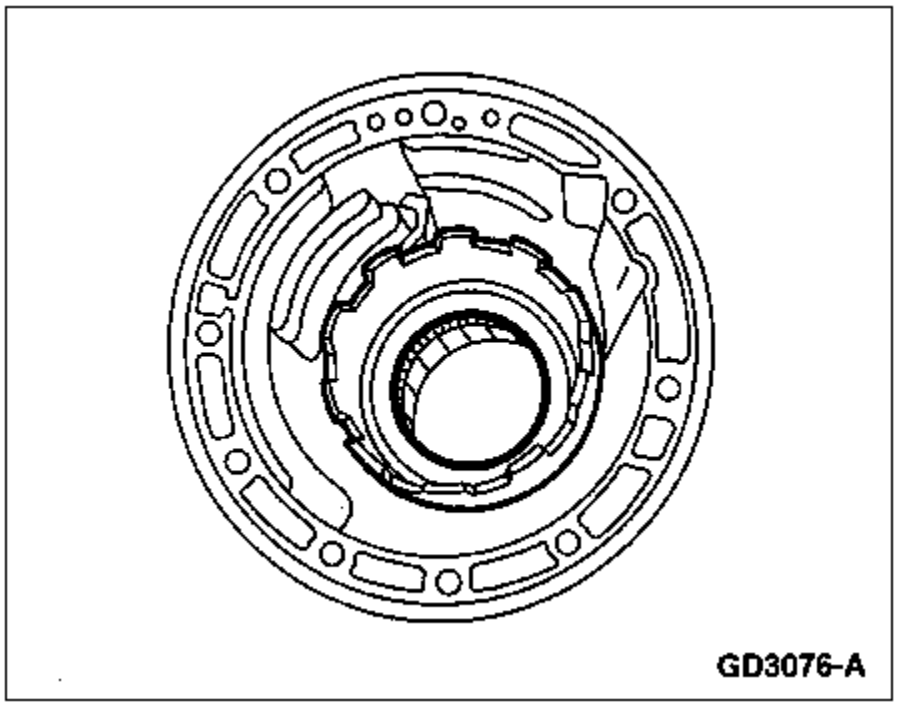
18. Install the park gear into the rear case bore.

tomsn048@gmail.com

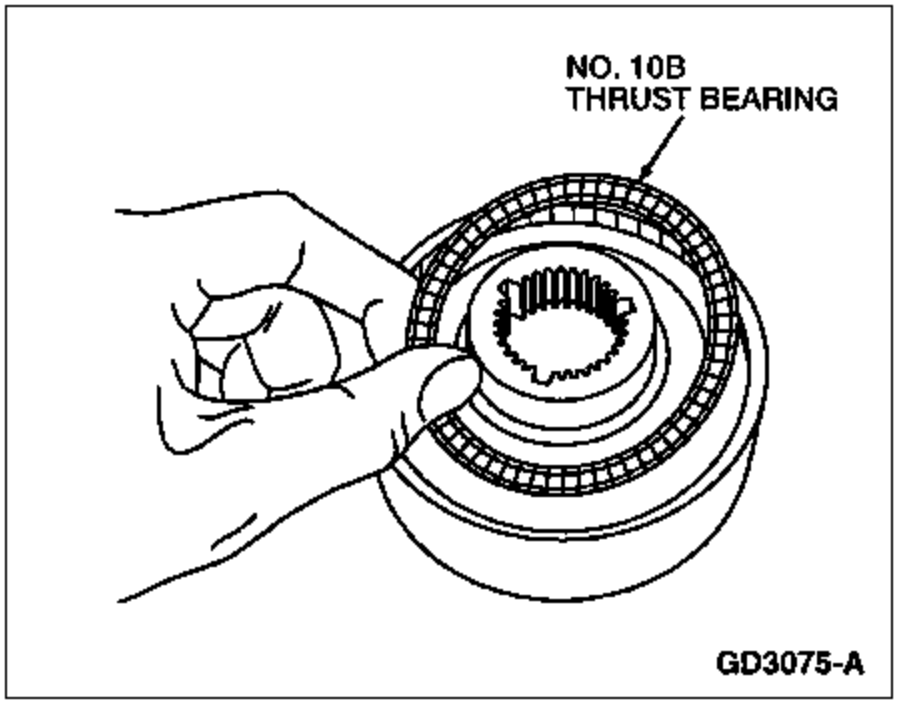


19. Rotating the reverse brake drum assembly clockwise and install into case.

tomsn048@gmail.com

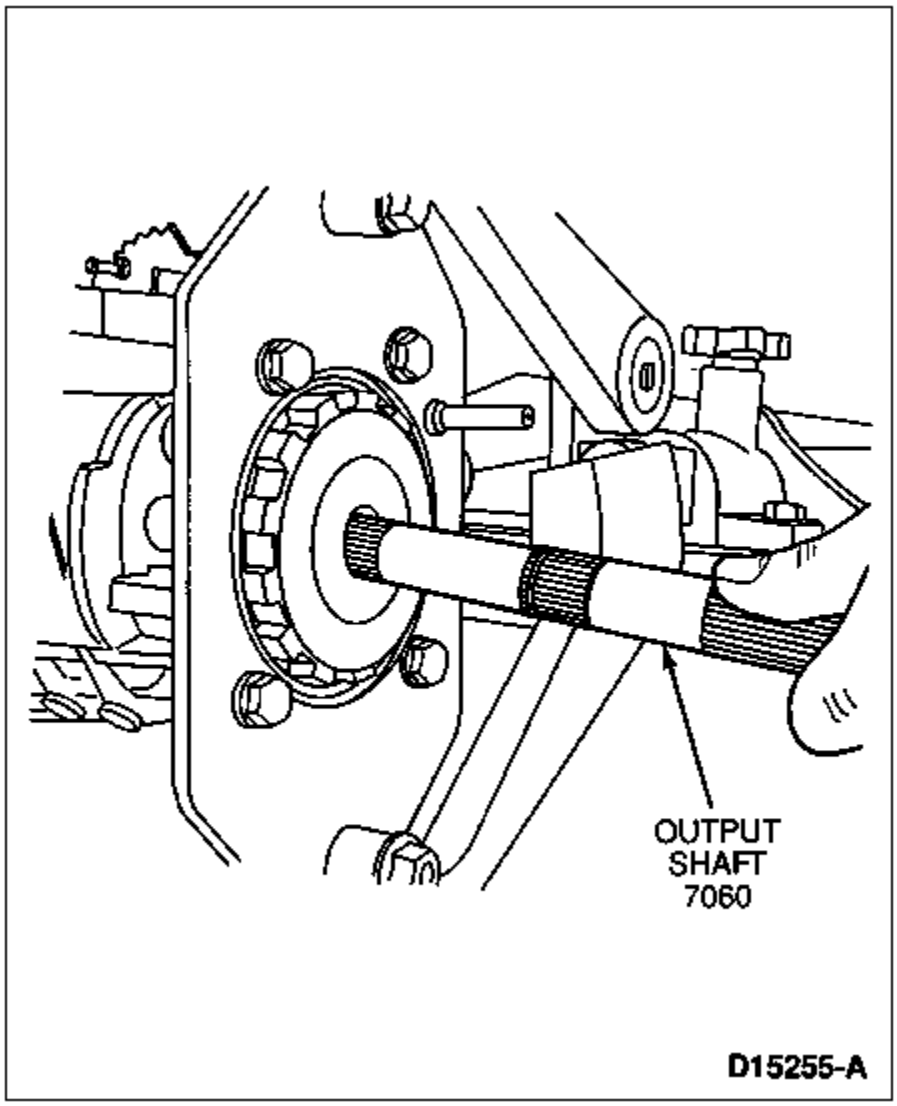


20. If not already installed, use petroleum jelly to install No. 10B thrust bearing onto output shaft hub.



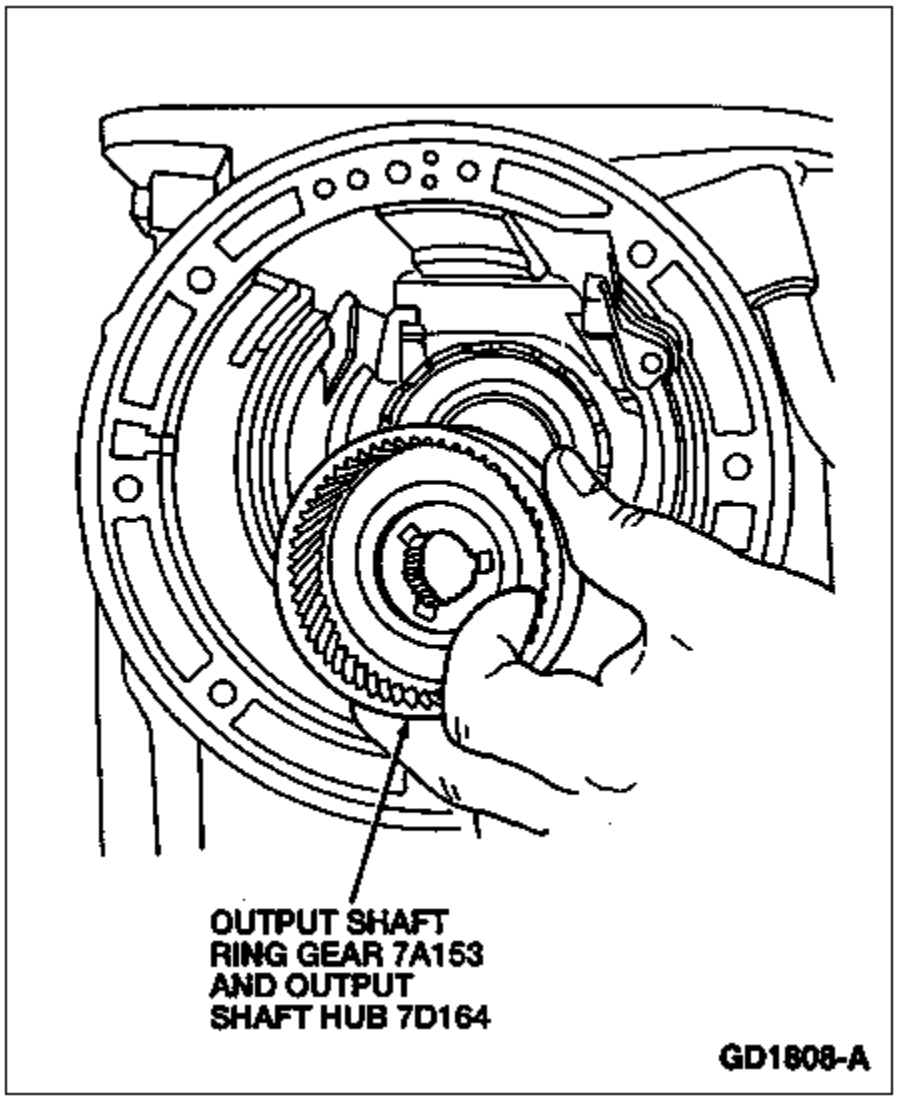
21. Install the output shaft through the output shaft park gear.

tomsn048@gmail.com



22. Install the output shaft ring gear and output shaft hub assembly.

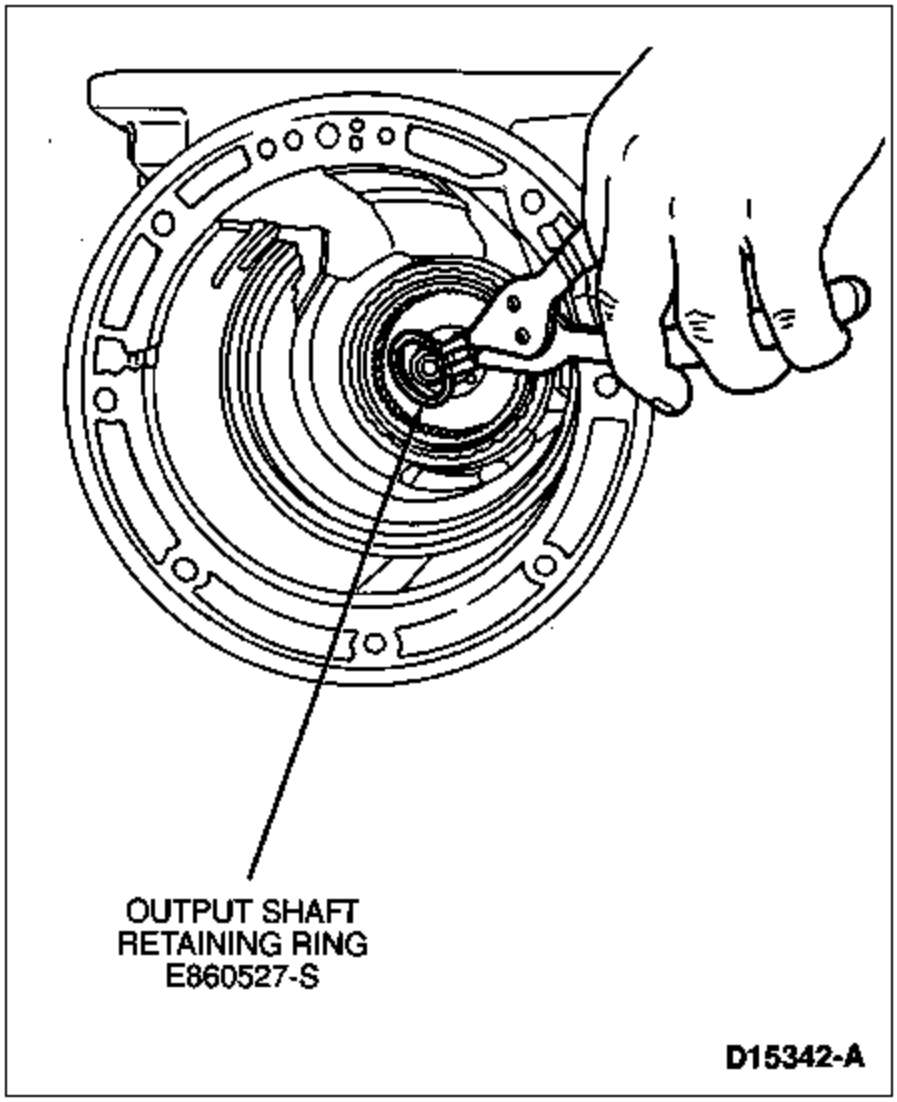
tomsn048@gmail.com



23. **CAUTION: Always use a new retaining ring.**

Install a new output shaft retaining ring in the output shaft retaining ring groove.

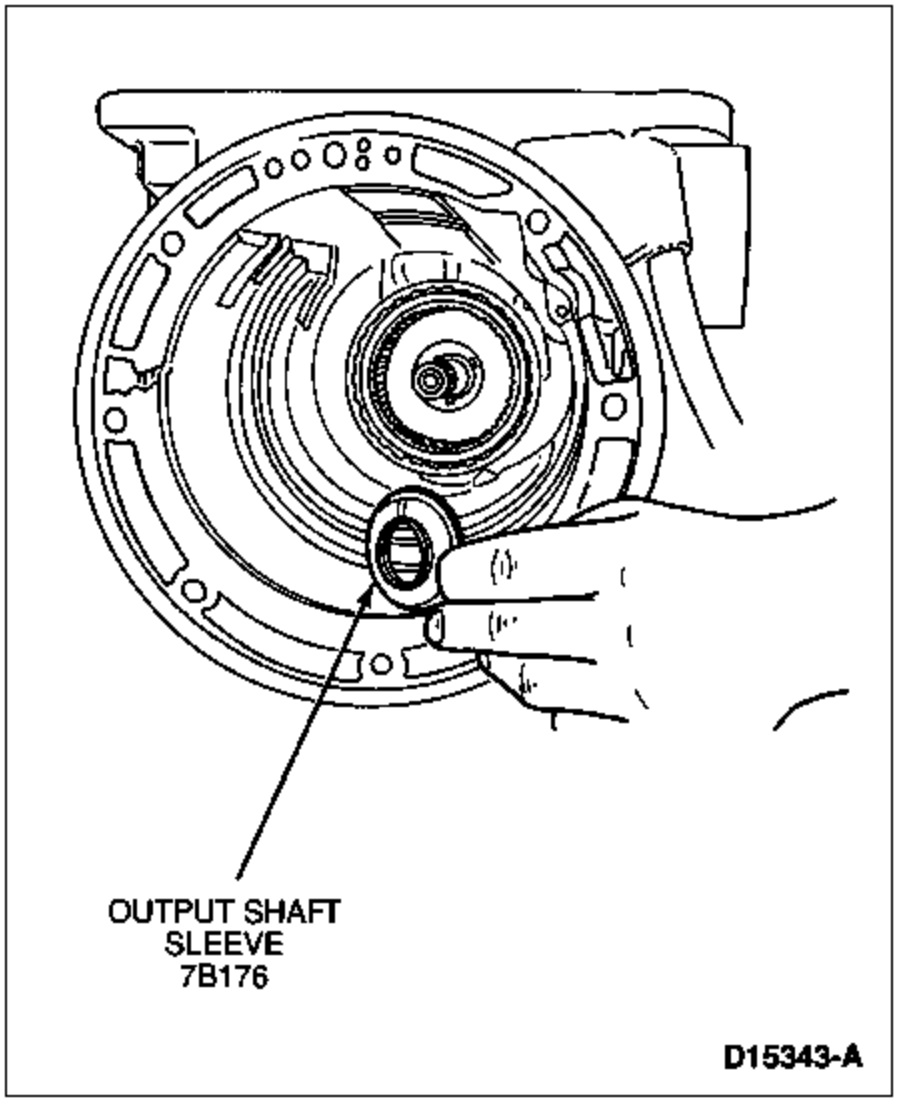
tomsn048@gmail.com



24. **NOTE: Use petroleum jelly to hold the sleeve in place.**

    Install the output shaft sleeve with cone facing up.

tomsn048@gmail.com

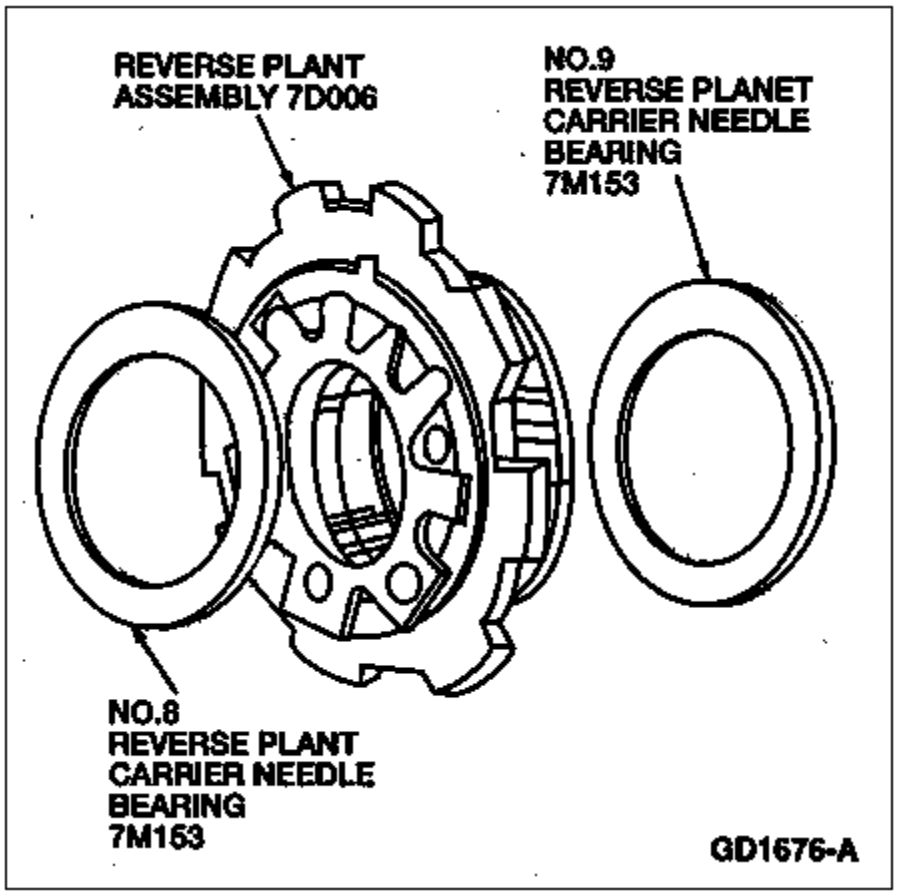


25. **NOTE: Use petroleum jelly to hold the needle bearings in place.**

Position the No. 8 reverse planetary carrier needle bearing on the front face of the reverse planetary.
Position the No. 9 reverse planetary carrier needle bearing on the rear face of the reverse planetary.

No. 8 and 9 Reverse Planetary Carrier Needle Bearing Position

tomsn048@gmail.com

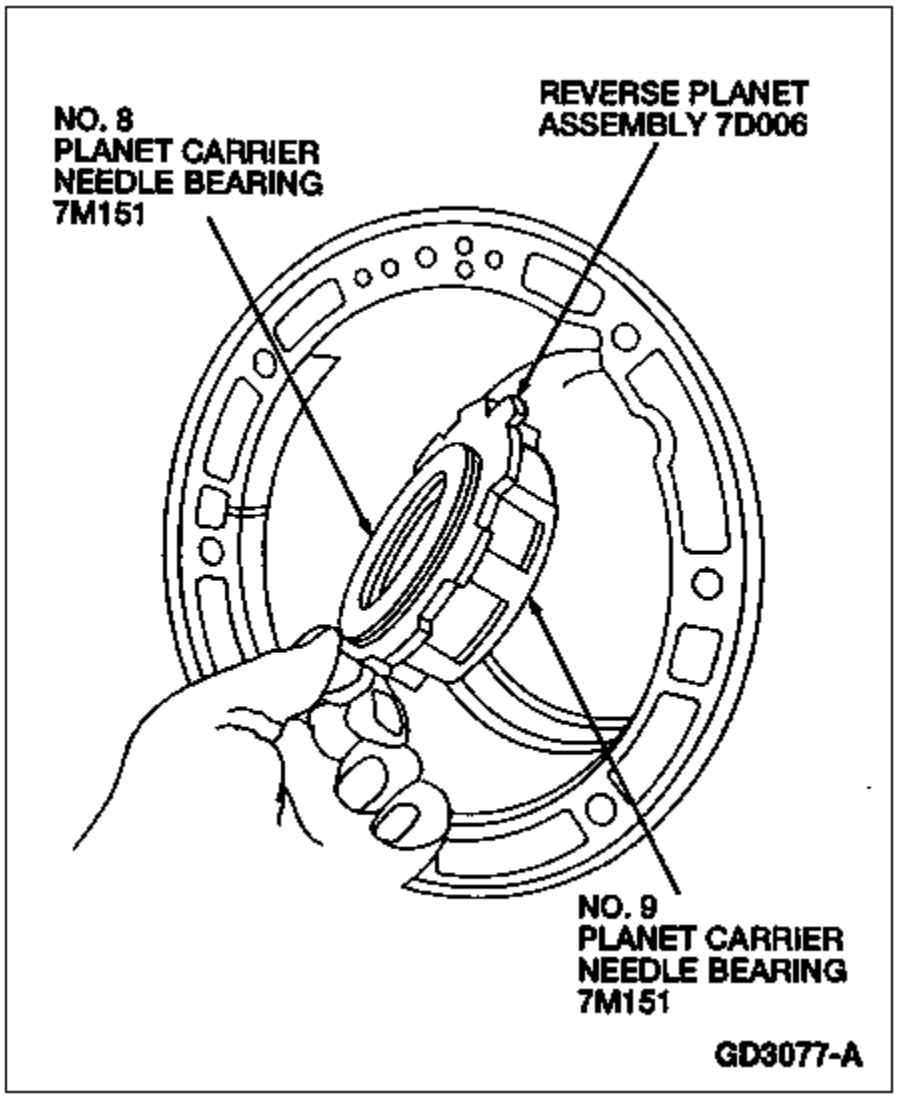


26. **CAUTION: Make sure the needle bearings stay in place.**

Install the reverse planetary assembly, with No. 8 and No. 9 reverse planetary carrier needle bearings, into the output shaft ring gear.

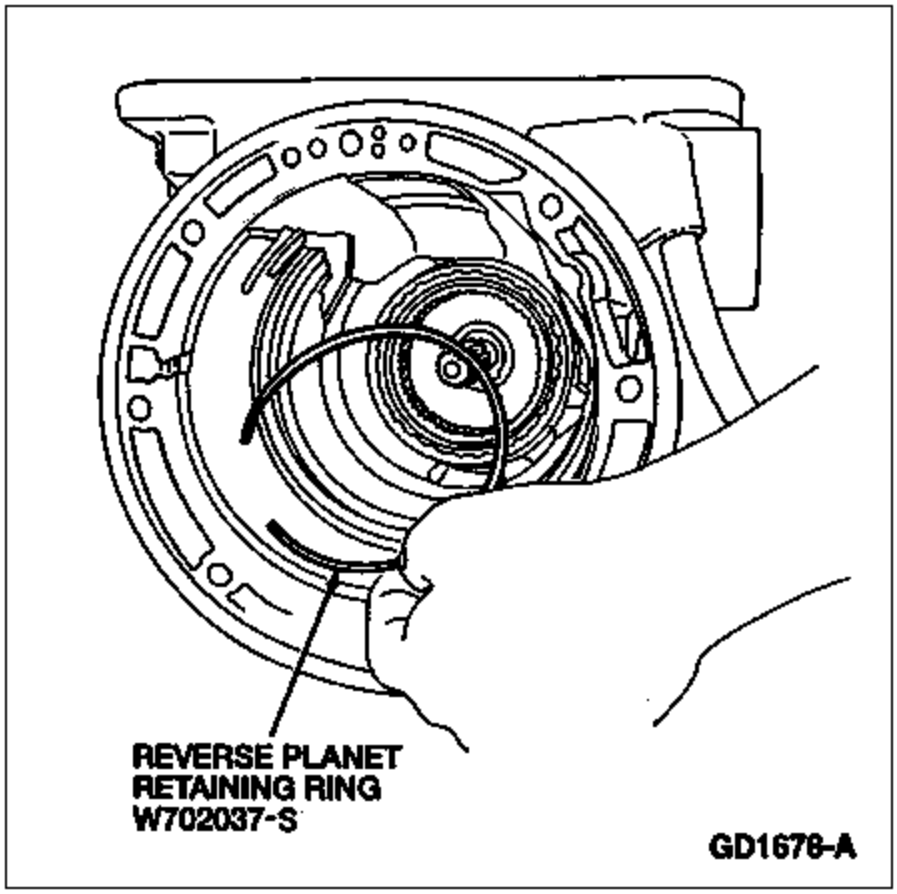
Reverse Planetary Assembly Installation

tomsn048@gmail.com



27. PULL THE REVERSE BRAKE DRUM FORWARD and install the retaining ring into reverse brake drum groove. This will hold the reverse planetary assembly in place.

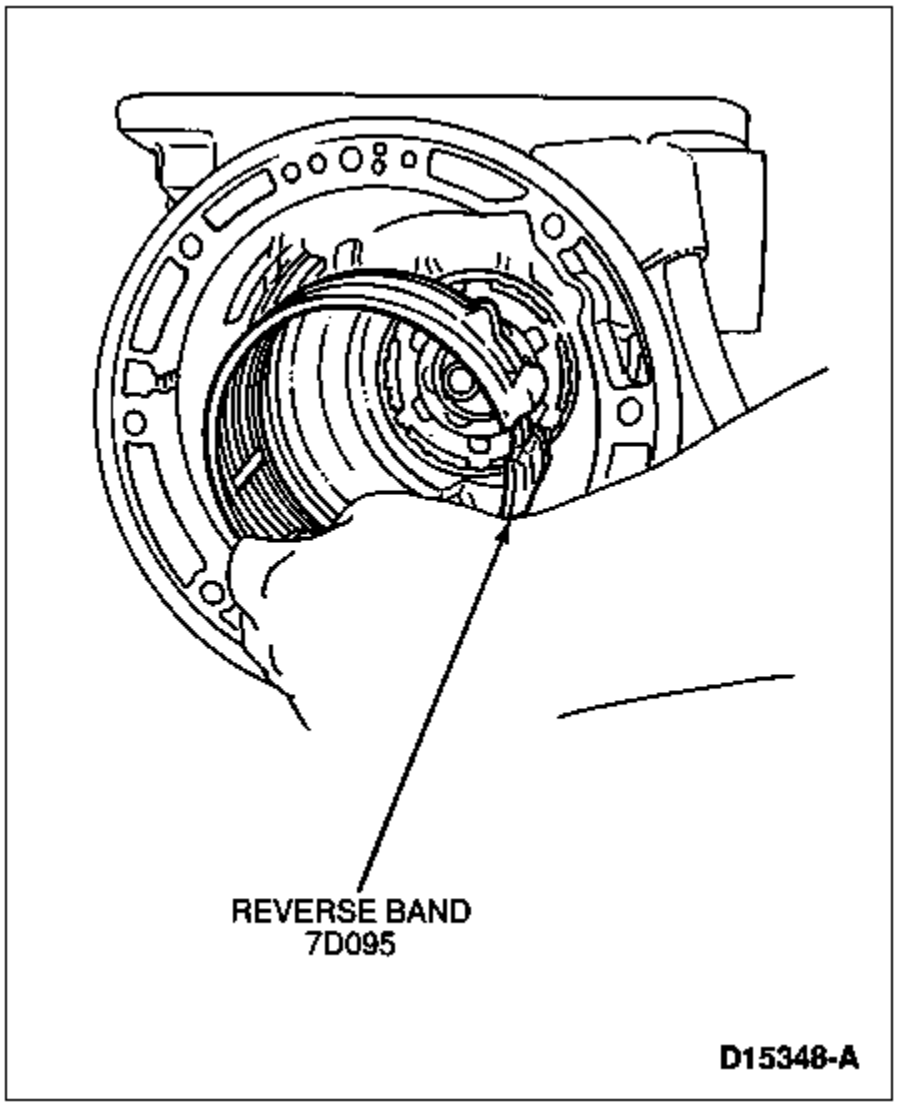
tomsn048@gmail.com



28. **CAUTION: Make sure band is resting on the two anchor pins in the case.**

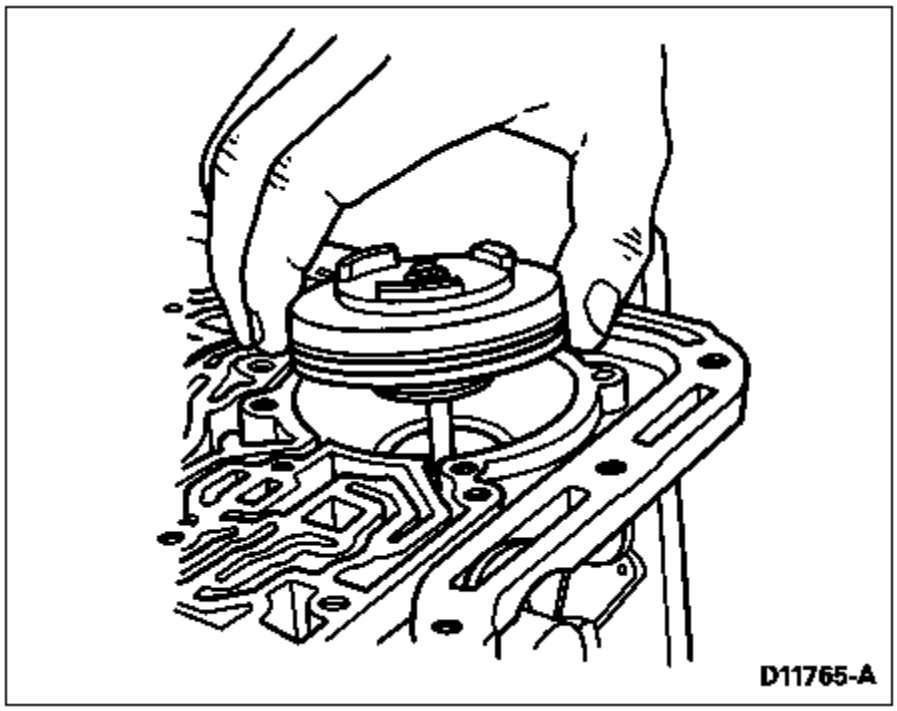
Install the reverse band over the reverse brake drum.

tomsn048@gmail.com

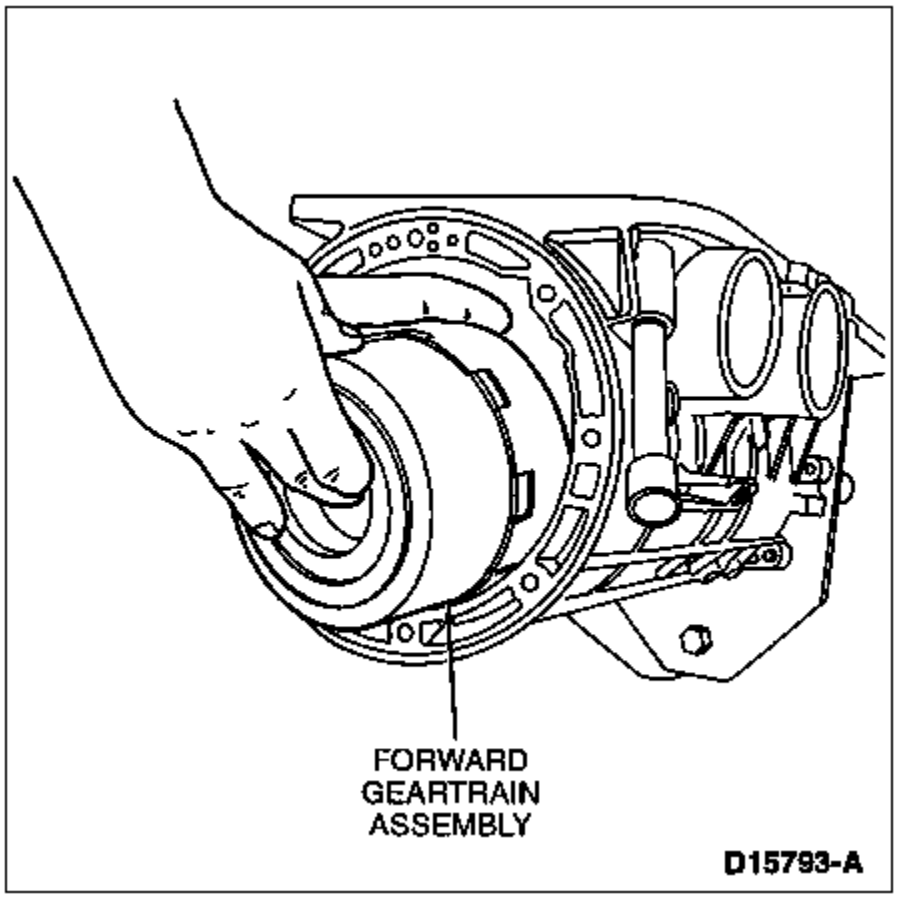


29. Install the reverse band servo piston and rod temporarily to hold the reverse clutch band in position.

tomsn048@gmail.com



30. Install the previously assembled forward geartrain assembly.

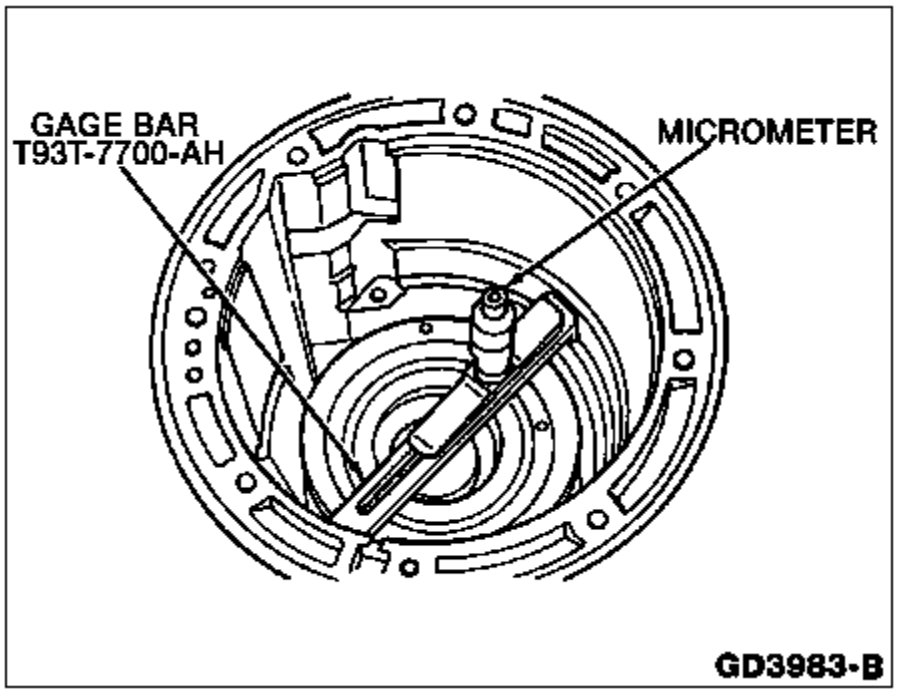


tomsn048@gmail.com

31. **WARNING: MAKE SURE THE LOCK PIN ON BENCH-MOUNTED HOLDING FIXTURE T57L-500-B IS SECURE.**

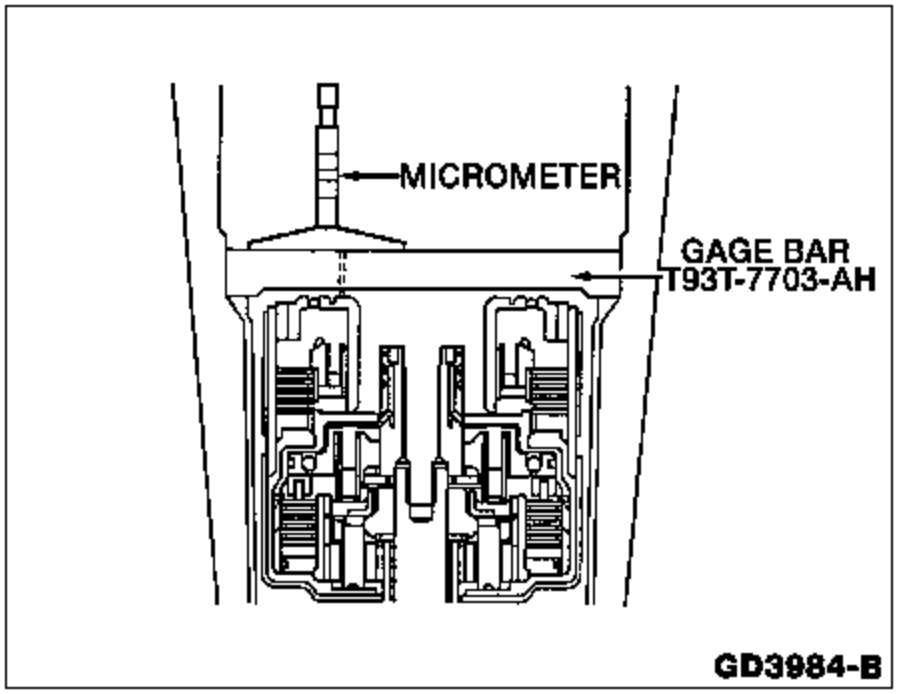
    Rotate the transmission assembly so that the converter housing gasket surface is facing up.

32. Place Gage Bar T93T-77003-AH on the case shoulder of the number four intermediate brake drum thrust surface. Set the mircometer on top of the gage bar as shown.

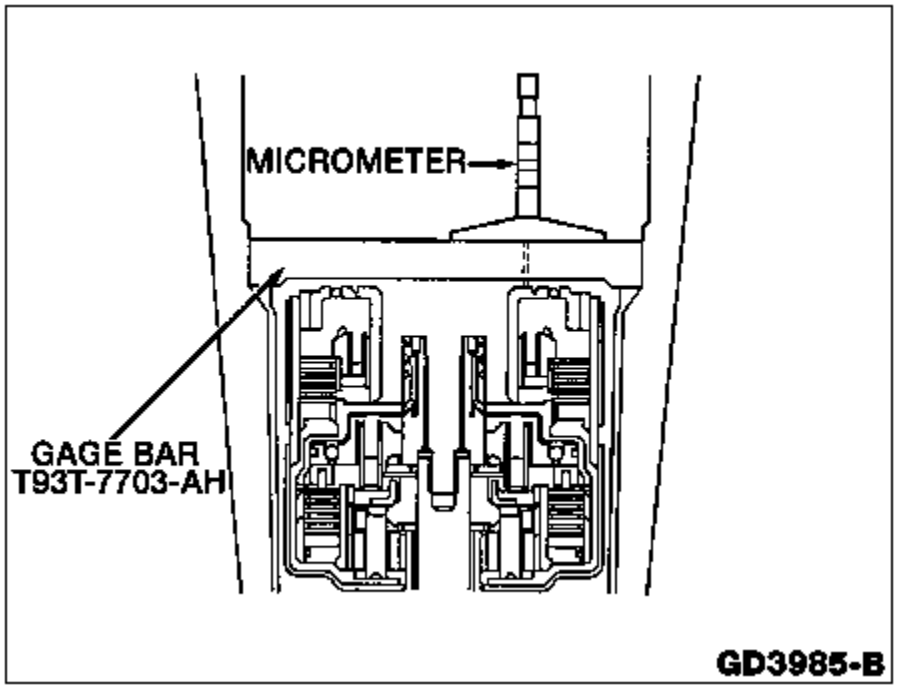


33. Extend the micrometer probe until it contacts the intermediate brake drum thrust bearing surface. Record the reading as dimension "A."

tomsn048@gmail.com



34. Place the micrometer on the opposite side and extend the mircometer probe until it contacts the intermediate brake drum thrust surface. Record the reading as dimension "B."

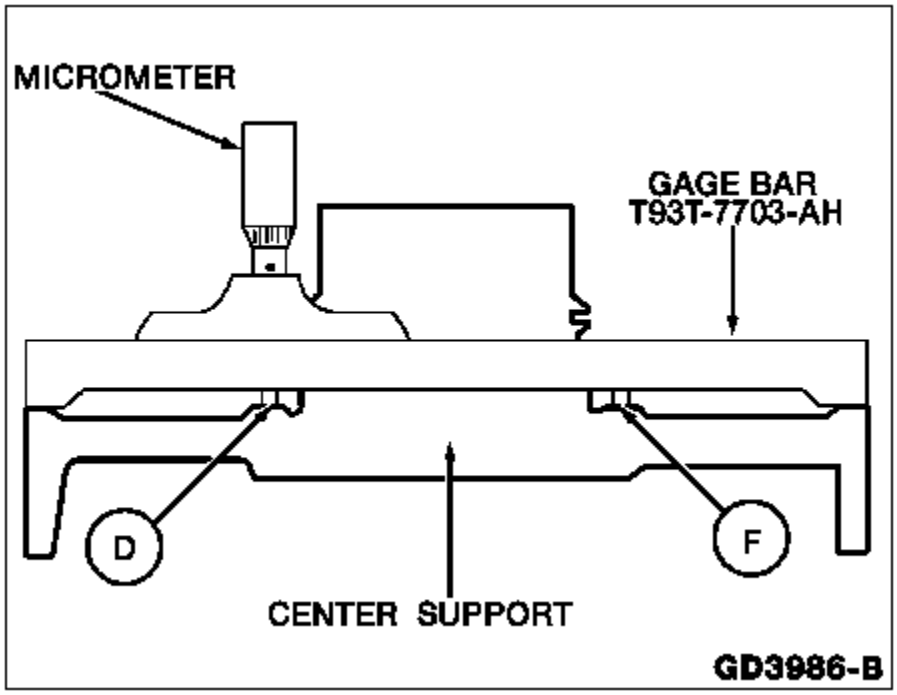


35. Add the dimensions "A" and "B," divide the total of "A" and "B" by two. Subtract the gage bar thickness (17.18 mm [0.700 in]). This is dimension "C."

36. Place Gage Bar T93T-77003-AH across the center support. Place micrometer on top of the gage bar as shown. Extend the micrometer probe until it contacts the center support thrust bearing surface.

tomsn048@gmail.com

Record the reading as dimension "D."



37. Place the micrometer on the opposite side of Gage Bar T93T-77003-AH and extend the micrometer until it contacts the center support thrust bearing surface. Record the dimension as "F."

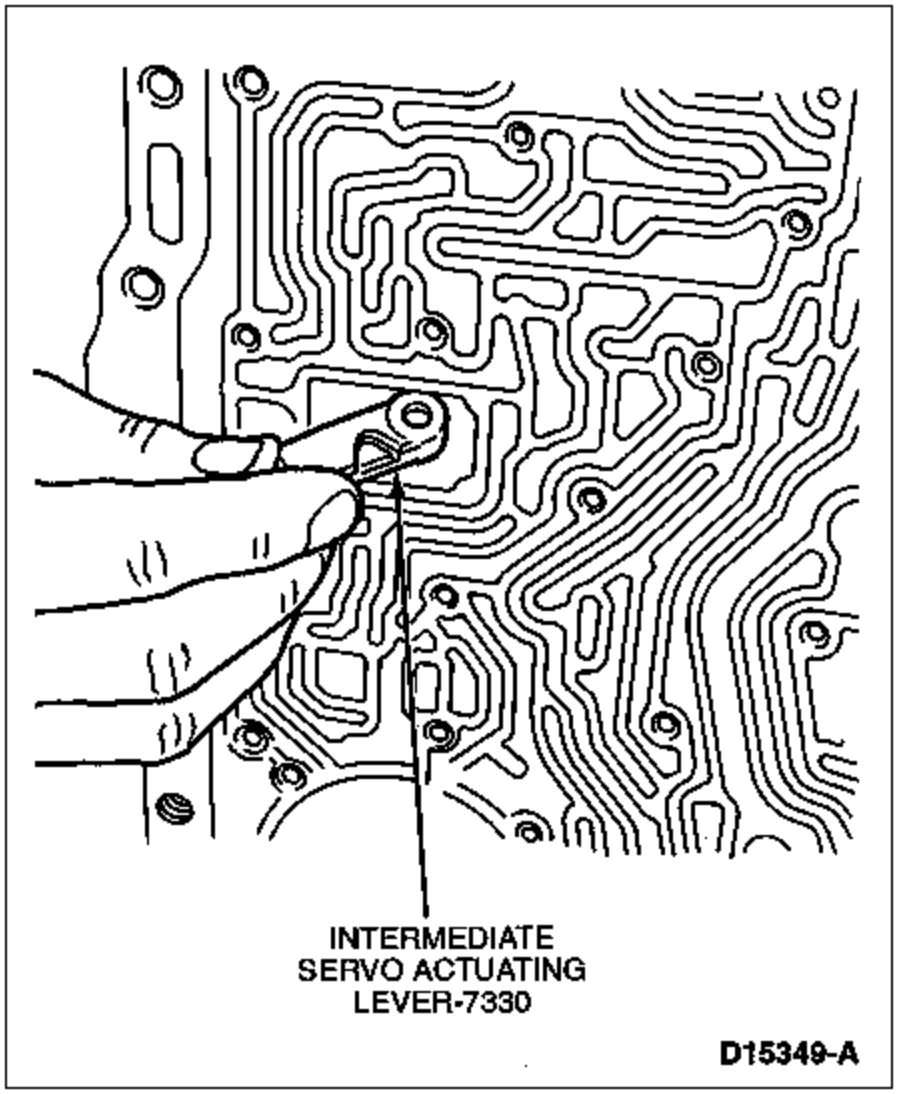
38. Add dimensions "D" and "F" and divide the total of "D" and "F" by two, then subtract the Gage Bar thickness (17.18 mm [0.700 in]). The resulting dimension is "G."

39. Add dimensions "G" and "C." This total is dimension "J." Use the chart below and dimension "J" to choose the proper number four thrust bearing. Reference end play is 0.21-0.51 mm (0.008-0.020 in).

Dimension "J"	Service Part Number	Bearing Thickness	Identification Notches
3.01-3.15 mm (0.119-0.124 in)	F77Z-7D014-GA	2.65-2.80 mm (0.104-0.110 in)	None
3.17-3.34 mm (0.125-0.132 in)	F77Z-7D014-HA	2.80-2.95 mm (0.110-0.116 in)	One
3.36-3.54 mm (0.133-0.140 in)	F77Z-7D014-KA	3.00-3.15 mm (0.118-0.124 in)	Two
3.57-3.71 mm (0.141-0.147 in)	F77Z-7D014-LA	3.20-3.35 mm (0.126-0.132 in)	Three

40. Install the intermediate servo actuating lever as shown.

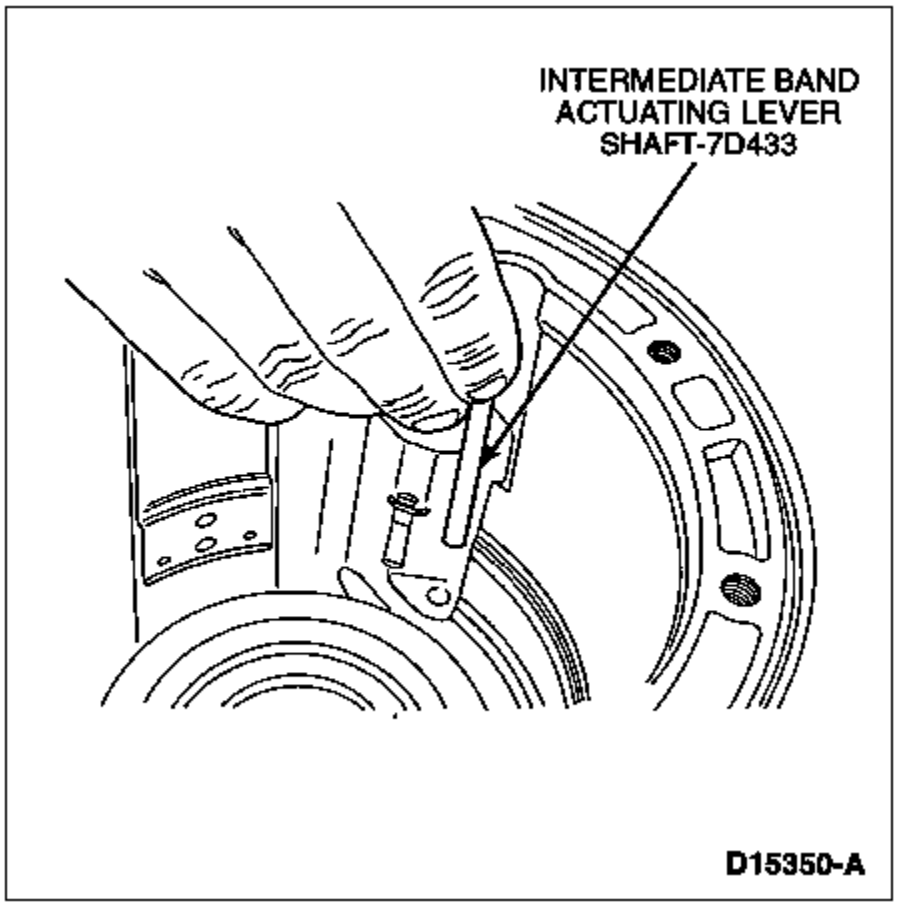
tomsn048@gmail.com



41. **NOTE: The intermediate band actuating lever shaft is shorter than the overdrive shaft.**

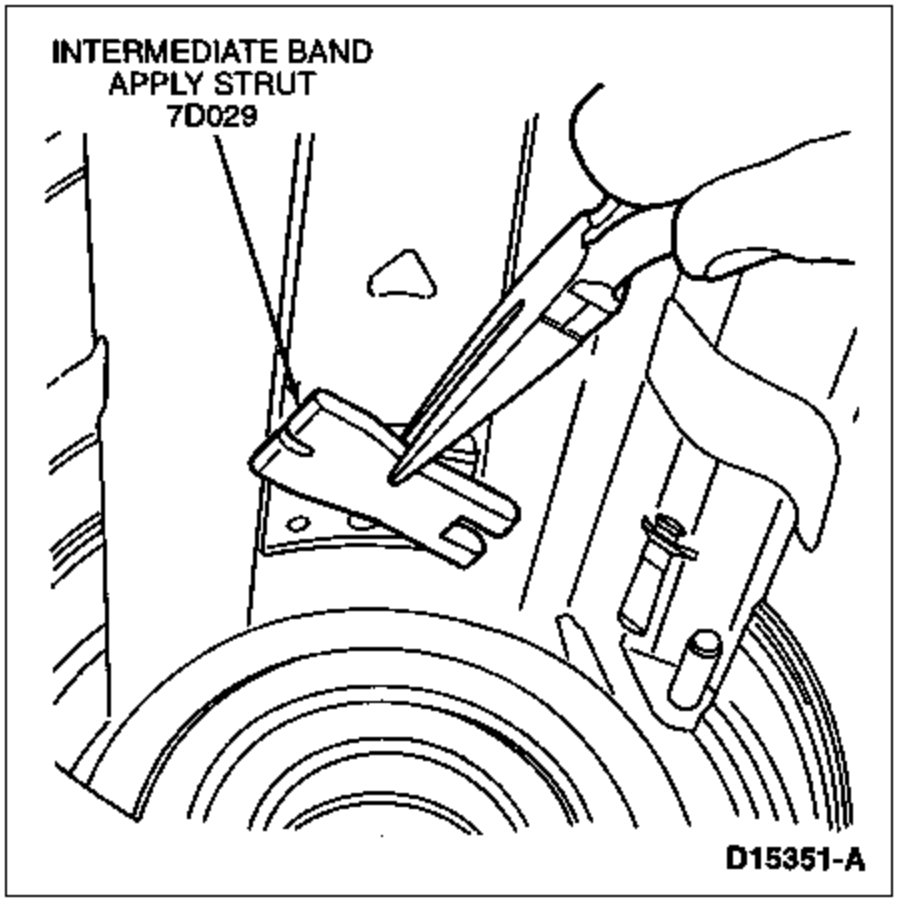
    Install the intermediate band actuating lever shaft through the intermediate servo lever.

tomsn048@gmail.com



42. Install the intermediate band apply strut on the intermediate servo lever.

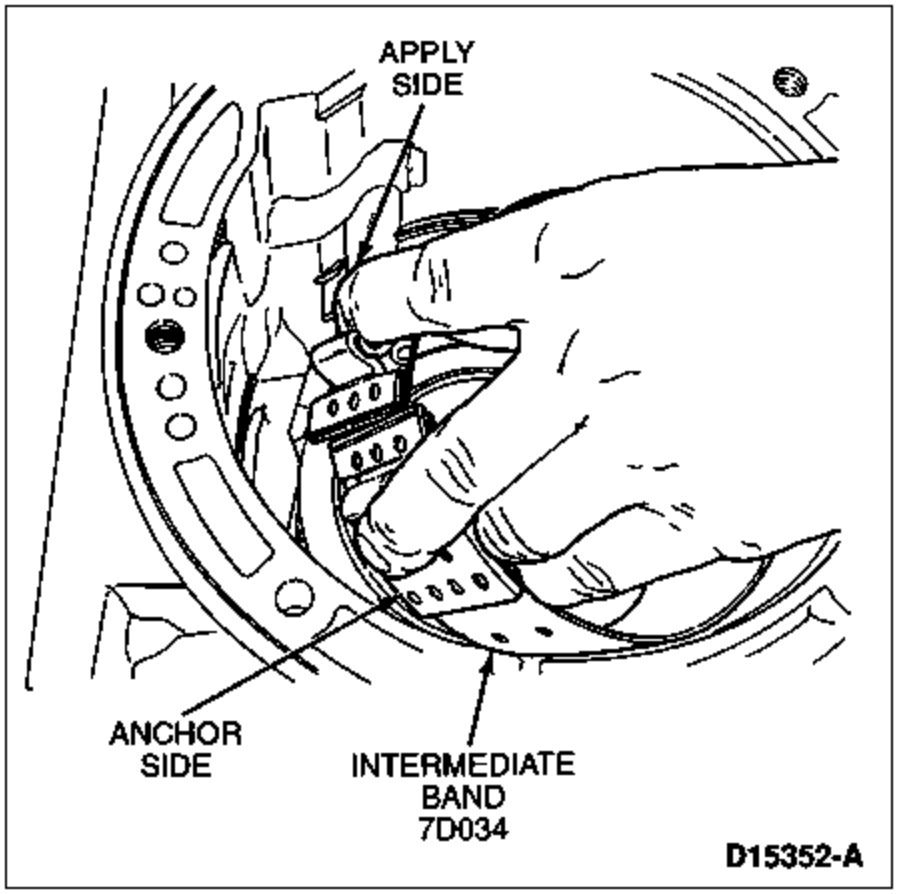
tomsn048@gmail.com



43. **NOTE: Make sure the apply strut is aligned with the band notch.**

    Install the intermediate band.

tomsn048@gmail.com

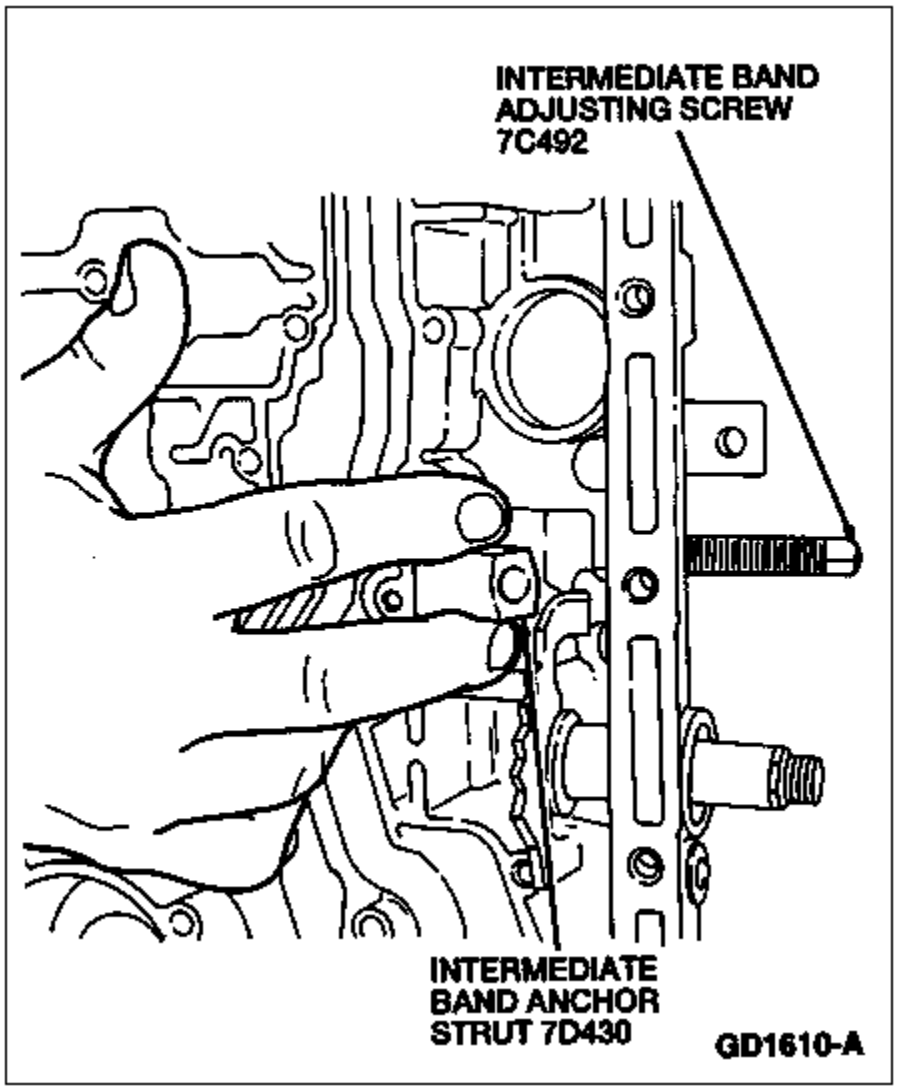


44. **NOTE: Use the intermediate band adjusting screw as a temporary alignment guide.**

    NOTE: The overdrive and intermediate band anchor struts are the same.

    Install the intermediate band anchor strut and intermediate band adjusting screw.

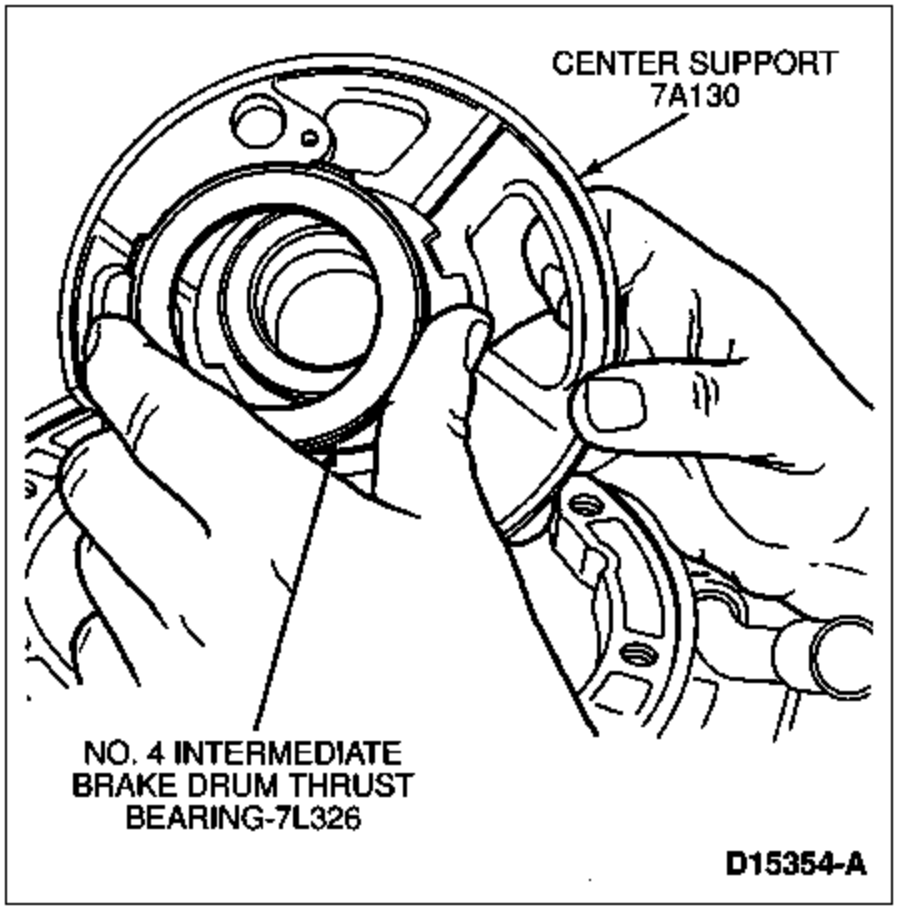
tomsn048@gmail.com



45. **NOTE: Use petroleum jelly to hold the No. 4 intermediate brake drum thrust bearing in place.**

Install the correctly selected No. 4 intermediate brake drum thrust bearing over the center support as shown.

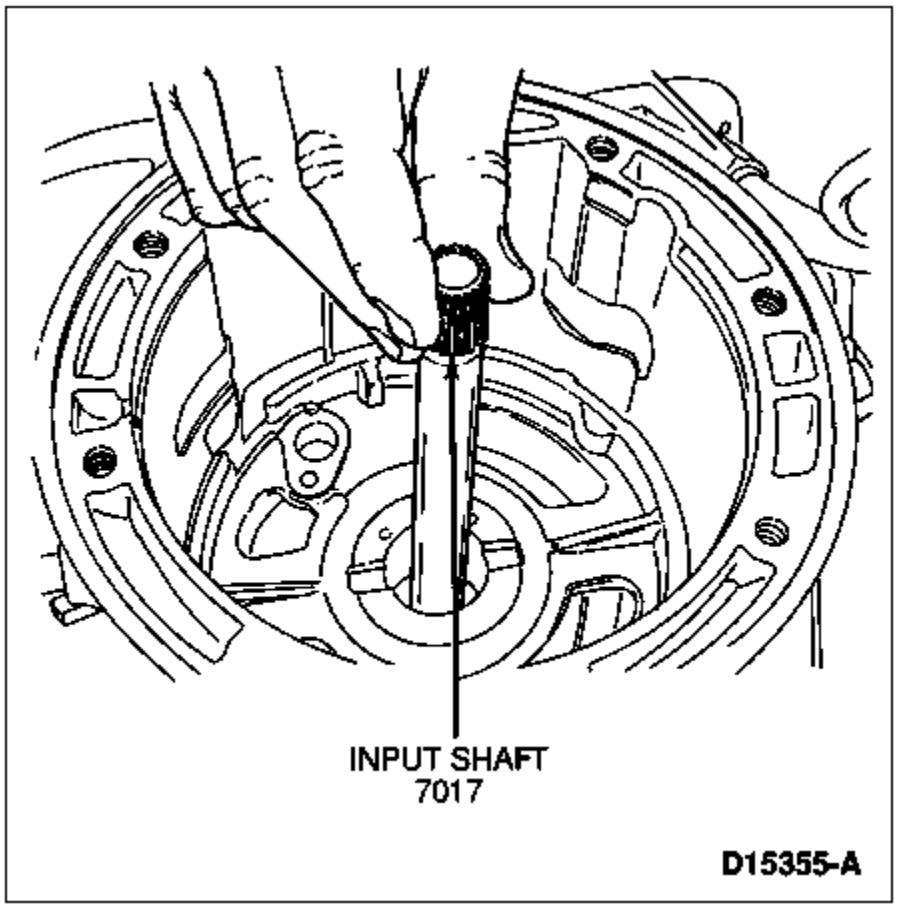
tomsn048@gmail.com



46. **CAUTION: Do not apply pressure to the rear planetary support while installing. Damage to the sealing rings may result. Make sure the rear planetary support is seated.**

Position the center support into the reverse clutch drum. Use the input shaft as an aid to seat the center support. Gently wiggle the input shaft from side to side until the center support is seated against the case shoulder. Remove the input shaft.

tomsn048@gmail.com

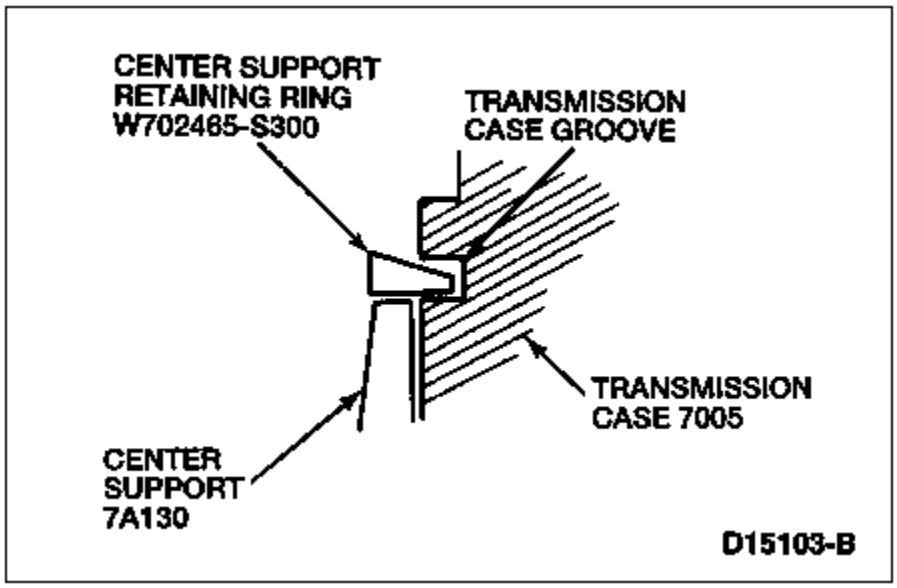


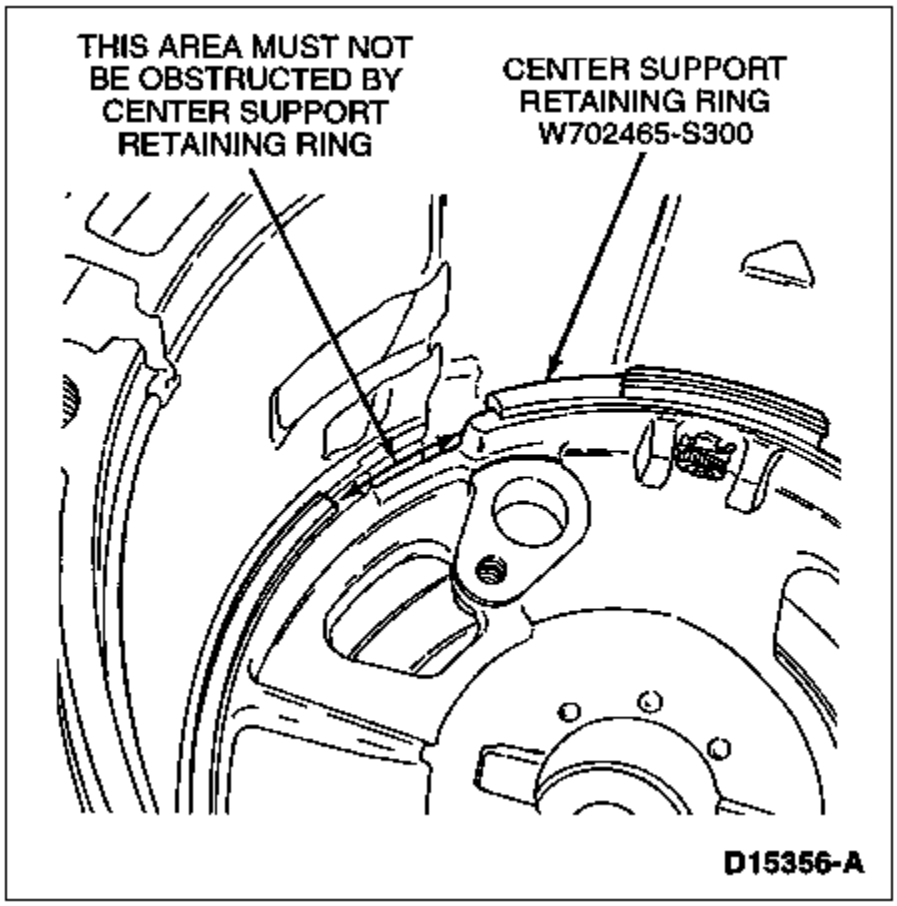
47. **CAUTION: Install the retaining ring in the transmission case groove with the tapered side facing up.**

CAUTION: The retaining ring must be installed so the notch opening is not obstructed by the center support retaining ring. This will prevent damage to the turbine shaft speed (TSS) sensor wires.

Install the center support retaining ring in the transmission case groove.

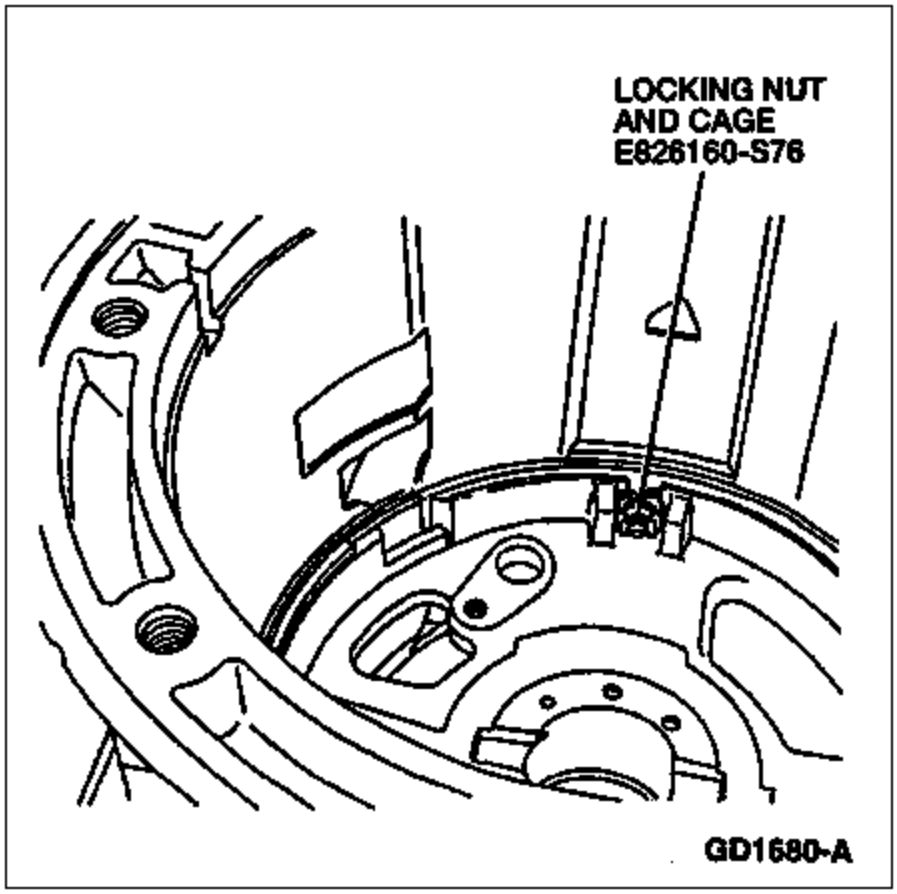
tomsn048@gmail.com





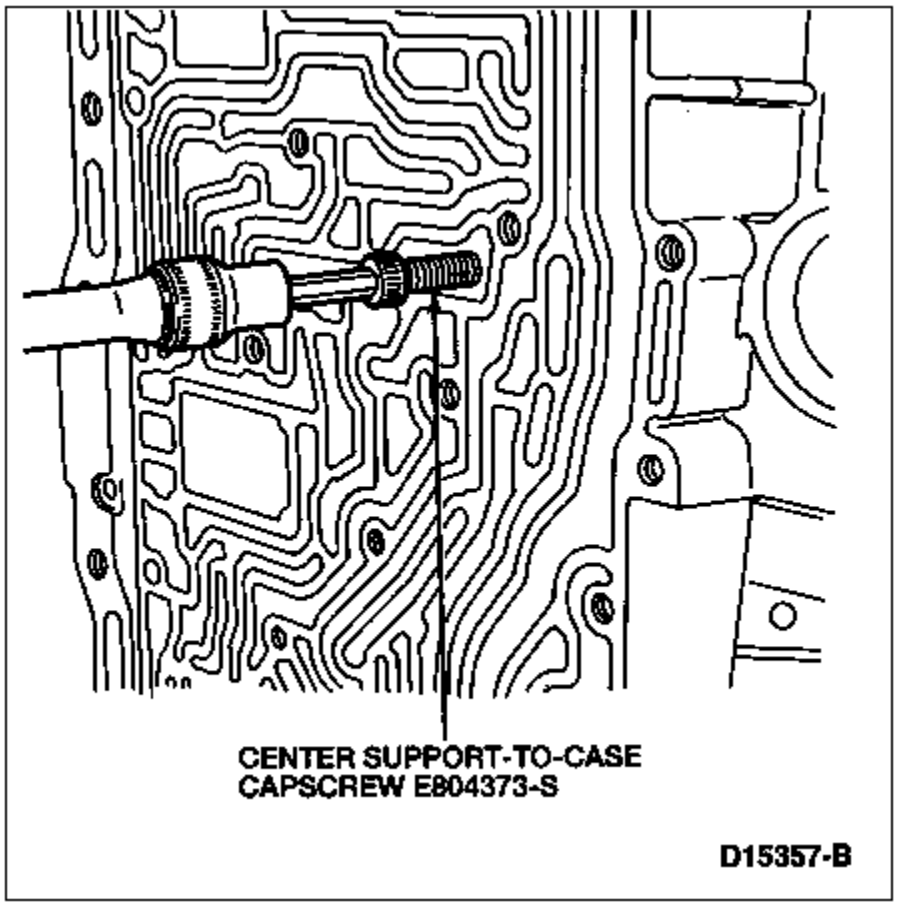
48. Ensure that the nut and cage assembly is in place.

tomsn048@gmail.com



49. Use a 5 mm Allen wrench to install the M6 x 20 mm center support-to-case capscrew into the nut and cage assembly as shown. Tighten the center support-to-case capscrew to 9-13 Nm (80-115 lb-in).

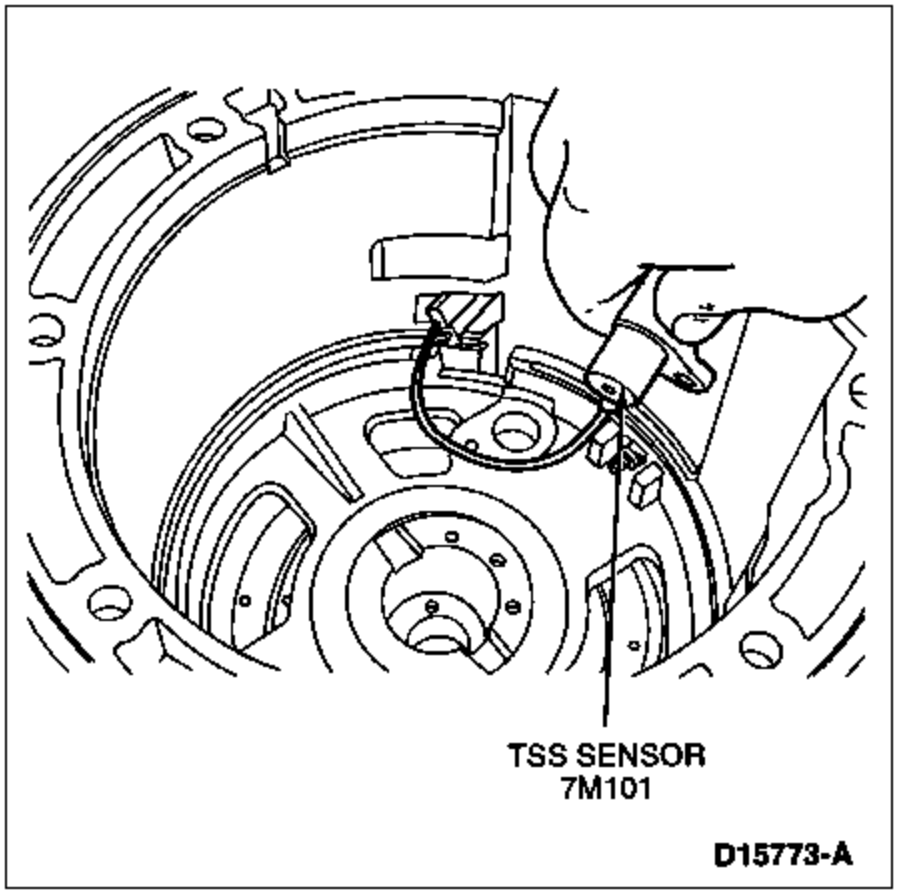
tomsn048@gmail.com



50. **CAUTION: Carefully route the turbine shaft speed (TSS) sensor connector and wiring harness through the opening in the case. Do not damage the wiring.**

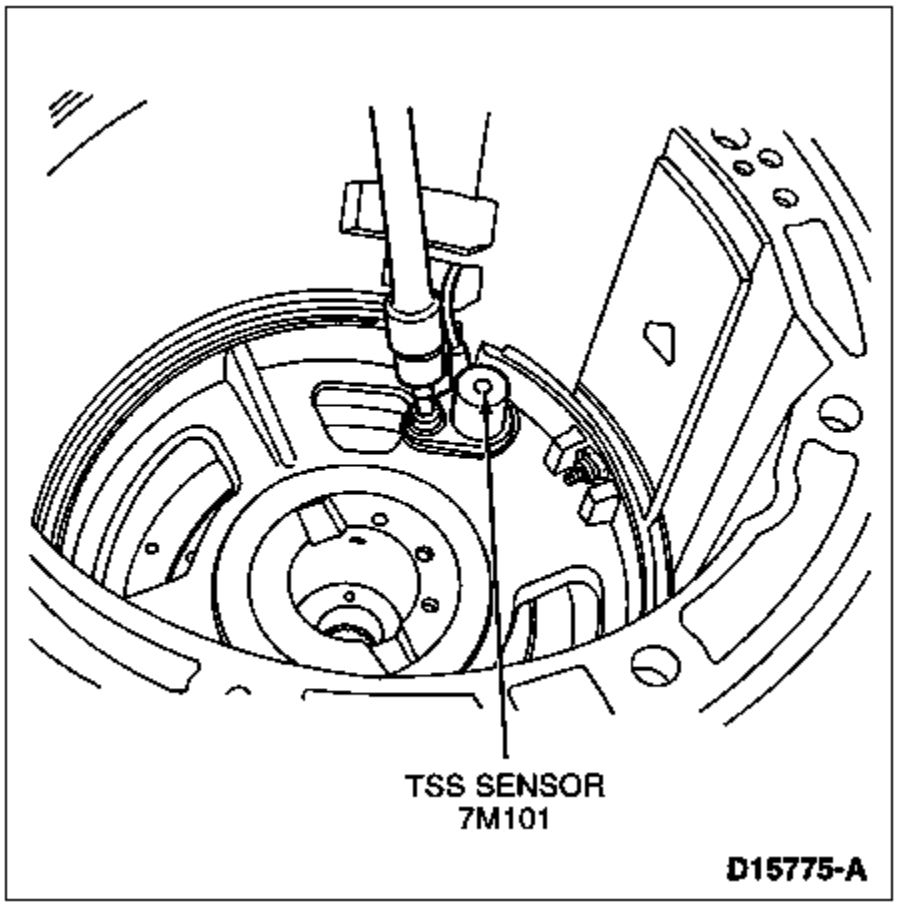
Route the TSS sensor connector and wiring harness through the opening in the case.

tomsn048@gmail.com



51. Install the turbine shaft speed (TSS) sensor on the center support. Use a T30 Torx® Socket to install the TSS screw. Tighten the TSS sensor-to-center support screw to 8-11 Nm (71-97 lb-in).

tomsn048@gmail.com

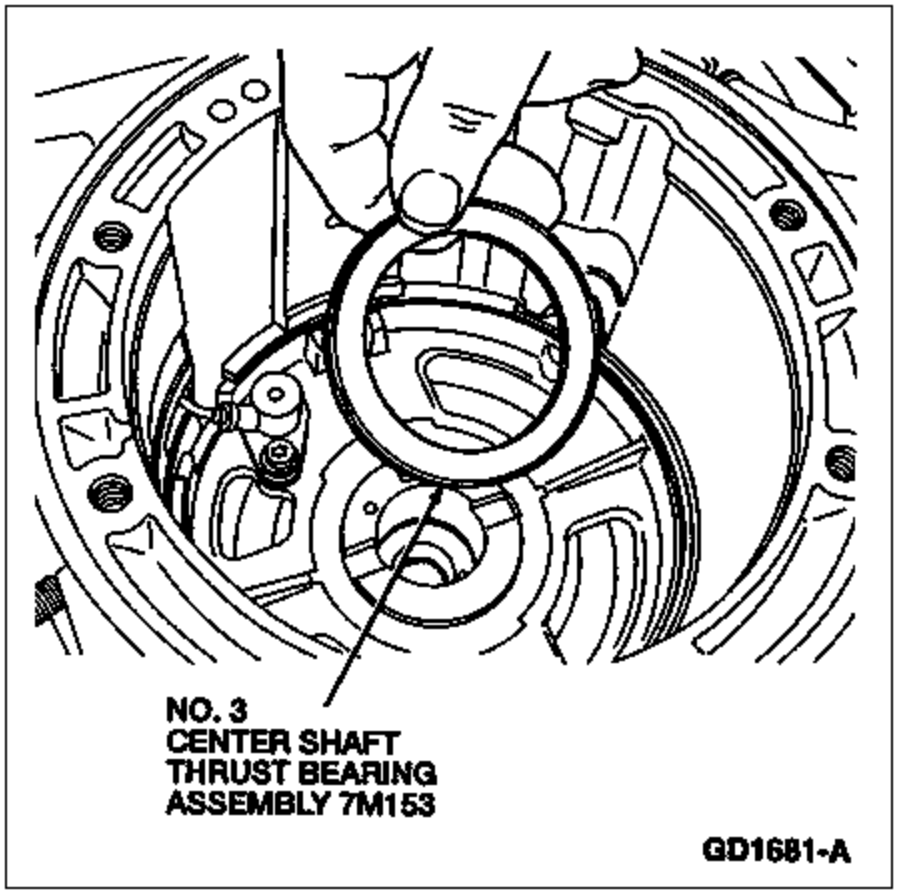


52. **CAUTION: Use only the No. 3 center shaft thrust bearing assembly.**

NOTE: No. 3 center shaft thrust bearing assembly has no notches on the outer race.

Install the No. 3 center shaft thrust bearing assembly.

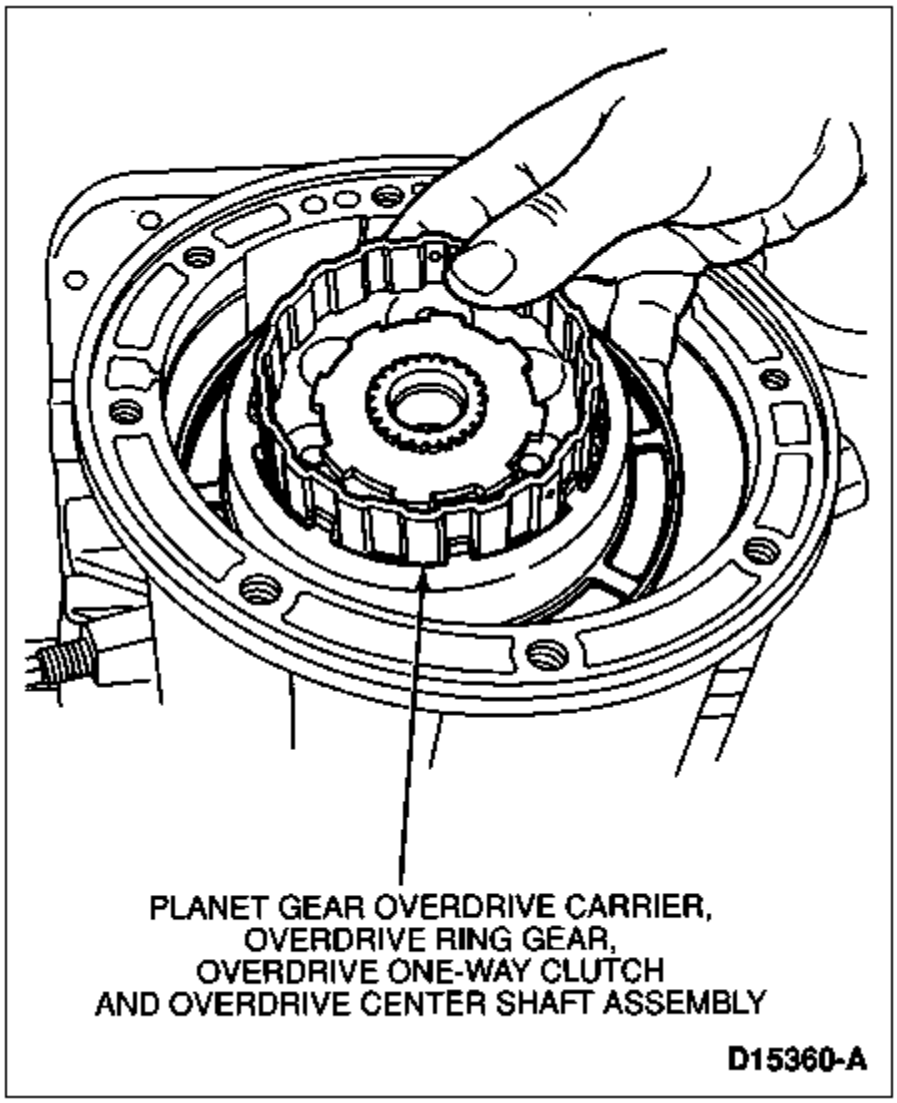
tomsn048@gmail.com



53. **CAUTION: Do not bend the trigger wheel.**

Install the planetary gear overdrive carrier, overdrive ring gear, overdrive one-way clutch and overdrive center shaft assembly.

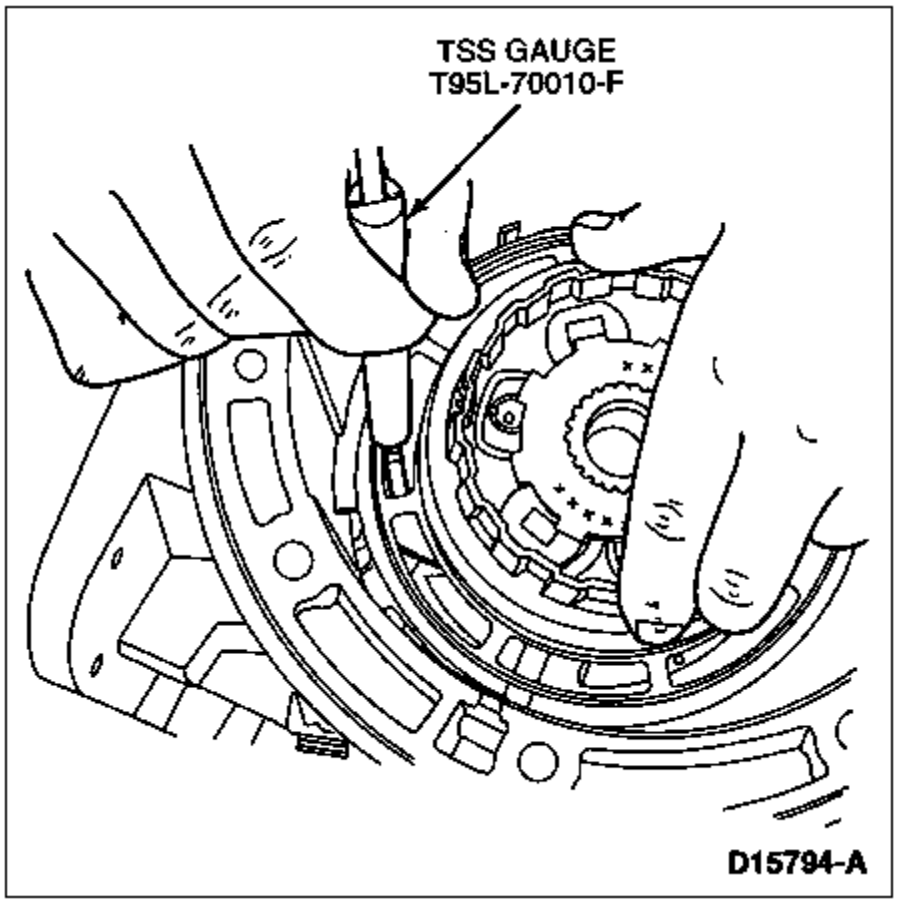
tomsn048@gmail.com



54. **NOTE: Perform TSS air gap clearance check.** This step and the next two steps describe the procedures for checking the turbine shaft speed (TSS) sensor air gap clearance.

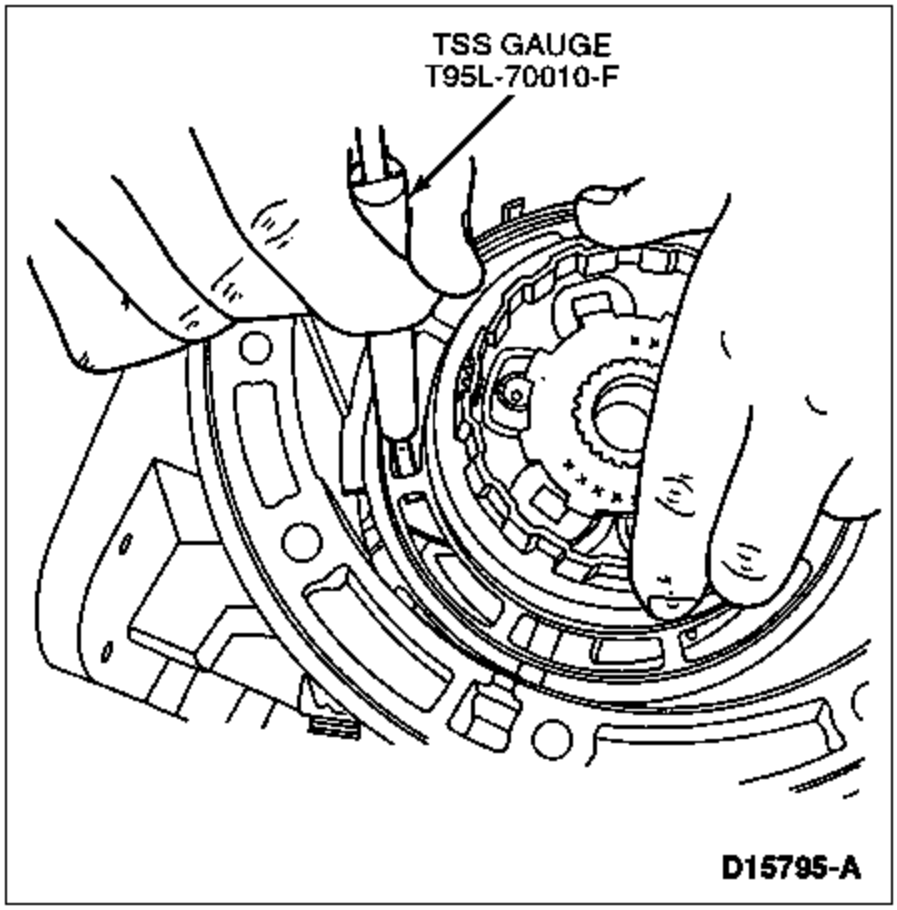
    Place the thin blade of Turbine Shaft Speed Sensor Gauge T95L-70010-F over the turbine shaft speed (TSS) sensor as shown. Rotate the trigger wheel. The trigger wheel window should pass over the thin blade of the TSS gauge. If it doesn't, the planetary gear overdrive carrier and trigger wheel must be replaced.

tomsn048@gmail.com



55. Place the thick blade of Turbine Shaft Speed Sensor Gauge over the turbine shaft speed (TSS) sensor as shown. Rotate the trigger wheel. The trigger wheel window should not pass over the thick blade of the TSS gauge. If it does, the planetary gear overdrive carrier and trigger wheel must be replaced.

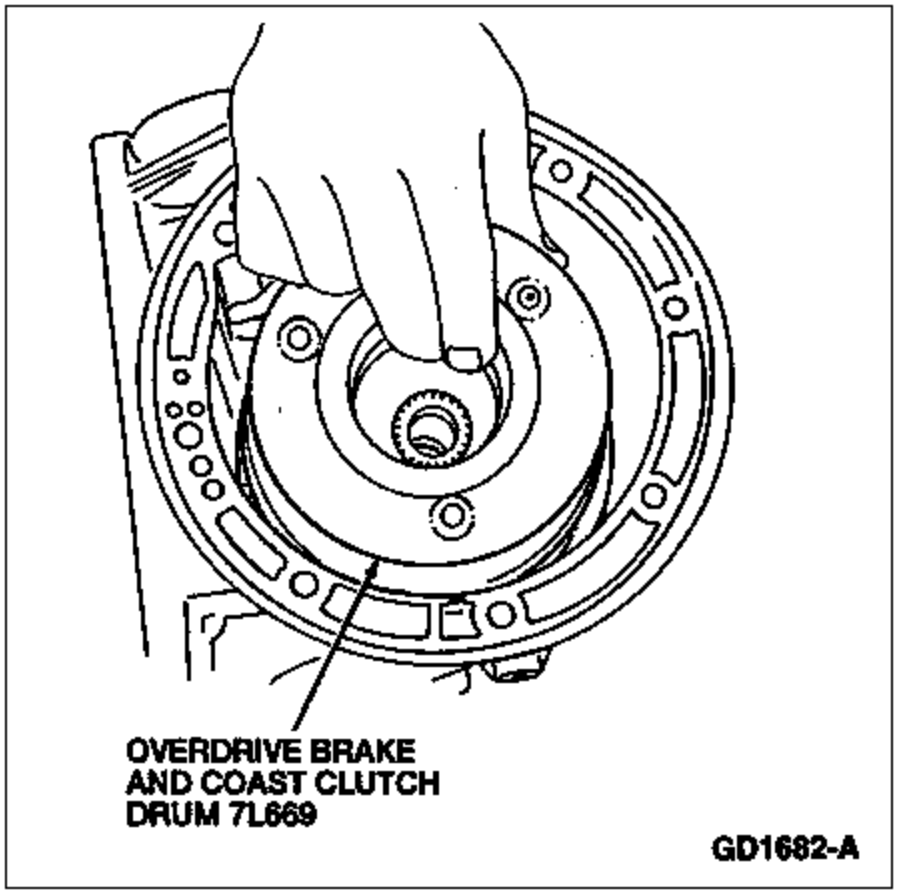
tomsn048@gmail.com



56. Repeat the previous two steps for the remaining trigger wheel windows.

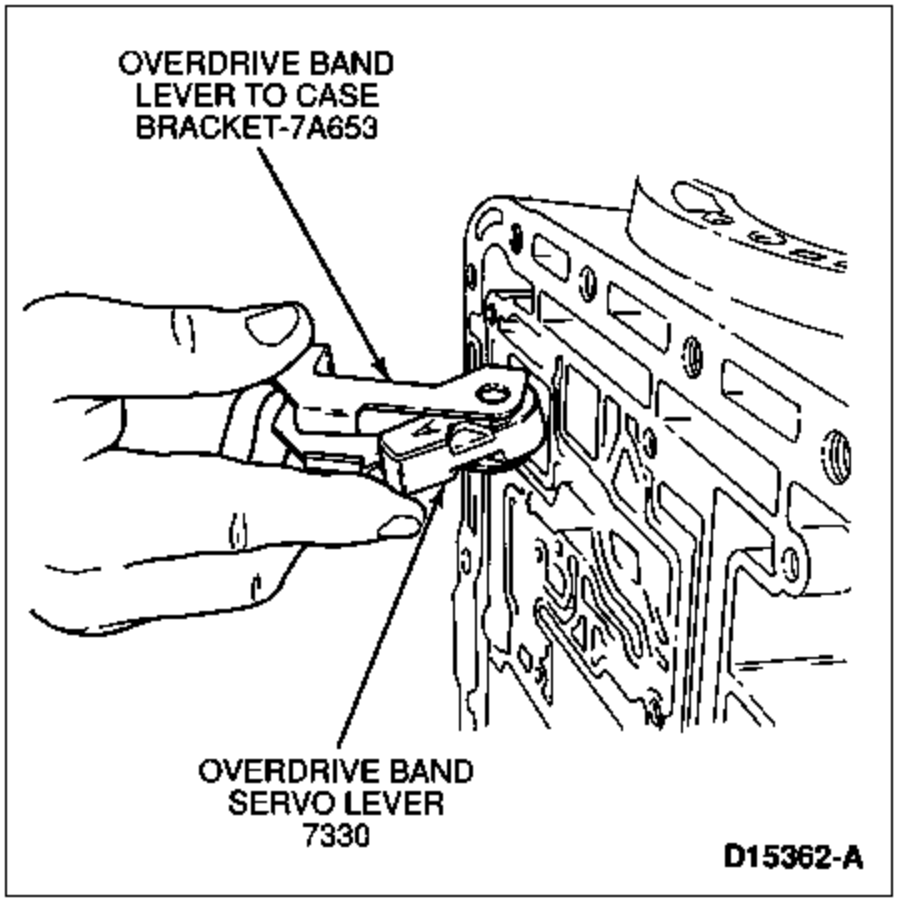
57. Align the clutch plates and front adapter gear and install the overdrive brake and coast clutch drum assembly.

tomsn048@gmail.com



58. Install the overdrive band lever-to-case bracket and overdrive band servo lever as shown.

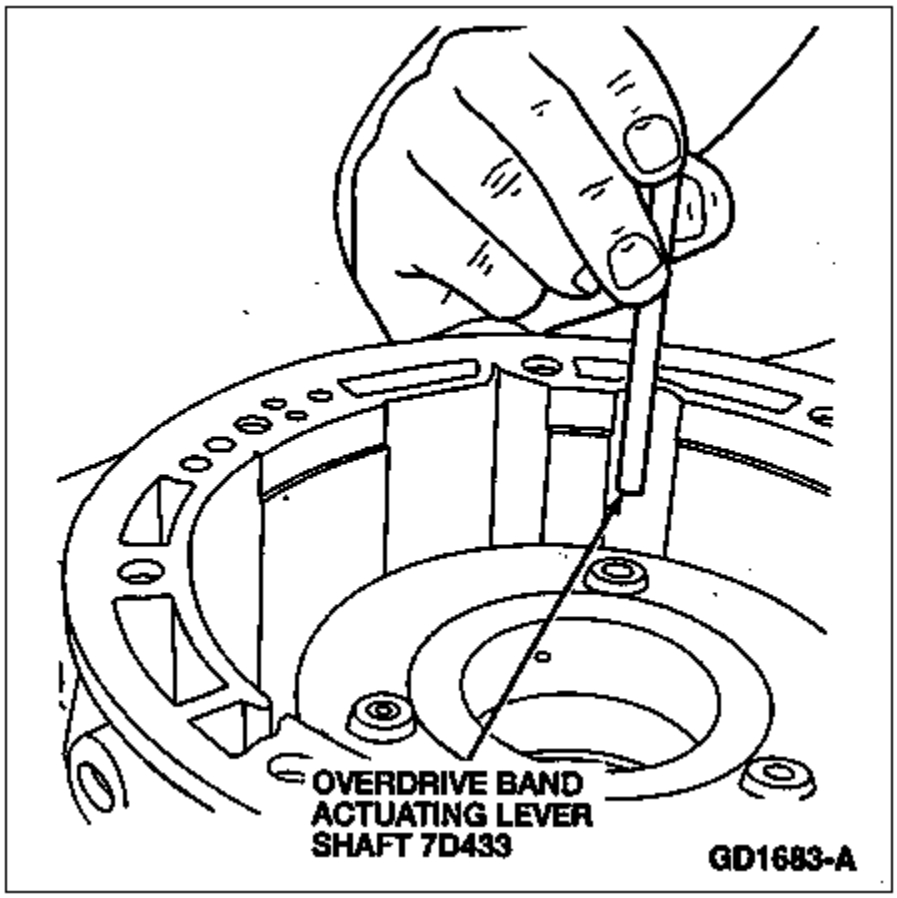
tomsn048@gmail.com



59. **NOTE: The overdrive band actuating lever shaft is longer than the intermediate band actuating lever shaft.**

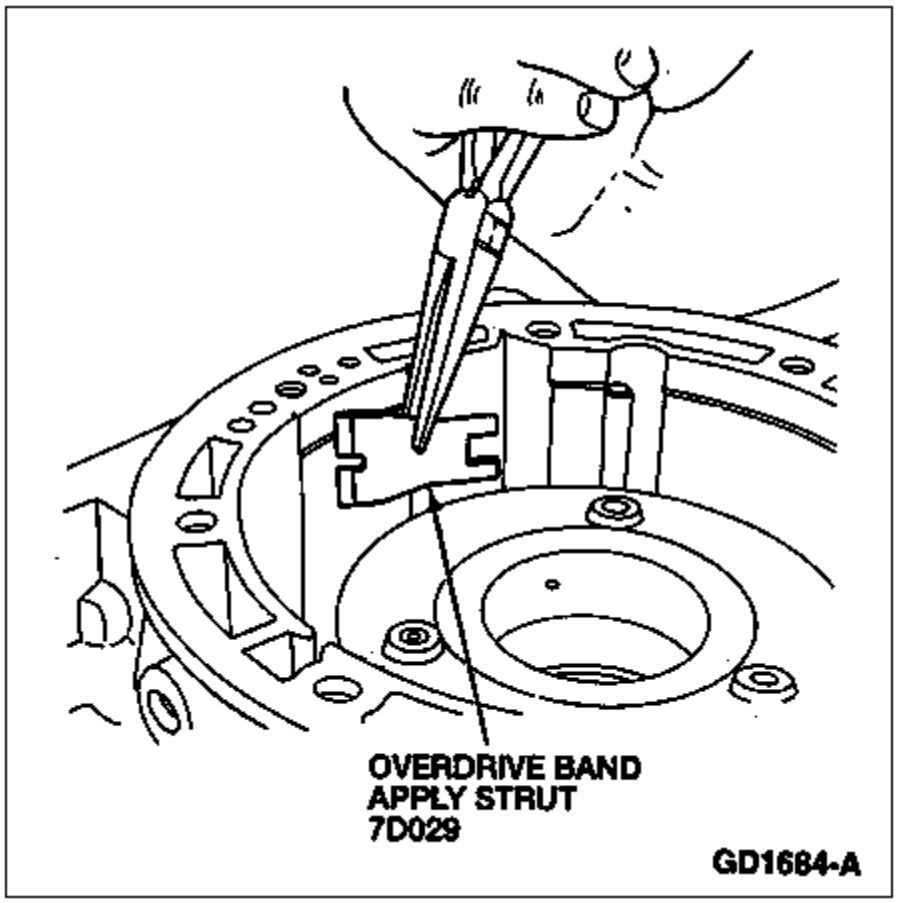
    Install the overdrive band actuating lever shaft through the overdrive band lever to case bracket and overdrive band servo actuating lever.

tomsn048@gmail.com



60. Install the overdrive band apply strut.

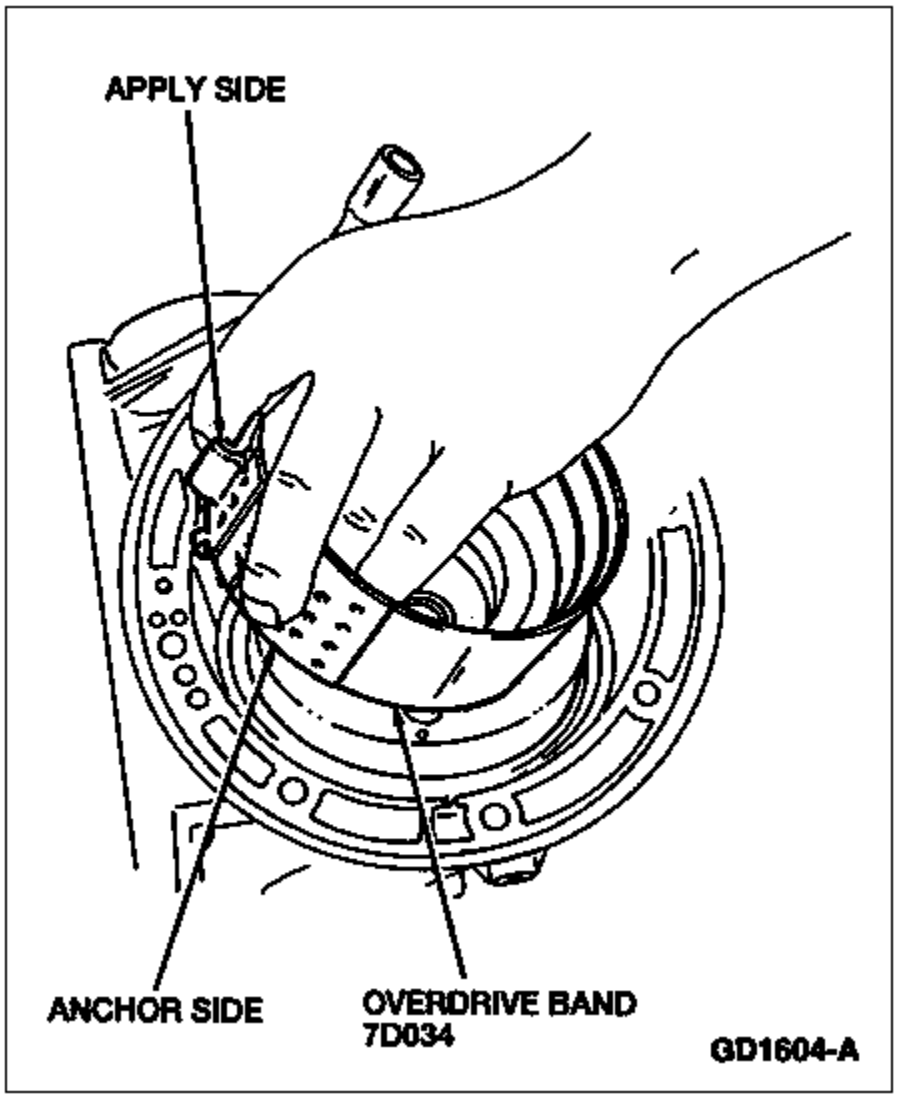
tomsn048@gmail.com



61. **NOTE: If the overdrive band is reused, it must be installed in the same position as when removed.**

    Install the overdrive band assembly over the overdrive brake and coast clutch drum.

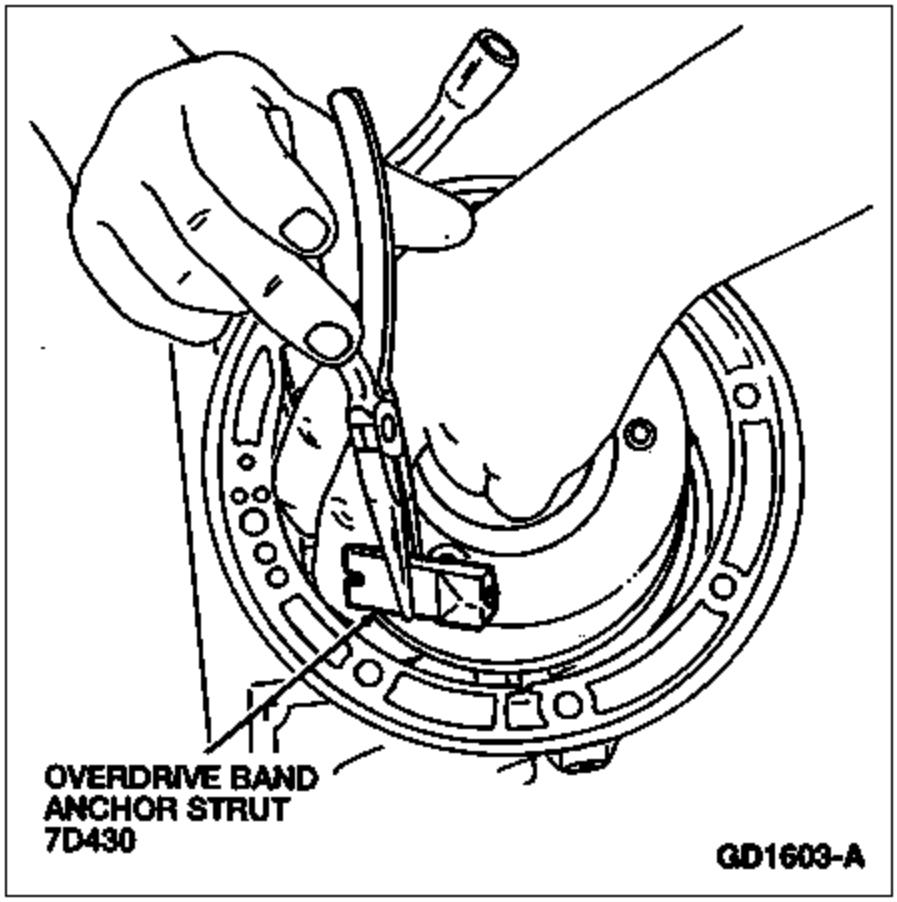
tomsn048@gmail.com



62. **NOTE: Use the band adjusting screw as a temporary alignment guide.**

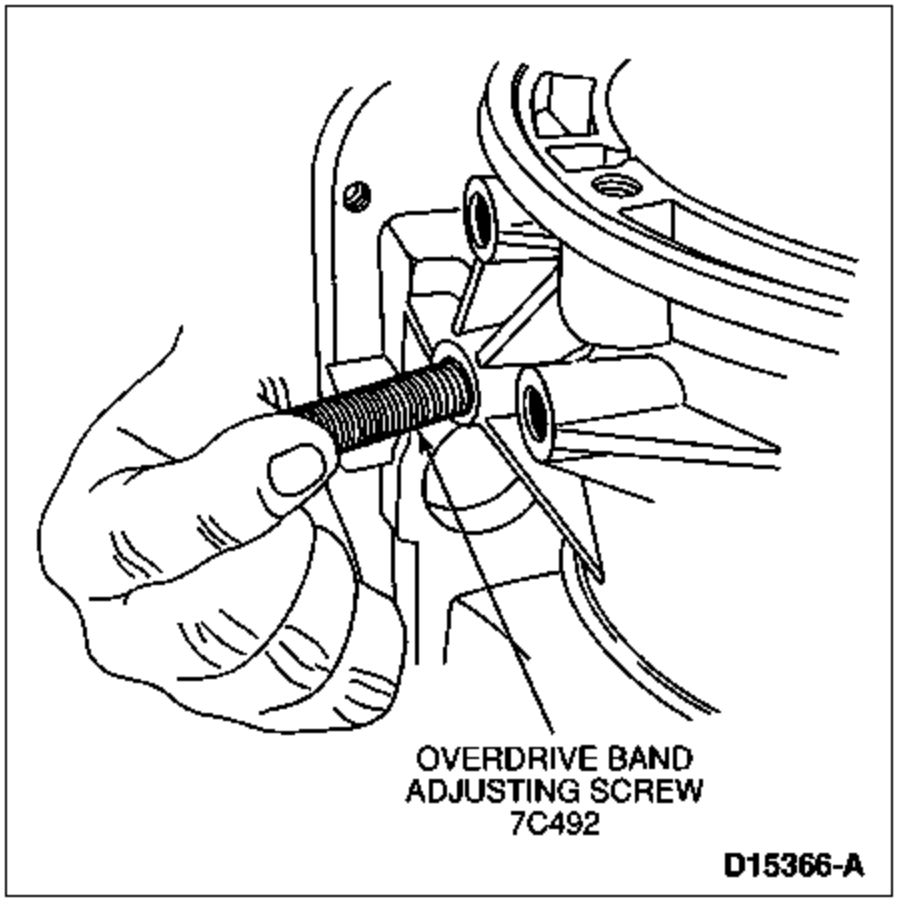
    Install the overdrive band anchor strut.

tomsn048@gmail.com



63. Install the overdrive band adjusting screw.

tomsn048@gmail.com

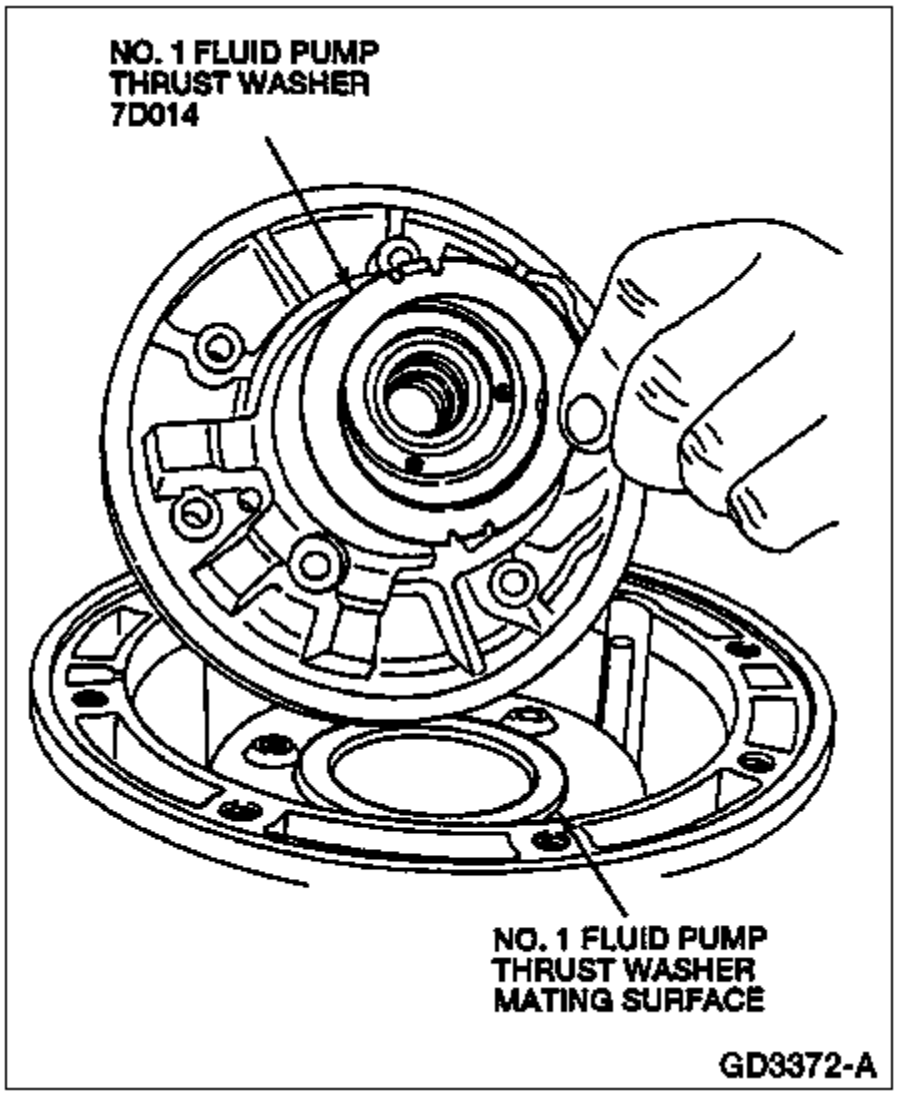


64. Perform the front end play check procedure as follows:

    a. **CAUTION: Be sure the pump body is seated against the washer and overdrive brake and coast clutch drum. The pump body must be below the level of the case gasket surface.**

    Use petroleum jelly to hold any No. 1 fluid pump thrust washer on the rear of the pump. The washer tabs go into the pump face. Place the pump into position in the case.

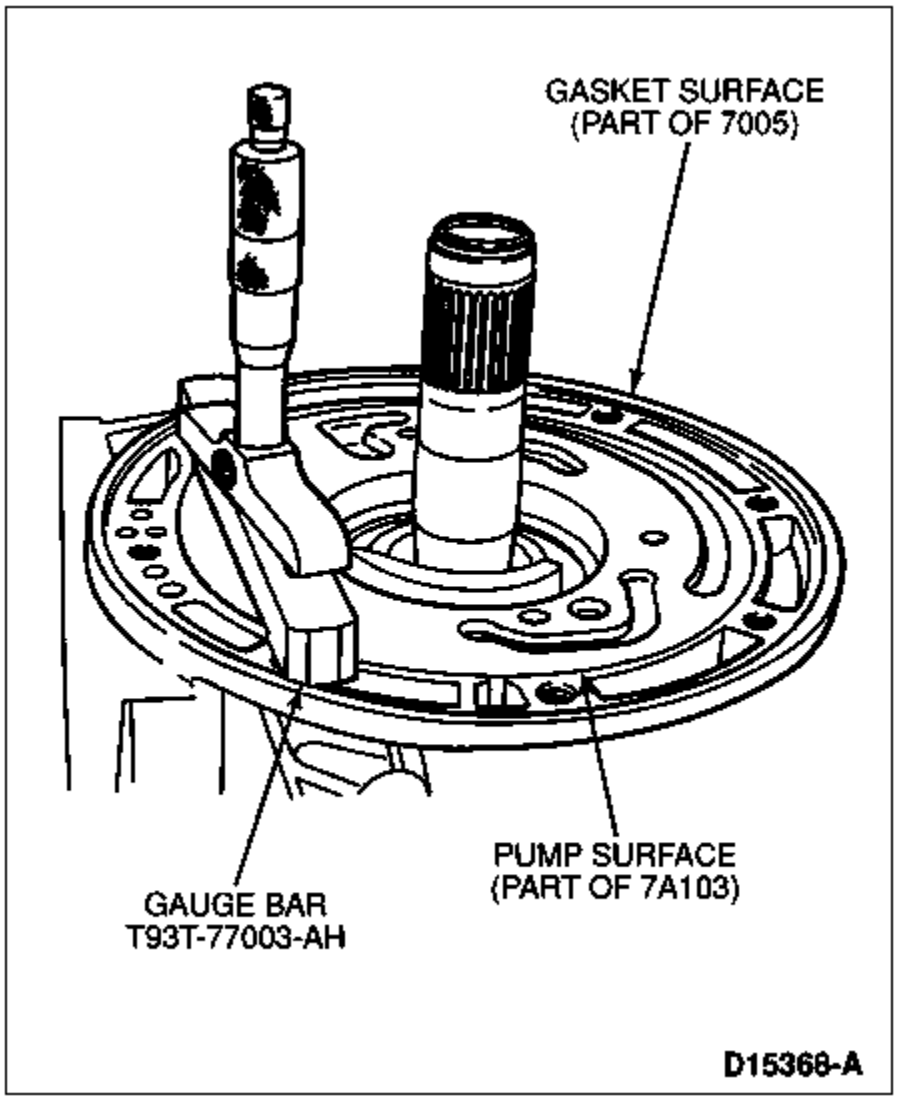
tomsn048@gmail.com



b. **CAUTION: The gauge bar must rest on the gasket surface.**

   Place Gauge Bar T93T-77003-AH across the case as shown.
c. Place a micrometer on the gauge bar and extend the probe until it contacts the pump surface.
d. Read the micrometer and subtract the thickness of the gauge bar (17.78 mm [0.700 inch]). Record this as dimension "A."
e. Move the gauge bar to the opposite side of the case.
f. Repeat Steps c and d and record this measurement as dimension "B."
g. Add dimensions "A" and "B" together and divide by 2. This is the front end clearance, dimension "C."

tomsn048@gmail.com



h. **CAUTION: If the average is below the specification, choose a thinner washer. If the average is above the specification, choose a thicker washer.**

NOTE: The front end play specification is 0.18-0.70 mm (0.007-0.028 in).

NOTE: The tabs on the washer go into the pump face.

Remove the pump and install the correct No. 1 thrust washer. Use petroleum jelly to hold the washer in place.

TRANSMISSION END CLEARANCE

Dimension "C"	Identification: Color	Service Part Number	Washer Thickness
Front No. 1 (All Engines) 0.18-0.70 mm (0.007-0.028 in.) Without Gasket	White Green Red Beige Black Yellow	97GT-7D014-TA 97GT-7D014-MA 97GT-7D014-NA 97GT-7D014-PA 97GT-7D014-RA 97GT-7D014-SA	1.55-1.60 mm (0.061-0.063 in.) 1.75-1.80 mm (0.069-0.071 in.) 1.85-1.90 mm (0.073-0.075 in.)

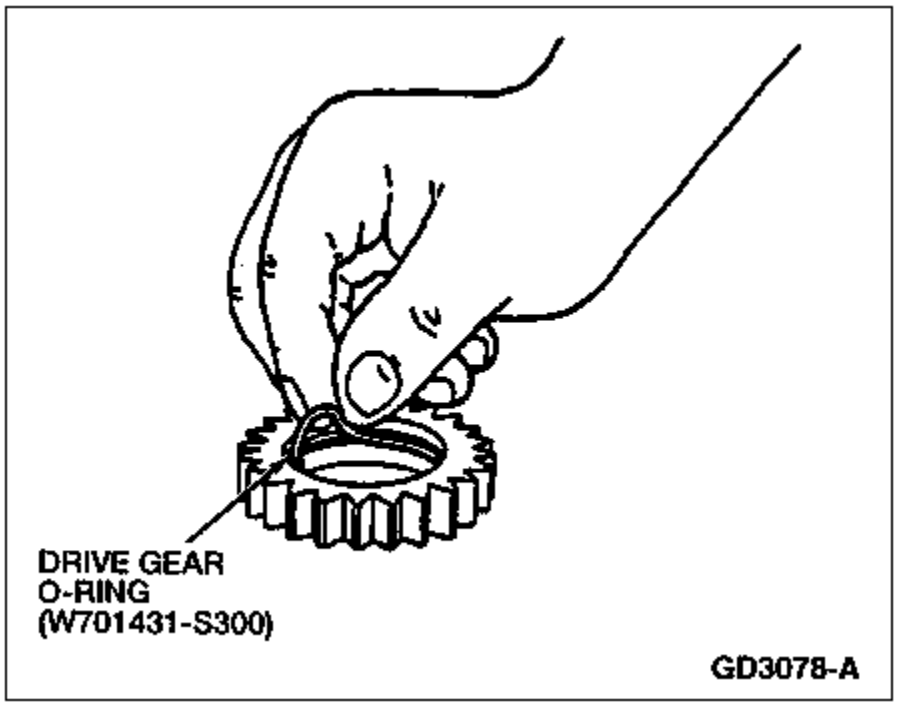
tomsn048@gmail.com

			1.95-2.00 mm (0.077-0.079 in.) 2.05-2.10 mm (0.081-0.083 in.) 2.15-2.20 mm (0.085-0.087 in.)

i. **NOTE: Front end clearance specification is 0.18-0.70 mm (0.007-0.028 in).**

Verify front end clearance is correct; repeat steps a-g.

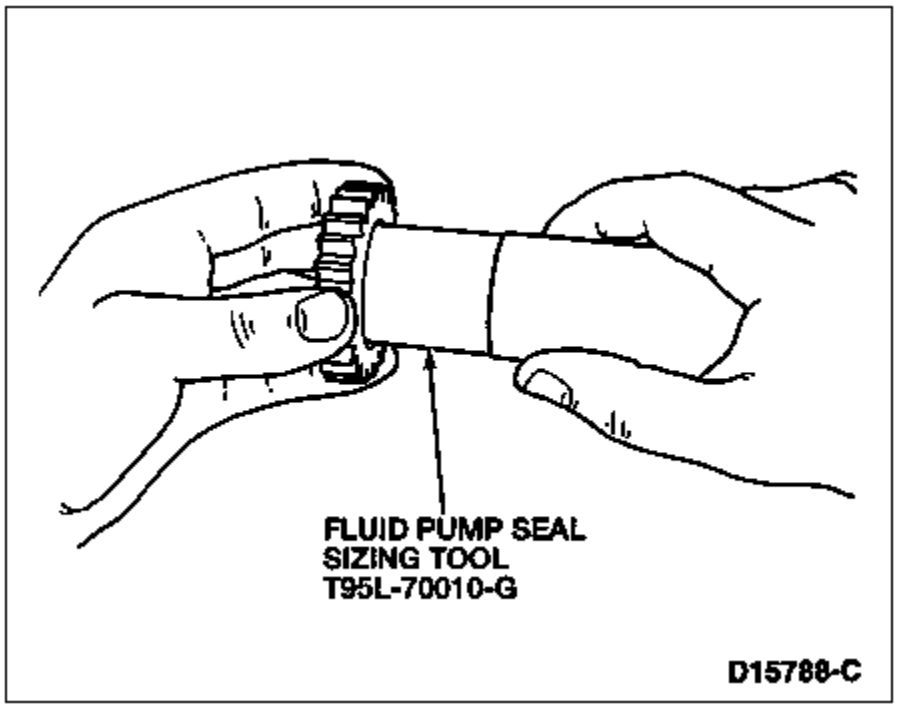
65. Install a new drive gear O-ring.



66. Lubricate Fluid Pump Seal Sizing Tool T95L-70010-G to seat drive gear O-ring.

67. Install Fluid Pump Seal Sizing Tool into pump drive gear to seat drive gear O-ring into groove.

tomsn048@gmail.com

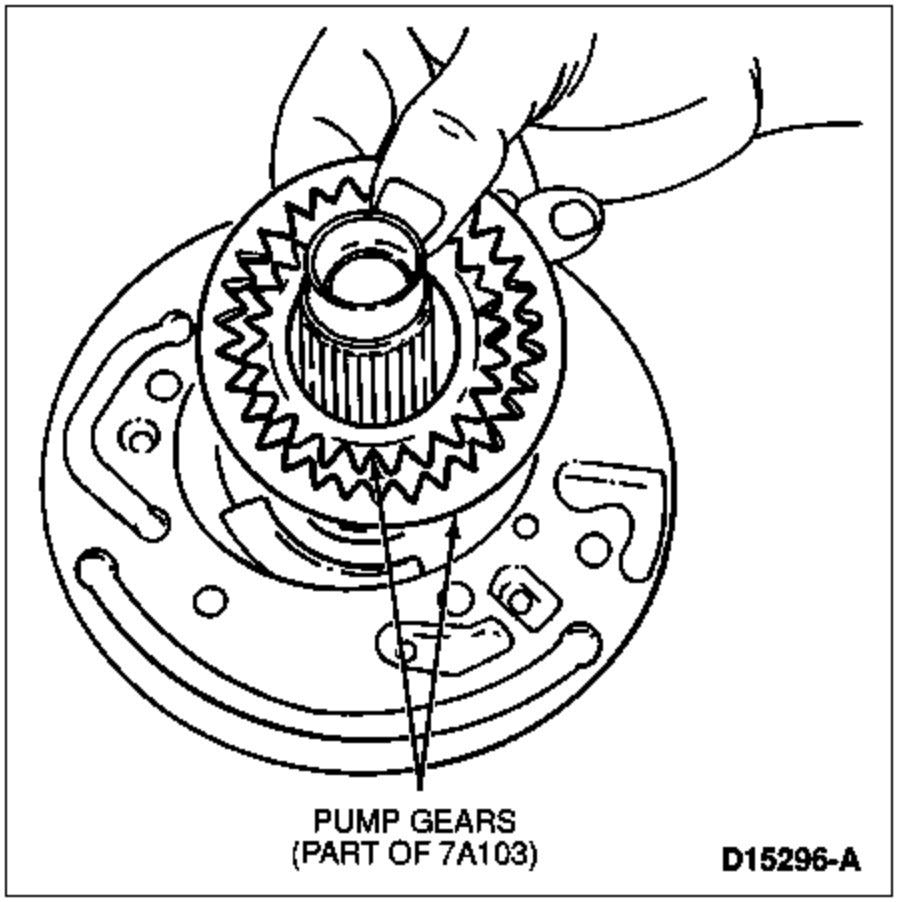


68. Remove Fluid Pump Seal Sizing Tool.

69. **CAUTION: The chamber on the inside edge of the small gear must be up when in the pump housing gear pocket. The dimple on the larger gear must be down when in the pump housing gear pocket.**

    Position the two pump gears into the pump housing. Apply a lubricant to the pump gears to prevent scoring at initial start-up.

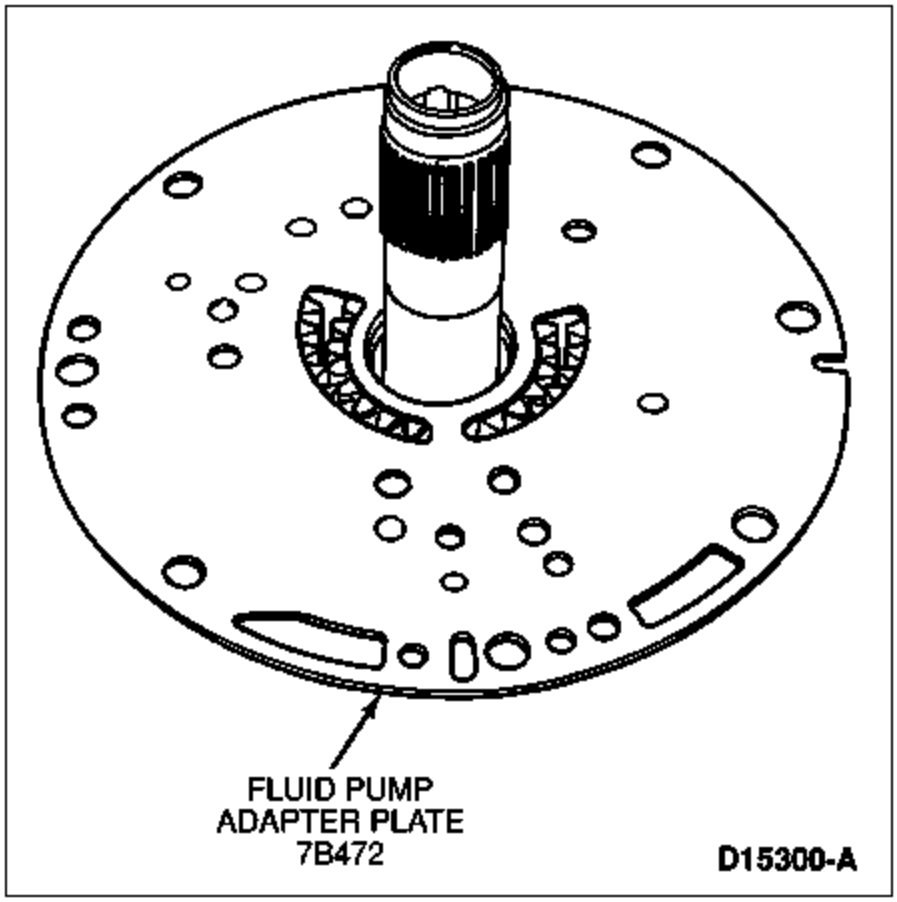
tomsn048@gmail.com



70. **CAUTION: Make sure the holes in the plate line up with the holes in the pump.**

Install the fluid pump adapter plate.

tomsn048@gmail.com

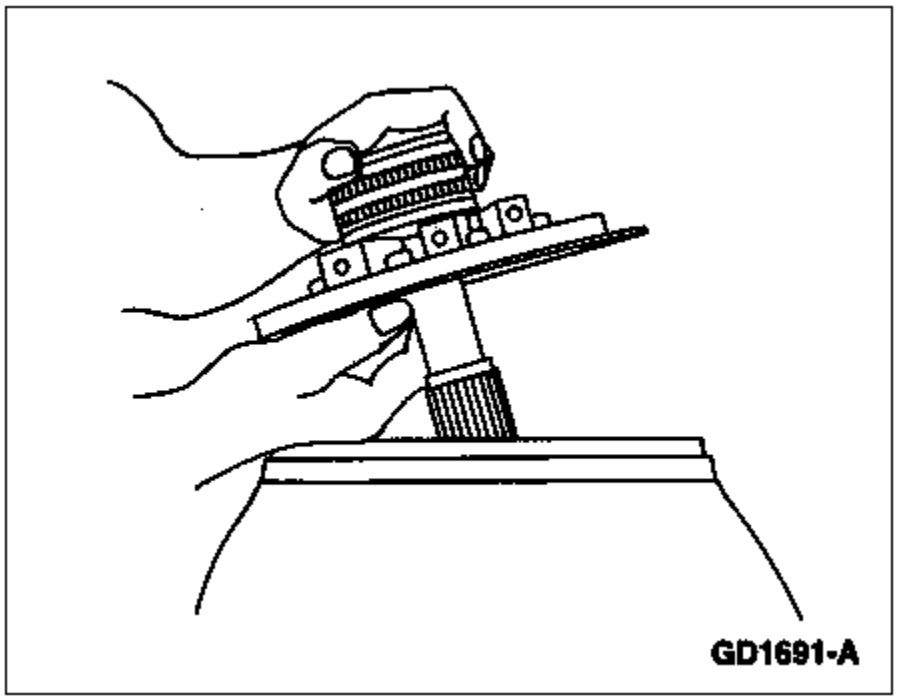


71. **CAUTION: Do not allow the pump gears to come out of the pump housing pocket.**

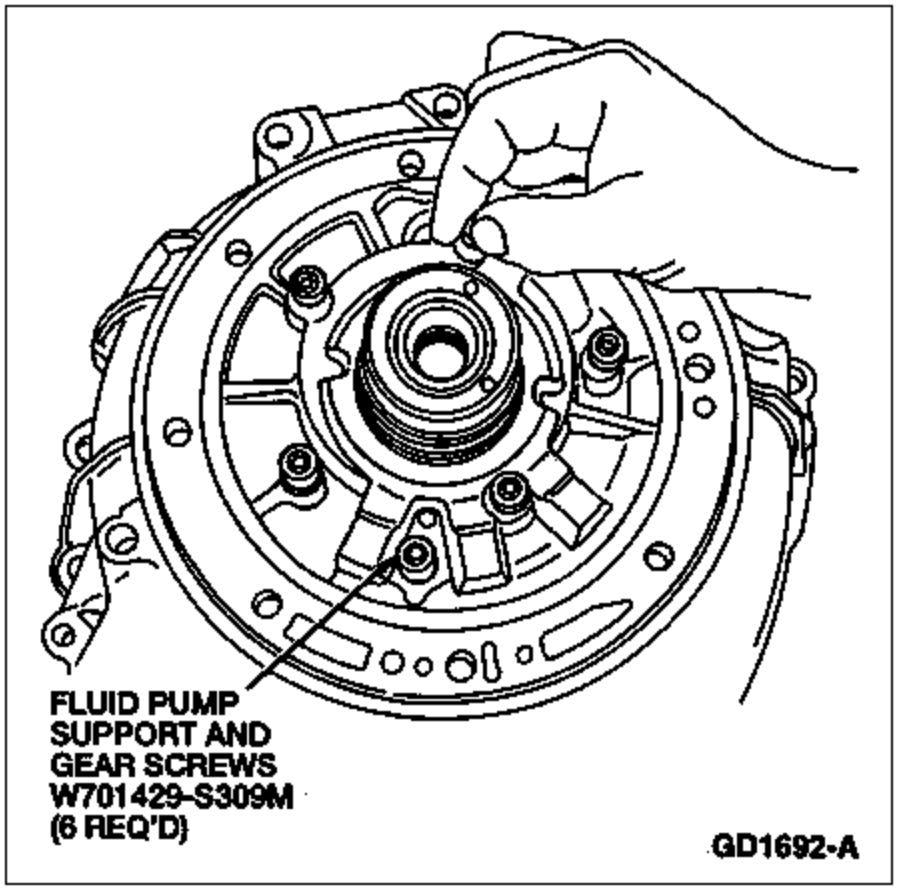
NOTE: The notch on the outside of the fluid pump adapter plate will be at the nine o'clock position, relative to the converter housing.

Turn the converter housing face down on the bench. Hold the fluid pump adapter plate against the front pump support and gear to keep the pump gears in place. Turn the pump and adapter plate over and place on the converter housing.

tomsn048@gmail.com



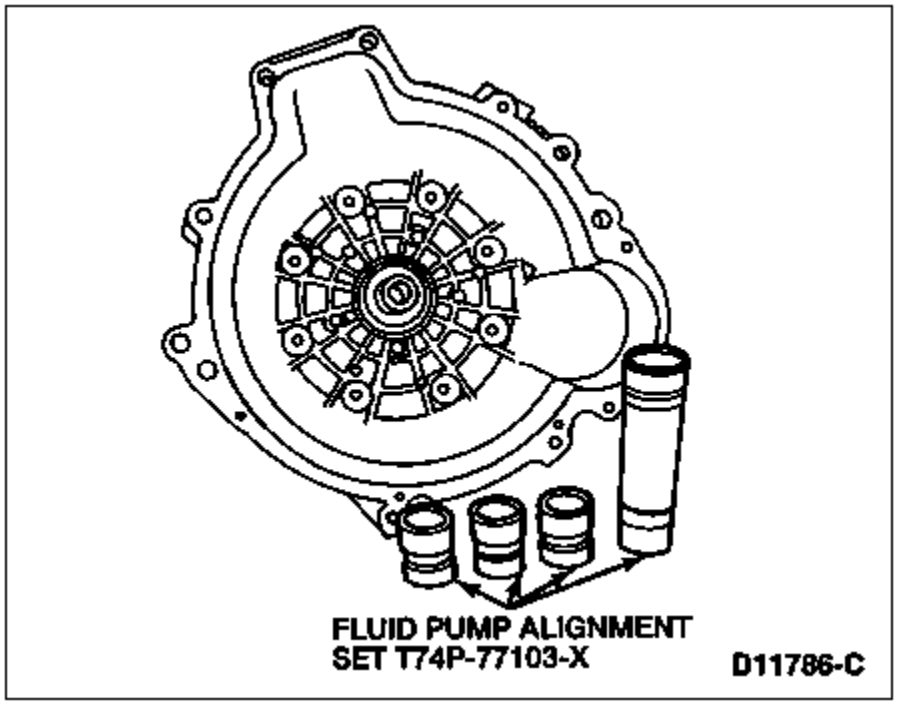
72. Install the six M8 x 35 mm Torx® head front pump support and gear screws fingertight only.



tomsn048@gmail.com

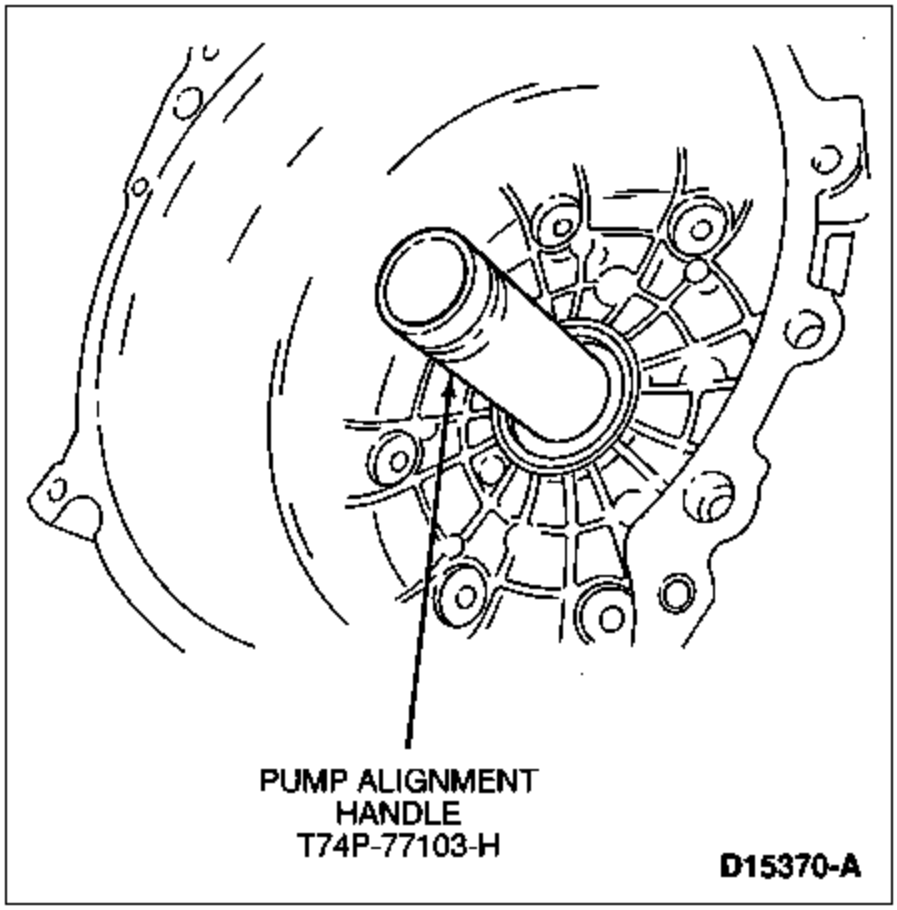
73. **CAUTION: Fluid Pump Alignment Set T74P-77103-X must be used to properly align the front pump support and gear to the fluid pump adapter plate. This will prevent seal leakage, gear noise, broken gears and bushing failure.**

    Select the gauge that will be the snuggest fit when placed over the fluid pump support and gear.



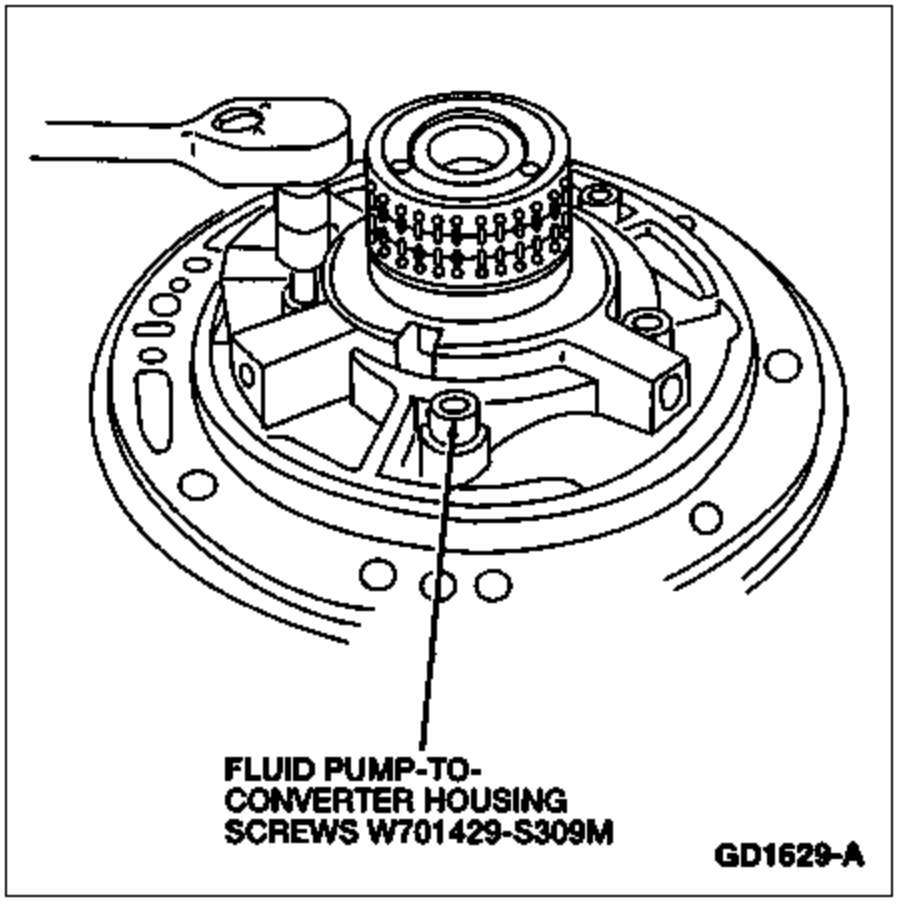
74. Thread the gauge into Pump Alignment Handle T74P-77103-H (Part of T74P-77103-X, Fluid Pump Alignment Set). Slide the tool over the front pump support and gear until it bottoms out in the pump gear pocket. This centers the pump to the converter housing.

tomsn048@gmail.com



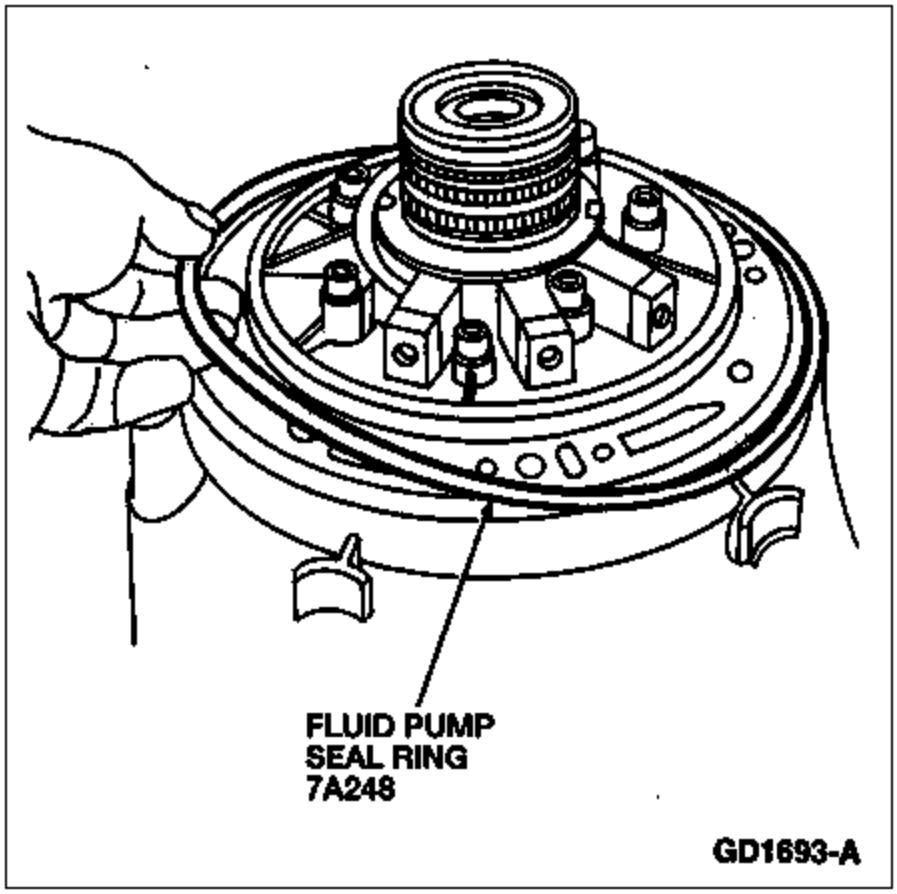
75. Use a Torx® 40 socket wrench to tighten the six M8 x 35 mm fluid pump support and gear-to-converter housing screws. Tighten the fluid pump support and gear-to-converter housing screws in a star pattern to 22-28 Nm (16-21 lb-ft). Remove the Pump Alignment Handle.

tomsn048@gmail.com



76. Install a new fluid pump seal ring.

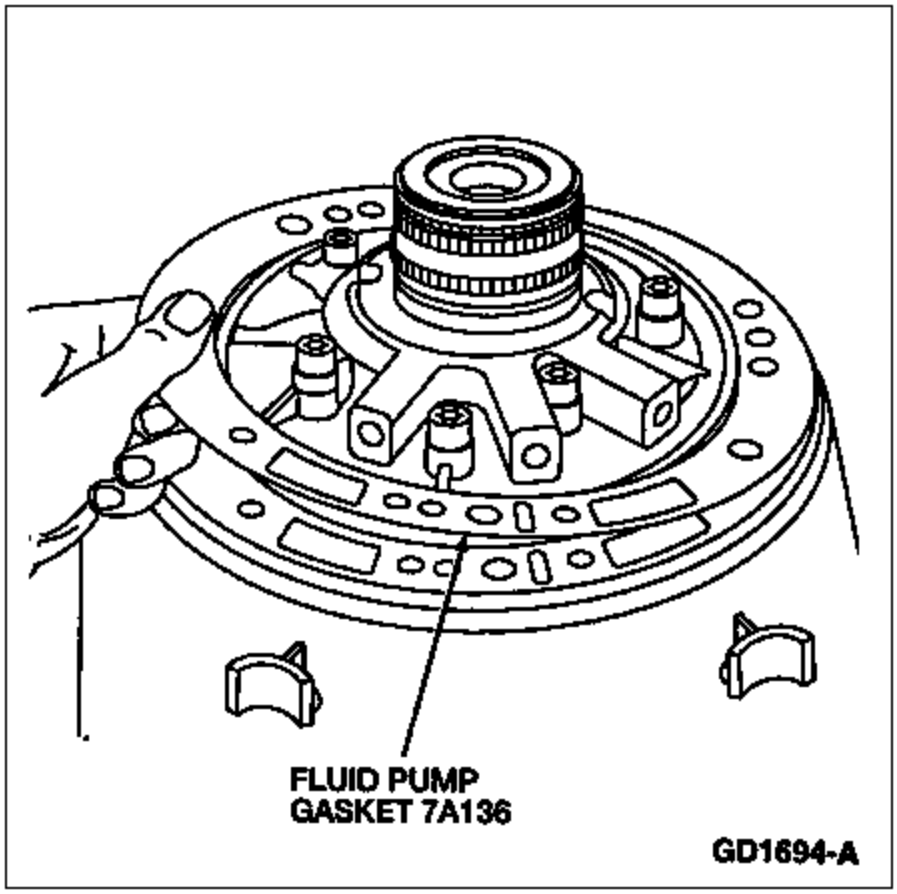
tomsn048@gmail.com



77. **NOTE: Make sure the fluid pump seal ring is installed on the converter housing and pump assembly.**

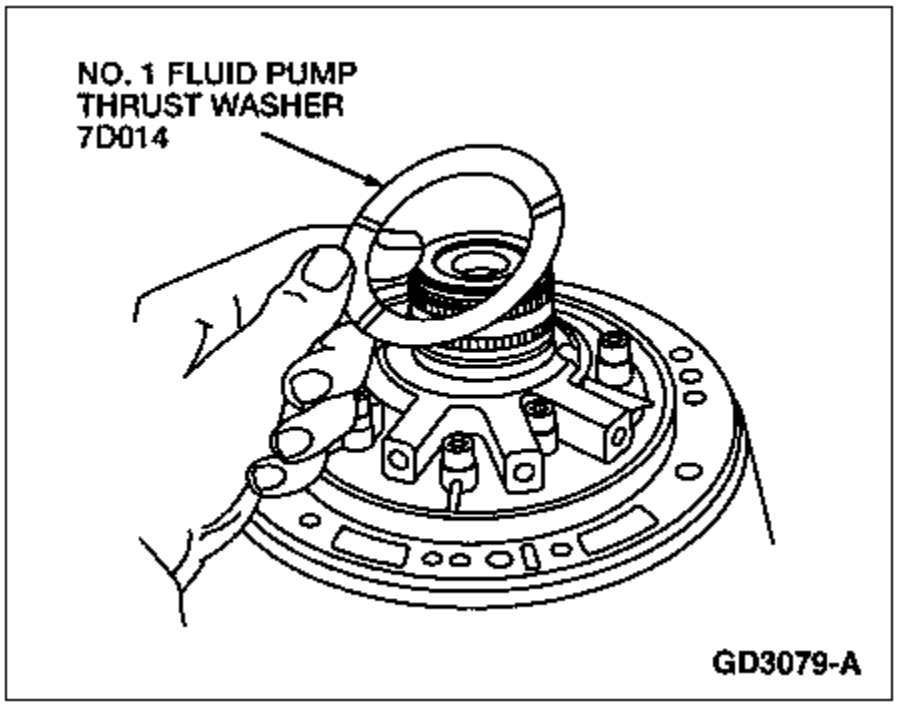
    Place a new fluid pump gasket on the fluid pump adapter plate as shown. Use petroleum jelly to hold the fluid pump gasket in place.

tomsn048@gmail.com



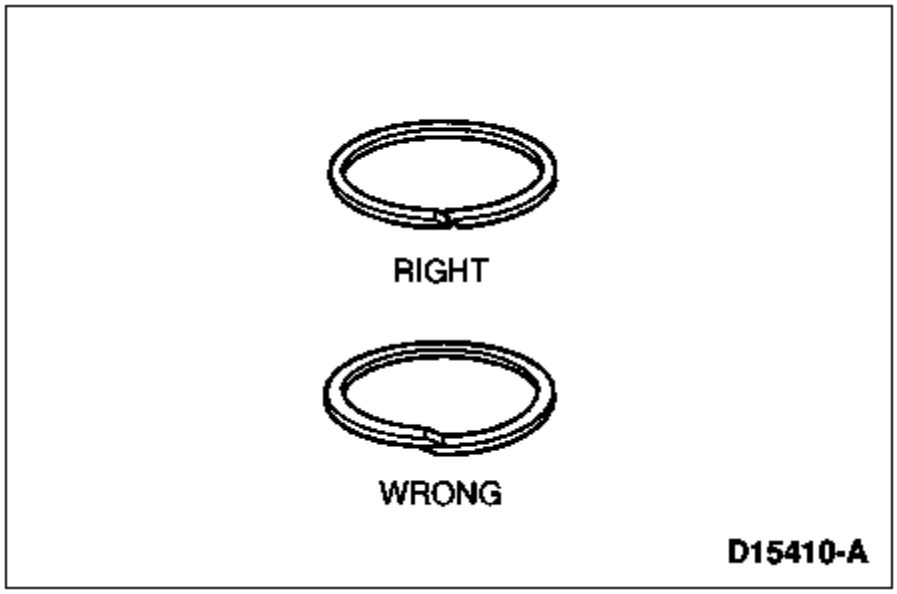
78. Install the correct No. 1 fluid pump thrust washer on the fluid pump support and gear. Use petroleum jelly to hold the washer in place.

tomsn048@gmail.com

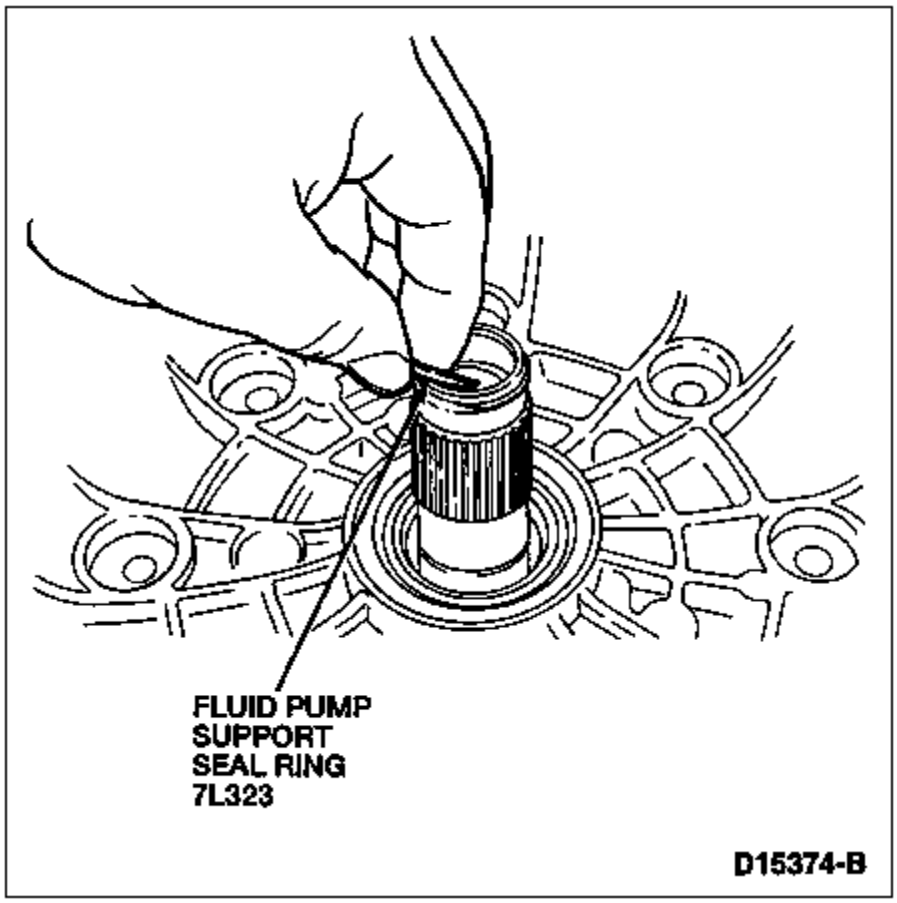


79. **NOTE: Verify correct seal installation. Be sure seal grooves are clean and free of burrs.**

Turn the converter housing over and install the front pump support seal ring.



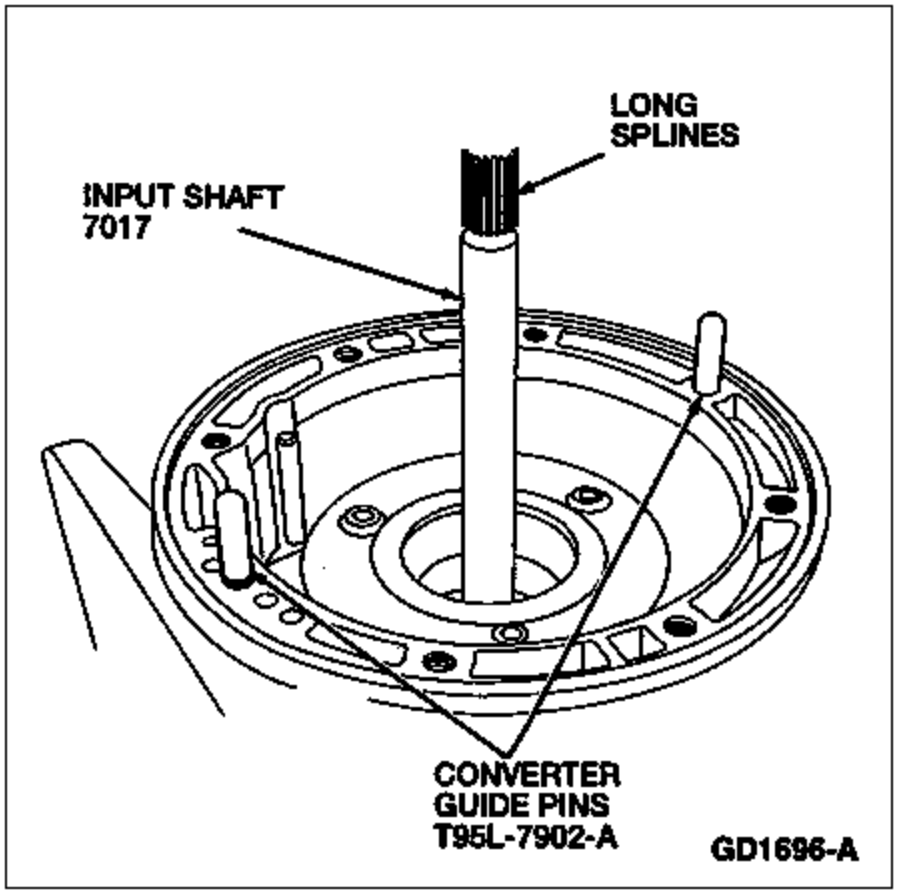
tomsn048@gmail.com



80. **NOTE: The splines on the input shaft are not the same length. The shorter splines go into the assembly.**

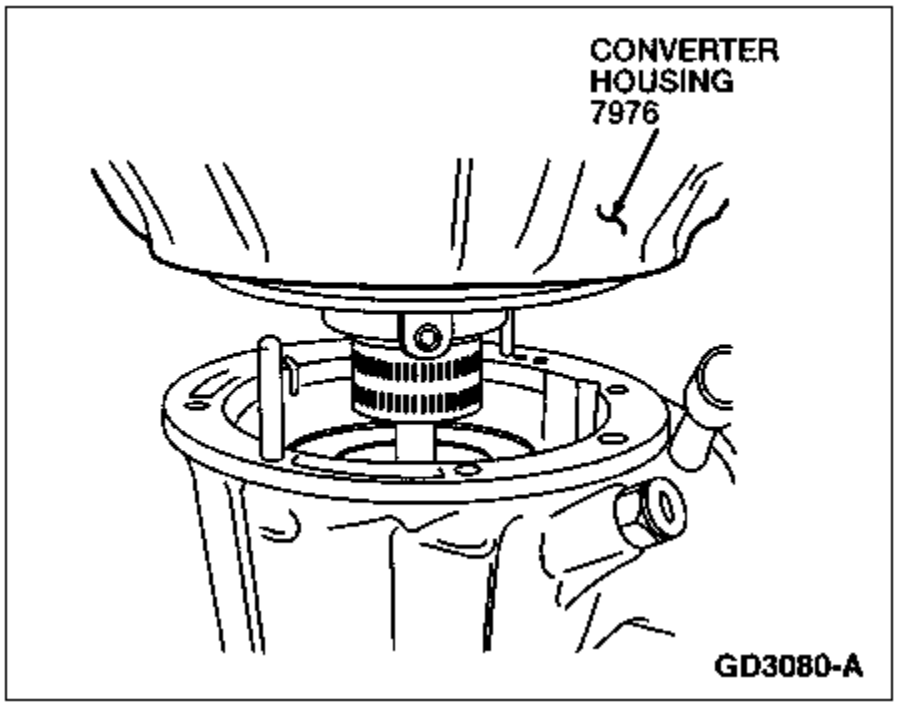
Install the input shaft as a guide for the converter housing and fluid pump support and gear assembly. Install the Converter Guide Pins T95L-7902-A as shown.

tomsn048@gmail.com



81. Install the converter housing and fluid pump support and gear assembly (with the fluid pump gasket) and the No. 1 fluid pump thrust washer to the case.

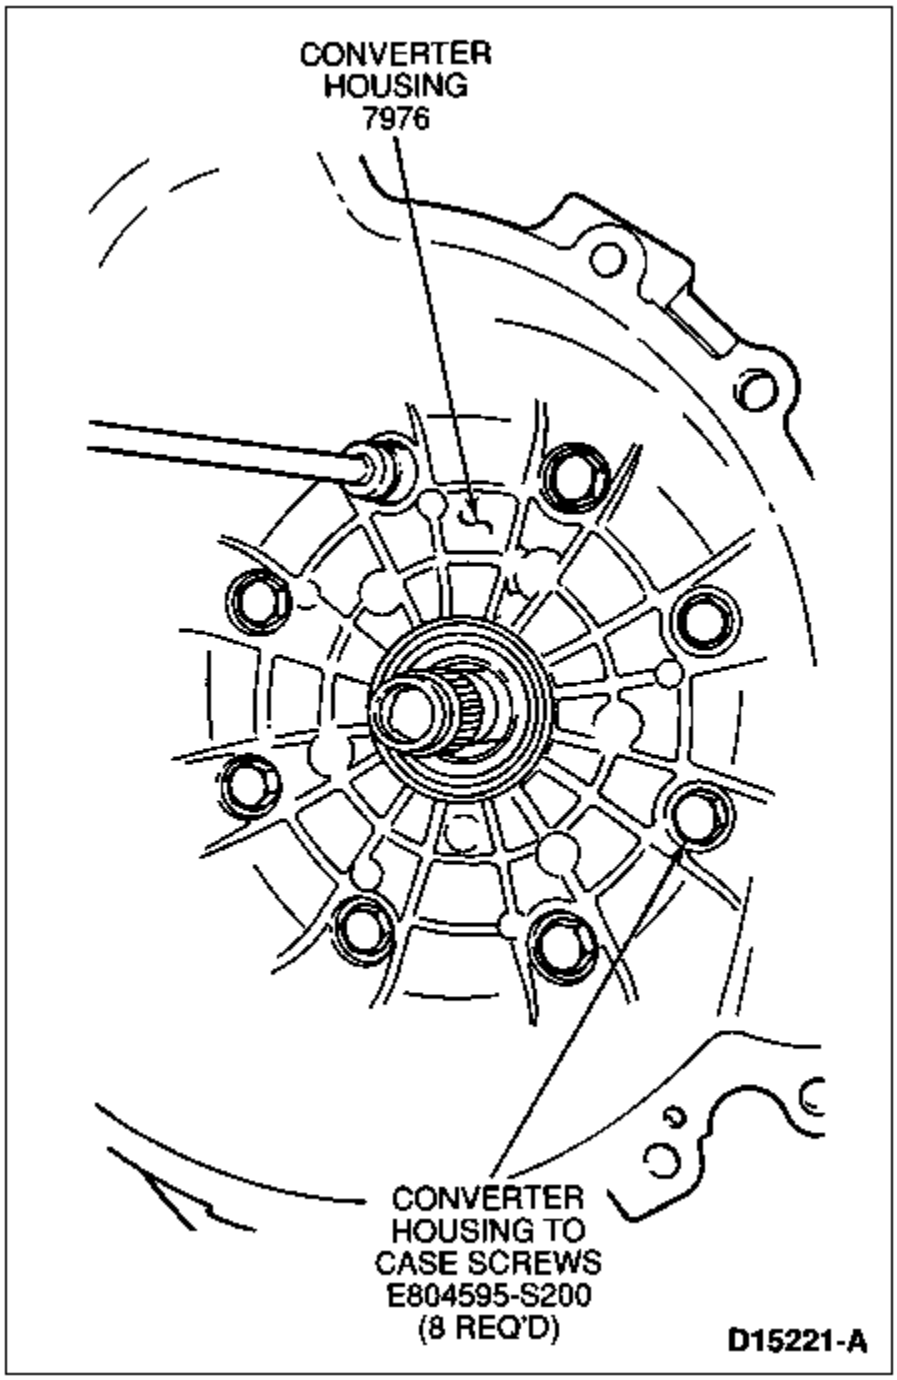
tomsn048@gmail.com



82. **NOTE: Lubricate O-rings on converter housing screws.**

Remove Converter Guide Pins and use a 17 mm socket wrench to install the eight new M10 x 33 mm converter housing-to-case screws. Tighten the converter housing-to-case screws in a star pattern to 36-52 Nm (27-39 lb-ft).

tomsn048@gmail.com



83. Remove input shaft.

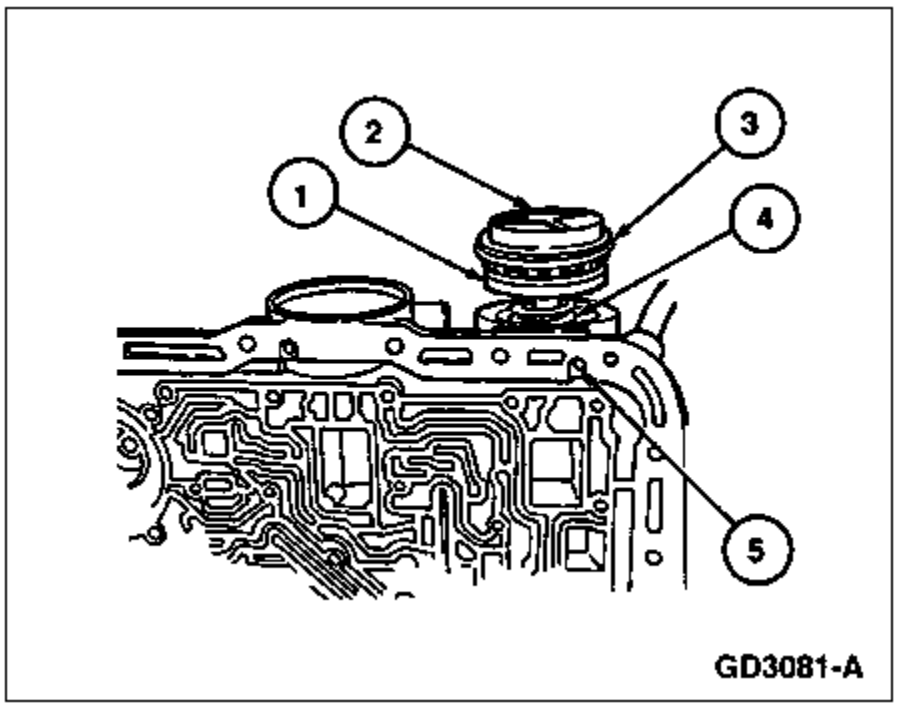
84. **WARNING: MAKE SURE THE LOCK PIN ON BENCH-MOUNTED HOLDING FIXTURE T57L-500-B IS SECURE.**

    Rotate the transmission assembly so the fluid pan rail is facing up.

85. **CAUTION: Do not damage the overdrive servo cover to case O-ring during installation. Do not press the overdrive servo cover and O-ring past the relief hole in the case. O-ring damage may occur.**

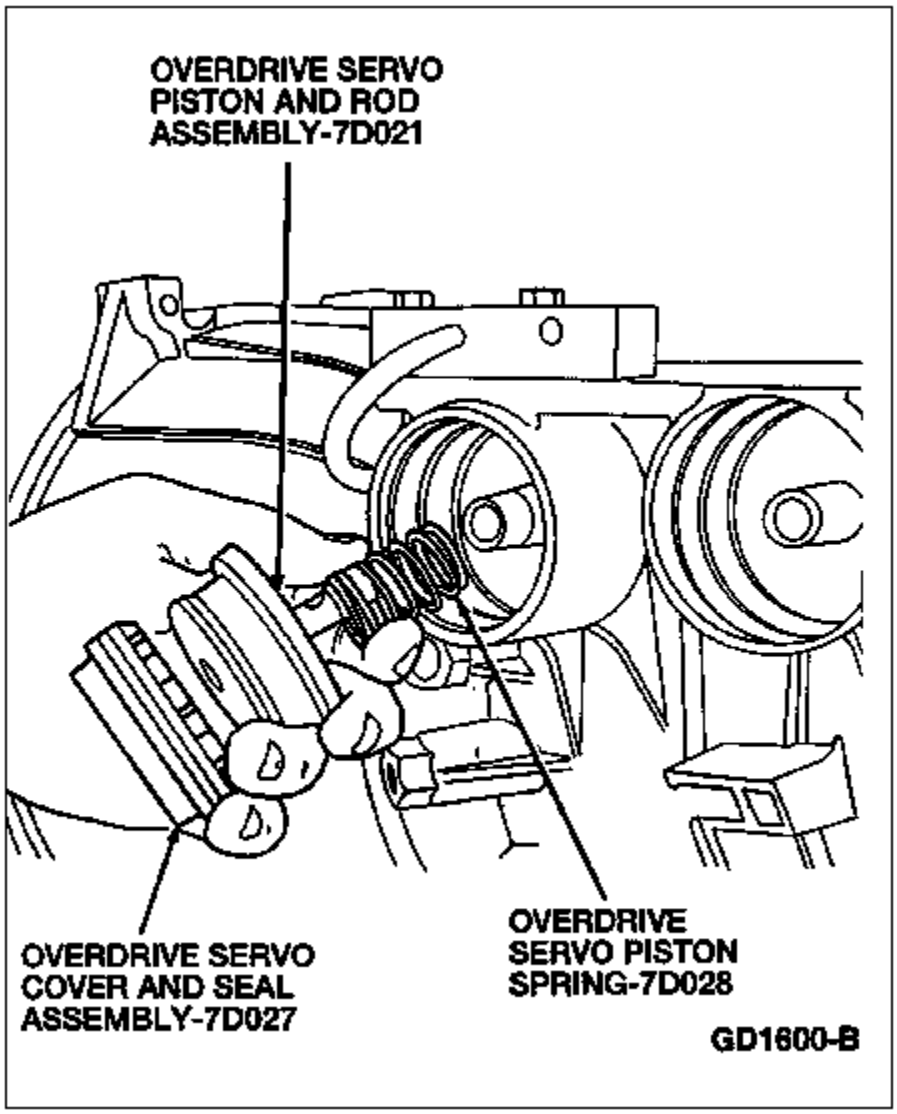
tomsn048@gmail.com

Install the overdrive servo piston spring, servo piston and rod assembly, servo cover to case O-ring with servo cover.



Item	Part Number	Description
1	7D021	Overdrive Servo Piston and Rod Assembly
2	7D027	Overdrive Servo Cover and Seal Assembly
3	7D040	Overdrive Servo O-Ring
4	7D028	Overdrive Servo Piston Spring
5	—	Relief Hole (Part of 7005)

tomsn048@gmail.com

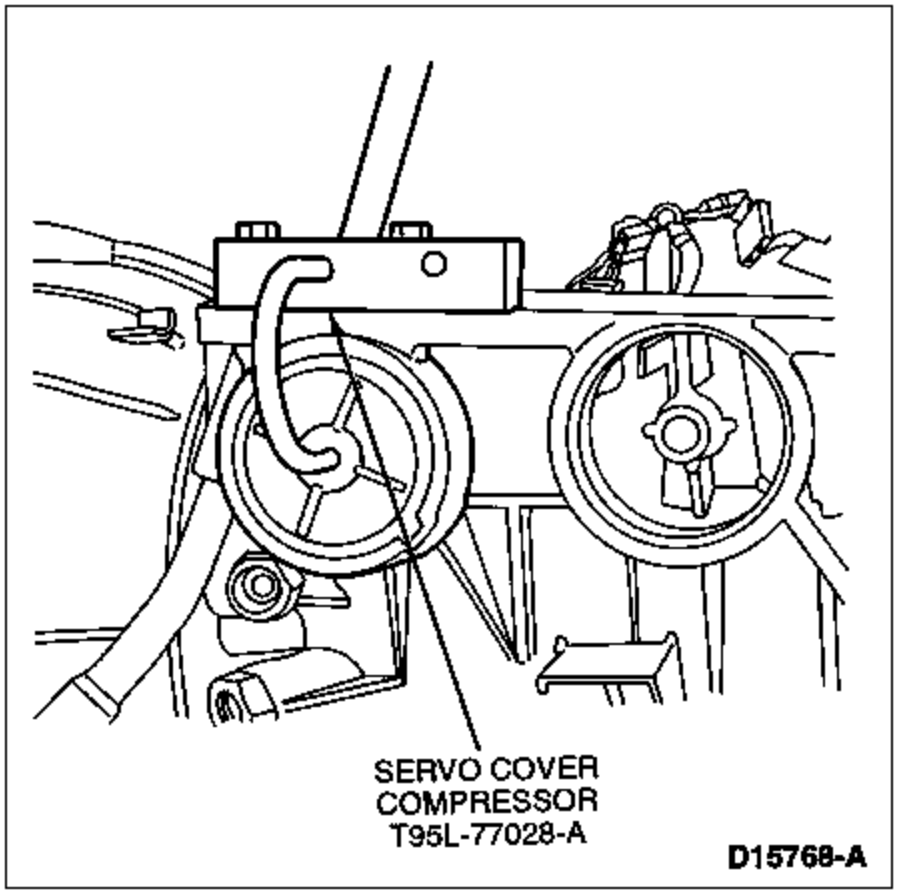


86. **NOTE: The J-hook must be in the appropriate hole for the servo being removed, and tool number should be facing up.**

    Install Servo Cover Compressor T95L-77028-A over the overdrive servo cover at the fluid pan rail. Tighten the screws.

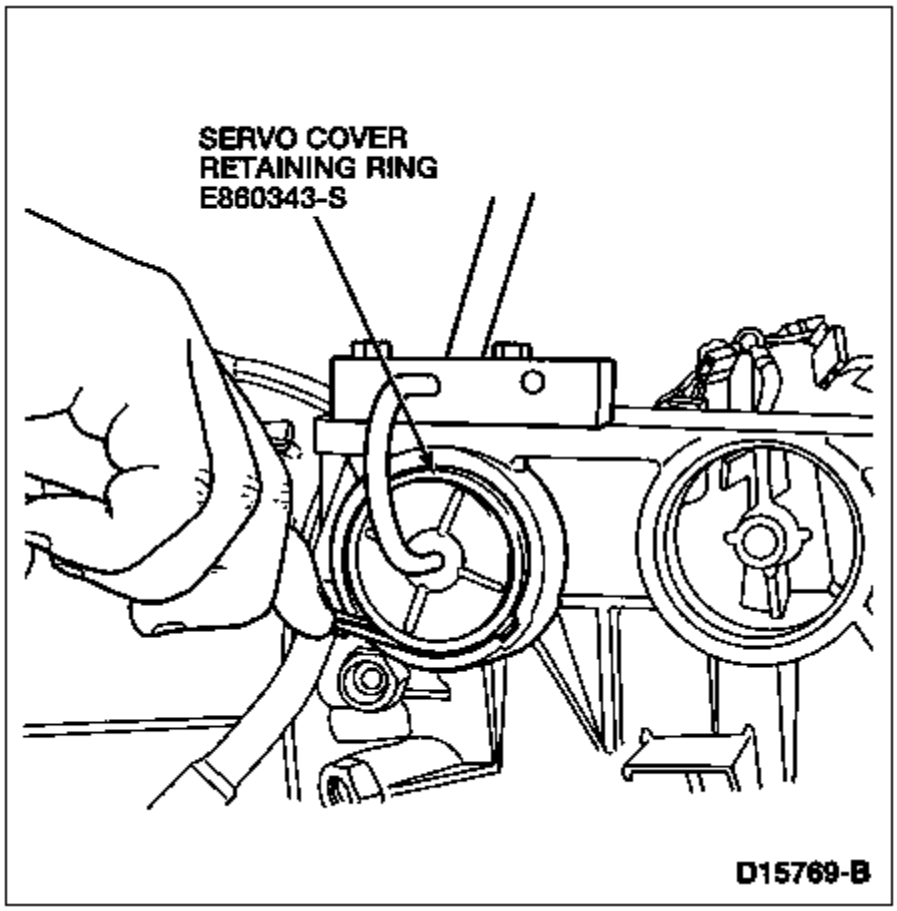
87. Use a 1/2-inch wrench to tighten the nut on the J-hook until there is a gap between the servo cover and the snap ring.

tomsn048@gmail.com



88. Carefully install the servo cover retaining ring.

tomsn048@gmail.com



89. **CAUTION: The servo cover is under spring tension.**

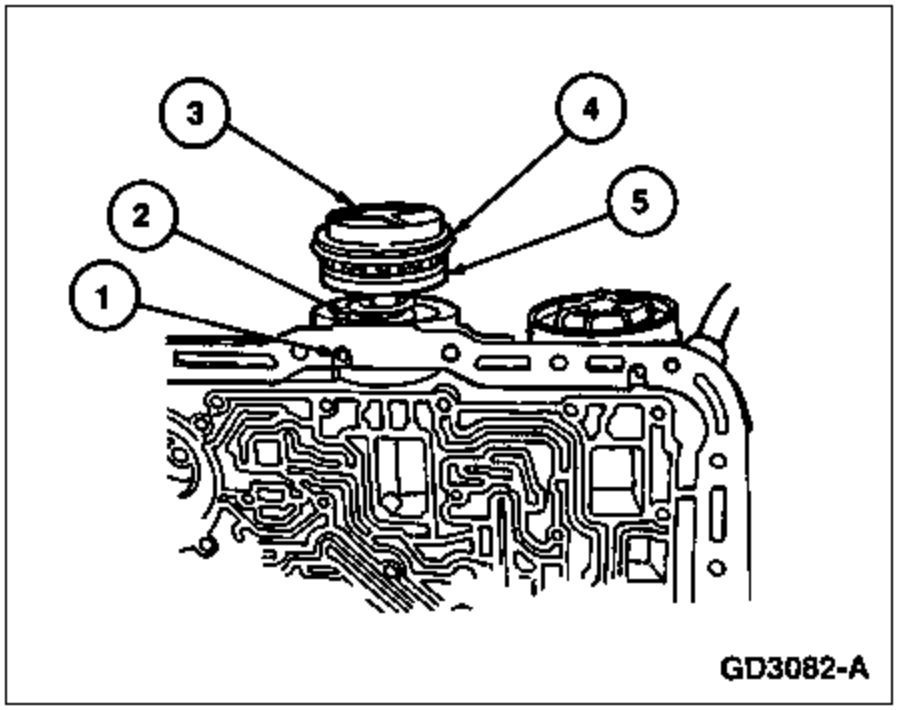
    Carefully back off the nut on the J-hook until the servo spring is unloaded.

90. Remove Servo Cover Compressor T95L-77028-A.

91. **CAUTION: Do not damage the intermediate servo cover to case O-ring during installation. Do not press the intermediate servo cover and seal assembly and O-ring past the relief hole in the case. O-ring damage may occur.**

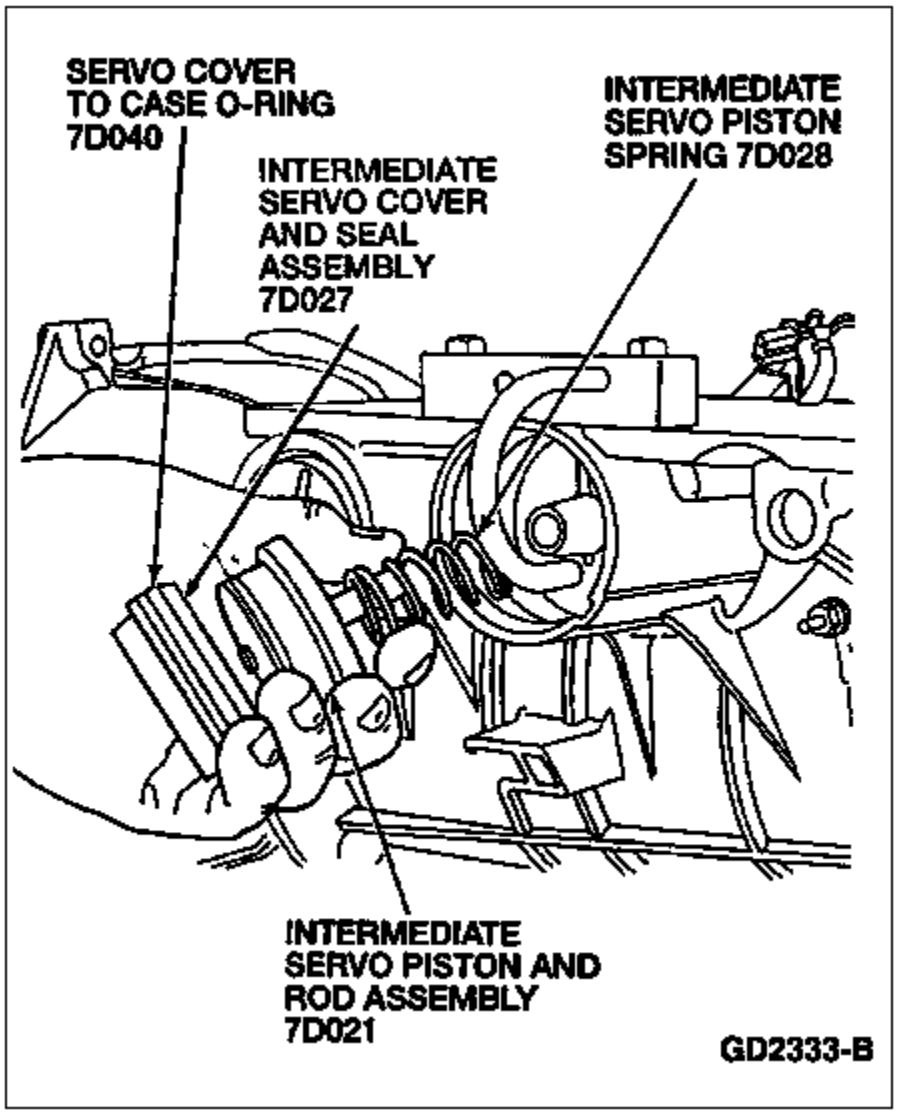
    Install the intermediate servo piston spring, servo piston and rod assembly, servo cover to case O-ring with servo cover assembly with O-ring.

tomsn048@gmail.com



Item	Part Number	Description
1	—	Relief Hole (Part of 7005)
2	7D028	Intermediate Servo Piston Spring
3	7D027	Intermediate Servo Cover and Seal Assembly
4	7D040	Intermediate Servo O-Ring
5	7D021	Intermediate Servo Piston and Rod Assembly

tomsn048@gmail.com

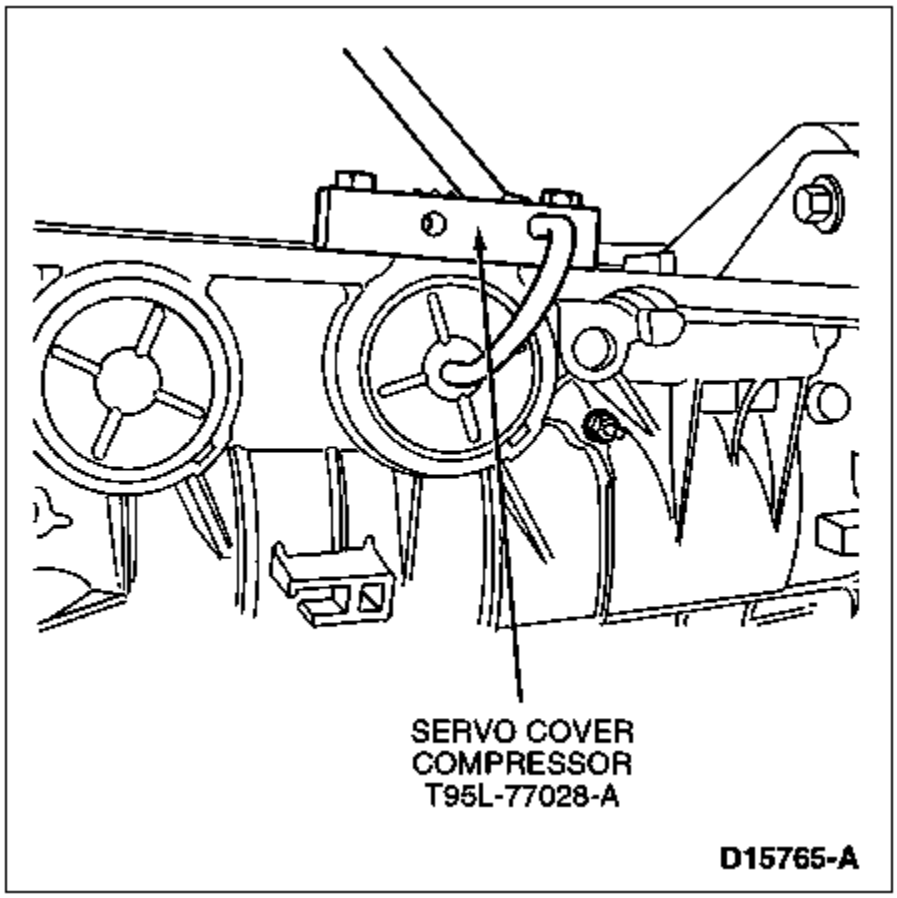


92. **NOTE: The J-hook must be in the appropriate hole for the servo being removed, and tool number should be facing up.**

    Install Servo Cover Compressor T95L-77028-A over the intermediate servo cover at the fluid pan rail. Tighten the screws.

93. Use a 1/2-inch wrench to tighten the nut on the J-hook until there is a gap between the servo cover and the snap ring.

tomsn048@gmail.com



94. Carefully install the intermediate servo cover retaining ring.

tomsn048@gmail.com

95. **CAUTION: The servo cover is under spring tension.**

    Carefully back off the nut on the J-hook until the servo piston spring is unloaded.

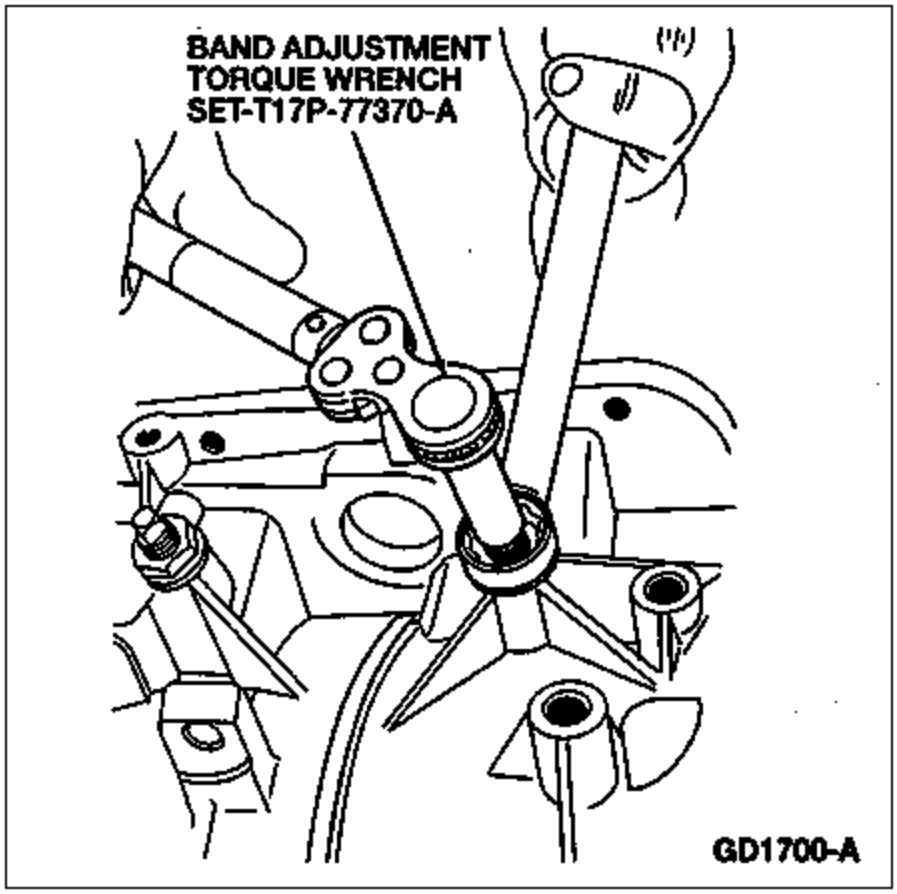
96. Remove Servo Cover Compressor T95L-77028-A.

97. **CAUTION: Install, but do not tighten, a new locknut on the band adjusting screw. Apply petroleum jelly to the locknut seal.**

    CAUTION: The overdrive servo must be installed prior to band adjustment.

    Install new locknut. Tighten the overdrive band adjusting screw using Band Adjustment Torque Wrench Set T71P-77370-A. The wrench will click at 14 Nm (10 lb-ft). Back off the band adjusting screw exactly two (2) turns and hold that position. Tighten the overdrive band locknut to 47-61 Nm (35-45 lb-ft) using a 19 mm wrench.

tomsn048@gmail.com

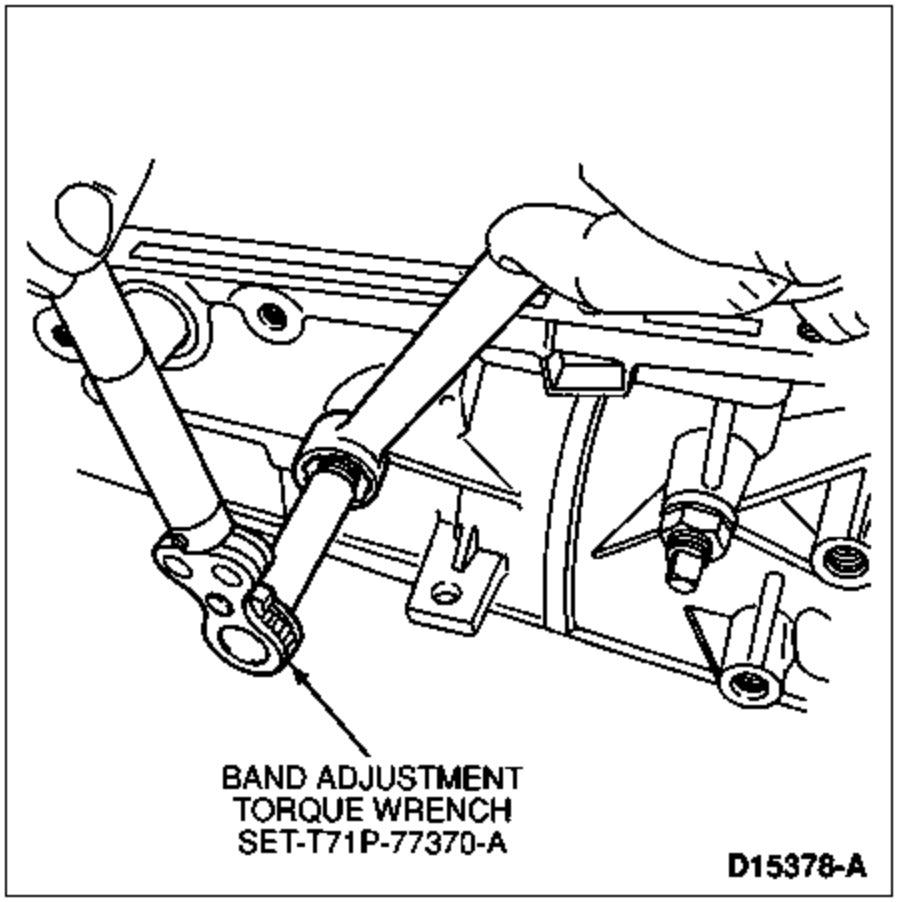


98. **CAUTION: Install, but do not tighten, a new locknut on the band adjusting screw. Apply petroleum jelly to the locknut seal.**

CAUTION: Intermediate servo must be installed prior to band adjustment.

Install new locknut. Tighten the intermediate band adjusting screw using Band Adjustment Torque Wrench Set T71P-77370-A. The wrench will click at 14 Nm (10 lb-ft). Back off the band adjusting screw exactly two and one-half (2 1/2) turns and hold that position. Tighten the intermediate band locknut to 47-61 Nm (35-45 lb-ft) using a 19 mm wrench.

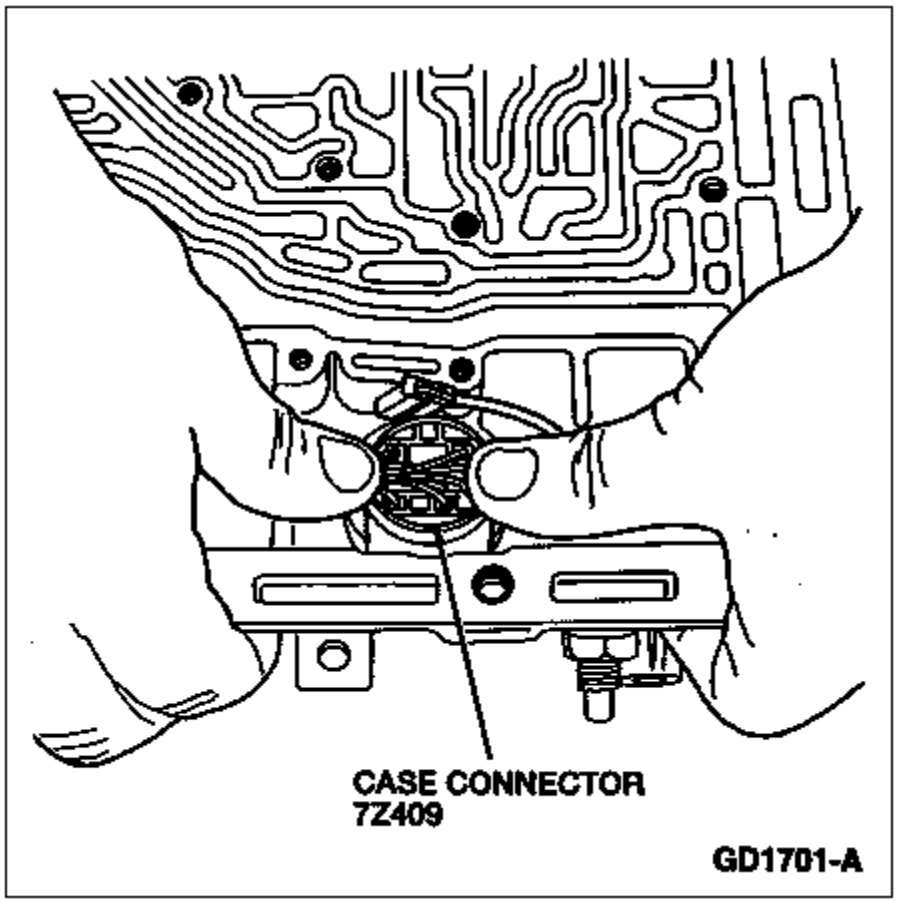
tomsn048@gmail.com



99. **NOTE: Make sure the tab is in the lock position.**

Inspect O-rings (W703015-S300) for damage. Replace if damaged. Lubricate and install the 16-pin connector assembly through the case until a click is heard.

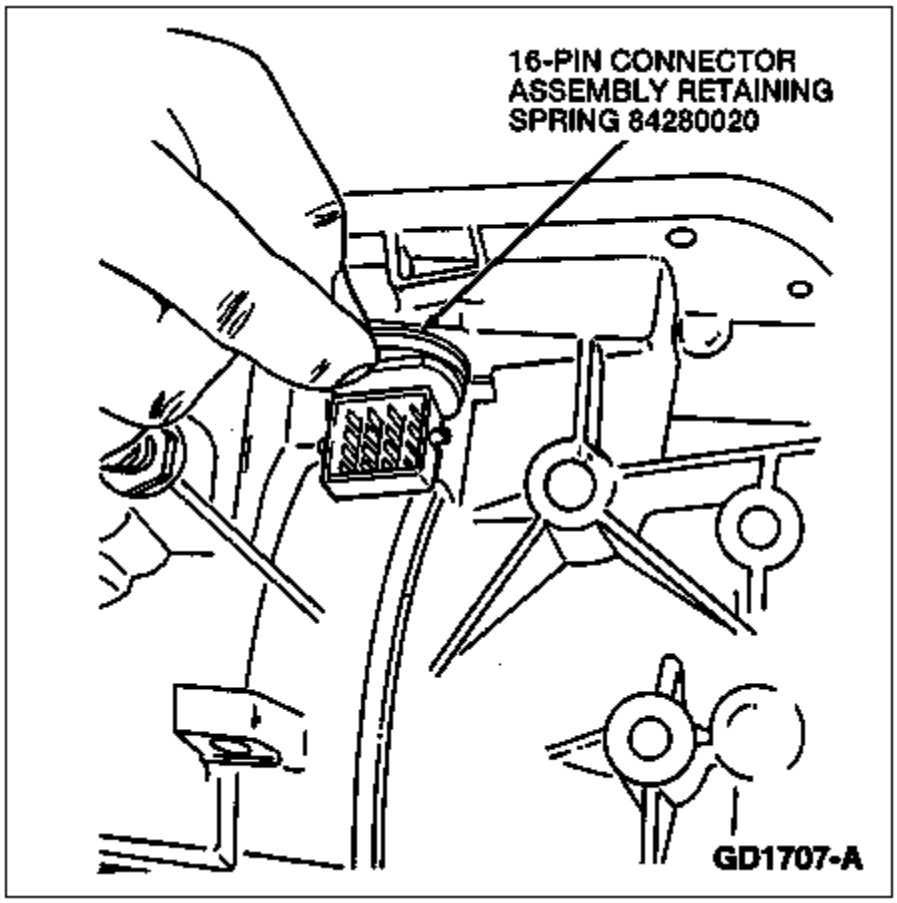
tomsn048@gmail.com



100. **CAUTION: Do not overstretch the 16-pin connector assembly retaining spring.**

Install the 16-pin connector assembly retaining spring.

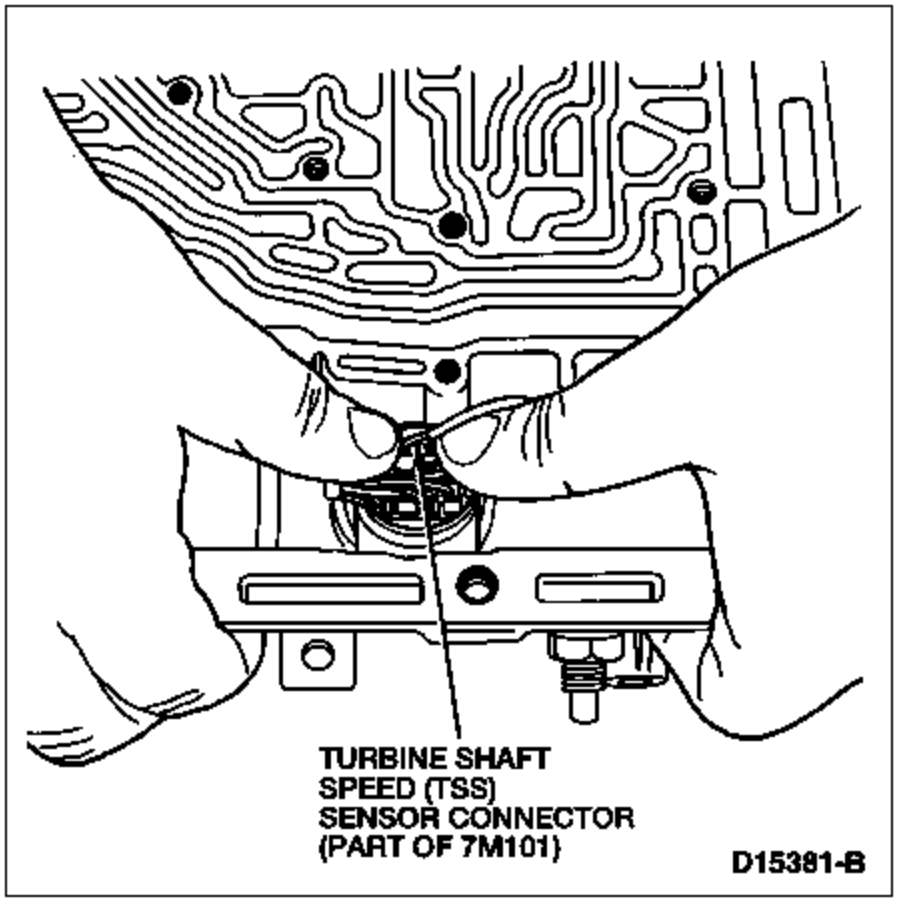
tomsn048@gmail.com



101. **NOTE: Align the slot on the turbine shaft speed (TSS) sensor connector with the slot on the 16-pin connector assembly.**

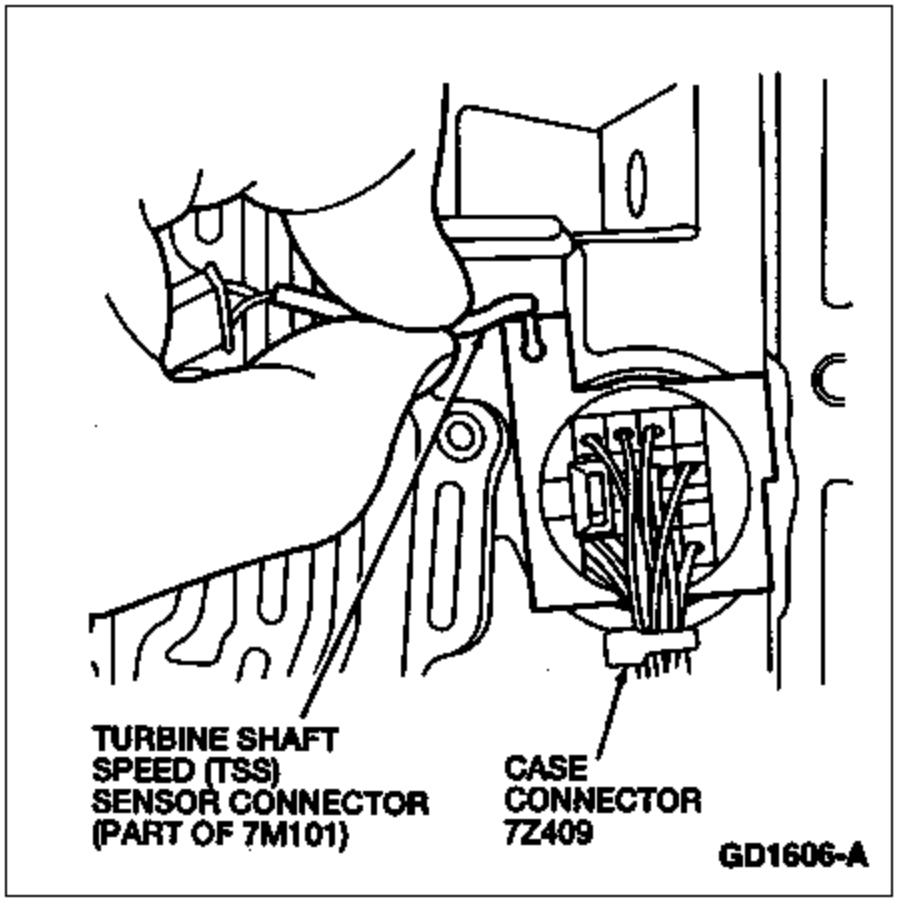
Carefully install the TSS sensor connector into the 16-pin connector assembly.

tomsn048@gmail.com



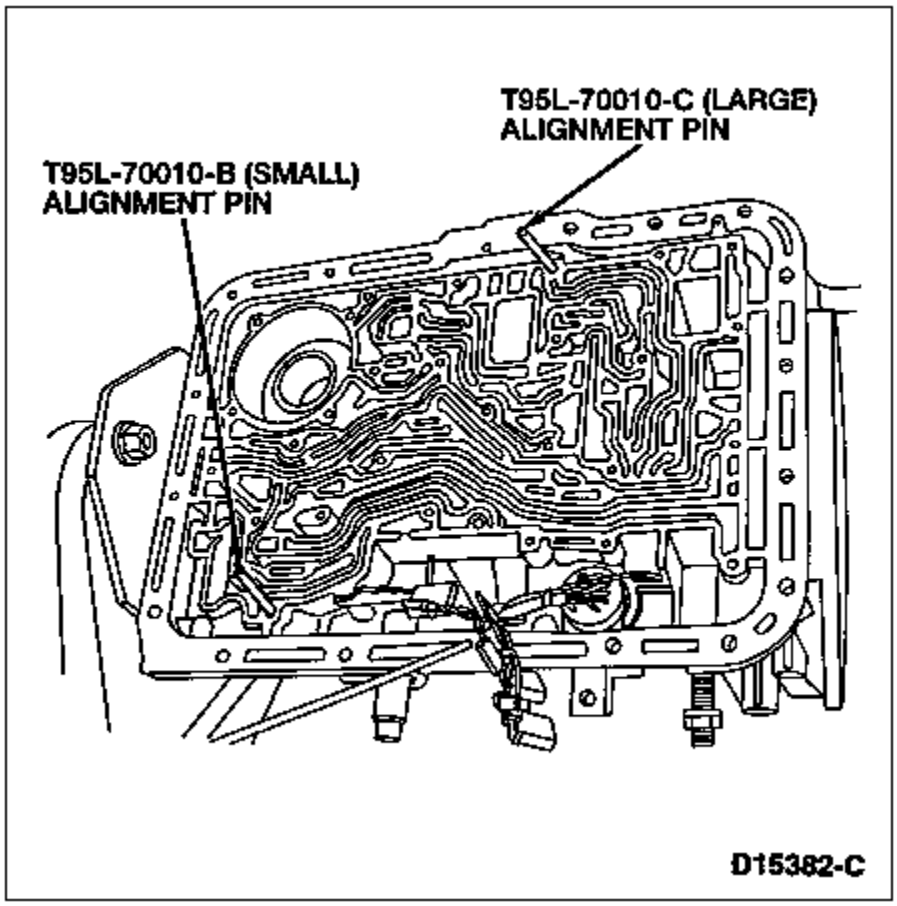
102. Carefully insert TSS sensor connector wires into the retaining slot on the 16-pin case connector.

tomsn048@gmail.com



103. Install the valve body guide pins into the case in the positions shown.

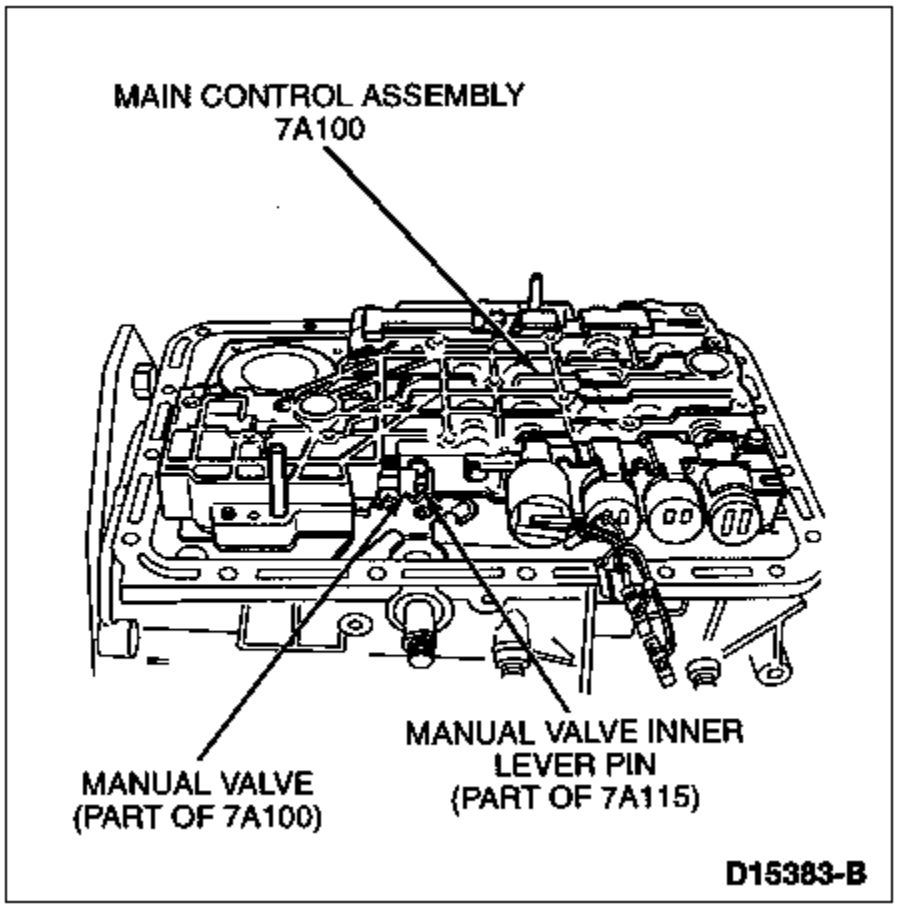
tomsn048@gmail.com



104. **NOTE: Ensure main control assembly gasket is properly aligned.**

Install the main control assembly on the case. Align the manual valve with the manual valve inner lever pin as shown.

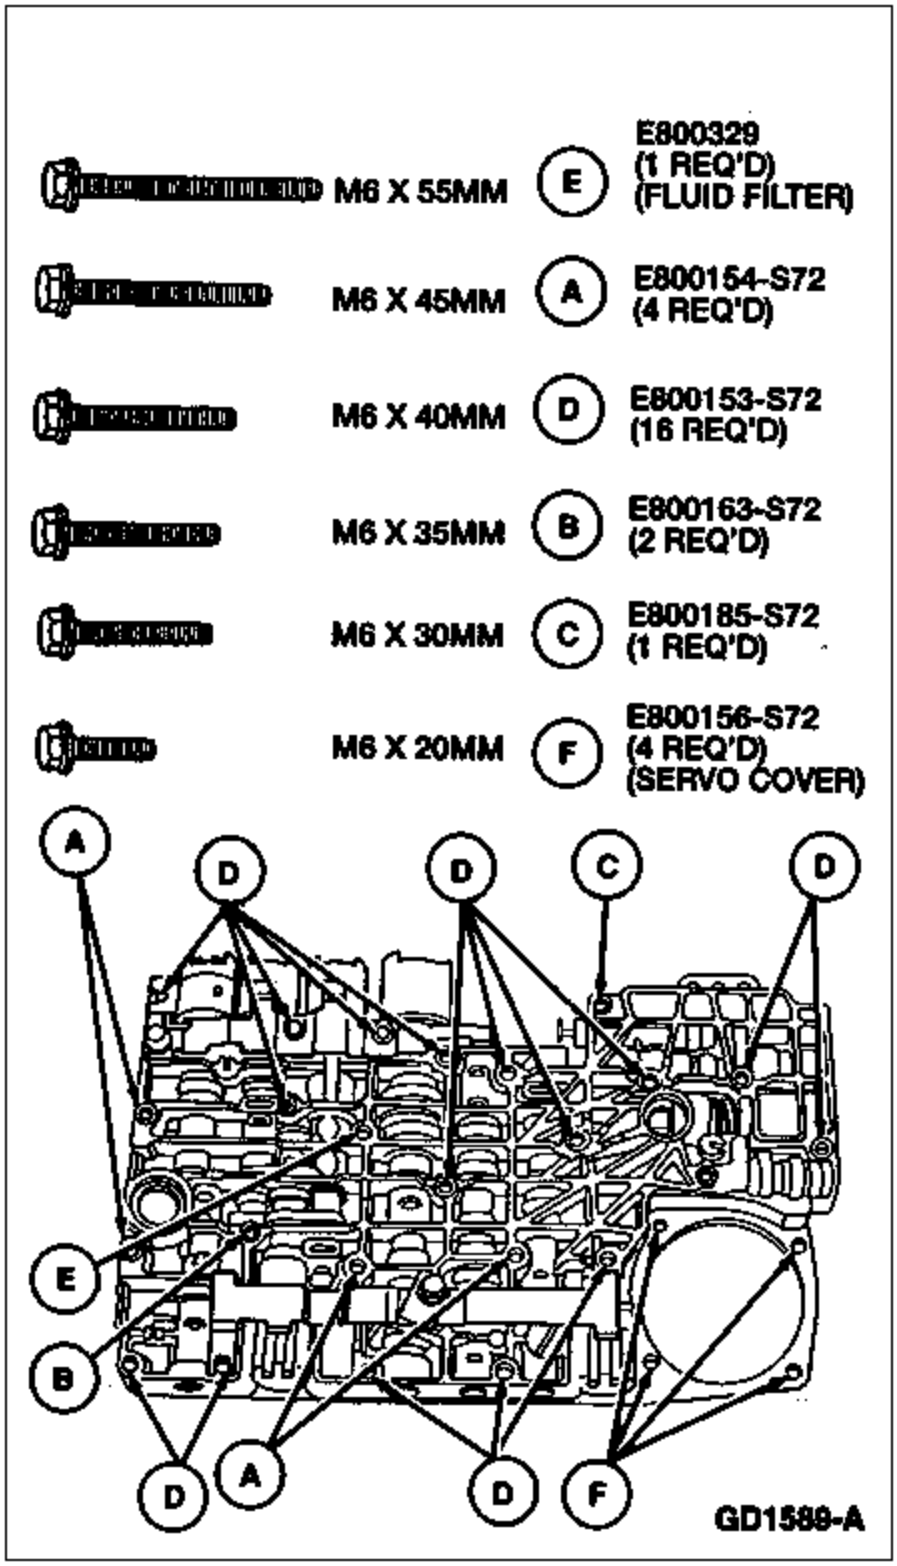
tomsn048@gmail.com



105. Install four M6 x 45 mm main control assembly-to-case screws in location A. Fingertighten.

Main Control Assembly Screws and Locations

tomsn048@gmail.com



106. Install two M6 x 35 mm main control assembly-to-case screws in location B. Fingertighten.

107. Install one M6 x 30 mm main control assembly-to-case screw in location C. Fingertighten.

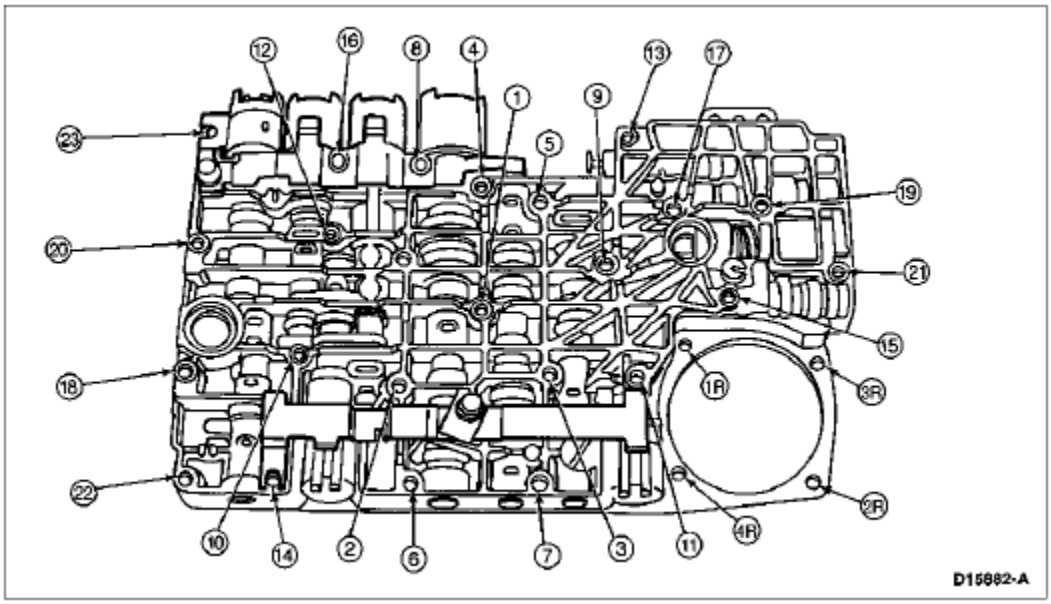
108. Remove both Valve Body Guide pins T95L-70010-B and T95L-70010-C.

tomsn048@gmail.com

109. Install sixteen M6 x 40 mm main control assembly-to-case screws in location D. Fingertighten.

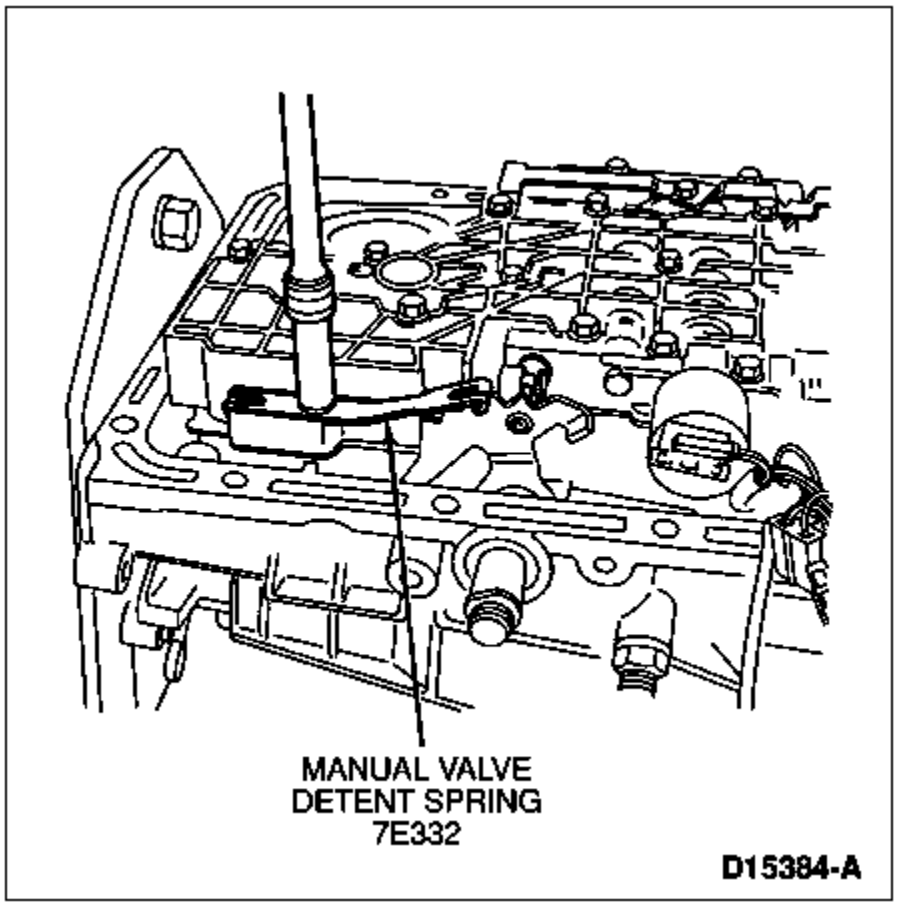
110. Tighten all main control assembly-to-case screws including reverse servo cover sequence (1R, 2R, 3R and 4R), to 8-11 Nm (71-97 lb-in) in sequence shown, using a 10 mm socket wrench.

Tightening Sequence



111. Install the manual valve detent spring. Install the manual valve detent spring screw in location A. Tighten the manual valve detent spring screw to 8-11 Nm (71-97 lb-in).

tomsn048@gmail.com



112. **NOTE: Perform Steps 105 through 112 only if rear reverse servo piston and rod is to be checked.**

Remove the reverse servo piston and rod from the case.

113. **NOTE: An A4LD Reverse Servo Return Spring D4ZZ-7D031-A is to be used only as a test spring.**

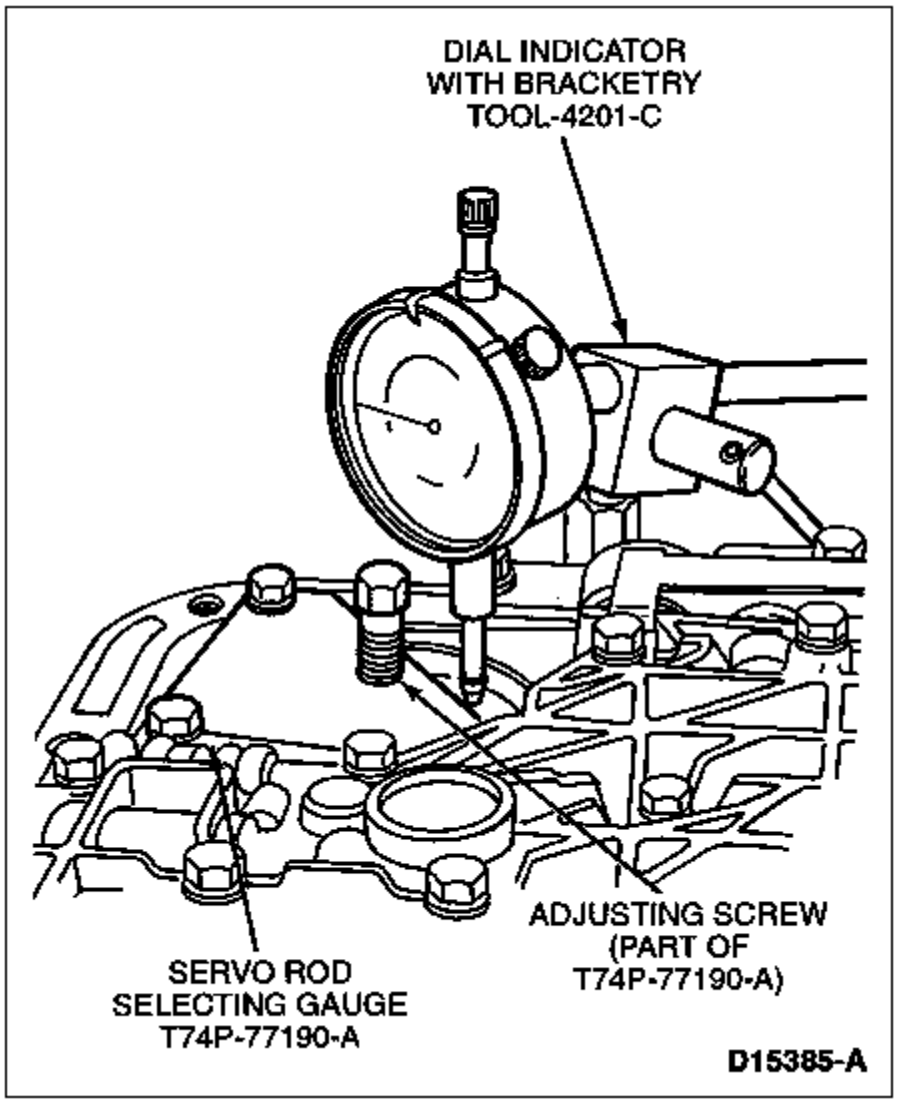
Install the reverse servo piston and rod into the servo bore along with a D4ZZ-7D031-A reverse servo return spring.

114. Install a new reverse servo separator plate cover gasket. Install Servo Rod Selecting Gauge T74P-77190-A and tighten with the three screws.

115. Tighten the servo gauge adjusting screw to 4 Nm (35.5 lb-in).

116. Install Dial Indicator with Bracketry TOOL-4201-C or equivalent on the transmission case. Position the indicator on the piston pad. Set the dial indicator to zero.

tomsn048@gmail.com



117. **NOTE: If the piston travel in this step is 3-5.6 mm (0.120-0.220 inch), it is within specification. If the piston travel is greater than 5.6 mm (0.220 inch), use the next longer piston and rod. If the piston travel is less than 3 mm (0.120 inch), use the next shorter piston and rod.**

Back out the servo gauge adjusting screw until it bottoms out on the tool. Record the distance the servo piston traveled.

118. **CAUTION: Make sure the test spring is removed after this step.**

Use the above procedure to check the piston travel with the newly selected reverse band servo piston and rod (if required) to make sure that the piston travel is 3-5.6 mm (0.120-0.220 inch).

Remove the servo gauge and the reverse band servo return spring.

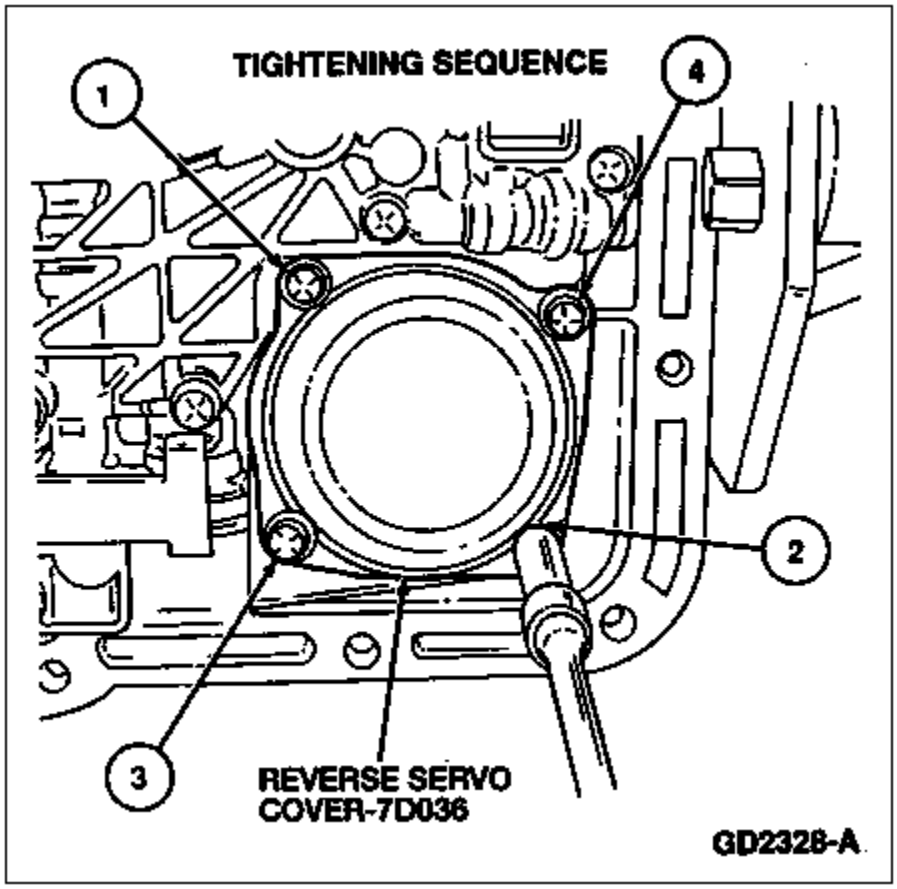
NOTE: Grooves are located on reverse servo rod.

tomsn048@gmail.com

Length — mm	Length — Inches	I.D.
54/53	2.112/2.085	1 Groove
51/50	2.014/1.986	No Groove
49/48	1.915/1.888	2 Grooves

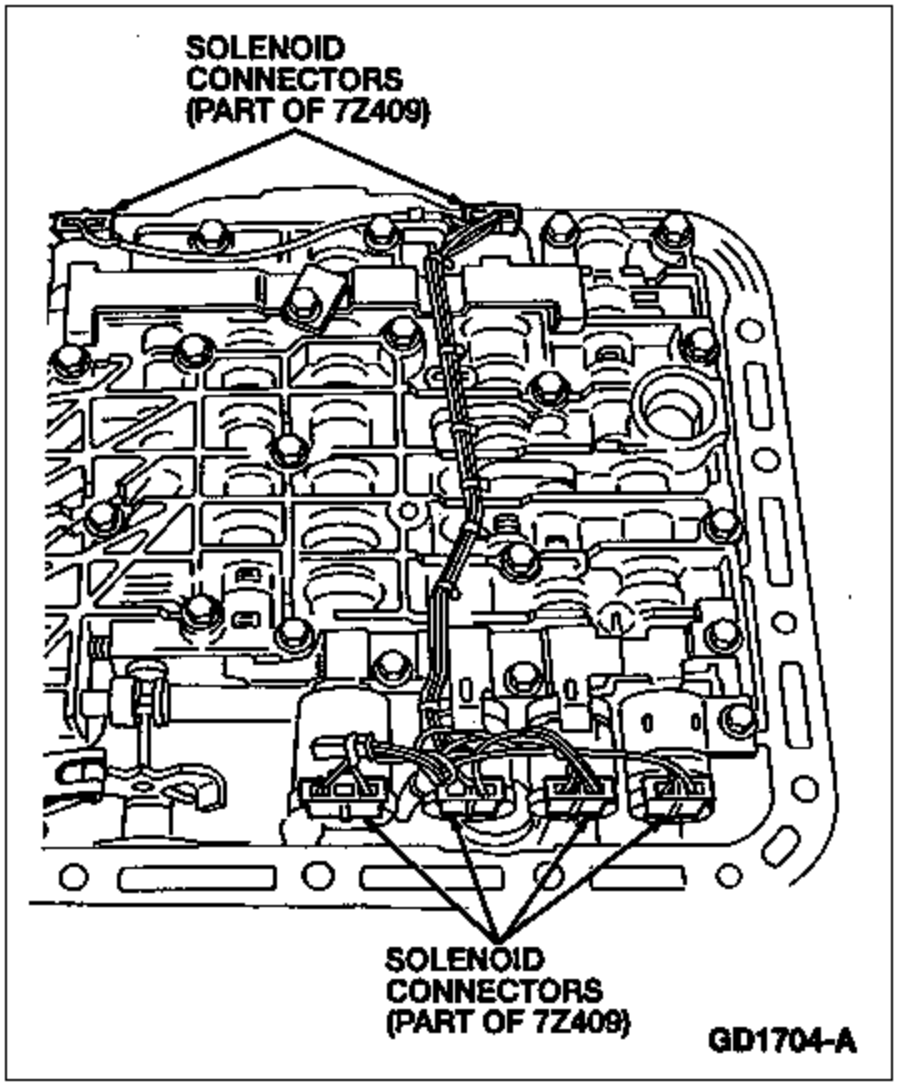
119. **CAUTION: The reverse servo test spring must be removed.**

Install the reverse servo cover and the four reverse servo cover-to-case screws. Tighten the reverse servo cover-to-case screws to 12-14 Nm (106-124 lb-in) in the sequence shown.



120. Carefully press down to install the solenoid connectors on the solenoids as shown.

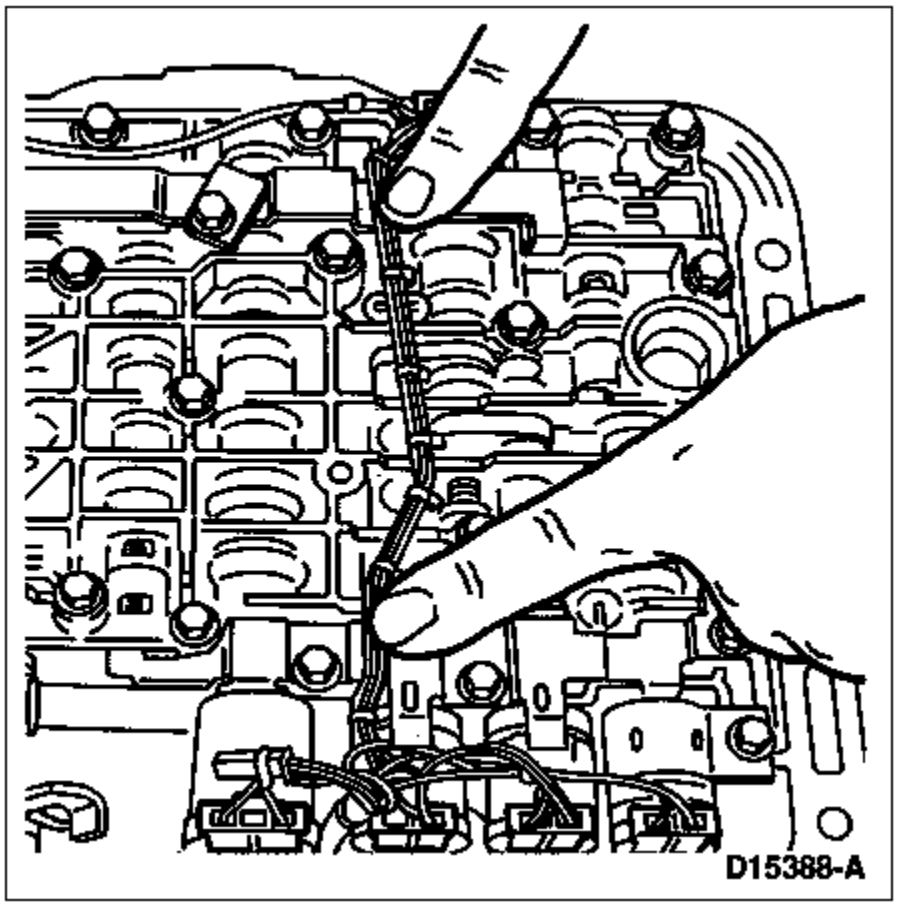
tomsn048@gmail.com



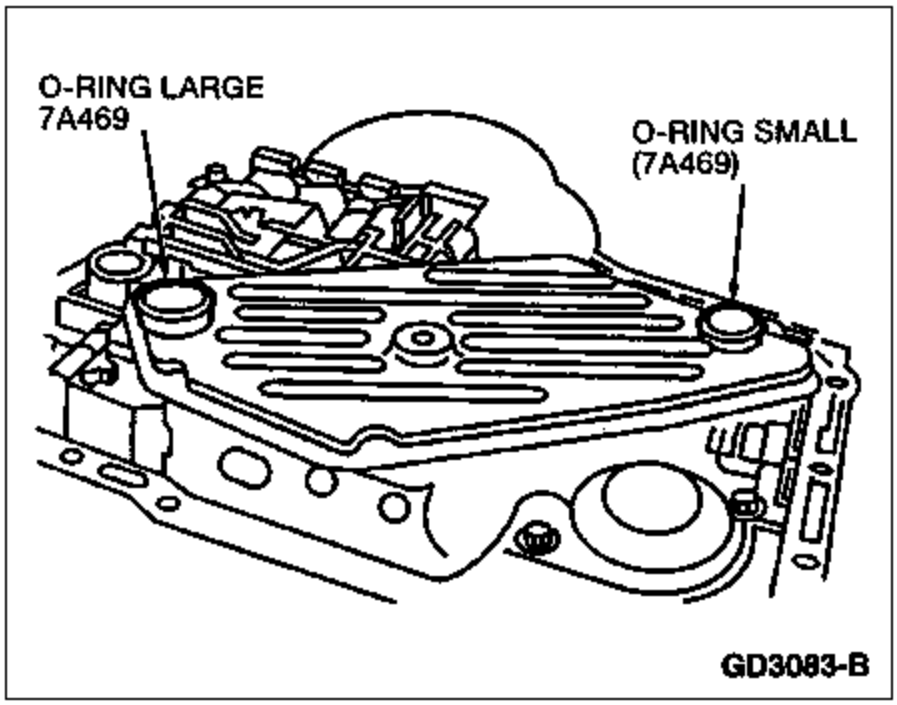
121. **CAUTION: Excessive pressure may break the locating pins.**

Install the wiring loom protector and guide. Align the pins in the holes of the solenoid clamps and gently push down.

tomsn048@gmail.com



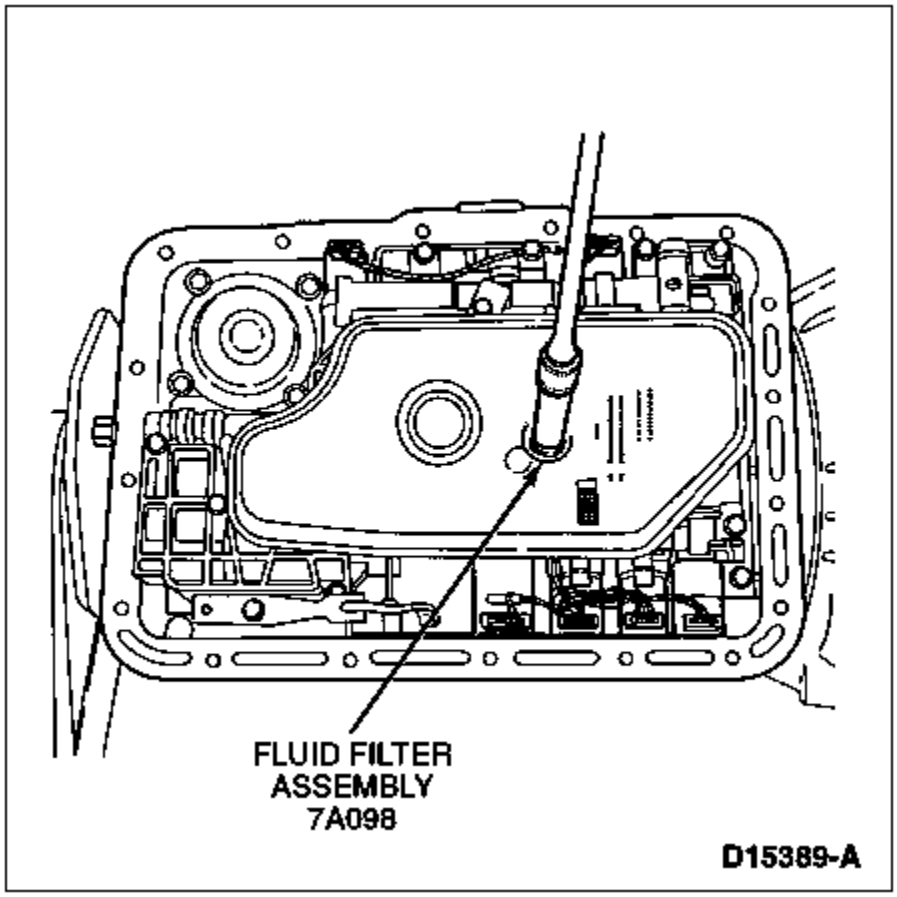
122. Ensure that both O-rings are properly installed onto filter prior to installation.



tomsn048@gmail.com

123. **CAUTION: Lubricate the fluid filter O-rings with MERCON V® XT-5-QM approved fluid, or they may be damaged.**

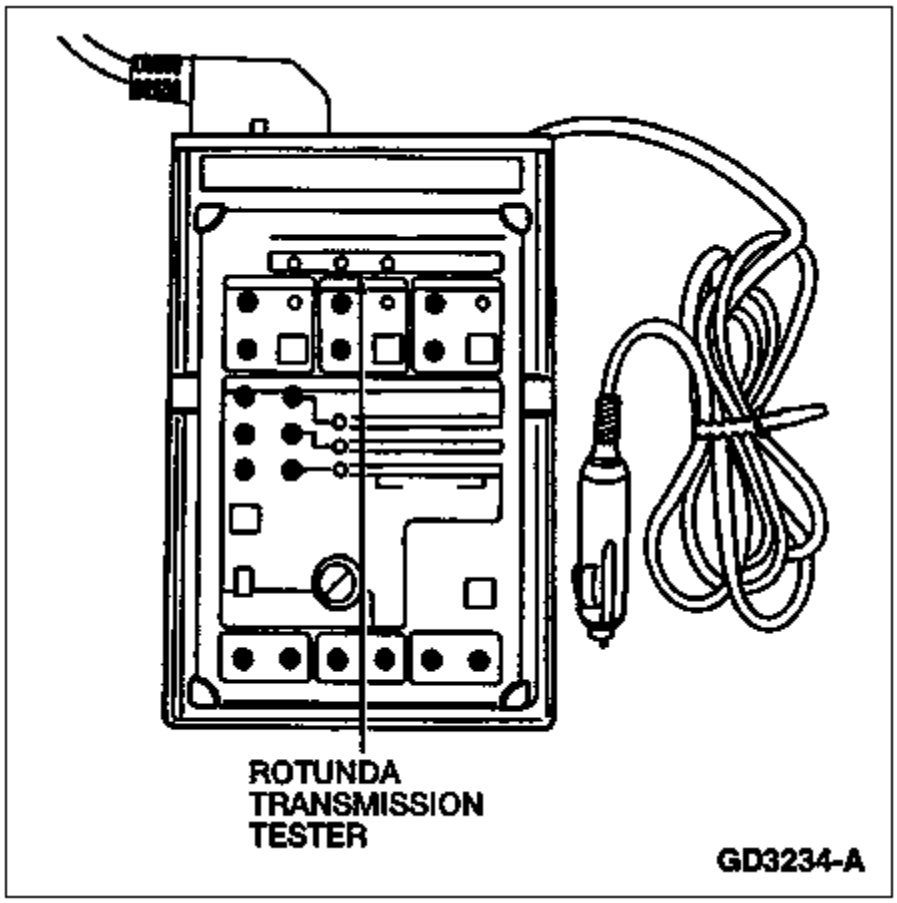
Lubricate and install new O-rings onto filter assembly. Install a new fluid filter assembly into the main control assembly. Install one "E" length M6 x 55 fluid filter assembly-to-main control assembly screw and tighten to 8-11 Nm (71-97 lb-in).



124. Install Rotunda Transmission Tester 007-00130 on the transmission 16-pin case connector.

tomsn048@gmail.com

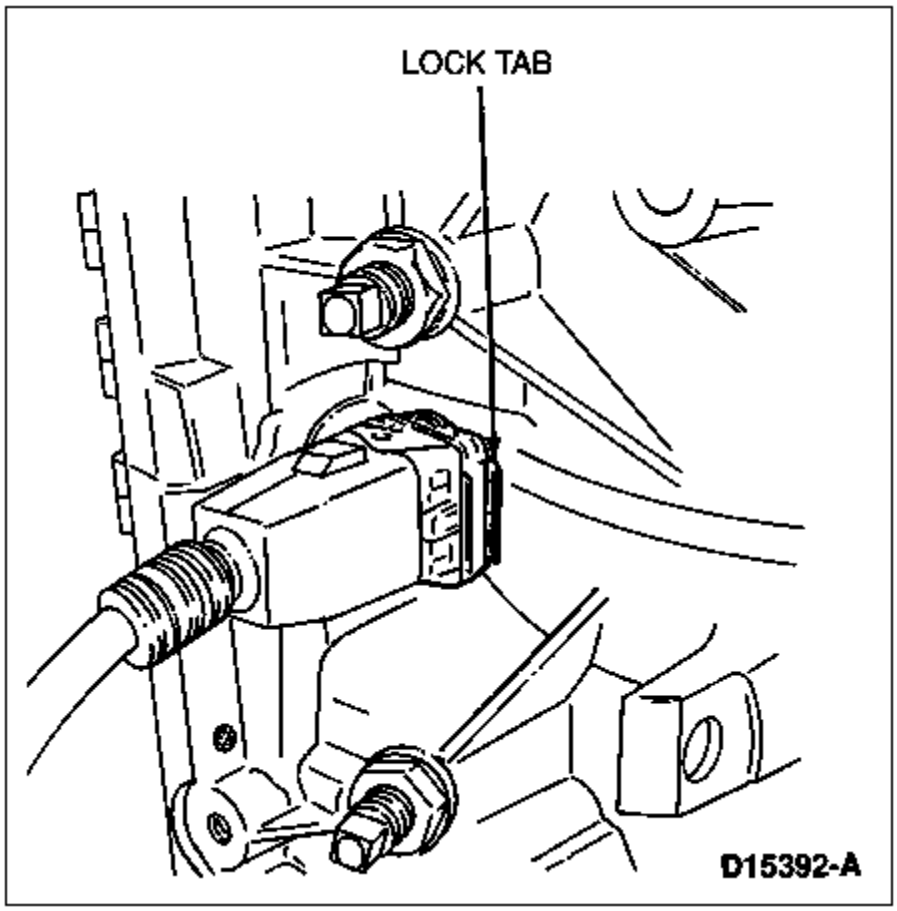
tomsn048@gmail.com



125. Use Rotunda Transmission Tester 007-00130 and the 4R44E/4R55E Cable/Overlay 007-00106 to perform the solenoid static function check bench testing procedures. Refer to Diagnosis and Testing in this section. This procedure will verify the electrical function of all solenoids prior to installing the fluid pan.

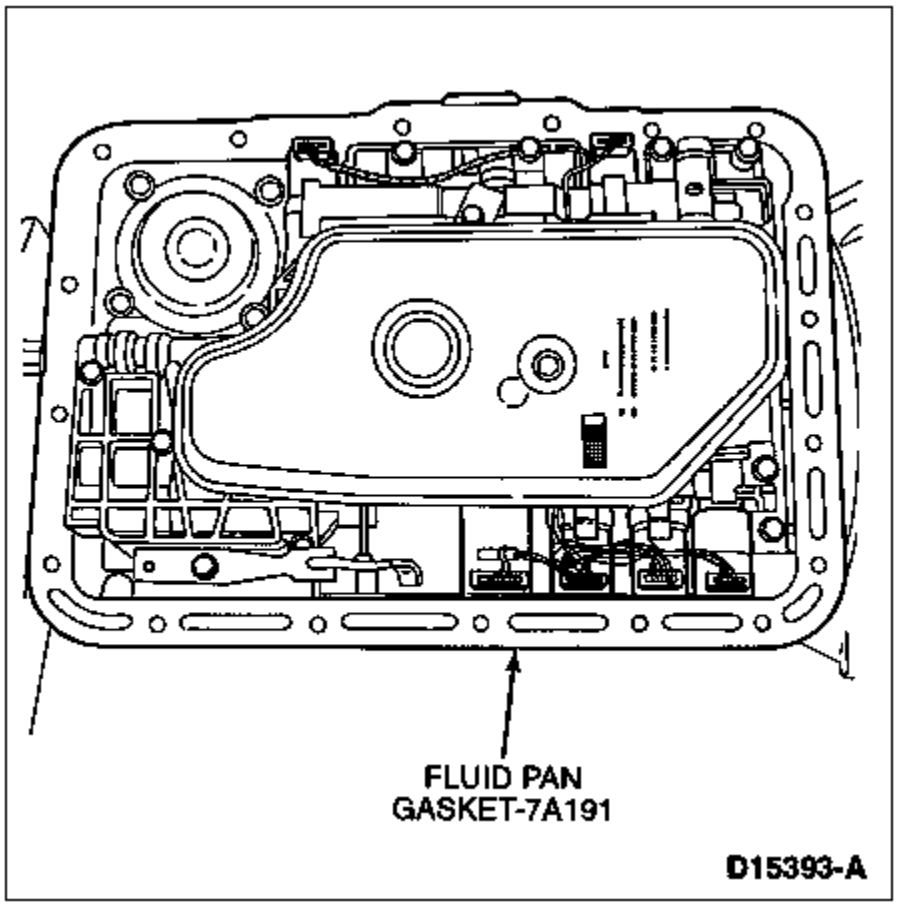
126. Depress the lock tab and remove the transmission tester.

tomsn048@gmail.com



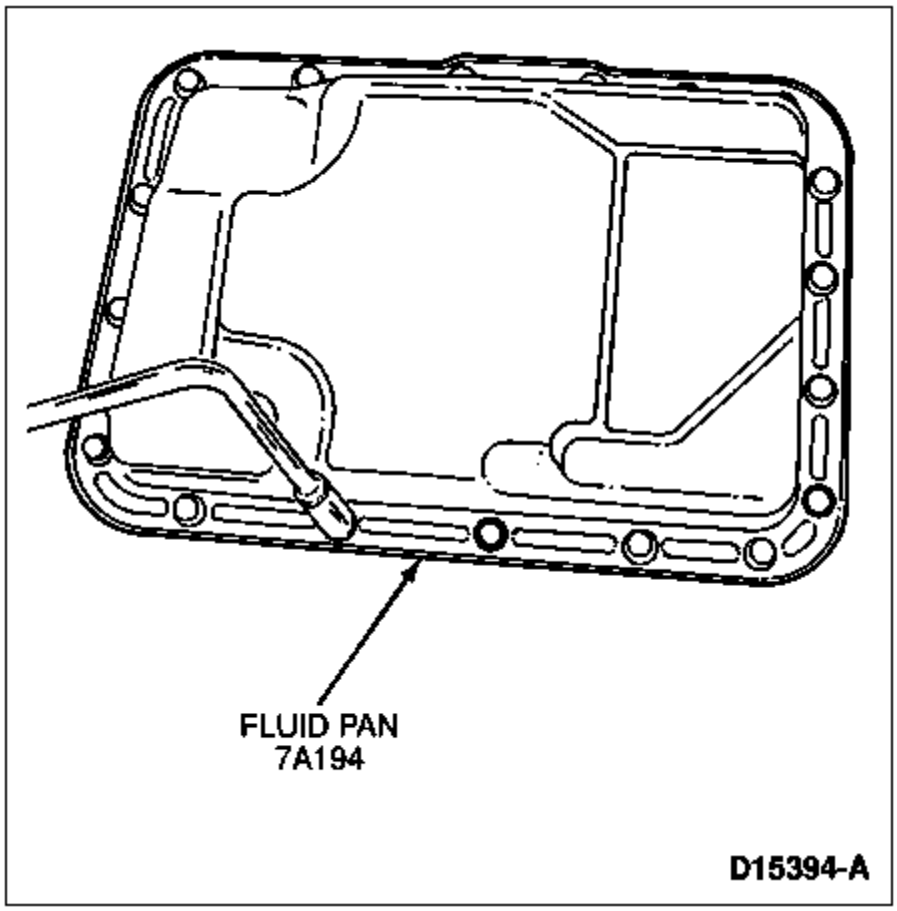
127. Position a new fluid pan gasket on the case fluid pan rail.

tomsn048@gmail.com



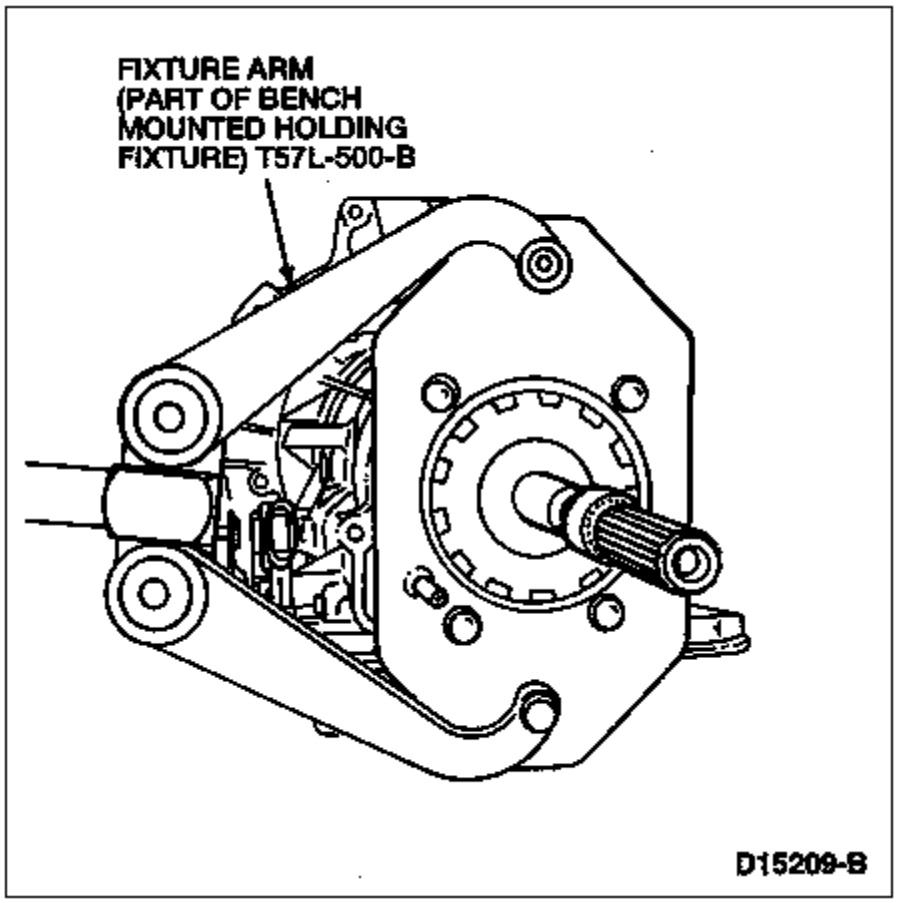
128. Install the fluid pan on top of the gasket. Use a 13 mm socket wrench to install the eighteen M8 x 16 mm fluid pan-to-case screws. Tighten the fluid pan-to-case screws to 13-15 Nm (115-133 lb-in).

tomsn048@gmail.com



129. Remove the transmission from the bench fixture pivot. Place the transmission on a flat surface. Remove the fixture and adapter plate.

tomsn048@gmail.com



130. **CAUTION: Make sure the parking lever actuating rod is correctly seated into the case parking rod guide cup.**

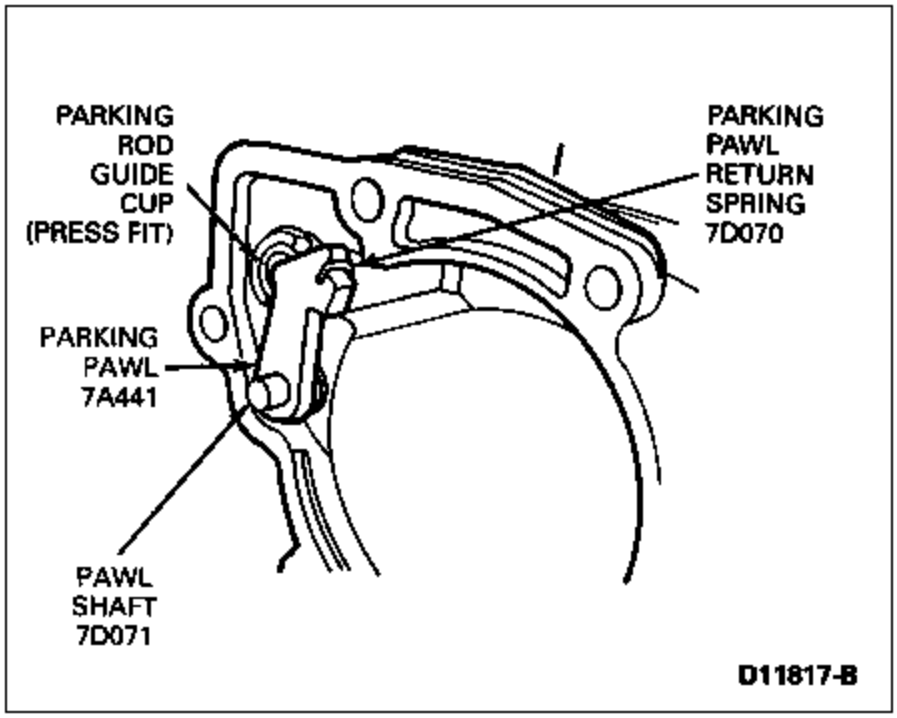
NOTE: Use petroleum jelly to hold the gasket in place.

NOTE: The guide cup is press-fit into the extension housing and is not serviced separately.

Install a new extension housing gasket on the case.

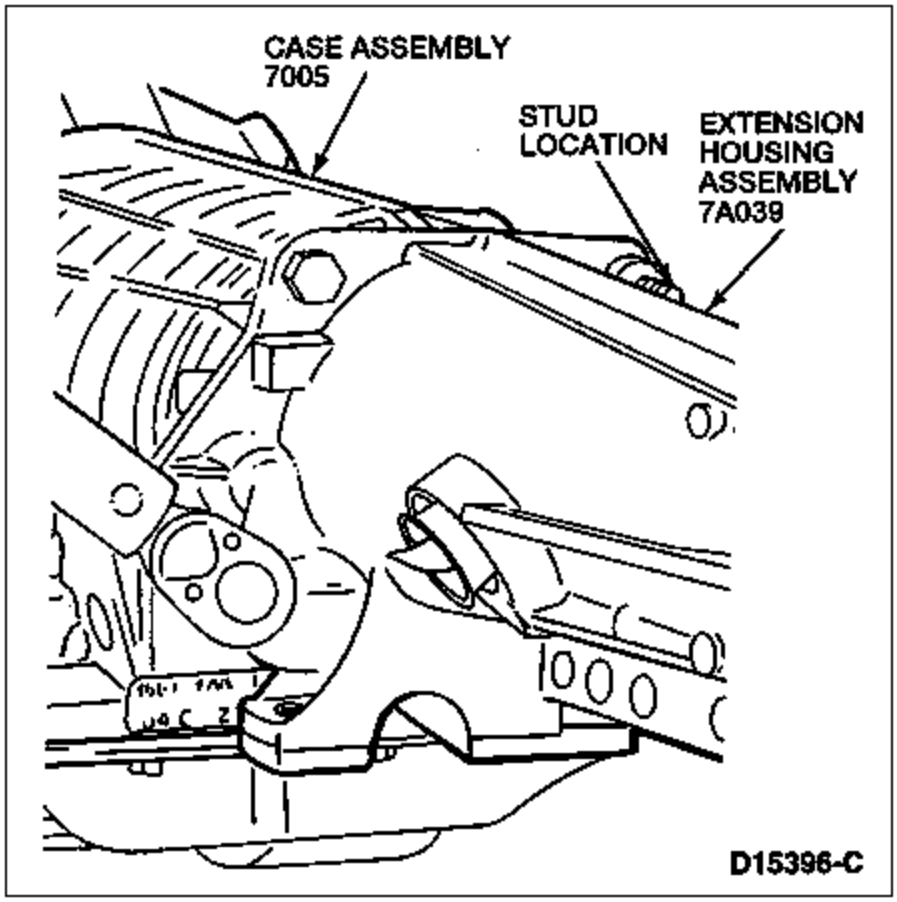
131. Install the parking pawl, pawl return spring and pawl shaft into the extension housing.

tomsn048@gmail.com



132. Install the extension housing. Install the five M10 x 30 mm extension housing-to-case screws and one stud. Tighten the extension housing-to-case screws and stud to 36-52 Nm (27-39 lb-ft).

tomsn048@gmail.com



133. **CAUTION: The lube hole in the bushing must be aligned with the lube groove in the extension housing.**

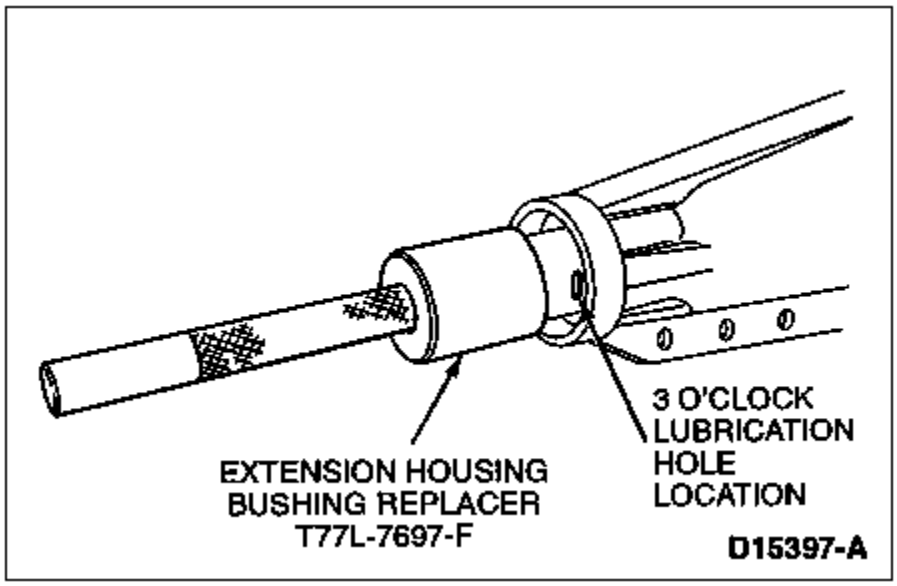
CAUTION: Tool will bottom when bushing is in the proper position.

NOTE: The lube hole should be located at the 3 o'clock position with view extension from the rear.

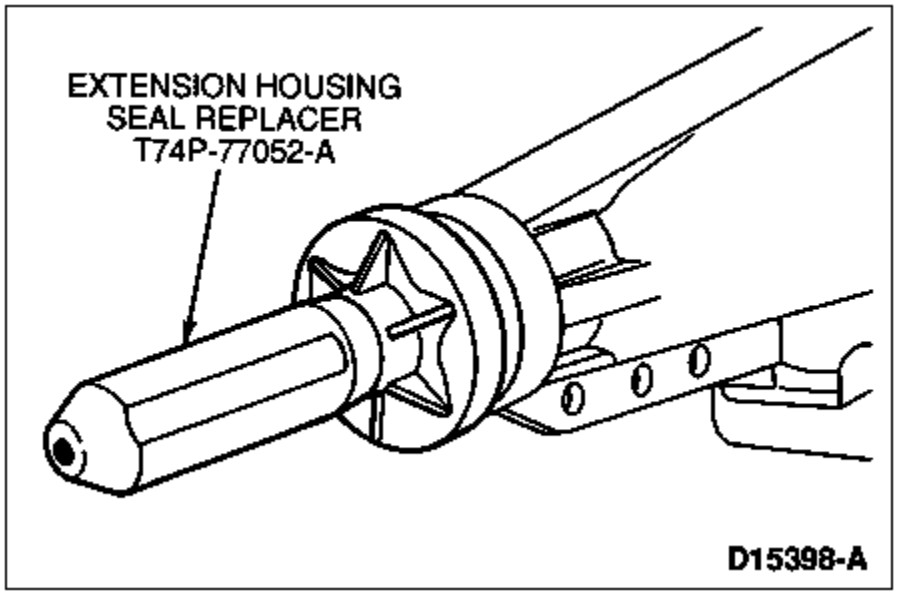
NOTE: Install the extension housing bushing only if it was removed in disassembly.

Install the extension housing bushing using Extension Housing Bushing Replacer T77L-7697-F.

tomsn048@gmail.com

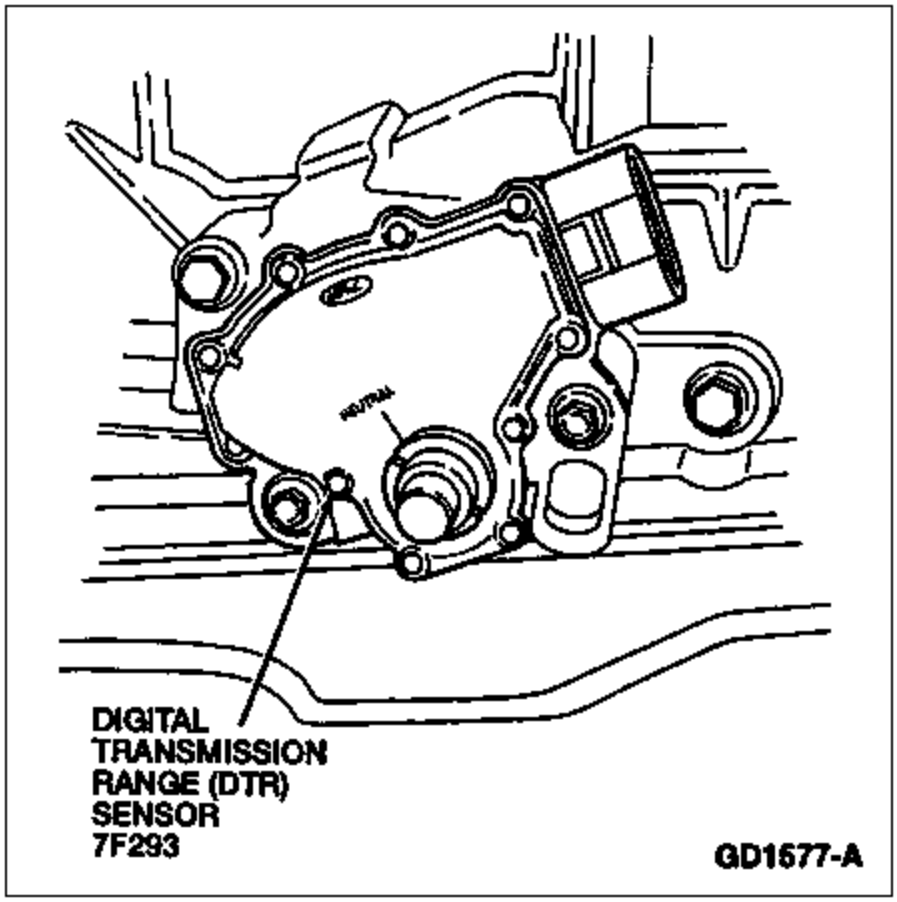


134. Position the extension housing seal drain hole at the 6 o'clock (down) position and install the extension housing seal using Extension Housing Seal Replacer T74P-77052-A.



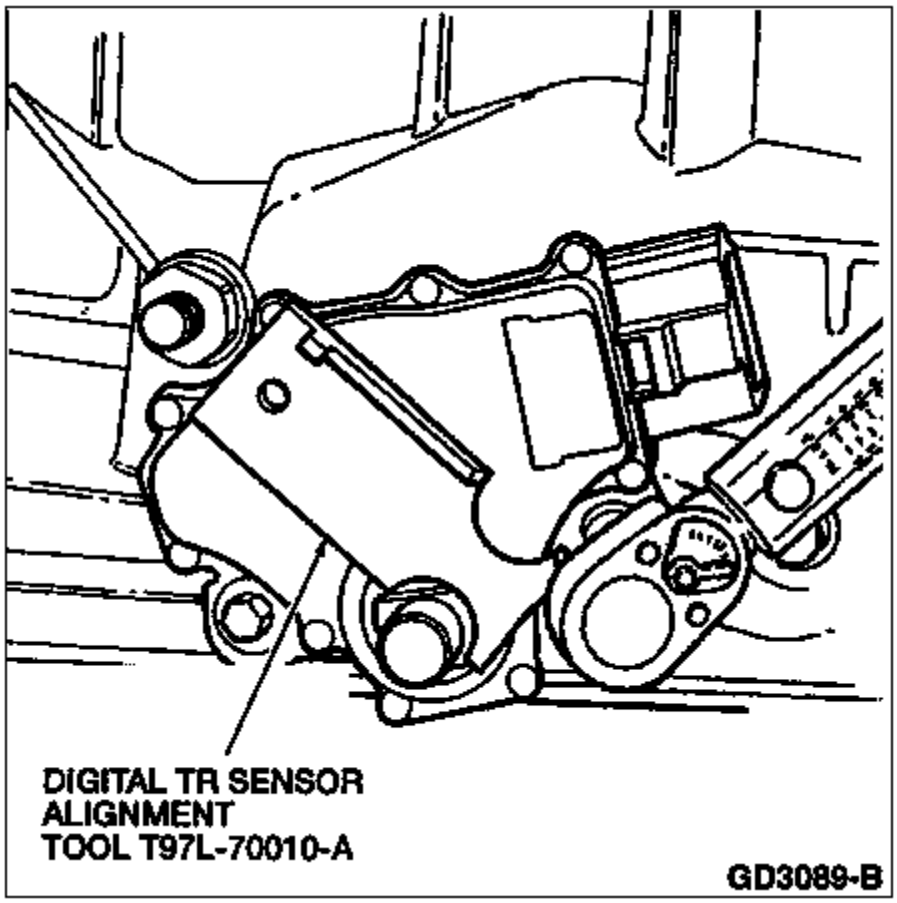
135. Install the digital transmission range (DTR) sensor on the manual lever. Install the two TR sensor screws and finger tighten. Rotate the manual lever to the neutral position (two detents rearward).

tomsn048@gmail.com



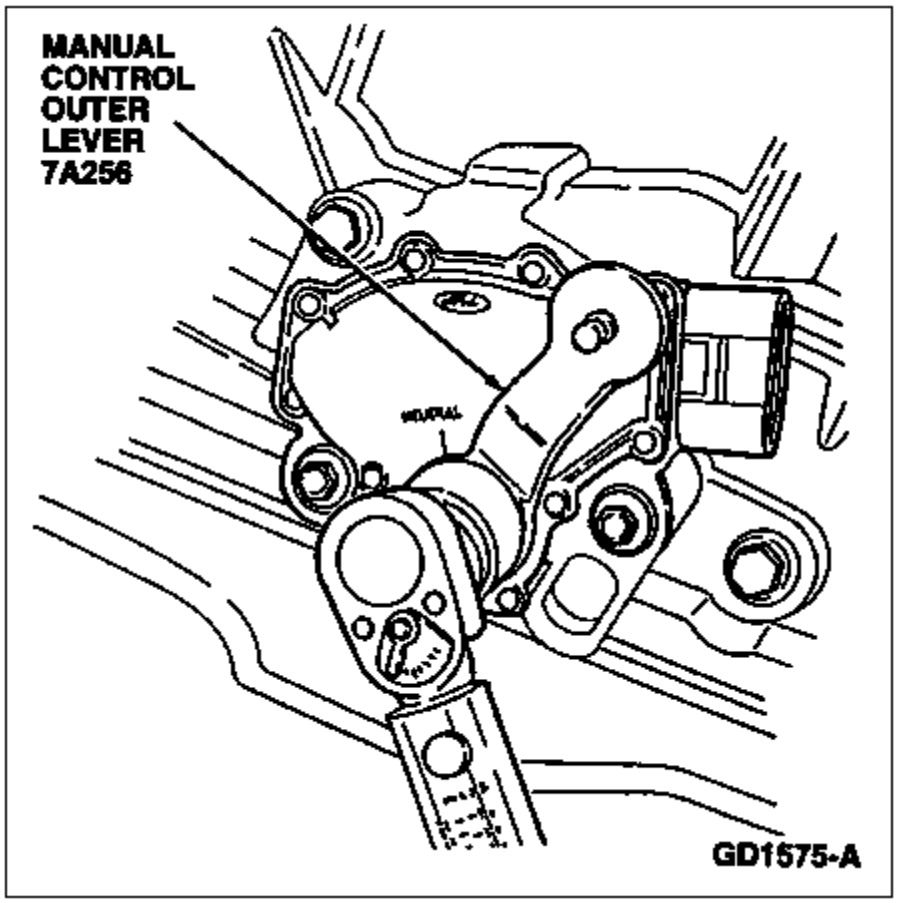
136. Install Digital TR Sensor Alignment Tool T97L-70010-A into the three slots on the DTR sensor. Tighten the TR sensor-to-case screws to 8-11 Nm (71-97 lb-in). Remove the alignment tool.

tomsn048@gmail.com



137. Install the manual control outer lever and manual control outer lever nut. Tighten the manual control outer lever nut to 41-54 Nm (30-40 lb-ft).

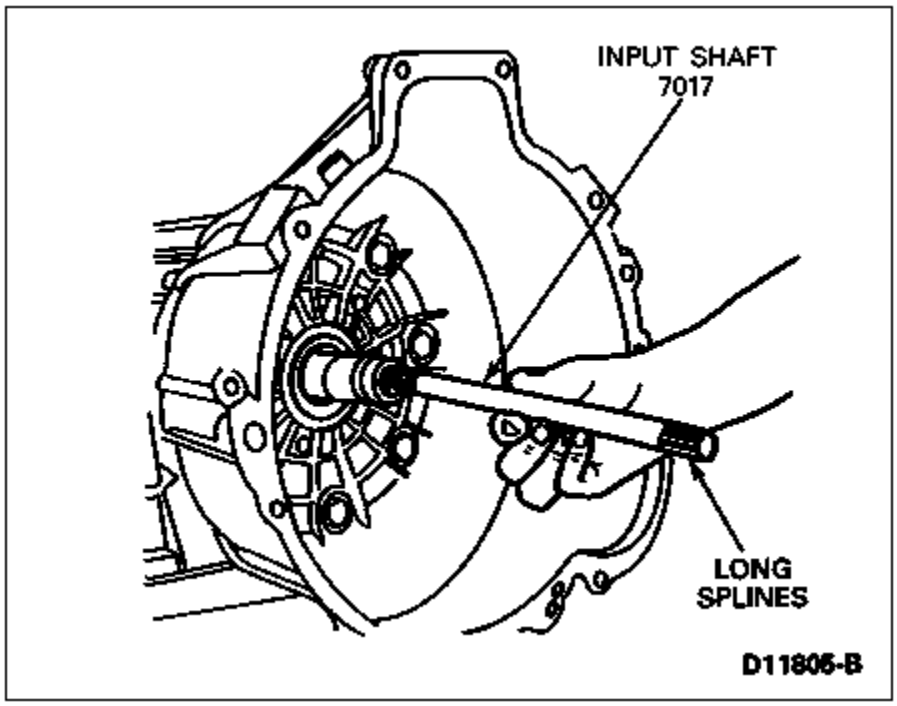
tomsn048@gmail.com



138. **CAUTION: The splines are not the same on both ends. The shaft end with the shorter splines goes into the front pump support and gear.**

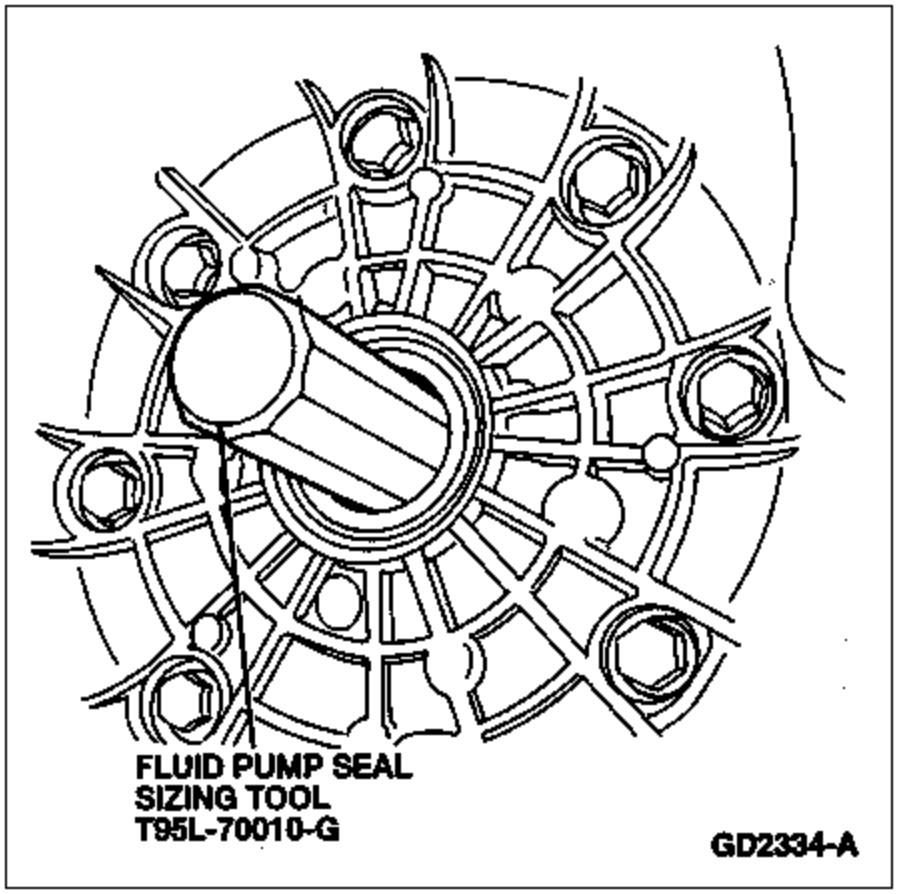
Install the input shaft into the front pump support and gear.

tomsn048@gmail.com



139. Insert Fluid Pump Seal Sizing Tool T95L-70010-G into pump drive gear to make sure the drive gear O-ring is properly seated prior to installing the torque converter. Remove tool.

tomsn048@gmail.com



140. **WARNING: THE TORQUE CONVERTER CAN FALL OUT IF THE TRANSMISSION IS TIPPED.**

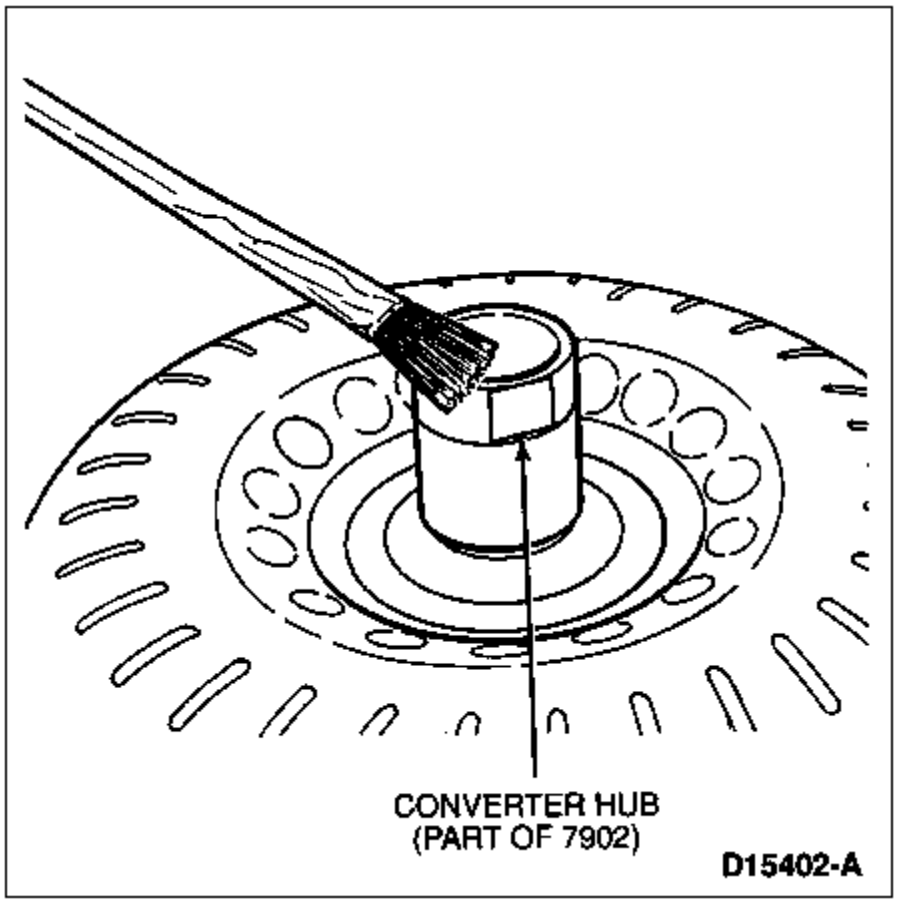
CAUTION: Do not damage the pump drive gear O-ring when installing the torque converter.

CAUTION: Make sure the converter hub is fully engaged in the front pump support and gear and rotates freely. Do not damage the hub seal.

CAUTION: If the torque converter slides out, the hub seal may be damaged.

Lightly lubricate the converter hub with MERCON V® XT-5-QM transmission fluid.

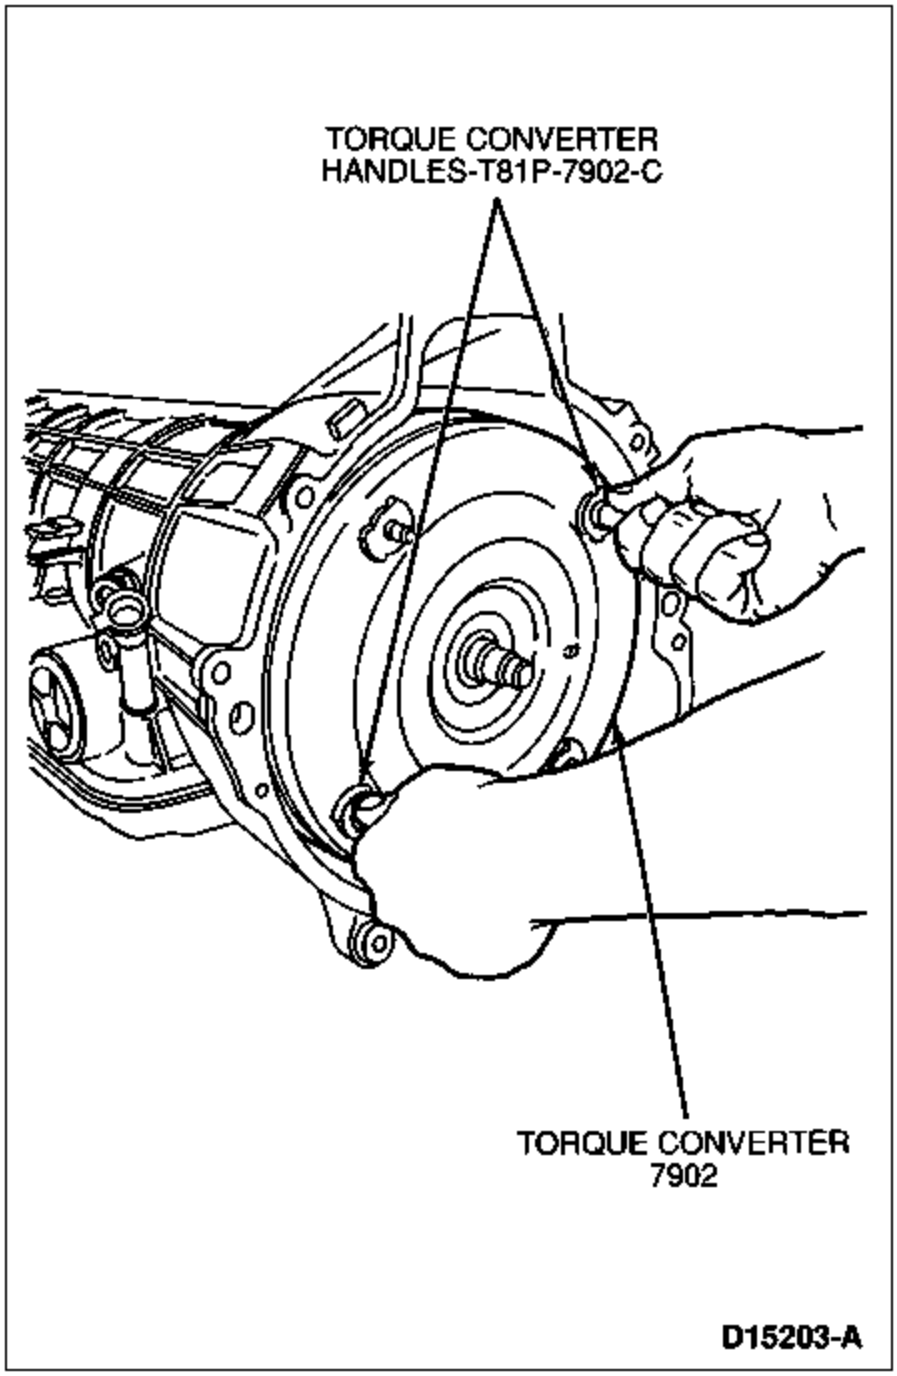
tomsn048@gmail.com



141. **WARNING: THE TORQUE CONVERTER IS HEAVY, ESPECIALLY WHEN FULL OF FLUID.**

Use Torque Converter Handles T81P-7902-C to install the torque converter by pushing and rotating.

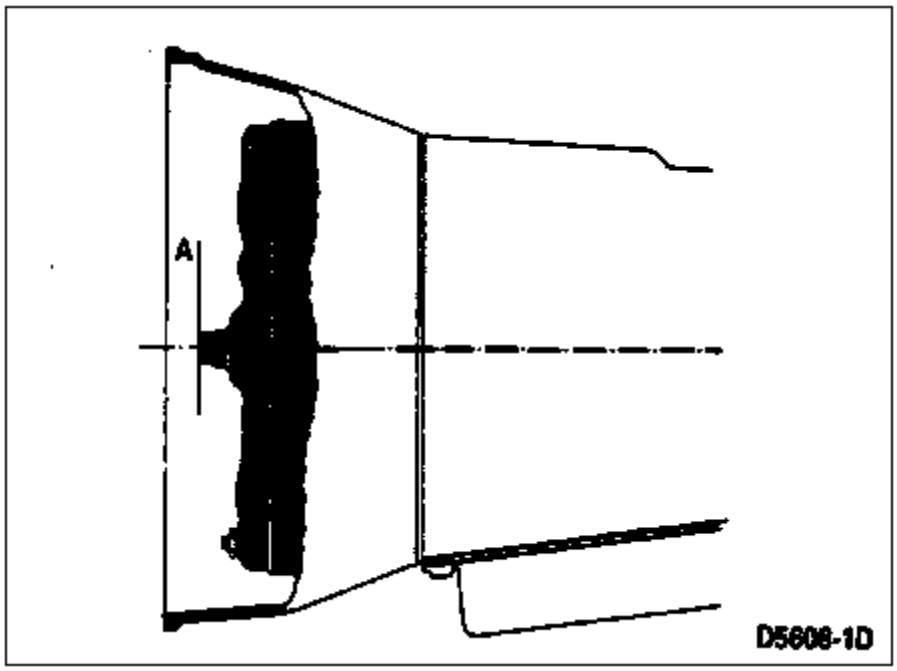
tomsn048@gmail.com



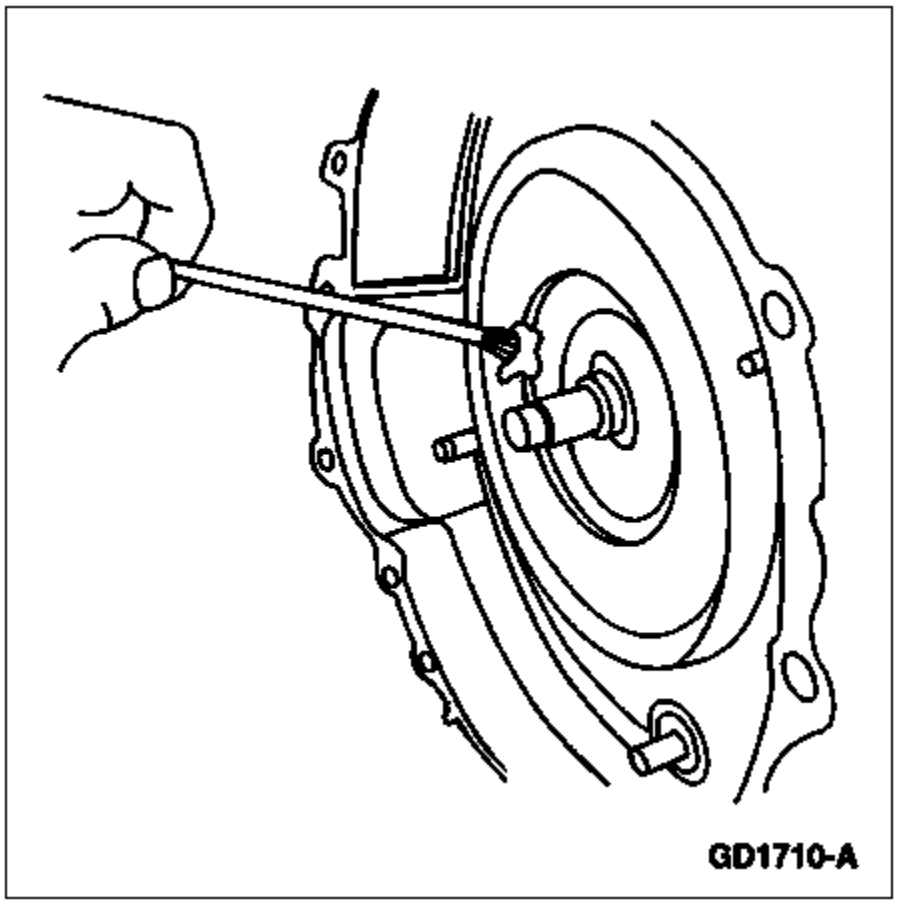
142. **NOTE: dimension "A" should be 10.23-14.43 mm (0.43-0.56 inch).**

Check dimension "A."

tomsn048@gmail.com



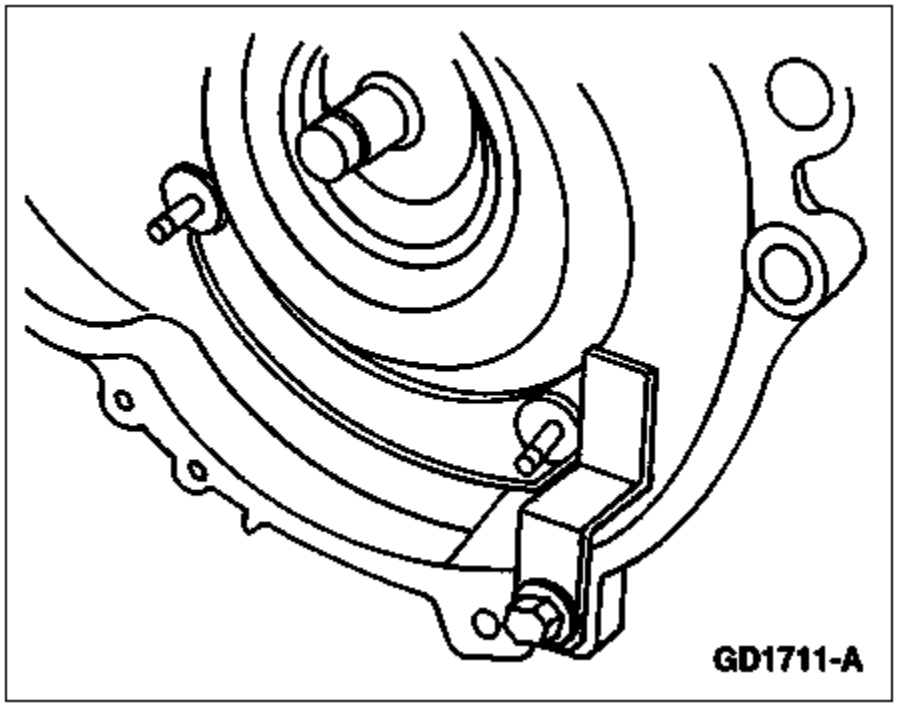
143. Prior to installation of the transmission assembly, the torque converter pilot hub must be properly lubricated. Use Ford Multi Purpose Grease (D0AZ-19584-AA, specification ESA-M1C45-A).



tomsn048@gmail.com

144. Before installing transmission, make sure that the transmission cooling system (line and cooler[s]) have been thoroughly flushed. Use the procedure found in this section. If contamination cannot be removed, or proper flow cannot be obtained, replace cooler and/or lines.

145. Install Torque Converter Holding Tool T97T-7902-A onto the case using standard bolt and nut to prevent converter from falling forward when moving to jackstand and to vehicle.



tomsn048@gmail.com

Transmission — 4x2 Aerostar

1. Install transmission and tighten bolts to 44-60 N-m (32-44 lb-ft).

2. **CAUTION: Use care not to bend or otherwise damage the cooler lines.**

   NOTE: The case connector fitting must be held in place to prevent it from moving while tightening the tube nut.

   Remove the caps from the lines and fittings. Securely install the transmission cooler lines to the transmission fittings.

3. Install new torque converter nuts and tighten them to 34-46 Nm (25-34 lb-ft).

4. Position the dual TWC converter assembly to the exhaust manifolds. Install four bolts and tighten them to 34-46 Nm (25-34 lb-ft).

5. Install the exhaust hanger to the transmission mount. Tighten the retainer to 20-27 Nm (15-20 lb-ft).

6. Raise the transmission, position the crossmember, and install through bolts and nuts. Tighten the retainers to 37-52 Nm (27-38 lb-ft).

7. Lower the transmission onto the crossmember. Remove the transmission jack adapter plate from the transmission. Lower and remove the jack.

8. Install the nuts to the transmission support insulator. Tighten the nuts to 85-118 Nm (63-87 lb-ft).

9. Reconnect the 8-pin and 16-pin connectors at the left rear cylinder head, reconnect the HO2S, and install the shift indicator cable to the bracket and lever.

10. Position the transmission access cover and install the two transmission access cover screws. Tighten them to 16-22 Nm (12-16 lb-ft).

11. Position the starter motor and ground wire. Install the bolts and tighten them to 22-28 Nm (16-21 lb-ft).

12. Lightly coat the slip yoke with High Temperature 4x4 Front Axle and Wheel Bearing Grease E8TZ-19590-A or equivalent.

13. Remove the plug and install the driveshaft. Rotate the driveshaft and align it with the index mark made during removal. Install the bolts and tighten them to 83-118 Nm (61-87 lb-ft).

14. Remove the safety stands.

15. Lower the vehicle.

16. Connect the negative battery cable.

tomsn048@gmail.com

17. Fill the transmission to the proper level with Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX or equivalent and install the indicator.

18. **NOTE: A weight of 1.4kg (3 lb) must be hung on the gearshift lever to verify the lever is located firmly on the DRIVE or the OVERDRIVE detent.**

    From inside the vehicle, place the gearshift lever in the DRIVE or the OVERDRIVE position.

19. Raise the vehicle.

20. Remove the shift cable from the transmission lever ball stud. Pull the lock tab down on the shift cable body. Position the gearshift lever in the DRIVE position (three detents from the front-most lever position, with the first position counted as one). Connect the cable end fitting to the transmission lever ball stud. Push up on the lock tab to lock the cable in the correctly adjusted position.

21. Lower the vehicle.

22. Remove the 1.4kg (3 lb) weight from the gearshift lever. After making the adjustment, check for park engagement. Check the gearshift lever in all detent positions with the engine running to verify correct detent/transmission actions. Readjust if necessary.

---

tomsn048@gmail.com

Transmission—4x2 Ranger

Installation

1. Position the torque converter to the transmission. Align the converter to the front pump by rotating the converter and pushing it inward until full engagement is made. Lightly lubricate the converter pilot hub using Ford Multi-Purpose Grease D0AZ-19584-AA or equivalent meeting Ford specification ESB-M1C93-B.

2. **NOTE: The torque converter must rest squarely against the flexplate. This indicates that the converter pilot is not binding in the crankshaft.**

   Position the transmission under the vehicle. Raise the transmission into position. Do not allow the torque converter drive flats to disengage the pump gear. Rotate the converter to align the studs with the flexplate mounting holes. Position the transmission to the engine.

3. **NOTE: The top right transmission-to-engine bolt, retaining the fluid level indicator tube and harness bracket, must be installed after the other transmission-to-engine bolts have been installed and tightend.**

   Install the connector bracket, fluid level indicator tube, and six transmission-to-engine bolts. Tighten the bolts to 44-60 Nm (32-44 lb-ft). Connect the 16-pin harness connectors.

4. Remove the engine support.

5. **CAUTION: Use care not to bend or otherwise damage the cooler lines. The case connector fitting must be held in place to prevent it from moving while tightening the tube nut.**

   Remove the caps from the lines and fittings. Install the transmission cooler lines. Tighten the fittings to 35-43 Nm (26-32 lb-ft). Securely install the bolt retaining the cooler line bracket to the engine block.

6. Install new torque converter nuts. Tighten the nuts to 34-46 Nm (25-34 lb-ft).

7. Install the torque converter access cover. Securely install two access cover bolts.

8. Raise the transmission and position the Y-pipe to the exhaust manifolds. Loosely install the hanger bracket bolt. Install the converter-to-tailpipe flange bolts and the Y-pipe-to-manifold bolts. Tighten the bolts to 34-46 Nm (25-34 lb-ft).

9. Install the exhaust hanger at the transmission support insulator. Tighten the retainer to 20-27 Nm (15-20 lb-ft).

10. Position the crossmember. Install the bolts and nuts. Tighten the retainers to 37-52 Nm (27-38 lb-ft).

11. Lower the transmission guiding support insulator studs into the crossmember. Install the transmission support insulator nuts. Tighten the nuts to 85-118 Nm (63-87 lb-ft).

tomsn048@gmail.com

12. Lower and remove the transmission jack from under the vehicle.

13. Connect the HO2S connectors and install the shift cable to the shift cable bracket. Connect the shift cable to the manual control lever.

14. Install the oil filter funnel and the starter motor. Install the bolts and tighten them to 22-28 Nm (16-21 lb-ft). Securely install the oil filter funnel bolt and nut.

15. Lightly coat the slip yoke with Premium Long-life Grease XG-1-C (or -K, or equivalent meeting Ford specification ESA-M1C75-B).

16. Remove the extension housing plug and install the driveshaft. Rotate the driveshaft and align it to the index mark made during removal. Install the bolts and tighten them to 83-118 Nm (61-87 lb-ft). Install two midship bearing clips and bolts. Tighten the retainers to 37-50 Nm (27-37 lb-ft).

17. Remove the jack stands.

18. Lower the vehicle.

19. From inside the vehicle, place the gearshift lever in the DRIVE or OVERDRIVE position. Hang a weight of 1.4 kg (3 lb) on the gearshift lever to verify the lever is located firmly on the D or OVERDRIVE detent.

20. Raise the vehicle.

21. Remove the shift cable from the transmission lever ball stud. Pull down on the lock tab on the shift cable body. Position the gearshift lever in the DRIVE position. (This is three detents from the frontmost lever position, with the first position counted as one). Connect the cable end fitting to the transmission lever ball stud. Push up on the lock tab and lock the cable in the correctly adjusted position.

22. Lower the vehicle.

23. Install the fan shroud-to-radiator bolts. Tighten the bolts to 6-8 Nm (53-71 lb-in).

24. Connect the negative battery cable.

25. Fill the transmission to the proper level with Mercon® Multi-Purpose Automatic Transmission Fluid XT-2-QDX or equivalent meeting MERCON® specification and install the fluid level indicator.

26. Check the operation of the transmission.

27. Remove the three-pound weight from the gearshift lever. After making the adjustment, check for park engagement. Check the gearshift lever in all detent positions with the engine running, to verify correct detent/transmission actions. Readjust if necessary.

---

tomsn048@gmail.com

tomsn048@gmail.com

Transmission — 4x4

1. **WARNING: SECURE THE TRANSMISSION TO THE TRANSMISSION JACK WITH A SAFETY CHAIN.**

   Position the transmission on a transmission jack.

2. Raise the transmission jack and position the transmission to engine.

3. Remove Torque Converter Holding Tool T97T-7902-A.

4. Position the transmission to the engine and align the converter stud-to-flex plate index mark made at removal.

5. Install the four converter housing-to-engine screws. Tighten to 40-55 Nm (30-41 lb-ft) on the 2.3L. On the 3.0L, tighten to 40-55 Nm (30-41 lb-ft).

6. **CAUTION: Use care not to bend or otherwise damage the cooler lines.**

   Remove the plugs and install the transmission cooler lines. Tighten the transmission cooler lines tube nuts to 24-31 Nm (18-23 lb-ft).

7. Install the two lower converter housing-to-engine screws. Tighten to 40-55 Nm (30-41 lb-ft) on the 2.3L. On the 3.0L, tighten to 40-55 Nm (30-41 lb-ft).

8. Install the fluid filler tube into the lube fluid inlet short tube.

9. Install the two upper converter housing-to-engine screws. Tighten to 40-55 Nm (30-41 lb-ft) on the 2.3L. Tighten to 40-55 Nm (30-41 lb-ft) on the 3.0L.

10. Install the transfer case. Refer to Section 07-07A , Section 07-07B , Section 07-07C or Section 07-07D .

11. Install the transfer case vent bracket. Tighten the transfer case vent bracket screws to 34-46 Nm (25-34 lb-ft).

12. Install the five transfer case-to-extension housing bolts. Tighten to 34-48 Nm (25-35 lb-ft).

13. On 3.0L, install the catalytic converter and crossover pipe nuts using 15 mm socket wrench. Tighten the nuts to 24-34 Nm (18-25 lb-ft).

14. On 3.0L, install the catalytic converter-to-exhaust bolts. Tighten to 24-34 Nm (18-25 lb-ft).

15. Install the rear engine mount. Refer to Section 02-03 .

16. On Aerostar vehicles, install the two crossmember-to-frame through nuts and bolts. Tighten to 37-52 Nm (28-38 lb-ft).

tomsn048@gmail.com

17. On Aerostar vehicles, install the engine support-to-crossmember screws. Tighten to 98-132 Nm (73-97 lb-ft).

18. On Ranger vehicles, install the two crossmember-to-frame through nuts and bolts. Tighten to 88-115 Nm (65-85 lb-ft).

19. On Ranger vehicles, install the engine support-to-crossmember nuts. Tighten to 88-115 Nm (65-85 lb-ft).

20. Install the two rear engine support-to-crossmember nuts. Tighten to 85-118 Nm (63-87 lb-ft).

21. Connect the transfer case electrical connectors.

22. Install the front axle driveshaft. Refer to Section 05-03A , Section 05-03B or Section 05-03C .

23. Install the transfer case skid plate. Tighten the skid plate screws to 22-28 Nm (16-21 lb-ft).

24. Connect the 16-pin transmission electrical connector and the digital transmission range (DTR) sensor connector.

25. Install the transmission shift cable into the cable bracket.

26. Install the transmission shift bellcrank on the ball stud lever.

27. Connect the transmission shift cable to the transmission manual control lever.

28. Adjust shift cable; refer to cable adjustment.

29. Install the vehicle speed sensor (VSS) (if equipped) into the transfer case.

30. Align the index mark made at removal and install the rear driveshaft. Refer to Section 05-01 .

31. **CAUTION: Never turn the engine counterclockwise (as viewed from the front).**

    CAUTION: Use new flexplate-to-converter nuts.

    Install the four new flexplate-to-converter nuts, using a 22 mm socket wrench and breaker bar on the crankshaft pulley to turn the engine into position. Tighten the flexplate-to-converter nuts to 30-40 Nm (22-30 lb-ft).

32. Install the starter motor. Refer to Section 03-06 .

33. For 3.0L, install the transmission access cover and screws. Tighten the bolts to 16-22 Nm (12-16 lb-ft).

34. Lower the vehicle.

35. Fill the transmission fluid with MERCON V® XT-5-QM to the proper level. Refer to procedure in this section.

36. Install the fluid level indicator.

tomsn048@gmail.com

37. Install the battery ground cable.

tomsn048@gmail.com

Transmission Fluid Lines

When one or more of the fluid cooler steel tubes must be replaced, each replacement tube must be fabricated from the same size steel tubing as the original line.

Using the old tube as a guide, bend the new tube as required. Add the necessary fittings and install the tube. Make sure the tube has adequate clearance to the other components, especially the exhaust system and parts having sharp edges.

After the fittings have been tightened, add fluid as needed and check for fluid leaks.

tomsn048@gmail.com

Transmission

It is important to completely clean all transmission components including the converter, fluid cooler, cooler lines, main control valve body, all clutches and check balls after any transmission servicing that generates contamination. These contaminants are a major cause for recurring transmission troubles and must be removed from the system before the transmission is put back into service. The cleaning of debris from the coast, direct/reverse, and the forward clutch check balls is often omitted. This omission can lead to a repeat servicing of the transmission.

Clean the parts with a suitable solvent and use moisture-free air to dry off all the parts and clean out fluid passages.

CAUTION: Do not use mineral spirits or oil based solvent.

The composition clutch plates, bands, and synthetic seals should not be cleaned in a vapor degreaser or any type of detergent solution.

To clean these parts, wipe them off with a lint-free cloth. New clutch plates or bands should be soaked in transmission fluid specified for that transmission type for 30 minutes before being assembled.

tomsn048@gmail.com

Main Control Valve Body

1. Clean all parts thoroughly in clean solvent and blow dry with moisture-free compressed air.

2. Inspect all valve and plug bores for scores. Check all fluid passages for obstructions. Inspect the check valve for free movement. Inspect all mating surfaces for burrs or distortion. Inspect all plugs and valves for burrs or scores. Replace the control valve body if the bores or valve are scored beyond the point of being cleanable.

3. **CAUTION: Do not sand, stone or polish valves and bores. This removes the anodizing treatment and destroys them.**

   Inspect all springs for distortion. Check all valves and plugs for free movement in their respective bores. Valves and plugs, when dry, must fall from their own weight into their respective bores.

4. Roll the manual valve on a flat surface to check for a bent condition.

tomsn048@gmail.com

Overdrive and Intermediate Servos

NOTE: Identify servo covers, pistons, and springs with a tag.

1. Inspect the servo bore for cracks and the servo piston for damage (the rubber sealing surfaces should be pliable). Inspect the piston bore, servo piston bore and servo piston stem for scores. Check the fluid passages for obstructions. Replace damaged seals.

2. Check the servo springs, servo band strut(s) and apply levers for distortion and wear.

3. Inspect the cover seal and gasket cover sealing surface for damage.

4. Inspect the band lining for excessive wear and for proper bonding to the metal band.

tomsn048@gmail.com

Low-Reverse Servo and Band

1. Inspect the bore for scores.
2. Check the fluid passages for obstructions.
3. Inspect the band for distortion. Inspect the band ends for cracks.
4. Inspect the servo for distortion.
5. Inspect the band lining for excessive wear and for proper bonding to the metal band.
6. Replace the cover seal if damaged.
7. Replace the piston seals if damaged.

tomsn048@gmail.com

Extension Housing

1. Inspect the housing for cracks. Inspect the gasket surface for burrs or warpage.
2. Inspect the bushing for scores or wear. Inspect slip yoke for damage. Replace if required.
3. Inspect the rear seal for hardness, cracks or wear. Replace if required.
4. Inspect the seal counterbore and remove all burrs and scores with a crocus cloth.

tomsn048@gmail.com

Pump

1. Inspect the mating surfaces of the pump body and case for burrs.
2. Inspect the drive and driven gear bearing surfaces for scores. Check the gear teeth for burrs.
3. Inspect the inner pump gear O-ring for damage.
4. Inspect the front pump seal for cuts or nicks. Inspect the pump bushing for scoring.
5. Check all fluid passages for obstruction.
6. If any parts are found damaged or worn, replace the pump as an assembly. Minor burrs and scores may be removed with a crocus cloth.

tomsn048@gmail.com

Direct/Reverse and Coast Clutches

1. Inspect the drum band surface, bushing and thrust surfaces for scores. Minor scores may be removed with a crocus cloth. Badly scored parts must be replaced.

2. Inspect the clutch piston bore and piston inner and outer bearing surfaces for scores.

3. Check the fluid passages for obstructions. All fluid passages must be clean and free of obstruction.

4. Inspect the clutch plates for wear, scoring and fit on the clutch hub serrations. Replace all plates that are badly scored, worn or do not fit freely in the hub serrations.

5. Inspect the clutch pressure plate for scoring and binding on the clutch plate surface. Check the clutch release spring for distortion pressure.

6. The clutch cylinders have check balls. Inspect the check balls for freedom of movement and proper seating.

7. Inspect the friction plates for proper installation (direction).

tomsn048@gmail.com

Forward Clutch

1. Inspect the clutch cylinder thrust surfaces, piston bore and clutch plate serration for scores or burrs. Minor scores and burrs may be removed with a crocus cloth. Replace the clutch cylinder if it is badly scored or damaged.

2. Check the fluid passages in the clutch cylinder for obstructions. Clean out all fluid passages. Inspect the clutch piston for scores and replace if necessary. Inspect the piston check ball for freedom of movement and proper seating.

3. Check the clutch release springs for distortion and cracks. Replace the springs if they are distorted or cracked.

4. Inspect the composition clutch plates, steel clutch plates and clutch pressure plate for worn or scored surfaces. Replace all parts that are deeply scored.

5. Check all clutch plates for flatness and fit on the clutch hub serrations. Discard any plate that does not slide freely on the serrations or that is not flat.

6. Check the clutch hub thrust surfaces for scores. Check the clutch hub splines for wear.

tomsn048@gmail.com

Input Shaft

Check the input shaft for damaged or worn splines. Replace the shaft if the splines are excessively worn. Inspect the bushings in the stator support for scores.

tomsn048@gmail.com

Overdrive One-Way Clutch and Rear One-Way Clutch

1. Inspect the outer and inner races for scores or damaged surface areas where the rollers contact the races.

2. Inspect the rollers and springs for excessive wear or damage.

tomsn048@gmail.com

Converter and Fluid Cooler

When wear or internal damage has occurred in the transmission, metal particles, clutch plate material, or band material may have been carried into the converter and fluid cooler. These contaminants are a major cause of recurring transmission troubles and must be removed from the system before the transmission is put back into service.

Whenever a transmission has been disassembled to replace worn or damaged parts, or because the valve body sticks from foreign material, the converter, fluid cooler and cooler lines must be cleaned and flushed. Rotunda Torque Converter/Transmission Oil Cooler Cleaner 014-00028 or equivalent can be used. Under no circumstances should an attempt be made to clean the torque converter by hand agitation with solvent.

The lack of a drain plug in the torque converter increases the amount of residual flushing solvent in the torque converter after cleaning. This retained solvent is not acceptable and a method of diluting is required. The following procedure is to be used after the removal of the torque converter from the cleaning equipment.

1. Thoroughly drain the remaining solvent through the converter hub.
2. Add 1.9L (2.0 quarts) of clean MERCON V® XT-5-QM transmission fluid to the converter. Agitate by hand.
3. Thoroughly drain the solution through the converter hub.

tomsn048@gmail.com

Pinion Carriers

Individual parts of the planetary carriers are not serviceable.

1. Check the pins and shafts in the planetary assemblies for loose fit and/or complete disengagement. Use a new planetary assembly if either condition exists. Before installing a planetary assembly, the shaft retaining pins should be checked for adequate staking. Do not restake the planetary pinion. If necessary, replace the planetary assembly.

2. Inspect the pinion gears for damaged or excessively worn teeth.

3. Check for free rotation of the pinion gears.

tomsn048@gmail.com

Stator Support

1. Inspect the stator support splines for burrs and wear.
2. Check the oil ring grooves in the stator support for nicks, burrs or damaged edges.
3. Check the front and rear bushings of the stator support for wear or scoring.
4. Check front pump support seal and groove.
5. Check the seal rings for damage.
6. Check bearings for damage.

tomsn048@gmail.com

Case

Inspect the case for cracks and stripped threads. Inspect the gasket surfaces and mating surfaces for burrs. Check the vent for obstructions, and check all fluid passages for obstructions and leakage.

Inspect the case bearing for scores. Check all parking linkage parts for wear or damage.

Inspect the case threads for damage.

tomsn048@gmail.com

Case Thread Repair Procedures

If a transmission case thread is damaged, service kits may be purchased from local jobbers. To service a damaged thread, the following procedure should be carefully followed.

1. Drill out the damaged threads, using the same drill size as the thread outside diameter. For example, use a 5/16-inch drill for a 5/16-18-inch thread.

2. Select the proper special tap and tap the drilled hole. The tap is marked for the size of the thread being repaired. The special tap marked 5/16-18 inch will not cut the same thread as a standard 5/16-18-inch tap. It does cut a thread large enough to accommodate the insert, and after the insert is installed, the original thread size is restored.

3. Select the proper coil inserting tool. These tools are marked with the thread size being repaired. Place the insert on the tool and adjust the sleeve to the length of the insert being used. Press the insert against the face of the tapped hole. Turn the tool clockwise and wind the insert into the hole until the insert is one-half turn below the face.

4. Working through the insert, bend the insert tang straight up and down until it breaks off at the notch.

5. Improperly installed inserts can be removed with the extractor tool. Place the extractor tool in the insert with the blade resting against the top coil one-quarter to one-half turn away from the end of the coil. Tap the tool sharply with a hammer until the blade cuts into the insert. Exert downward pressure on the tool and turn it counterclockwise until the insert is removed.

SPECIFICATIONS

Fluid Capacity

Vehicle	Engine	Approximate Refill Capacity [1]	
		Liters	U.S. Quarts
Aerostar, Ranger — 4R44E (4x2)	2.3L, 3.0L	9.0	9.5
Aerostar, Ranger — 4R44E (4x4)	2.3L, 3.0L	9.3	9.8

[1] Approximate dry capacity, includes cooler and lines. Fluid level indicator should be used to determine actual fluid requirements and fluid specification. Check level at normal operating temperature. DO NOT OVERFILL.

If it is necessary to add or replace fluid, use only fluid which has been certified by the supplier as meeting one of the Ford Motor Company specifications shown.

Note: Use Motorcraft MERCON V® or fluid meeting Ford specification XT-5-QM.

Transmission Description

The 5R55E automatic transmission is an electronically controlled five-speed unit.

The 5R55E transmission is used with the 4.0L engine applications.

This transmission features a four element torque converter with a torque converter clutch (TCC). The geartrain includes:

- Three compound planetary gearsets
- Three bands
- Three multi-plate clutches
- Two one-way clutches

The hydraulic functions are directed by electronic solenoids to control:

- Engagement feel
- Shift feel
- Shift scheduling
- Modulated TCC applications
- Timing of the 3-2 T.D. and K.D. shifts
- Engine braking (with O/D canceled) utilizing the coast clutch
- Manual 1st timing

Transmission Range Operation

The 5R55E transmission range selector lever has six positions: P, R, N, D, 2, 1. The driver selects the required gear position by moving the selector lever to the various positions. Interlocking cables and linkages connect the selector lever to the transmission. This allows the selector lever to move internal linkages and the manual control valve, which signals the driver demand.

Park

No powerflow is transferred through the transmission in PARK. The manual lever shaft, which is connected to a park rod, presses the parking pawl into the park gear on the output shaft. This locks the output shaft and prevents the vehicle from rolling. However, for safety reasons, the parking brake should be applied whenever the vehicle is parked.

While the engine can be started in either P or N position, the ignition key can only be removed in PARK.

Reverse

Reverse gear allows the vehicle to be operated in a rearward direction, at a reduced gear ratio. When overdrive has been cancelled, engine braking is provided in the R position with the coast clutch applied.

Neutral

As in PARK, there is no power transferred through the transmission. However, the final drive is not locked by the parking pawl, so the wheels are free to rotate. The vehicle may be started in the N position, but the ignition key cannot be removed.

Overdrive

In the (D) position, the transmission will upshift or downshift 1-2-3-4-5 automatically.

When overdrive has been canceled by turning the transmission control switch on, the transmission will not upshift to 5th gear. Engine braking is provided in 1st, 2nd, 3rd, 4th and reverse gears with the coast clutch applied.

2nd Position

Selection of the 2 position provides a 3rd gear hold position from a manual upshift or downshift. When the 2 position is selected from a stop, the transmission will start in 3rd gear. This allows for maximum traction on slippery surfaces. Engine braking is provided in the 2 position when the transmission control switch (TCS) is on or off.

1st Position

The 1 position provides a 1st gear hold after an automatic or manual downshift. The transmission is prevented from downshifting above a specific speed (approximately 48 km/h [30 mph]) to protect the powertrain from overspeeding. Engine braking is provided in the 1 position when the transmission control switch (TCS) is on or off.

tomsn048@gmail.com

tomsn048@gmail.com

Transmission Shift Patterns

Upshifts

Transmission upshifting is controlled by the powertrain control module (PCM). The PCM receives inputs from various engine or vehicle sensors and driver demands to control shift scheduling, shift feel and torque converter clutch operation.

Downshifts

Under certain conditions the transmission will downshift automatically to a lower gear range (without moving the range selector lever). There are three categories of automatic downshifts: Coastdown, Torque Demand and Forced or Kickdown shifts.

Coastdown

The coastdown downshift occurs as the name indicates, when the vehicle is coasting down to a stop.

Torque Demand

The torque demand downshift occurs (automatically) during part throttle acceleration when the demand for torque is greater than the engine can provide at that gear ratio. The transmission will also disengage the torque converter clutch to provide added acceleration, if applied.

Kickdown

For maximum acceleration, the driver can force a downshift by pressing the accelerator pedal to the floor. A forced downshift into a lower gear (4th, 3rd, 2nd or 1st) is possible below calibrated speeds. For all shift speeds, specifications are subject to variations due to tire size, engine and transmission calibration requirements.

tomsn048@gmail.com

tomsn048@gmail.com

Transmission Control Switch and Lamp Operation

The transmission control switch (TCS) is a driver-controlled momentary contact switch mounted on the end of the transmission range selector lever. When the TCS is activated, 5th gear operation (overdrive) is canceled, coast clutch is applied, and engine braking is provided in 1st, 2nd, 3rd, 4th and reverse gears.

The transmission control indicator lamp (TCIL) is located on the transmission range selector lever in the Aerostar and on the instrument panel in the Ranger. The TCIL indicates that the transmission control switch (TCS) has been depressed and 5th gear has been cancelled. The TCIL will flash if the powertrain control module (PCM) detects a concern in certain transmission related sensors or solenoids.

tomsn048@gmail.com

Main Components and Functions

Torque Converter

The 5R55E uses a four element torque converter. The converter contains the standard internal components (turbine, impeller, and stator) for transfer of power and multiplication of torque. It also utilizes a disc type torque converter clutch (TCC) for maximum fuel economy.

The operation of the main torque converter components is as follows:

- The converter cover and impeller are connected to the engine crankshaft. Rotation of the cover and impeller by the engine crankshaft sets the fluid in motion.
- The turbine reacts to the fluid motion from the impeller, transferring rotation to the geartrain by way of the turbine shaft.
- The stator redirects the fluid going back to the impeller, from the turbine. By directing fluid back to the impeller in the same direction as engine rotation, the stator multiplies engine torque.

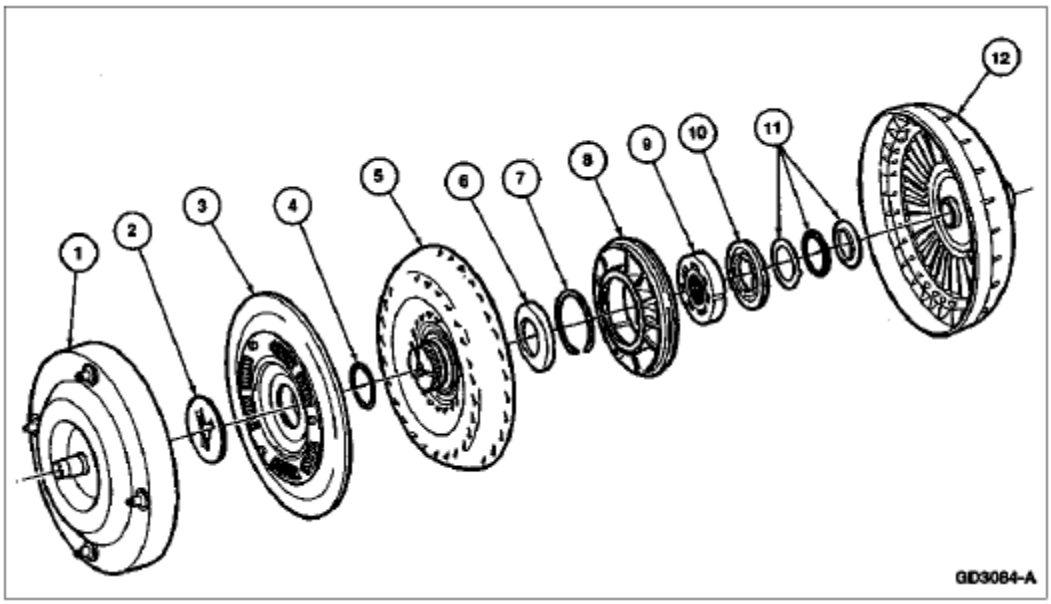
When applied, the TCC provides a mechanical link between the converter turbine and the engine, allowing for a direct mechanical power transfer from the engine to the transmission. The converter clutch pressure plate is applied and released by fluid pressure, which is controlled by the powertrain control module (PCM). The PCM controls the torque converter clutch using a pulse-width modulated TCC solenoid.

Torque Converter Clutch (TCC) Damper

The torque converter clutch damper assembly functions 100% of the time regardless of position of the torque converter clutch. With this design you have total dampening of the powertrain, similar to a manual transmission clutch disc assembly.

Torque Converter Assembly

tomsn048@gmail.com



Item	Part Number	Description

7	—	Snap Ring (Part of 7902)
8	—	Reactor (Part of 7902)
9	—	One-Way Clutch Assembly (Part of 7902)
10	—	Thrust Washer (Part of 7902)
11	—	Thrust Bearing (Part of 7902)
12	—	Impeller Assembly (Part of 7902)

Impeller and Cover

The impeller sets the fluid in motion and directs it to the turbine. The impeller is welded to the converter cover.

Turbine

The turbine is the driven member of the converter. It is driven by fluid from the impeller and transfers the hydraulic power to the transmission. When the converter lockup clutch is engaged, the power is transferred mechanically.

Reactor

The reactor is equipped with heavily curved vanes and its center hub has an one-way clutch which prevents the stator from rotating opposite to the engine rotation. The reactor reverses the fluid and returns it to the

tomsn048@gmail.com

impeller in the direction of impeller rotation. The one-way clutch prevents the force of this fluid from turning the stator against the impeller and turbine.

The reactor one-way clutch is built into the reactor (stator) and prevents it from rotating opposite to engine rotation.

Torque Converter Clutch

The clutch is joined to the turbine by means of the externally splined hub of the turbine and also internally splines within its own assembly.

When engaged the clutch friction plate bears against the inside of the converter cover, thereby producing a direct mechanical connection between the pump housing and the turbine.

Geartrain

Power is transmitted from the torque converter to the planetary gearsets through the input shaft.

By holding and driving certain numbers of the gearsets, four forward ratios and one reverse ratio are obtained and transmitted to the output shaft and differential.

The gear ratios are:

- 1st — 2.47
- 2nd — 1.87
- 3rd — 1.47
- 4th — 1.00
- 5th — 0.75
- Reverse — 2.1

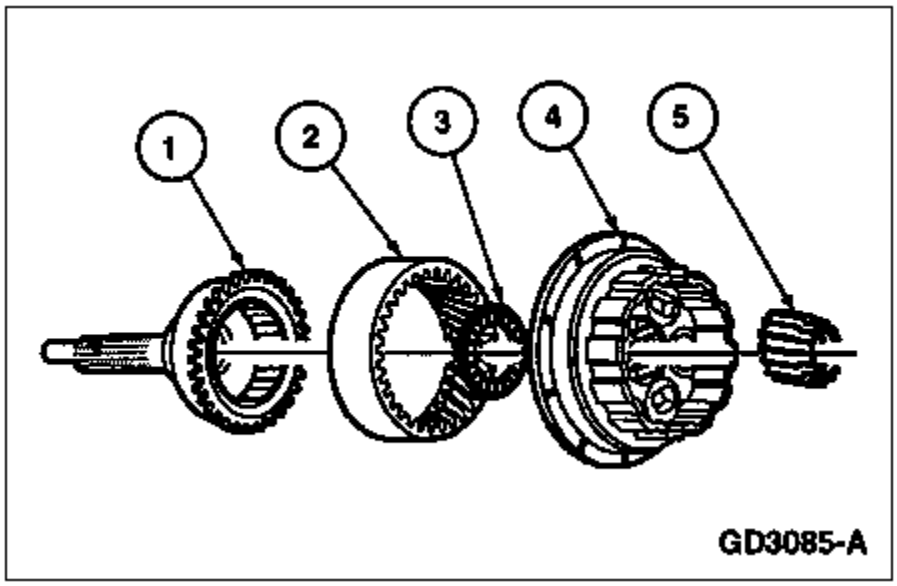
Planetary Gearset — Front

The planetary gear front carrier is driven by the input shaft. The planetary gearset front carrier drives the center shaft via the front one-way clutch in 1st, 2nd, 3rd and 4th gears.

In overdrive, the front sun gear is held, causing the pinion gear to rotate around the front sun gear. The pinion gears in turn drive the front ring gear resulting in an overdrive output ratio of 0.75:1.

The front planetary gearset is also internally splined to the coast clutch for engine braking.

tomsn048@gmail.com



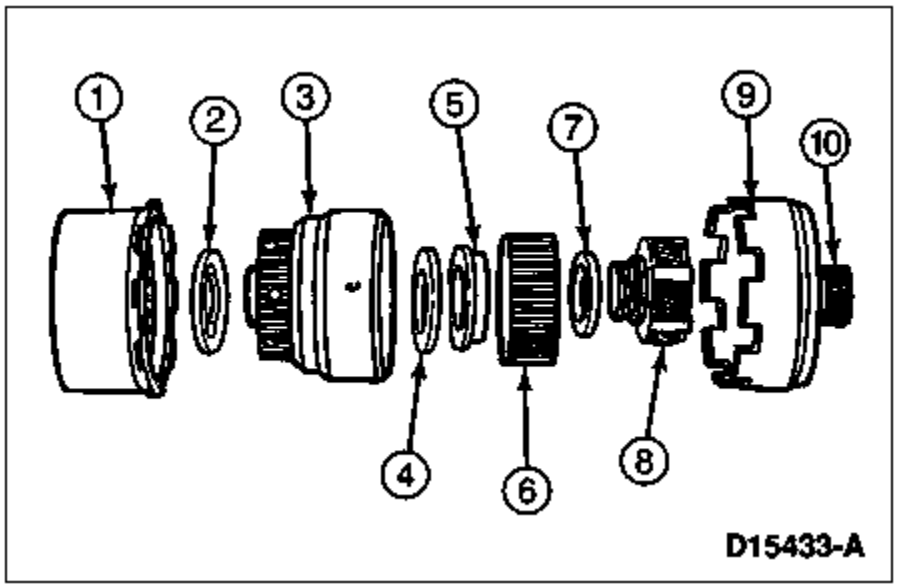
Item	Part Number	Description
1	7A658	Center Shaft Assembly
2	7653	Front Ring Gear
3	7L495	No. 2 Front Planetary Thrust Bearing
4	7B446	Front Planetary Gear Carrier Assembly
5	7D063	Front Sun Gear Assembly

Planetary Gearset — Forward

The forward planetary gearset is splined to the output shaft.

The forward planetary gearset is driven by the forward ring gear when the forward clutch is applied. The forward planetary gearset pinions drive the forward sun gear. The forward sun gear is splined to the input shell.

tomsn048@gmail.com



Item	Part Number	Description

10	7D063	Forward Sun Gear Assembly

Input Shaft

The input shaft is supported by two bushings in the stator support. End positioning of the input shaft is controlled by the splines in the converter turbine and the front planetary carrier.

Output Shaft

The output shaft is supported by two bushings in the case and by the slip yoke bushing in the extension housing. End positioning is controlled by the parking pawl gear and snap ring or shoulder and by the reverse ring gear hub and snap ring.

Planetary Gearset — Low/Reverse

The low/reverse planetary gearset is connected to the low/reverse brake drum by lugs from the low/reverse brake drum to the lugs of the low/reverse planetary gearset.

tomsn048@gmail.com

The low/reverse planetary gearset is driven by the forward sun gear which is splined to the input shell.

The splines of the forward sun gear drive the pinions in the low/reverse planetary gearset. The pinions of the low/reverse planetary gearset drive the output shaft ring gear and output shaft hub which is splined to the output shaft.

The low/reverse planetary gearset is held via the rear one-way clutch in the low/reverse brake drum assembly, when the low/reverse band is applied.

Apply Components

Bands — Front

Hydraulic pressure is applied to the front side of the front servo. This pressure causes the servo to stroke and apply force to the band, causing the front brake and coast clutch drum to be held.

The front band holds the front brake and coast clutch drum to the case in 2nd and 5th gears. This causes the front sun gear to be held stationary through the coast clutch adapter and the front brake and coast clutch drum.

tomsn048@gmail.com

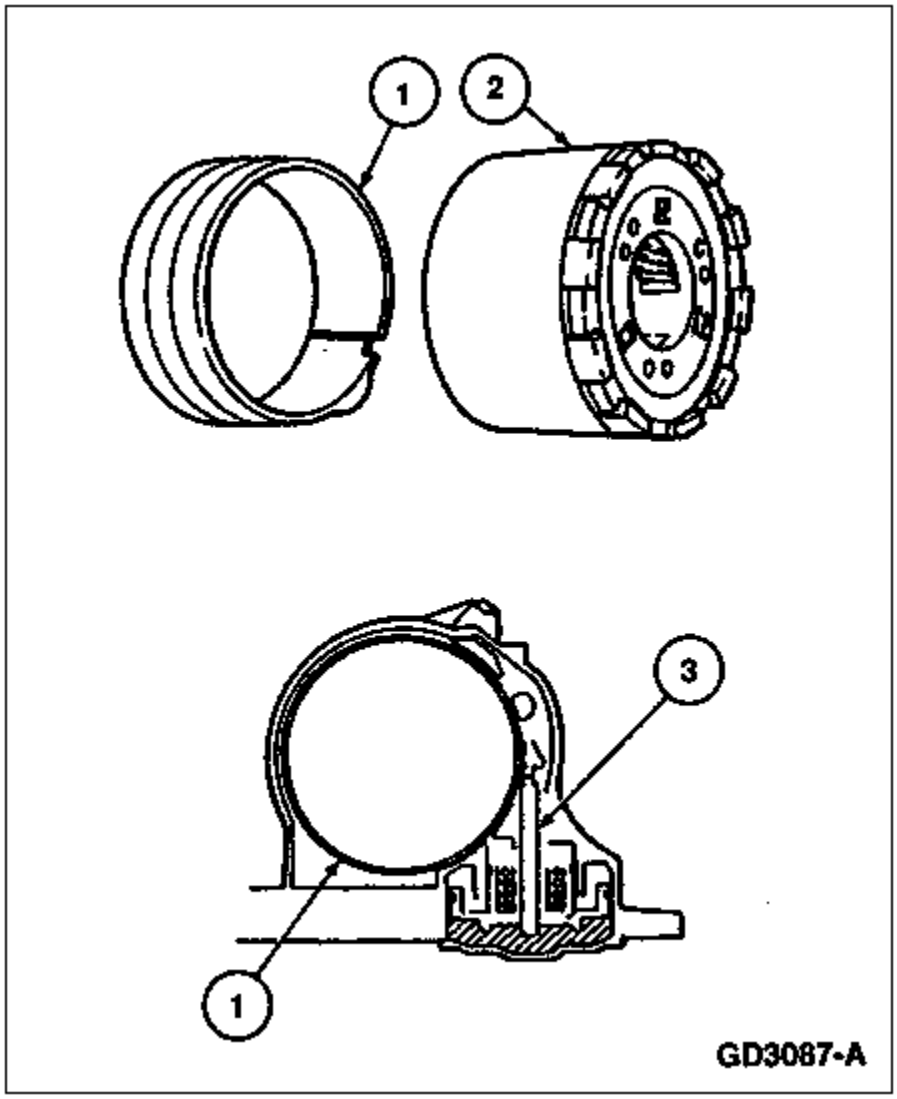
9	7C492	Intermediate Band Adjuster/Lock Screw

Bands — Low/Reverse

Hydraulic pressure is applied to the front side of the low/reverse servo. This pressure causes the servo to stroke and apply force to the low/reverse band, causing the low/reverse brake drum to be held.

The low/reverse band holds the low/reverse brake drum to the case in manual 1st and reverse gears. This causes the low/reverse planetary assembly to be held stationary.



Item	Part Number	Description
1	7D095	Low/Reverse Band Assembly
2	7C498	Low/Reverse Brake Drum Assembly
3	7D189	Low/Reverse Servo Piston Assembly

Clutches — Coast

tomsn048@gmail.com

The coast clutch is a multi-disc clutch made up of steel and friction plates. The coast clutch is applied with hydraulic pressure and disengaged by return springs and exhaust of the hydraulic pressure. It is housed in the front brake and coast clutch drum. The coast clutch is applied when the transmission control switch (TCS) is on and hydraulically applied in 2 and 1 positions. When the coast clutch is applied, it holds the planetary gear front carrier and disengages the front one-way clutch preventing overrunning. This uses engine compression to help slow the vehicle and provide engine braking.

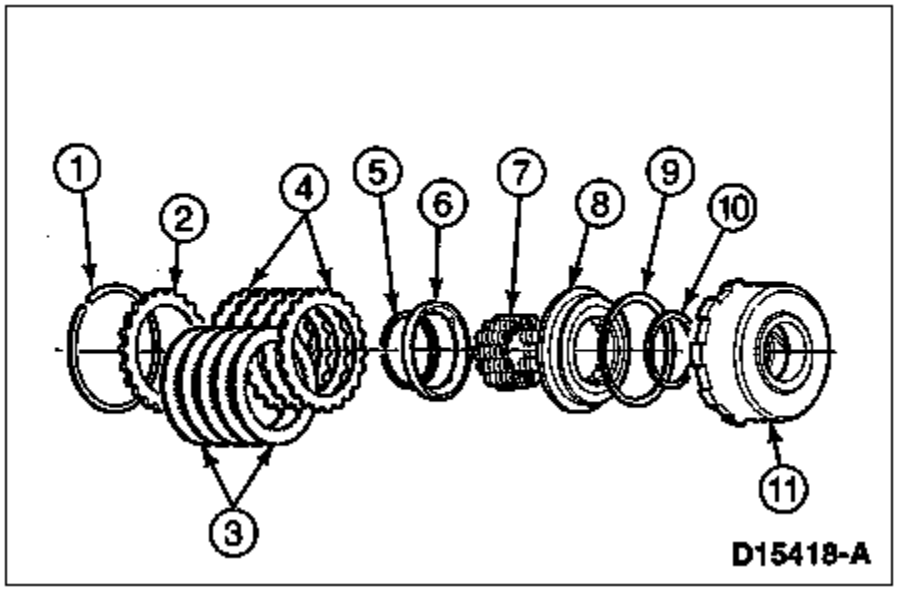
Clutches — Direct

The direct clutch is a multi-disc clutch made up of steel and friction plates. The direct clutch is applied with hydraulic pressure and disengaged by return springs and exhaust of the hydraulic pressure. It is housed in the intermediate brake and direct clutch drum. The intermediate brake and direct clutch drum provides two functions. In drive, the direct clutch is applied and coupled to the forward clutch in 4th and 5th gears. This drives the input shell and forward sun gear at a ratio of 1:1.

In reverse, the direct clutch is applied and coupled to the forward clutch and input shell. Since the forward sun gear is splined to the input shell, this causes the forward sun gear to drive the pinions of the low/reverse planetary assembly that is being held by the low/reverse band in reverse rotation. This in turn drives the

tomsn048@gmail.com

output shaft ring gear and hub at a ratio of 2.1:1.

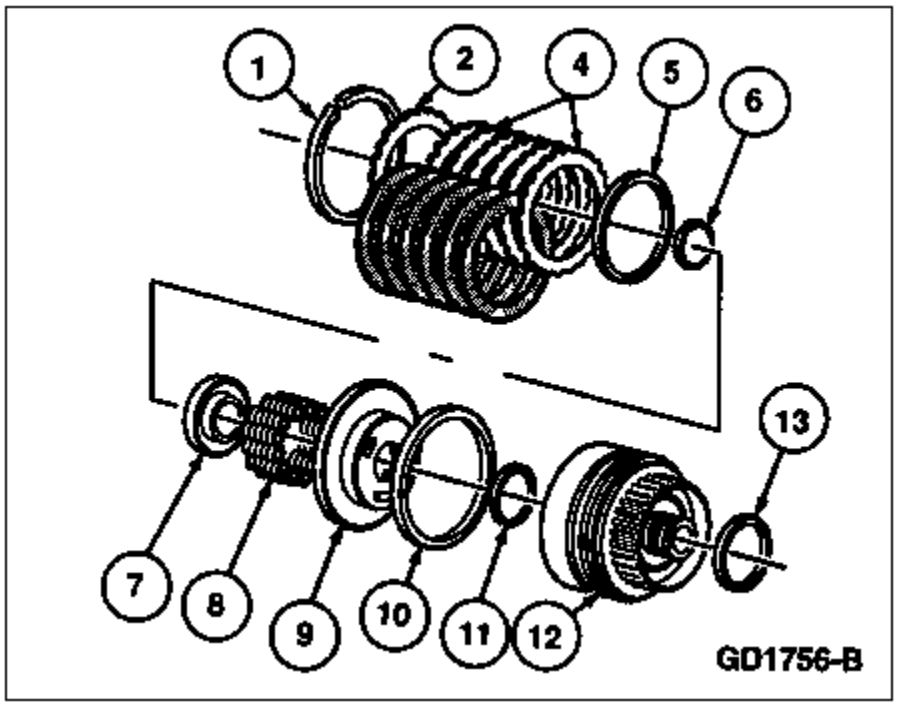


Item	Part Number	Description
1	E860126-S/129S	Retaining Ring (Select Fit)
2	7B066	Direct Clutch Pressure Plate
3	7B164	Direct Clutch Internal Plate — Friction
4	7B442	Direct Clutch External Plate — Steel
5	E860125-S	Retaining Ring
6	7A527	Direct Clutch Piston Springs Retainer (8 Tabs)
7	7A480	Direct Clutch Piston Spring (20 Req'd)
8	7A258	Direct Clutch Piston
9	7A548	Direct Clutch Piston Outer Seal Ring
10	7D404	Direct Clutch Piston Inner Seal Ring
11	7D044	Intermediate Brake and Direct Clutch Drum Assembly

Clutches — Forward

The forward clutch is a multi-disc clutch made up of steel and friction plates. The forward clutch is applied with hydraulic pressure and disengaged by return springs and exhaust of the hydraulic pressure. The forward clutch is applied in all forward gears and driven by the center shaft. The forward clutch also holds and drives the forward ring gear and hub when hydraulically applied.

tomsn048@gmail.com



Item	Part Number	Description
1	E860115-S/118S	Retaining Ring (Select Fit)
2	7B066	Forward Clutch Pressure Plate
3	7B164	Forward Clutch Internal Plate — Friction
4	7B442	Forward Clutch External Plate — Steel
5	7B070	Forward Clutch Cushion Spring
6	E860109-S	Retaining Ring
7	7A527	Forward Clutch Piston Spring Retainer
8	7A480	Forward Clutch Piston Spring (15 Req'd)

10	7A548	Forward Clutch Piston Outer Seal Ring
11	7A548	Forward Clutch Piston Inner Seal Ring
12	7A360	Forward Clutch Cylinder Assembly
13	7M153	No. 5 Forward Clutch Cylinder Thrust Bearing

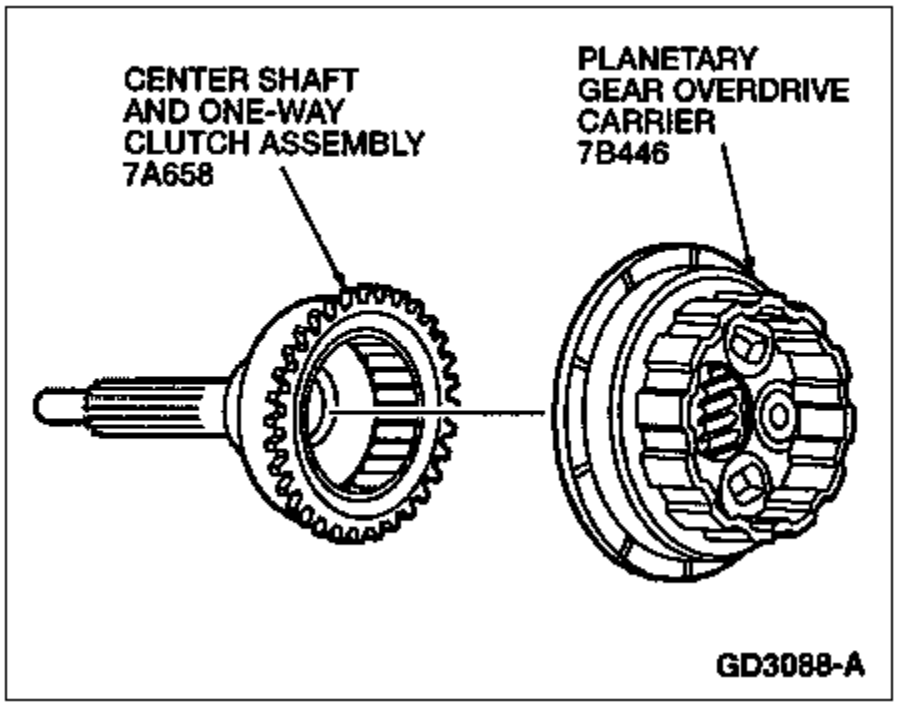
One-Way Clutches — Overdrive

The front one-way clutch is a sprag-type one-way clutch that is pressed into the center shaft.

The front one-way clutch is driven by the inner race of the front planetary gear carrier. The front one-way clutch holds and drives the outer race of the center shaft in 1st, 2nd, 3rd, 4th and reverse gears.

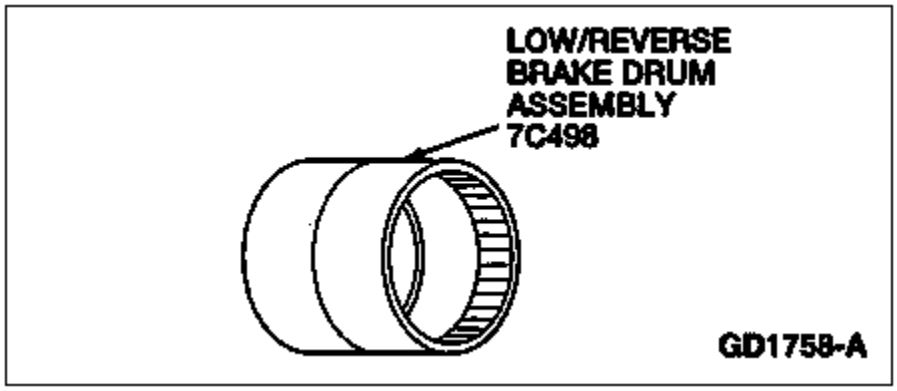
The front one-way clutch overruns during all coast operations and is always overrunning in 5th gear.

tomsn048@gmail.com



One-Way Clutches — Low

The 4.0L uses a sprag-type one-way clutch. The low/reverse one-way clutch holds the low/reverse brake drum and low/reverse planetary assembly to the gear case in 1st gear only and overruns in all other gears.



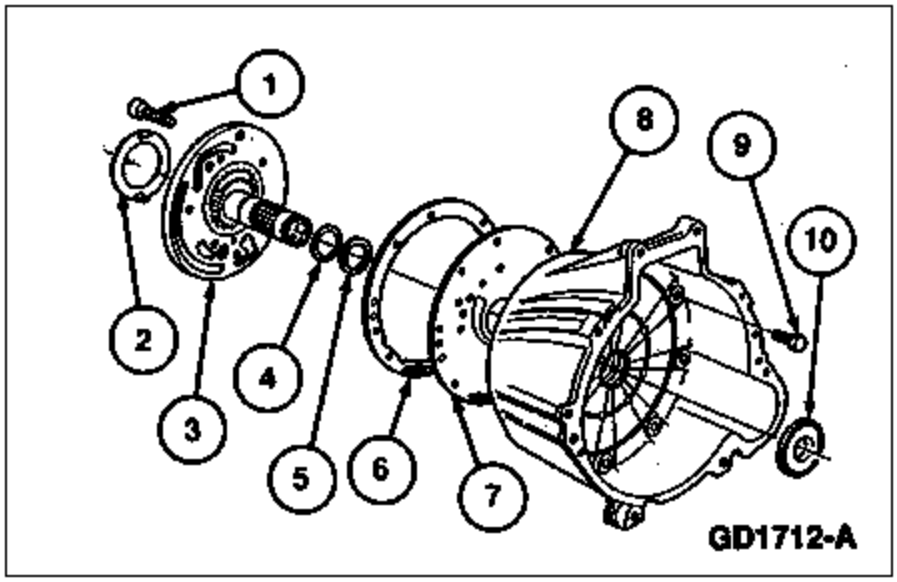
Hydraulic System

Pump

The fluid pump provides the fluid pressure required to charge the torque converter, main control assembly, transmission cooling system, lubrication system and apply devices.

The 5R55E has a positive displacement gear and crescent-type pump which is shaft-driven by the torque converter cover.

tomsn048@gmail.com



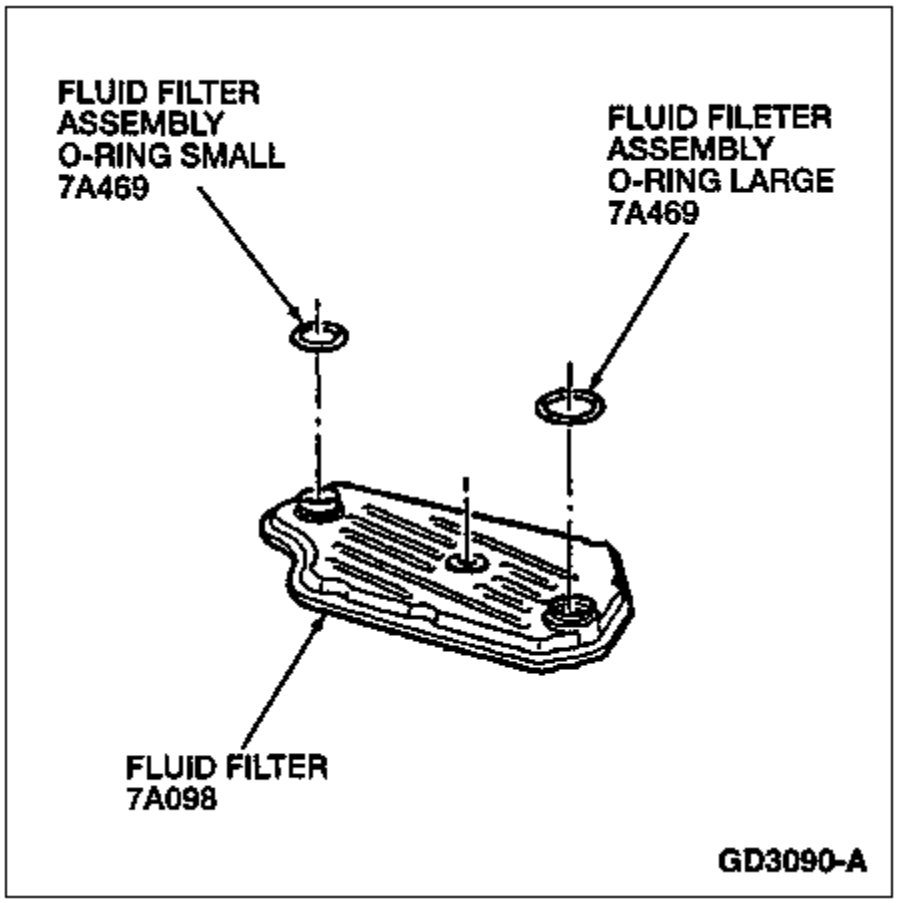
Item	Part Number	Description
1	W701429-S309M	Fluid Pump-to-Converter Housing Screws (6 Req'd)
2	7D014	No. 1 Fluid Pump Input Thrust Washer (Nylon)
3	7A103	Fluid Pump Support and Gear Assembly
4	W701431-S300	Fluid Pump Shaft-to-Inner Gear O-Ring
5	7L323	Fluid Pump Support Seal Ring
6	7A136	Fluid Pump Gasket
7	7B472	Fluid Pump Adapter Plate
8	7976	Converter Housing Assembly
9	E804595-S200 (8 Req'd)	Converter Housing-to-Case Screw and Seal Assembly
10	7A248	Converter Hub-to-Converter Housing Seal Assembly

Filter

All fluid drawn from the pan passes through the fluid filter. The fluid filter and its accompanying seals are part of the fluid path to the fluid pump.

The fluid filter also has a bypass section. This allows the fluid which is vented at the main regulator valve to be recirculated to the pump without passing through the filtering element.

tomsn048@gmail.com



Main Control

The main control assembly and related components are part of the pressure side of the 5R55E hydraulic system. The main control assembly consists of the solenoids, the valve body assembly and the separator plate.

All valves inside the main control assembly are anodized aluminum. They cannot be sanded, filed or dressed in any way that may damage the valve surface. If the valves have any scratches, burrs or nicks that prevent free movement, the main control assembly must be replaced.

tomsn048@gmail.com

tomsn048@gmail.com

Transmission Electronic Control System

Electronic System Description

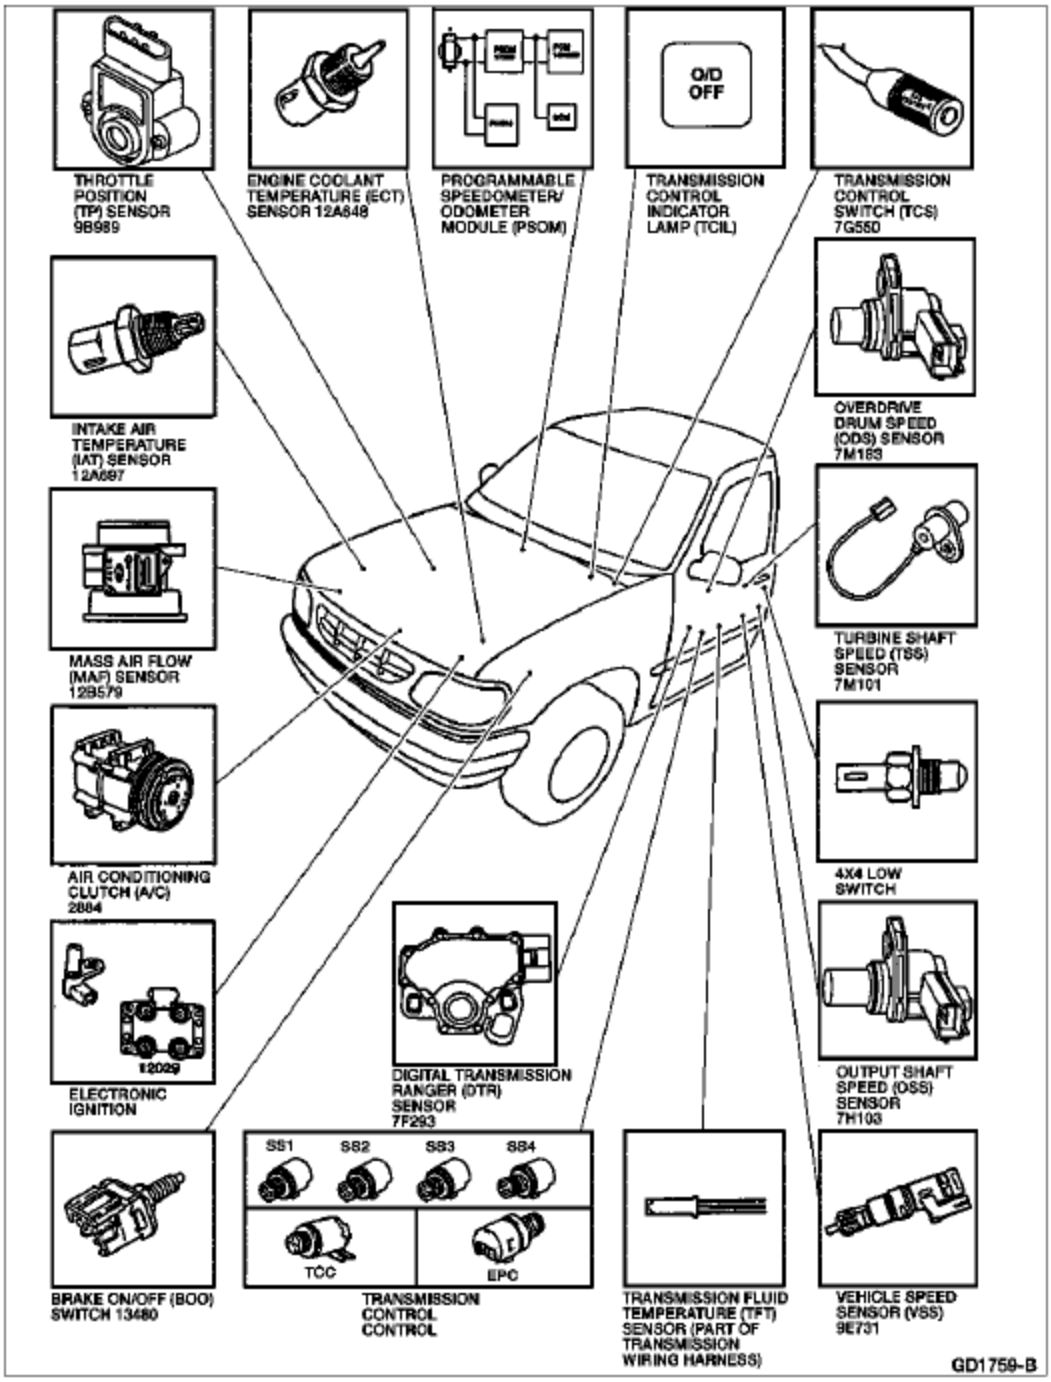
Shift scheduling, timing and feel (line pressure), as well as torque converter clutch (TCC) operation in the 5R55E is controlled electronically by the powertrain control module (PCM).

Input signals from various engine sensors give the PCM information about the engine's operating state. Other inputs are based on driver demands, such as the accelerator pedal position, which is monitored by the PCM using the throttle position (TP) sensor. Inputs are also supplied by the transmission itself. The turbine shaft speed (TSS) sensor, the output shaft speed (OSS) sensor and the transmission fluid temperature (TFT) sensor supply information to the PCM.

Using these input signals, the PCM can determine when the time and conditions are right for a shift or TCC application. The PCM controls six solenoids: four ON/OFF solenoids for upshifts, downshifts, and coast clutch application, one for pulse-width modulated control of the torque converter clutch and one for electronic line pressure control.

Component Locator

tomsn048@gmail.com



Powertrain Control Module (PCM) 12A650:

Description:
The powertrain control module (PCM) controls various engine functions and provides control of the 5R55E transmission.
The PCM responds to inputs and operates solenoids for electro-hydraulic control of line pressure, shift scheduling, torque converter clutch (TCC) scheduling and coast clutch control for coast braking.

tomsn048@gmail.com

The PCM has the ability to:

- Monitor its input and output devices for the presence of faults.
- Store diagnostic trouble codes (DTCs) related to detected faults.
- Alert the driver for some detected faults by turning on the malfunctioning indicator lamp (MIL) in the instrument cluster.
- Display information when a service technician connects diagnostic equipment.

Diagnostic Trouble Codes:

P0603, P0605.

Air Conditioning (A/C) Clutch 2884:

Description:

An electro-magnetic air conditioning (A/C) clutch is energized when the clutch cycling pressure switch closes. The switch is located on the suction accumulator-drier. The closing of the switch completes the circuit to the clutch and draws it into engagement with the compressor driveshaft.

When engaged, the A/C clutch is an input to the PCM to adjust electronic pressure control (EPC) pressure for the additional load on the engine. It is also used to adjust TCC modulation when the A/C clutch is engaged.

Symptoms:

Failed ON — EPC pressure slightly low with A/C off.
Failed OFF — EPC pressure slightly high with A/C on. If erratic A/C operation occurs, the customer may feel improper TCC apply and release.

Diagnostic Trouble Codes:

P1460.

Brake On/Off (BOO) Switch 13480:

Description:

The brake on/off (BOO) switch is connected to the brake pedal. When the brake pedal is pressed, the BOO switch has closed contacts allowing a voltage signal to the PCM.

The PCM may release TCC when the brakes are applied.

Symptoms:

Failed ON — converter clutch will not engage at less than 1/3 throttle.
Failed OFF or not connected — converter clutch will not disengage when brake is applied.

Diagnostic Trouble Codes:

P1703.

Engine Coolant Temperature (ECT) Sensor 12A648:

Description:

tomsn048@gmail.com

The engine coolant temperature (ECT) sensor detects the temperature of engine coolant and supplies the information to the PCM.
The ECT sensor is threaded into the heater outlet fitting or cooling passage on the engine. For automatic transmission applications, the ECT is used to control TCC solenoid operation. For engine control applications, the ECT signal is used to modify ignition timing, exhaust gas recirculation (EGR) flow, and air-to-fuel ratio as a function of engine coolant temperature. On electronic instrument cluster applications, the ECT output is used to control a coolant temperature indicator.
Symptoms:
Torque converter clutch solenoid will always be "off," resulting in reduced fuel economy.
Diagnostic Trouble Codes:
P0117, P0118, P1116.

Electronic Ignition (EI) System:

Description:
The electronic ignition (EI) system has a crankshaft position (CKP) sensor and ignition coil packs. The CKP sensor sends crankshaft position information to the PCM. The rpm signal in the transmission strategy is then used for torque converter clutch control, EPC and shift scheduling.
Symptoms:
Engine malfunction, no torque converter clutch engagement.
Diagnostic Trouble Codes:
P0300-P0306, P0320, P0340, P1351-P1364.

4x4 Low (4x4L) Switch:

Description:
The low range switch is located on the transfer case cover. It provides an indication of when the 4x4 transfer case gear system is in the low range.
NOTE: Not all 4x4L switch concerns will set a DTC. Refer to Diagnosis by Symptom or pinpoint tests if shifts are delayed in 4x4L or shift early in normal mode.
Transmission Function:
Modifies shift schedule for 4x4L transfer case gear ratio.
Symptoms:
Failed on — Early shift schedule in 4x2 and 4x4H. Failed off — Shifts delayed in 4x4L. If the 4x4 low indicator light fuse is blown, the transmission will shift according to 4x4 low shift schedule regardless of transfer case position.
Diagnostic Trouble Codes:
P1781, P1729.

Overdrive Drum Speed (ODS) Sensor 7M183:

tomsn048@gmail.com

Description:
The overdrive drum speed (ODS) sensor is a magnetic pickup that sends a signal to the powertrain control module (PCM) assembly that indicates overdrive drum speed. The ODS sensor signal is used in the transmission control strategy to determine EPC pressure, shift and torque converter scheduling. The ODS sensor is mounted externally on the transmission.
Diagnostic Trouble Codes:
P1719.

Output Shaft Speed Sensor (OSS) 7H103:

Description:
The output shaft speed (OSS) sensor is a magnetic pickup that sends a signal to the powertrain control module (PCM) assembly that indicates output shaft speed. The OSS sensor signal is used in the transmission control strategy to determine EPC pressure, shift and torque converter scheduling. The OSS sensor is mounted externally on the transmission.
Symptoms:
Harsh shifts, abnormal shift schedule, no torque converter engagements.
Diagnostic Trouble Codes:
P0720, P0721.

Intake Air Temperature (IAT) Sensor 12A697:

Description:
The intake air temperature (IAT) sensor is used to determine the EPC pressure. It also provides the electronic fuel injection system with mixture (fuel and air) temperature information. The IAT is used both as a density corrector for airflow calculation and to proportion the cold enrichment fuel flow. This sensor is similar in construction to the engine coolant temperature (ECT) sensor, except it is packaged to improve sensor response time.
Symptoms:
Incorrect EPC pressure either high or low resulting in either harsh or soft shifts.
Diagnostic Trouble Codes:
P0112, P0113, P0114.

Mass Air Flow (MAF) Sensor 12B579:

Description:
The mass air flow (MAF) sensor directly measures the mass of the air flowing into the engine. The sensor output is a DC (analog) signal ranging from about 0.5 volts to 5.0 volts used by the processor to calculate the injector pulse width for stoichiometry. For transmission strategies, this sensor is used for EPC pressure control, shift, and torque converter clutch scheduling.
Symptoms:

tomsn048@gmail.com

Incorrect shift schedule, high/low EPC pressure. Incorrect torque converter engagement scheduling and symptoms similar to a throttle position (TP) sensor malfunction. Soft or firm shift based on EPC/line pressure. Soft shifts may be caused by a restricted air inlet.
Diagnostic Trouble Codes:
P0102, P0103, P1100, P1101.

Transmission Control Switch (TCS) 7G550:

Description:
The transmission control switch (TCS) is a momentary contact switch. When the driver presses the button of the TCS, a signal is sent to the PCM. At the same time, the PCM also causes the transmission control indicator lamp (TCIL) in the instrument panel to turn on or off.
When the TCS is initially pressed, the PCM disables transmission operation in D position/5th gear. At the same time, coast braking in 1st, 2nd, 3rd, and 4th gears occurs because the coast clutch is applied.
When the button of the TCS is pressed again, the PCM enables 5th gear operation, releases the coast clutch and turns off the TCIL.
Symptoms:
If the TCS fails with open contacts, no disabling of 5th gear and enabling of coast braking in 1st, 2nd, 3rd, and 4th gears in D position is possible.
Diagnostic Trouble Codes:
P1780.

Transmission Control Indicator Lamp (TCIL):

Description:
The transmission control indicator lamp (TCIL) is located in the instrument panel for Ranger and on the shift lever for Aerostar. It is labeled O/D OFF. The transmission control switch (TCS) and the PCM control the on/off operation of the TCIL.
When the driver initially presses the button of the TCS, the TCIL turns on to indicate that transmission operation in 4th gear is disabled. When the driver presses the TCS again, the TCIL turns off. The TCIL will flash if EPC solenoid is shorted or a monitored sensor has failed.
Symptoms:
If the TCIL fails on or off, the driver may have an incorrect indication of transmission operation or monitored sensor malfunction.
Diagnostic Trouble Code:
N/A.

Throttle Position (TP) Sensor 9B989:

Description:
The throttle position (TP) sensor is a potentiometer mounted on the throttle body. The TP sensor detects

tomsn048@gmail.com

the position of the throttle plate and sends this information to the processor assembly as varying voltage signal.
The PCM uses the monitored voltage level of the TP sensor for control of EPC pressure, torque converter clutch operation and shift scheduling.
If a malfunction occurs in the TP sensor circuit, the processor will recognize that the TP sensor signal is out of specification. The processor will then operate the transmission in a high capacity mode to prevent transmission damage.
Symptoms:
Harsh engagements, firm shift feel, abnormal shift schedule, torque converter clutch does not engage, or torque converter clutch cycling.
Diagnostic Trouble Codes:
P0121-P0123, P1120, P1121, P1124, P1125.

Programmable Speedometer/Odometer Module (PSOM):

The programmable speedometer/odometer module (PSOM) receives input from the rear brake anti-lock sensor, which is mounted on the rear axle differential housing. The PSOM processes this input signal information and relays it to the powertrain control module and the speed control module. This signal tells the powertrain control module the vehicle speed in miles per hour (mph). The PSOM is also used as an input in determining shift scheduling and electronic pressure control.
Symptoms:
Harsh engagements, firm shift feel, abnormal shift schedule, unexpected downshifts may occur at closed throttle. Torque converter clutch will not engage, elevated EPC pressures.
NOTE: EPC shorted to ground or failed low may result in a false VSS code. Diagnose EPC concerns first. Then recheck VSS input and PSOM.
Diagnostic Trouble Codes:
P0500, P0501, P0503, P1500, P1501.

Vehicle Speed Sensor (VSS) 9E731:

Description:
The vehicle speed sensor (VSS) is a magnetic pickup that sends a signal to the processor assembly. This VSS signal tells the processor assembly the vehicle speed.
The PCM uses this information to control shift scheduling and EPC pressure.
Symptoms:
Harsh engagements, firm shift feel, abnormal shift schedule, unexpected downshifts may occur at closed throttle. Torque converter clutch will not engage, elevated EPC pressures.
NOTE: EPC shorted to ground or failed low may result in a false VSS code. Diagnose EPC concerns first. Then recheck VSS.
Diagnostic Trouble Codes:
P0500, P0501, P0503, P1500, P1501.

tomsn048@gmail.com

Transmission Fluid Temperature (TFT) Sensor:

Description:
The transmission fluid temperature (TFT) sensor is located on the transmission main control body wiring harness assembly. It is a temperature-sensitive device called a thermistor. The resistance value of the TFT will vary with temperature change. The processor monitors the voltage across the TFT to determine the temperature of the transmission fluid.
The processor assembly uses this initial signal to determine whether a cold start shift schedule is necessary. The cold start shift schedule allows quicker shifts when the transmission fluid temperature is cold. The processor also inhibits torque converter clutch operation at low transmission fluid temperatures and corrects EPC pressures for temperature.
Symptoms:
Torque converter clutch engagement and stabilized shift schedules happen too soon after a cold start. Harsh or soft shifts.
Diagnostic Trouble Codes:
P0712, P0713, P1711, P1783.

Digital Transmission Range (DTR) Sensor 7F293:

Description:
The digital transmission range (DTR) sensor is located on the outside of the transmission at the manual lever. The DTR sensor completes the start circuit in Park and Neutral, the back-up lamp circuit in Reverse and the Neutral sense circuit (4x4 only) in Neutral. The DTR sensor also sends a digital output signal to the powertrain control module (PCM) indicating the position of the manual lever (P, R, N, D, 2, 1).
Symptoms:
Engagement concerns, wrong gear, no shifts, increase in EPC pressure.
Diagnostic Trouble Codes:
P0705, P0708, P1705, P1704.

Turbine Shaft Speed (TSS) Sensor 7M101:

Description:
A turbine shaft speed (TSS) sensor is a magnetic pickup that sends a signal to the processor assembly that indicates transmission turbine shaft input speed.
The TSS sensor provides torque converter turbine speed information for torque converter clutch control strategy. Also used in determining static EPC pressure settings.
Symptoms:
Increased engine rpm on engagements, harsh shifts (converter engaged), delayed shifts with hard apply (slip/bump feel).
Diagnostic Trouble Codes:
P0715.

tomsn048@gmail.com

Electronic Pressure Control (EPC) Solenoid 7H144:

Description:
The electronic pressure control (EPC) solenoid is a variable force style (VFS) solenoid. The VFS type solenoid is an electro-hydraulic actuator combining a solenoid and a regulating valve. It supplies EPC which regulates transmission line pressure and line modulator pressure. This is done by producing resisting forces to the main regulator and line modulator circuits. These two pressures control clutch application pressures.
Symptoms:
Maximum EPC pressure, harsh shifts and engagements, **may set a false VSS code.** Zero EPC pressure — no 2nd and 4th gear, slips in 1st and 3rd with high input torque.
Diagnostic Trouble Codes:
P1746*, P1747*. *Output circuit check, generated only by electrical conditions.

Torque Converter Clutch (TCC) Solenoid 7F037:

Description:
The torque converter clutch (TCC) solenoid is used in the transmission control system to control the application, modulation, and release of the torque converter clutch.
Symptoms:
Failed ON — engine runs rough/vehicle shudder, engine stalls in Drive at low idle speeds (1st, 2nd, 3rd, 4th, or 5th gear). Failed OFF — torque converter never engages.
Diagnostic Trouble Codes:
P0741**, P0743*, P1740, P1744**.
*Output circuit check, generated only by electrical conditions. **May also be generated by a non-electrical transmission hardware condition.

Shift Solenoid Assemblies (SS1, SS2, SS3, SS4) (7G484):

Description:
Four on/off solenoids are used for electronically controlled shift scheduling. The four shift solenoids are two-way, normally open style. Solenoids SS1, SS2, SS3, and SS4 provide gear selection of 1st through 5th by controlling the pressure of the shift valves. SS4 is also used to apply and release the coast clutch.
SS1 Symptoms:
Improper gear selection depending on failure mode and manual lever position. Failed ON: No 4th and 5th gears. Failed OFF: No 1st and 2nd gears.
Diagnostic Trouble Codes:
P0750*, P0751**, P0731**, P0732**, P0734**, P0735**, P1714**.

tomsn048@gmail.com

SS2 Symptoms:
Improper gear selection depending on failure mode and manual lever position. Failed ON: No 1st, 2nd, 4th, and 5th gears. Failed OFF: No 3rd gear.
Diagnostic Trouble Codes:
P0755*, P0756**, P0731**, P0732**, P0733**, P0734**, P0735**, P1715**.
SS3 Symptoms:
Improper gear selection depending on failure mode and manual lever position. Failed ON: No 1st, 3rd, and 4th gears. Failed OFF: No 2nd and 5th gears.
Diagnostic Trouble Codes:
P0760*, P0761**, P0731**, P0732**, P0733**, P0734**, P0735**, P1716***, P7162.
SS4 Symptoms:
Improper gear selection depending on failure mode and manual lever position. Failed On: No 2nd and 5th gears. Failed Off: No engine braking.
Diagnostic Trouble Codes:
P0765*, P0732**, P0735**, P1717***, P1762.
*Output circuit check, generated only by electrical conditions.
**May also be generated by some other non-electrical transmission hardware condition.
***Solenoid mechanically or hydraulically stuck.

SOLENOID APPLICATION CHART — 5R55E

Transmission Range Selector Lever Position	Powertrain Control Module (PCM) Commanded Gear	5R55E Solenoid States				
		SS1	SS2	SS3	SS4	Engine Braking

Diagnostic Strategy

Troubleshooting an electronically controlled automatic transmission is simplified by using the proven method of diagnosis. One of the most important things to remember is that there is a definite procedure to follow.

NOTE: Do not take any short cuts or assume that critical checks or adjustments have already been made.

Follow the procedures as written to avoid missing critical components or steps.

To properly diagnose a concern the technician should have the following publications available:

- Workshop Manual
- Powertrain Control/Emissions Diagnosis (PC/ED) Manual
- OASIS Messages
- Technical Service Bulletins (TSBs)
- Electrical/Vacuum Troubleshooting Manual (EVTM)

These publications provide the information required when diagnosing transmission concerns.

Using the Diagnostic Flow Chart as a guide, follow the steps as indicated.

Preliminary Inspection

- Know and understand the customer's concern.
- Verify the concern by operating the vehicle.
- Check the fluid level and condition.
- Check for non-factory add-on items.
- Check shift linkages for proper adjustment.
- Check TSBs and OASIS messages for the concern.

Diagnostics

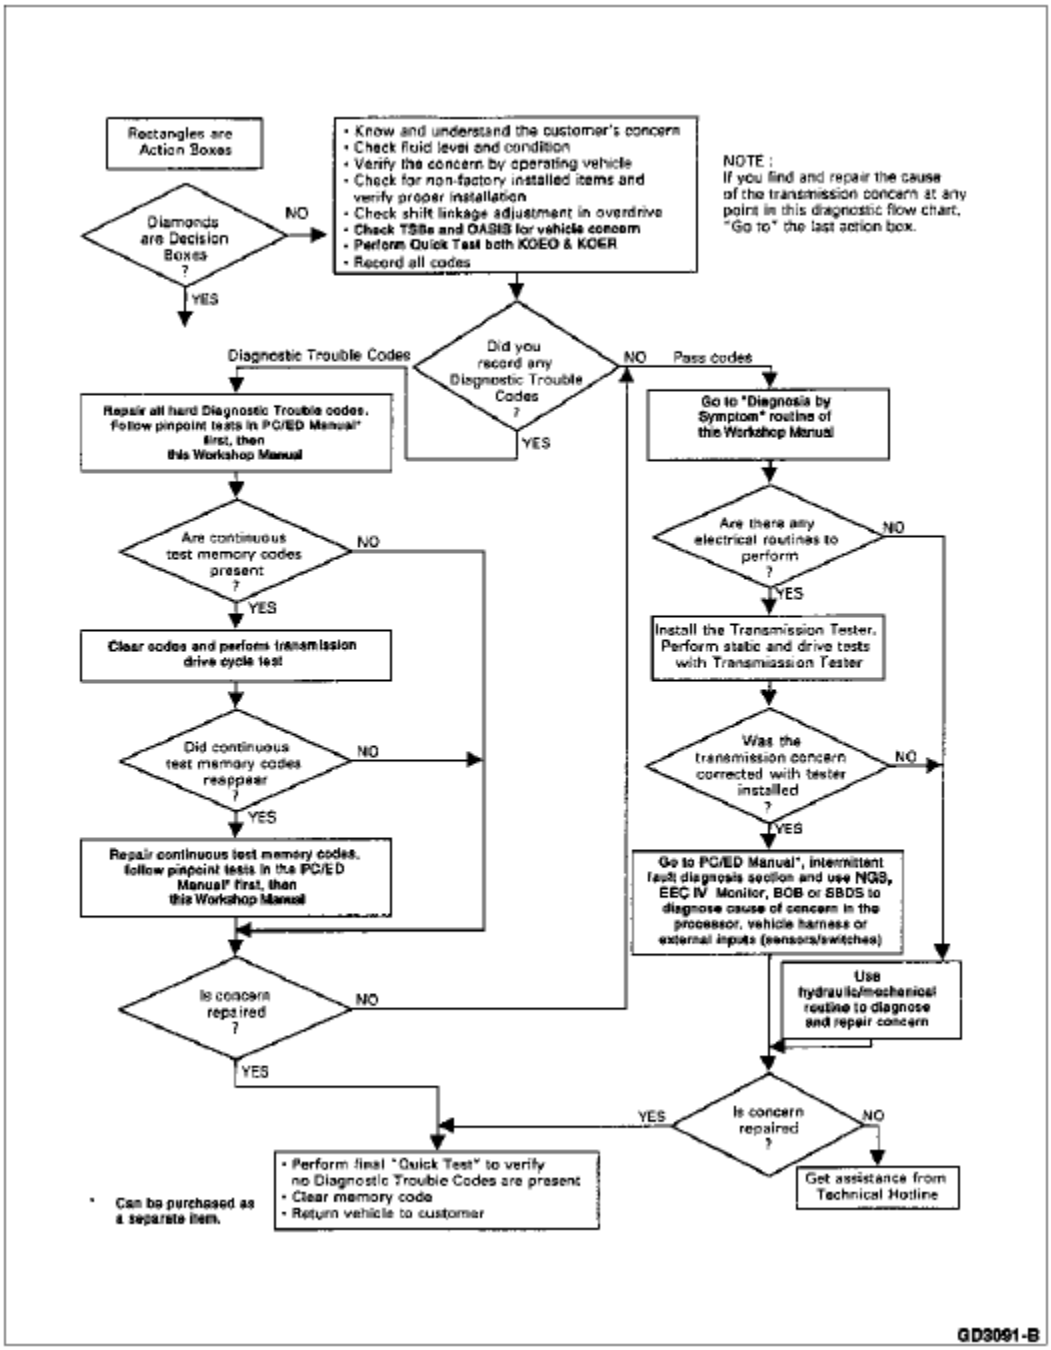
- Perform On-Board Diagnostic Procedures, key on engine off (KOEO), key on engine running (KOER).
- Record all diagnostic trouble codes (DTCs).
- Repair all non-transmission codes first.
- Repair all transmission codes second.
- Erase all continuous codes and attempt to repeat them.
- Repair all continuous codes.
- If only pass codes, proceed to Diagnosis by Symptom Charts for further information and diagnosis.

By following the diagnostic sequence the service technician will be able to diagnose and repair the concern the first time.

tomsn048@gmail.com

tomsn048@gmail.com

Diagnostic Flow Chart



tomsn048@gmail.com

tomsn048@gmail.com

Preliminary Inspection

The following items must be checked before proceeding.

Know and Understand the Concern

This section provides information which must be used in determining the actual cause of customer concerns and performing the appropriate repair procedures.

Verification of Condition

The following procedures must be used when verifying customer concerns for the transmission.

Required Equipment

Required equipment to diagnose the 5R55E transmission consists of:

- Rotunda Transmission Tester 007-00130, part of Rotunda Transmission Tester Kit, or equivalent.
- Rotunda New Generation STAR (NGS) Tester 007-00500 or equivalent.
- Rotunda EEC-V 104-pin Breakout Box 014-00950 or equivalent.
- Rotunda 73 Digital Multimeter 105-R0051 or equivalent.
- Digital TR Sensor Overlay 007-00131, used with Rotunda Transmission Range (TR) Cable "E" 007-00111.
- Rotunda Transmission Range (TR) Sensor Cable "E" 007-00111 or equivalent.

Determine Customer Concern

NOTE: If noise/vibration, check for dependencies: rpm, vehicle speed, shift, gear, range, or temperature.

NOTE: Some transmission conditions may cause engine concerns. The torque converter clutch not disengaging will stall the engine.

Determine customer concerns relative to vehicle usage and dependent driving conditions. Pay attention to the following items:

- Hot or cold vehicle operating temperature
- Hot or cold ambient temperatures
- Type of terrain
- Vehicle loaded/unloaded
- City/highway driving
- Upshift
- Downshift
- Coasting
- Engagement
- Noise/vibration

tomsn048@gmail.com

Check Fluid Level and Condition

Fluid Level Check

NOTE: If the vehicle has been operating for an extended period at high speeds in city traffic during hot weather or pulling a trailer, the vehicle should be turned off for about 30 minutes to allow the oil to cool before checking.

Under normal circumstances, check the transmission fluid level during normal maintenance and does not require a change. For severe duty only, change the fluid at 80,000 km (50,000 miles), since the vehicle does not use up transmission fluid. If the transmission is not working properly, or if there is some sign of fluid leakage, the fluid level should be checked.

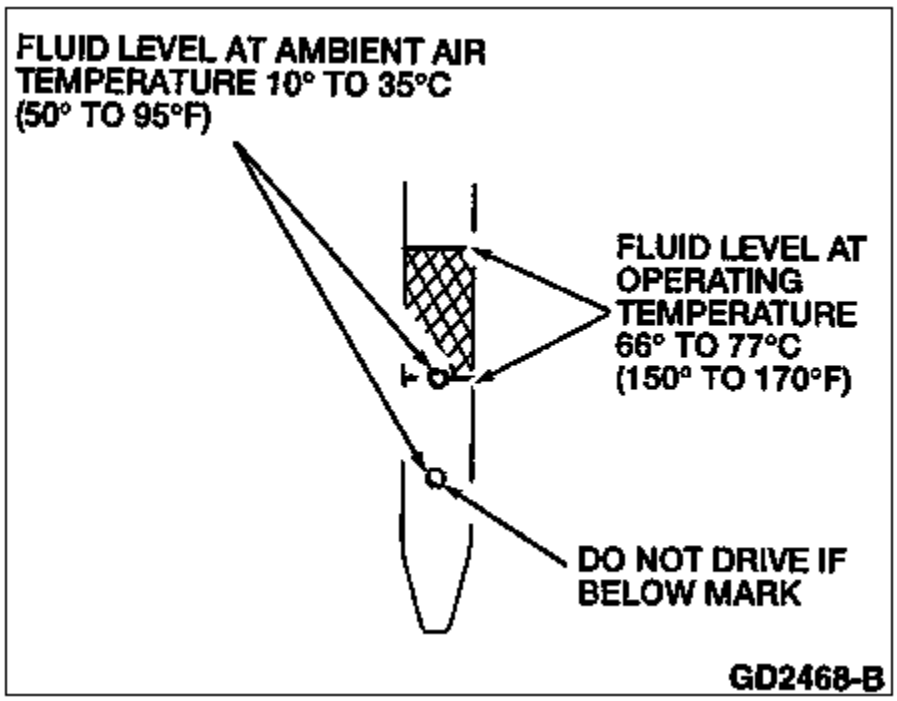
It is preferable to check the transmission fluid level at normal operating temperature after approximately 32 km (20 miles) of driving. The fluid level can be checked without driving the vehicle if the outside temperature is above 10℃ (50℉).

With the vehicle on a level surface, start the engine and move the transmission range selector lever through all of the gear ranges, allowing sufficient time for each position to engage. Securely engage the transmission range selector lever in the Park position, fully set the parking brake control (2780) and leave the engine running.

Wipe off the fluid level indicator cap, pull thefluid level indicator (7A020) out and wipe the indicator end clean. Insert the fluid level indicator back into the oil filler tube (7A228) and make sure it is fully seated. Pull the fluid level indicator out and read the fluid level.

CAUTION: The vehicle should not be driven if the fluid level is below the bottom hole on the fluid level indicator and outside temperature is above 10°C (50℉).

When checking fluid at normal operating temperature, the fluid level should be within the crosshatched area on the fluid level indicator. When the vehicle has not been driven, and outside temperature is above 10°C (50℉), the fluid level should be between the holes in the fluid level indicator.



tomsn048@gmail.com

High or Low Fluid Level

CAUTION: If the fluid level is high, damage to the vehicle may occur. Excess fluid must be removed.

A fluid level that is too high may cause the fluid to become aerated due to the churning action of the rotating parts of the transmission. Aerated fluid will cause erratic line pressure, which may result in harsh/soft shifts or engagements, damage to the clutch materials, improper torque converter operation, and fluid coming out of the vent. Refer to Fluid Change — Drain/Refill in this section.

A fluid level that is too low will affect transmission operation, causing slipping, slow engagements, or damage to internal hardware. Low levels may also indicate that a leak is present in the fluid system. If the fluid level is low, add fluid using the procedures shown in Adding Fluid in this section.

Adding Fluid

CAUTION: Use of any fluid other than specified could result in transmission malfunction or failure.

Before adding any fluid, be sure that the correct type is used. MERCON V® XT-5-QM is stamped on the container.

Add fluid in 0.25L (1/2 pint) increments through the filler tube to bring the level to the correct area on the dipstick. If an overfill occurs, excess fluid must be removed.

Fluid Change — Drain/Refill

Normal maintenance and lubrication does not necessitate periodic automatic transmission fluid changes. For severe duty applications change the fluid at 80,000 km (50,000 miles).

To remove excess fluid, disconnect the cooler feed line at the cooler. Attach a rubber hose to the line and insert the other end into a drain pan. Crank the engine for a short period of time (do not allow the engine to start) to remove a quantity of transmission fluid. Reattach the cooler line to the cooler. Start the engine. Move the transmission range selector lever through all gear ranges. Recheck the fluid for the proper level. Continue to add or subtract fluid until the proper level is reached. If a major repair (e.g., clutch, band, bearing, etc.) is required, the unit will have to be removed. At this time, the torque converter (7902), transmission cooler, and cooler lines must be flushed to remove any contaminates. Refer to the Converter and Fluid Cooler Cleaning and Inspection procedure.

When used under severe duty conditions the transmission fluid filter/screen assembly should be replaced at 80,000 km (50,000 miles). The transmission fluid should be drained from the transmission and torque converter and refilled with MERCON V® XT-5-QM or equivalent MERCON V® approved fluid as specified to the proper level.

When filling a dry transmission and torque converter, refer to Specifications for capacity. Check the fluid level as outlined.

Procedures for Drain and Refill

- Normal Maintenance
  - Not required. Filled for life.
- Severe Duty Maintenance
  - Change fluid at 80,000 km (50,000 miles) intervals. Use MERCON V® XT-5-QM.

tomsn048@gmail.com

CAUTION: Use only MERCON V® XT-5-QM transmission fluid. Use of any other fluids may result in a transmission malfunction or failure.

Maintenance Procedure

1. Loosen, then remove, the transmission fluid pan attaching screws to drain the fluid.
2. Remove and discard old pan gasket.
3. Thoroughly clean the pan and the transmission case pan rail surface.
4. Install new pan gasket onto pan and install pan to case with screws. Tighten screws to 13-15 Nm (115-133 lb-in).
5. Add 2.8 liters (3 quarts) of MERCON V® XT-5-QM or equivalent MERCON V® approved fluid to transmission through the fill tube.
6. Start the engine. Move transmission range selector lever through all gear ranges, checking for engagements.
7. Check and adjust transmission fluid in 0.25 liter (1/2 pint) increments to proper level (cross-hatched area of fluid level indicator at normal operating temperature).

Major Service/Overhaul

1. Loosen, then remove, the transmission fluid pan attaching bolts to drain fluid.
2. Remove and discard old pan gasket.
3. Perform required internal repair and cleaning.
4. Thoroughly flush torque converter, cooler lines and transmission in-tank radiator cooler and auxiliary cooler (if equipped).
5. Replace fluid filter and seal assembly.
6. Install cleaned pan and new pan gasket with screws. Tighten screws to 13-15 Nm (115-133 lb-in).
7. Add 3.7 liters (4 quarts) of MERCON V® XT-5-QM or equivalent MERCON V® approved fluid to the transmission through the fill tube.
8. Start engine. Move the transmission range selector lever through all gear ranges, checking for engagements.
9. Check and adjust the transmission fluid level in 0.25 liter (1/2 pint) increments to the proper level (cross-hatched area of the fluid level indicator at normal operating temperature).

Fluid Condition Check

1. Check the fluid level. Refer to the Fluid Level Check for proper procedure.
2. Observe color and odor of the fluid. It should be red, not brown or black. Odor may indicate an overheating condition, clutch disc or band failure.

tomsn048@gmail.com

3. Use an absorbent white facial tissue and wipe the fluid level indicator. Examine the stain for evidence of solid particles and for engine coolant signs (gum or varnish on fluid level indicator) .

   If particles are present in the fluid or there is evidence of engine coolant or water, the transmission fluid pan (7A194) must be removed for further inspection.

   If fluid contamination or transmission failure is confirmed by further evidence of coolant or excessive particles in the transmission fluid pan, the transmission must be disassembled and completely cleaned and serviced. This includes cleaning and flushing the torque converter and transmission cooling system.

   During disassembly and assembly, all overhaul checks and adjustments of clearances and end play must be made.

   After the transmission has been repaired, all diagnostic tests and adjustments listed in the Diagnosis by Symptom charts must be completed to make sure that the problem has been corrected.

Road Testing Vehicle

The Shift Point Road Test and Torque Converter Clutch Operation Test provide diagnostic information on transmission shift controls and torque converter operation.

Shift Point Road Test

This test verifies that the shift control system is operating properly.

1. Bring engine and transmission up to normal operating temperature.
2. Operate vehicle with transmission selector in (D) range.
3. Apply minimum throttle and observe speeds at which upshift occurs and torque converter engages. Refer to the following Shift Speeds chart. (Also refer to Automatic Transmission Specifications Issue FPS-12180-97.)
4. Stop the vehicle. Depress transmission control switch (TCS) to activate D range. Repeat Step 3. Transmission will make all upshifts except 4-5 and torque converter clutch apply should occur above 46 km/h (27 mph).
5. Press accelerator pedal to floor, wide open throttle (WOT). Transmission should shift from third to second, or third to first, depending on vehicle speed, and torque converter clutch should release.
6. With vehicle speed above 48 km/h (30 mph), move transmission range selector lever from D range to 1 range (LOW) and release accelerator pedal. Transmission should immediately downshift to third gear. When vehicle speed drops below 32 km/h (20 mph), transmission should downshift into first gear.
7. If transmission fails to upshift/downshift or torque converter clutch does not apply/release, refer to Diagnosis by Symptom Index for possible causes.

SHIFT SPEEDS — KM/H (MPH) [1]

Throttle Position	Range	Shift	KM/H (MPH) Range [1]
Closed Throttle	(D)	3-2	12-37 (8-23)
	(D)	2-1	12-32 (8-20)
Minimum Throttle	(D)	1-2	16-32 (10-20)
	(D)	2-3	25-48 (16-30)

tomsn048@gmail.com

	(D)	3-4	63-89 (39-55)
		4-5	93-117 (58-73)
Part Throttle	(D)	1-2	27-53 (17-33)
	(D)	2-3	46-79 (29-49)
	(D)	3-4	72-110 (45-69)
	(D)	4-5	82-117 (51-73)
	(D)	5-4	74-104 (46-65)
	(D)	4-3	64-100 (40-62)
	(D)	3-2	40-68 (25-42)
Wide Open Throttle	(D)	1-2	53-77 (33-48)
	(D)	2-3	96-131 (60-82)
	(D)	3-2	80-123 (50-77)
	(D)	3-1, 2-1	38-68 (24-42)
Manual Pull-In	1	2-1	48-56 (30-35)

[1] Shift Speed Ranges are approximate for all applications. For specific applications (Engine, Axle Ratio and Application) refer to the Automatic Transmission Specification Issue FPS-12180-97.

Torque Converter Diagnosis

Prior to torque converter replacement, all diagnostic procedures must be followed. This is to prevent the unnecessary replacement of good torque converters. Only after a complete diagnostic evaluation can the decision be made to replace the torque converter.

Begin with the normal diagnostic procedures as follows:

1. Preliminary inspection.
2. Know and understand the customer's concern.
3. Verify the concern.
    - Perform the Torque Converter Clutch Operation Test. Refer to the procedure in this section.
4. Perform diagnostic procedures.
    - Run on-board diagnostics. Refer to the procedure in this section.
        - Repair all non-transmission related DTCs first.
        - Repair all transmission DTCs.
        - Rerun on-board diagnostic to verify repair.
    - Perform Line Pressure Test . Refer to the procedure in this section.
    - Perform Stall Speed Test . Refer to the procedure in this section.
    - Diagnosis by Symptom Routines . Refer to the procedure in this section.
        - Use the index to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed, diagnose and repair as required before repairing the torque converter.

Torque Converter Operation Test

tomsn048@gmail.com

This test verifies that the torque converter clutch control system and the torque converter are operating properly.

1. Connect tachometer to engine.
2. Bring engine to normal operating temperature by driving vehicle at highway speeds for approximately 15 minutes in (D) range.
3. After normal operating temperature is reached, maintain constant vehicle speed of about 80 km/h (50 mph). Release throttle for about two seconds then reapply throttle to previous setting.
4. Engine rpm should increase when throttle is released and decrease in about five seconds (converter engagement) after throttle is reapplied. If this does not occur, refer to Torque Converter Clutch Operation Concerns in the Diagnosis by Symptom Index .

Visual Inspection

This inspection will identify malfunctions to the vehicle operating system that may affect diagnosis.

- Vehicle modification
- Electronic add-on items
  - Air conditioning
  - Generator (alternator)
  - Engine turbo
  - Cellular telephone
  - Cruise control
  - CB radio
  - Linear booster
  - Backup alarm signal
  - Computer
- Leaks — Refer to Leakage Inspection in this section.
- Proper linkage adjustments — Refer to Section 07-05 in this workshop manual.

These items, if not installed properly, will affect powertrain control module or transmission function. Pay particular attention to add-on wiring splices in the powertrain control module harness or transmission wiring harness, abnormal tire size, or axle ratio changes.

After a road test, with the vehicle warm and before disturbing any connectors, perform the Quick Test using Rotunda New Generation STAR (NGS) Tester 007-00500 or equivalent. Refer to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the automatic transmission.

Check TSBs and OASIS

Refer to all Technical Service Bulletins and OASIS messages which pertain to the transmission concern and follow the procedures as outlined.

Perform On-Board Diagnostics

After a road test, with the vehicle warm and before disturbing any connectors, perform Quick Test using Rotunda New Generation STAR (NGS) Tester 007-00500 or equivalent. Refer to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the automatic transmission.

tomsn048@gmail.com

tomsn048@gmail.com

Diagnostics

Diagnosing electronically controlled automatic transmissions is simplified using the following procedures. It is important to remember that there is a definite procedure to follow. Do not take short cuts or assume that critical checks or adjustments have already been made. Follow the procedures as written to avoid missing critical components or steps. By following the diagnostic sequence, the technician will be able to diagnose and repair the concern the first time.

On-Board Diagnostics With NGS

NOTE: For detailed instructions and other diagnostic methods using the NGS, refer to the Powertrain Control/Emissions Diagnosis Manual or NGS instruction guide.

NOTE: If using a generic scan tool, refer to the Powertrain Control/Emissions Diagnosis Manual for instructions on performing OBD procedures.

The Quick Tests are in the Powertrain Control/Emissions Diagnosis Manual (PC/ED). These tests can be used to diagnose the powertrain control module (PCM) (12A650), sensors and actuators of the 5R55E transmission.

The following is a guide for using the On-Board Diagnostic (OBD) Quick Tests and the New Generation STAR (NGS) Tester.

Quick Test 1.0 — Visual Inspection

Perform the Visual Check and Vehicle Preparation procedures as outlined in the Powertrain Control/Emissions Diagnosis Manual.

Inspect the following:

- Air cleaner and inlet ducting.
- All engine vacuum hoses for damage, such as leaks, cracks, blockage, proper routing, etc.
- Powertrain control module (PCM) system wiring harnesses for proper connections, bent or broken pins, corrosion, loose wires, proper routing, etc.
- Sensors, actuators and powertrain control module (PCM) for physical damage.
- Engine coolant for proper level.
- Transmission fluid for proper level and condition.
- Any non-factory installed items wired into the transmission or PCM harnesses.

Perform all necessary repairs before continuing with Quick Tests.

Quick Test 2.0 — Set Up

Connect Rotunda New Generation STAR (NGS) Tester 007-00500 or equivalent to Data Link Connector (refer to vehicle owner manual for connector location).

The following are steps to run OBD II procedures.

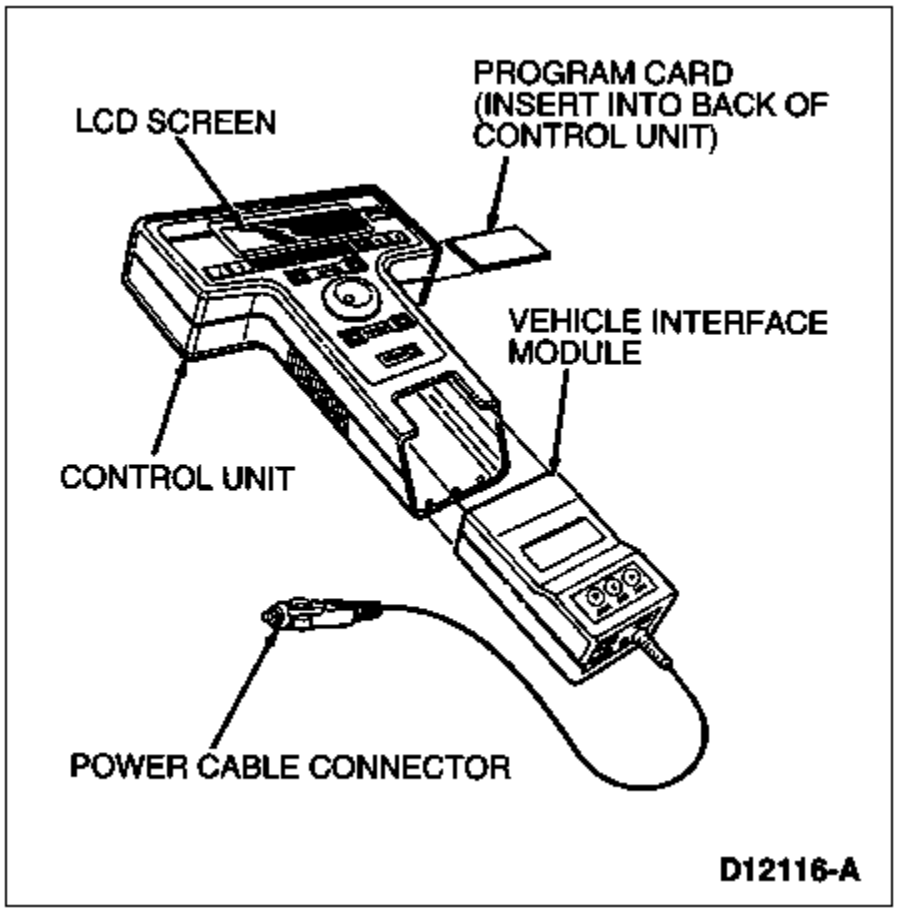
tomsn048@gmail.com

Vehicle and Tester Preparation

Prepare the vehicle as follows:

- Transmission range selector lever in PARK.
- Engine to operating temperature.
- Apply parking brake.
- Block wheels.
- Turn off all electrical loads including A/C and defroster. (If A/C is ON, DTC P1460 will set.)

Prepare the NGS as follows:



- Key OFF.
- Verify that the proper program card is inserted in the NGS.
- Connect J1962/16-way DCL cable adapter to the NGS.
- Connect NGS DCL cable adapter securely into the vehicle's DCL connector.
- Connect the NGS power supply cable to the vehicle battery power supply through cigarette lighter or at the battery with alligator clip adapter.
- Key ON or start vehicle if necessary.
- The NGS is now ready to communicate with the PCM.

Quick Test 3.0 — Key On, Engine Off (KOEO)

tomsn048@gmail.com

CAUTION: Do not replace parts based on a code, perform Pinpoint Tests first.

- The key on engine off (KOEO) test provides "hard" diagnostic trouble codes (DTCs) present at the time of testing.
- Always repair the "hard" DTCs first.

Performing KOEO

- Perform visual inspection and vehicle preparation as required.
- Select "Vehicle and Engine Selection" menu.
- Select year, engine, model with the appropriate qualifier if needed, for example, transmission or 49 state/Cal.
- Select "Diagnostic Data Link" menu.
- Select "Diagnostic Test Mode" menu.
- Select "KOEO On-Demand Self Test."
- Follow operating instructions from the NGS menu screen.
- Record all DTCs displayed.
- Repair non-transmission DTCs first as they can directly affect the operation of the transmission. Road test the vehicle and repeat Quick Test to verify the repair.

Quick Test 4.0 — Continuous Memory Codes

Continuous DTCs are concerns which were detected during normal vehicle operation. These codes are retained for 40 warm-up cycles.

- The cause of some continuous DTCs may have been eliminated if KOEO and/or KOER DTCs were repaired. Always retest and repair any DTCs that still remain.
- If DTCs are present, go to the On-Board Diagnostic Trouble Code Description Chart in this section for service information. Erase DTC, perform the Transmission Drive Cycle Test and repeat all Quick Test procedures after completing repair on the DTCs.
- If the Continuous tests passes and a concern is still present, refer to the Diagnosis by Symptom charts, OASIS and TSBs for concern diagnosis.

Performing Continuous DTC Tests

- Select "Vehicle and Engine Selection" menu
- Select year, engine, model with the appropriate qualifier if needed, for example, transmission or 49 state/Cal.
- Select "Diagnostic Data Link" menu.
- Select "Diagnostic Test Mode" menu.
- Select "Retrieve Continuous Codes."
- Follow operating instructions from the NGS menu screen.
- Record all DTCs displayed.
- Perform Transmission Drive Cycle Test .
- Rerun Continuous DTC Test. If DTCs have returned, repair as required. Road test and rerun all DTC test procedures.

Quick Test 5.0 — Key On, Engine Running (KOER)

This test provides "hard" DTCs only.

tomsn048@gmail.com

- Follow the menu screen instructions as they appear.
- If a DTC appears after the key on engine running (KOER) test, a malfunction is present. Refer to the DTC Code Chart for service information.

Performing KOER

- Perform visual inspection and vehicle preparation as required.
- Select "Vehicle and Engine Selection" menu.
- Select year, engine, model with the appropriate qualifier if needed, for example, transmission or 49 state/Cal.
- Select "Diagnostic Data Link" menu.
- Select "Diagnostic Test Mode" menu.
- Select "KOER On-Demand Self Test."
- Follow operating instructions from the NGS menu screen (example: turn key on, etc.) and perform brake on/off (BOO) and cycle the transmission control switch (TCS) on and off, if equipped, rotate steering wheel.
- Record all DTCs displayed.
- Repair all non-transmission DTCs first as they can directly affect the operation of the transmission. Road test the vehicle and repeat Quick Test to verify the repair.

Special Test Modes

The following Special Test Modes may be used or required during diagnostics.

Output Test Mode

The diagnostic test mode aids is servicing output actuators associated with the PCM system. It allows the technician to energize and de-energize most of the system output actuators on command.

Performing Output Test Mode

Enter Output Test Mode with ignition key ON and the engine OFF.

- Perform visual inspection and vehicle preparation as required.
- Select "Vehicle and Engine Selection" menu.
- Select year, engine, model with the appropriate qualifier if needed, for example, transmission or 49 state/Cal.
- Select "Diagnostic Data Link" menu.
- Select "Diagnostic Test Mode" menu.
- Enter "Active Tests."
- Enter "Output Control."
- Follow operating instructions from the NGS menu screen.

Output State Control (OSC) Mode

Output State Control (OSC) allows the technician to take control of certain parameters to function the transmission. For example, OSC allows the technician to shift the transmission only when he/she commands a gear change. If the technician commands 1st gear in OSC, the transmission will remain in 1st gear until the technician commands the next gear. Another example, the technician can command a shift solenoid to turn on or off when performing an electrical circuit check. OSC has two modes of operation for transmission, the BENCH MODE and the DRIVE MODE. Each mode/parameter has a unique set of vehicle operating

tomsn048@gmail.com

requirements that the technician is required to meet before being allowed to operate OSC.

NOTE: To operate OSC the Digital Transmission Range (DTR) Sensor and the Vehicle Speed Sensor (VSS) must be operational. No Diagnostic Trouble Codes (DTCs) related to the DTR sensor or the VSS sensor can be present.

- The vehicle requirements MUST BE MET when SENDING the OSC value.
- If the vehicle requirements are NOT MET when SENDING the OSC value, and ERROR MESSAGE will appear. When the ERROR MESSAGE is received, OSC is aborted and must be restarted.
- If AFTER SENDING an OSC value, and the vehicle requirements are no longer met, the PCM will cancel the OSC value and NO ERROR message will appear.
- The OSC value [XXX] may be sent anytime to cancel OSC.

Output State Control (OSC) Procedures

- Perform visual inspection and vehicle preparation as required.
- Select "Vehicle and Engine Selection" menu.
- Select appropriate vehicle and engine.
- Select "Diagnostic Data Link".
- Select "Powertrain Control Module".
- Select "Diagnostic Test Mode".
- Select "KOEO On-Demand Self Test and KOER On-Demand Self Tests".
- Perform test and record DTCs.
- Repair all NON-Transmission DTCs.
- Repair all VSS and DTR Sensor DTCs.
- Ensure that VSS/DTR Sensors are functional.
- Select "Active Command Modes".
- Select "Output State Control".
- Select "Trans - Bench Mode or Trans - Drive Mode".

OSC — Transmission Bench Modes

The following OSC — Transmission Bench Modes may be used or required during diagnostics.

SS1, SS2, SS3, SS4 and TCC in BENCH MODE

The BENCH MODE allows the technician to perform electrical circuit checks on the following components:

- SS1 - Activates SS#1 OFF or ON
- SS2 - Activates SS#2 OFF or ON
- SS3 - Activates SS#3 OFF or ON
- SS4 - Activates SS#4 OFF or ON
- TCC - Activates TCC OFF or ON

OSC "SS1, SS2, SS3, SS4, TCC" BENCH Mode Operates ONLY when:

- VSS and DTR Sensor are operational.
- No VSS and DTR Sensor DTCs.
- Transmission Range Selector Lever in P.
- Key ON.
- Engine OFF.

tomsn048@gmail.com

OSC COMMAND VALUES

- [OFF] - turns solenoid OFF
- [ON] - turns solenoid ON
- [XXX] - cancels OSC value sent
- [SEND] - sends the values to PCM

Bench Mode Procedure for SS1, SS2, SS3, SS4, and TCC

Follow operating instructions from the NGS menu screen:

- Select "Output State Control".
- Select "Trans - Bench Mode".
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters - SS1, SS2, SS3, SS4, or TCC".
- Select "ON" to turn solenoid ON.
- Press "SEND" to send command ON.
- Select "OFF" to turn solenoid OFF.
- Press "SEND" to send command OFF.
- Select "XXX" to cancel at any time.
- Press "SEND".

EPC in BENCH MODE

The BENCH MODE is also used to test the functionality of the transmission's electronic pressure control. During BENCH MODE, the EPC solenoid can ramp in increments of 15 PSI from zero to 90 PSI and 90 to zero PSI.

The OSC functions for the parameter EPC allows the technician to choose the following options:

- EPC - Activates EPC to selected values
- [00] - sets EPC pressure to 00 PSI
- [15] - sets EPC pressure to 15 PSI
- [30] - sets EPC pressure to 30 PSI
- [45] - sets EPC pressure to 45 PSI
- [60] - sets EPC pressure to 60 PSI
- [75] - sets EPC pressure to 75 PSI
- [90] - sets EPC pressure to 90 PSI

OSC "EPC" BENCH Mode Operates ONLY when:

- VSS and DTR Sensor are operational.
- No VSS and DTR Sensor DTCs.
- Transmission Range Selector Lever in P.
- Pressure gauge installed.
- Key ON.
- Engine ON.
- Engine RPM at 1500.

OSC COMMAND VALUES

tomsn048@gmail.com

- [00] - sets EPC pressure to 00 PSI
- [15] - sets EPC pressure to 15 PSI
- [30] - sets EPC pressure to 30 PSI
- [45] - sets EPC pressure to 45 PSI
- [60] - sets EPC pressure to 60 PSI
- [75] - sets EPC pressure to 75 PSI
- [90] - sets EPC pressure to 90 PSI
- [OFF] - turns solenoid off
- [ON] - turns solenoid on
- [XXX] - cancels OSC value sent
- [SEND] - sends the values to PCM

Bench Mode Procedure for EPC

Following operating instructions from the NGS menu screen.

- Select "Output State Control".
- Select "Trans - Bench Mode".
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters - EPC".
- Select Value "0 - 90 psi".
- Press "SEND" to send command.
- Select "XXX" to cancel at any time.
- Press "SEND".

OSC — Transmission Drive Modes

The DRIVE MODE allows control of three transmission parameters. Each mode/parameter has a unique set of vehicle operating requirements that the technician is required to meet before being allowed to operate OSC. The recommended procedure, when using the DRIVE MODE, is to control one parameter at a time.

The DRIVE MODE allows the technician to perform the following functions on the transmission:

- GR_CM - allows upshifts or downshifts
- TCC - engages or disengages the torque converter clutch
- EPC - increases/decreases EPC pressure

GR_CM in DRIVE MODE

This OSC function is used to test the transmission shift functions.

The OSC functions for the GR_CM parameter allows the technician to choose the following options:

- [1] - PCM selects 1st gear
- [2] - PCM selects 2nd gear
- [3] - PCM selects 3rd gear
- [4] - PCM selects 4th gear
- [5] - PCM selects 5th gear

OSC "GR_CM" Mode Operates ONLY when:

tomsn048@gmail.com

- VSS and DTR Sensor are operational.
- No VSS and DTR Sensor DTCs.
- Engine "ON".
- TCC "OFF".
- Transmission Range Selector Lever on O/D.
- Vehicle Speed is greater than 2 mph.

OSC COMMAND VALUES

- [1] - PCM selects 1st gear
- [2] - PCM selects 2nd gear
- [3] - PCM selects 3rd gear
- [4] - PCM selects 4th gear
- [5] - PCM selects 5th gear
- [OFF] - turns solenoid off
- [ON] - turns solenoid on
- [XXX] - cancels OSC value sent
- [SEND] - sends the values to PCM

Drive Mode Procedure for GR_CM

Follow operating instructions from the NGS menu screen.

- Select "Output State Control".
- Select "Trans - Drive Mode".
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters - GR_CM".
- Select Value "1-5".
- Press "SEND" to send command.
- Re-Select Value "1-5".
- Press "SEND" to send command.
- Select "XXX" to cancel at any time.
- Press "SEND".

TCC in DRIVE MODE

This OSC function is used to test whether the torque converter clutch is engaging and disengaging correctly.

The OSC functions for the TCC parameter allows the technician to choose the following:

- TCC - activates TCC OFF and ON
- [ON] - turns TCC solenoid ON
- [OFF] - turns TCC solenoid OFF

OSC "TCC OFF" DRIVE Mode Operates ONLY when:

- VSS and DTR Sensors are operational.
- No VSS and DTR Sensor DTCs present.
- Engine ON.

tomsn048@gmail.com

- Transmission Range Selector Lever in O/D.
- Vehicle speed is greater than 2 mph.

OSC "TCC ON" DRIVE Mode Operates ONLY when:

- VSS and DTR Sensors are operational.
- No VSS and DTR Sensor DTCs present.
- Engine ON.
- Transmission Range Selector Lever in O/D.
- Vehicle speed is greater than 2 mph.
- Transmission in 2nd gear or higher.
- TFT is between 60 and 275 degrees F.
- Brake not applied "OFF" below 20 mph.
- (Not an excessive load on engine (engine lugging).

OSC COMMAND VALUES

- [OFF] - turns TCC OFF
- [ON] - turns TCC ON
- [XXX] - cancels OSC value sent
- [SEND] - sends the values to PCM

Drive Mode Procedures for TCC

Follow operating instructions from the NGS menu screen.

- Select "Output State Control".
- Select "Trans - Drive Mode".
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters - TCC".
- Select "ON" to turn solenoid ON.
- Press "SEND" to send command ON.
- Select "OFF" to turn solenoid OFF.
- Press "SEND" to send command OFF.
- Select "XXX" to cancel at any time.
- Press "SEND".

EPC in DRIVE MODE

This OSC functions is used to increase the EPC pressure while testing the transmission shift functions. This OSC functions can only increase the EPC pressure greater than what the PCM normally commands. If an OSC value, such as [75] or [90] PSI is sent, the upshifts and downshifts should exhibit a harsher shift. Harsher shifts would indicate that the EPC pressure control works at higher pressures. The best test for the EPC is to use the BENCH MODE and a hydraulic pressure gauge. Using EPC in the BENCH MODE will confirm that the EPC works at both the higher and lower pressures.

The OSC functions for the parameter EPC allows the technician to choose the following options:

- EPC - Activates EPC to selected
    - [00] - sets EPC pressure to 00 PSI

tomsn048@gmail.com

- [15] - sets EPC pressure to 15 PSI
- [30] - sets EPC pressure to 30 PSI
- [45] - sets EPC pressure to 45 PSI
- [60] - sets EPC pressure to 60 PSI
- [75] - sets EPC pressure to 75 PSI
- [90] - sets EPC pressure to 90 PSI

OSC "EPC" DRIVE Mode Operates ONLY when:

- VSS and DTR Sensor are operational.
- No VSS and DTR Sensor DTCs.
- Transmission Range Selector Lever in O/D.
- Pressure gauge installed.
- Key ON.
- Engine ON.
- Vehicle speed greater than 2 mph.
- OSC value for EPC must be greater than what the PCM commands (see EPC PID).

OSC COMMAND VALUES

- [00] - sets EPC pressure to 00 PSI
- [15] - sets EPC pressure to 15 PSI
- [30] - sets EPC pressure to 30 PSI
- [45] - sets EPC pressure to 45 PSI
- [60] - sets EPC pressure to 60 PSI
- [75] - sets EPC pressure to 75 PSI
- [90] - sets EPC pressure to 90 PSI
- [OFF] -" turns solenoid off
- [ON] - turns solenoid on
- [XXX] - cancels OSC value sent
- [SEND] - sends the values to PCM

Drive Mode Procedure for EPC

Follow operating instructions from the NGS menu screen.

- Select "Output State Control".
- Select "Trans - Drive Mode".
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters - EPC".
- Select Value "0-90 psi".
- Press "SEND" to send command.
- Re-Select Value "0-90 psi".
- Press "SEND" to send command.
- Select "XXX" to cancel at any time.
- Press "SEND".

Using Output State Control (OSC) and Accessing PIDs

tomsn048@gmail.com

To confirm that the OSC value was sent by the NGS and the EEC has accepted the OSC substitution, a corresponding PID for each OSC parameter must be monitored. Additional PIDs should be monitored to help the technician adequately diagnose the transmission.

The following is a list of OSC parameters and their corresponding PID:

OSC Parameter	Corresponding PID	Additional PIDs
SS1	SS1	SS1F
SS2	SS2	SS2F
SS3	SS3	SS3F
SS4	CCSF	—
TCC	TCC	TCCF, TCCMACT (do not use PID TCCMCMD during OSC)
EPC	EPC	—
GR_CM	GEAR	TRANRAT

To confirm that the OSC substitution occurred, SEND the OSC value and monitor the corresponding PID value. If no ERROR MESSAGE was received and the value of the corresponding PID remains the same as the value sent from OSC, then the OSC substitution was successful.

PCM Reset Mode

The PCM reset mode provides a means for the NGS to command the powertrain control module to clear all DTCs. When resetting the PCM, a DTC P1000 will be set in the PCM until all OBD II system or components have been monitored during the OBDII Drive Cycle. When a PCM reset is performed the following occurs:

- DTCs cleared.
- Freeze Frame Data cleared.
- Oxygen Sensor Test Data cleared.
- Status of the OBD II System Monitors reset.
- DTC P1000 set.

Performing PCM Reset

- Perform visual inspection and vehicle preparation as required.
- Select "Vehicle and Engine Selection" menu.
- Select year, engine, model with the appropriate qualifier if needed, for example, transmission or 49 state/Cal.
- Select "Generic OBD II Functions" menu.
- Select "Clearing ALL Codes."
- Follow operating instructions from the NGS menu screen.
- Perform OBD II Drive Cycle — Clear DTC P1000.

Clearing DTC P1000

In some localities it may become a legal requirement to pass an Inspection/Maintenance (I/M) test of the OBD II system. If the vehicle's powertrain system or its battery has just been repaired or replaced, the OBD II system is reset to a not ready for I/M testing condition. To prepare the vehicle for the test and to clear the DTC No. P1000, an OBD II Drive Cycle must be performed.

OBD II Drive Cycle

tomsn048@gmail.com

The following steps must be run in the order shown. If Steps 2, 3, or 4 are interrupted, repeat the step before proceeding. Any safe driving mode is acceptable between steps.

Always drive vehicle in a safe manner according to traffic conditions and obey all traffic laws.

1. Start engine and drive vehicle in typical city stop-and-go traffic for at least 10 minutes after it has reached normal operating temperature.

2. Idle vehicle for at least 45 seconds, then accelerate at part throttle to near 72 km/h (45 mph).

3. Cruise and maintain a select speed in the range of 48-64 km/h (30 to 40 mph) on a level road with throttle held steady for at least one minute.

4. Drive to accumulate at least four minutes in the range of 32-72 km/h (20 to 45 mph). If stop-and-go conditions occur, the accumulated time must be within the 32-72 km/h (20 to 45 mph) range. No wide open throttle (WOT) conditions should be encountered.

5. Decelerate and idle for at least 10 seconds.

6. Accelerate to approach 88 km/h (55 mph) at 1/2 throttle (elapsed time is about 10 seconds).

7. Cruise and maintain select speed in the range of 64-104 km/h (40 to 65 mph) on a level road with throttle held steady for at least one minute and 20 seconds.

8. OBD II Drive Cycle has been completed.

Other NGS Features

For further information on other diagnostic testing features using the NGS or generic scan tool, refer to the Powertrain Control/Emissions Diagnosis Manual. Other diagnostic methods include the following:

- Parameter Identification (PID) Access Mode, used to monitor sensor and actuators.
- Freeze Frame Data Access Mode, used to view emissions related data values from specific PIDs.
- Oxygen Sensor Monitor Mode, used to monitor the O2 sensor.

Transmission Drive Cycle Test

NOTE: The Transmission Drive Cycle Test must be followed exactly. Malfunctions must occur four times consecutively for codes P0731, P0732, P0733, P0734 and P0735 to be set, and five times consecutively for continuous code P0743.

NOTE: When performing the Transmission Drive Cycle Test, refer to the Solenoid Application Chart for proper solenoid operation.

After performing the Quick Test, use the Transmission Drive Cycle Test for checking continuous codes.

1. Record and then erase Quick Test codes.

2. Warm engine to normal operating temperature.

tomsn048@gmail.com

3. Make sure transmission fluid level is correct.

4. With transmission in (D), moderately accelerate from stop to 80 km/h (50 mph). This allows the transmission to shift into fifth gear. Hold speed and throttle opening steady for a minimum of 15 seconds.

5. With transmission in fifth gear and maintaining steady speed and throttle opening, lightly apply and release brake pedal (2455) (to operate stoplamps). Then hold speed and throttle steady for an additional five seconds (minimum).

6. Brake to a stop and remain stopped for a minimum of 20 seconds.

7. Repeat Steps 4 through 6 at least five times.

8. Perform Quick Test and record continuous codes.

    - If DTCs are present, go to the On-Board Diagnostic Trouble Code Description Chart in this section for service information. Repair all non-transmission DTCs first as they can directly affect the operation of the transmission. Repeat the Quick Test and Road Test to verify the correction. Erase DTCs, perform Drive Cycle and repeat the Quick Test after completing repair on the DTCs.
    - If the continuous test passes and a concern is still present, refer to the Diagnosis by Symptom charts, OASIS and TSBs for concern diagnostics.

---

tomsn048@gmail.com

After On-Board Diagnostics

NOTE: The vehicle wiring harness, powertrain control module (PCM) (12A650) and non-transmission sensors may affect transmission operations. Repair these concerns first.

After the On-Board Diagnostics procedures are completed, repair all DTCs.

Begin with non-transmission related DTCs, then service any transmission related DTCs. Refer to the On-Board Diagnostic Trouble Code Description Chart for information on condition and symptoms. This chart will be helpful in referring to the proper manual(s) and to aid in diagnosing internal transmission concerns and external non-transmission inputs. The Pinpoint Tests are used in diagnosing electrical concerns of the transmission. Make sure that the vehicle wiring harness and the powertrain control module are diagnosed as well. The Powertrain Control/Emissions Diagnosis Manual will aid in diagnosing non-transmission electronic components.

tomsn048@gmail.com

Before Pinpoint Tests

NOTE: Prior to entering Pinpoint Tests, refer to TSBs and OASIS messages for 5R55E concerns.

NOTE: Prior to entering Pinpoint Tests, the vehicle harness must be checked for continuity and shorts, and the powertrain control module (PCM) must be checked for any concerns. Refer to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the PCM concerns.

NOTE: If any non-transmission repair codes appear, repair those codes first. They could affect the electrical operation of the transmission. Record and erase codes from continuous memory after repairs have been performed. After repairing any fault codes in the Quick Test, the Quick Test should be repeated.

NOTE: Check the EEC-V system wiring harness for proper connection, bent or broken pins, corrosion, loose wires, proper routing, proper seals and their condition. Check the powertrain control module (PCM) (12A650), sensors, and actuators for physical damage.

If codes appear while performing the Self Test, refer to the On-Board Diagnostic Trouble Code Description Chart for the appropriate repair procedure.

tomsn048@gmail.com

On-Board Diagnostic Trouble Code Description Chart

ON-BOARD DIAGNOSTIC TROUBLE CODE DESCRIPTION CHART

****May also be generated by some other non-electric transmission hardware system.**					
***Output circuit check, generated only by electrical symptoms.**					
Four-Digit DTC	**Component**	**Description**	**Condition**	**Symptom**	**Action**
P0112	IAT	IAT indicates 125°C (254°F) (grounded).	Voltage drop across IAT exceeds scale set for temperature 125°C (254°F).	Incorrect EPC pressure. Either high or low which will result in harsh or soft shifts.	Refer to PCED [1]
P0113	IAT	IAT indicates -40°C (-40°F) (open circuit).	Voltage drop across IAT exceeds scale set for temperature -40°C (-40°F).	Incorrect EPC pressure. Either high or low which will result in harsh or soft shifts.	Refer to PCED [1]
P0114	IAT	IAT out of on-board diagnostic range.	IAT temperature higher or lower than expected during KOEO and KOER.	Rerun on-board diagnostic at normal operating temperature.	Refer to PCED [1]
P1116	ECT	ECT out of on-board diagnostic range.	ECT temperature higher or lower than expected during KOEO and KOER.	Rerun on-board diagnostic at normal operating temperature.	Refer to PCED [1]
P0117	ECT	ECT indicates 125°C (254°F).	Voltage drop across ECT exceeds scale set for temperature 125°C (254°F) (grounded).	Torque converter clutch will always be off, resulting in reduced fuel economy.	Refer to PCED [1]
P0118	ECT	ECT indicates -40°C (-40°F).	Voltage drop across ECT exceeds scale set for temperature -40°C (-40°F) (open circuit).	Torque converter clutch will always be off, resulting in reduced fuel economy.	Refer to PCED [1]
P1124	TP	TP voltage high/low for on-board diagnostic.	TP was not in the correct position for on-board diagnostic.	Rerun at appropriate throttle position per application.	Refer to PCED [1]
P0121, P0122, P0123,	TP	TP concern.	PCM has detected an error. This error may cause a	Harsh engagements, firm shift feel, abnormal shift schedule, torque	Refer to PCED [1]

P1120, P1121, P1125, P1124			transmission concern.	converter clutch does not engage. Torque converter clutch cycling.	
P0102, P0103, P1100, P1101	MAF	MAF concerns.	MAF system has a malfunction which may cause a transmission concern.	High/low EPC pressure, incorrect shift schedule. Incorrect torque converter clutch engagement scheduling. Symptoms similar to a TP failure.	Refer to PCED [1]
P0300-P0308, P0320, P0340, P1351-P1364	EI	EI concerns.	EI system has a malfunction which may cause a transmission concern.	Harsh engagements and shifts, late WOT shifts, no torque converter clutch engagement.	Refer to PCED [1]
P0500, P0501, P0503, P1500, P1501	VSS	Insufficient VSS input.	PCM detected a loss of vehicle speed signal during operation.	Torque converter clutch engages, shift engagement/ disengagement (hunting) on grades.	Refer to PCED [1]
P1705	DTR	DTR not in PARK or NEUTRAL.	On-board diagnostic not run in PARK.	Rerun on-board diagnostic in PARK.	Refer to Pinpoint Test D.
P1704	DTR	DTR sensor failure in transition state.	DTR sensor misaligned or failed electrically.	Increase in EPC pressure.	Refer to Pinpoint Test D.
P1703	BOO	Brake not actuated during on-board diagnostic KOER.	Brake not cycled during KOER.	Failed ON or not connected — torque converter clutch will not engage at less than 1/3 throttle. Failed OFF or not connected — torque converter clutch will not disengage when brake is applied.	Refer to PCED [1]
P1703	BOO	BOO switch circuit failed.	Brake ON circuit failure during KOEO.	Failed ON or not connected — torque converter clutch will not engage at less than 1/3 throttle. Failed OFF or not connected — torque converter clutch will not disengage when brake is applied.	Refer to PCED [1]
P1460	A/C	A/C clutch cycling pressure switch error.	A/C or Defrost ON condition may result from A/C clutch being ON during on-board diagnostic.	DTC set during on-board diagnostic — rerun with A/C OFF. Failed ON — EPC pressure slightly low with A/C OFF.	Refer to PCED [1]
P0731**	SS1, SS2, SS3 or	1st gear error.	No 1st gear.	Improper gear selection depending on	Refer to Solenoid

tomsn048@gmail.com

	internal parts			failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material).	On/Off Charts. Refer to Pinpoint Test A.
P0732**	SS1, SS2, SS3 or internal parts	2nd gear error.	No 2nd gear.	Improper gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material).	Refer to Solenoid On/Off Charts. Refer to Pinpoint Test A.
P0733**	SS1, SS2, SS3 or internal parts	3rd gear error.	No 3rd gear.	Improper gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material).	Refer to Solenoid On/Off Charts. Refer to Pinpoint Test A.
P0734**	SS1, SS2, SS3 or internal parts	4th gear error.	No 4th gear.	Improper gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material).	Refer to Solenoid On/Off Charts. Refer to Pinpoint Test A.
P0750*	SS1	SS1 solenoid circuit failure.	SS1 circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Improper gear selection depending on condition mode and manual lever position. See Solenoid On/Off charts.	Refer to Pinpoint Test A.
P0755*	SS2	SS2 solenoid circuit failure.	SS2 circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Improper gear selection depending on condition mode and manual lever position. See Solenoid On/Off charts.	Refer to Pinpoint Test A.
—	TCIL	TCIL circuit failure	TCIL circuit open or shorted.	Failed ON — Overdrive cancel mode always	Refer to PCED [1]

tomsn048@gmail.com

				ON. NO flashing TCIL for EPC failure or sensor. Failed OFF — Overdrive cancel mode never indicated. NO flashing TCIL for EPC sensor failure.	
P1747**	EPC	EPC solenoid circuit failure, shorted circuit.	Voltage through EPC solenoid is checked. An error will be noted if tolerance is exceeded.	Short Circuit — Causes minimum EPC pressure (minimum capacity) and limits engine torque (alternate firm). Zero EPC — no 2nd and 4th gear. Slips in 1st and 3rd with high torque input.	Refer to Pinpoint Test E.
P0741**, P1744**	TCC	TCC slippage detected.	The PCM picked up an excessive amount of TCC slippage during normal vehicle operation.	TCC slippage/erratic or no torque converter clutch operation. Flash TCIL.	Refer to Diagnosis by Symptom Index.
P1780	TCS	TCS not changing states.	TCS not cycled during self test. TCS circuit open or shorted.	No (D) cancel when switch is cycled during KOER.	Rerun on-board diagnostic and cycle switch. Refer to PCED [1]
P1711	TFT	TFT out of on-board diagnostic range.	Transmission not at operating temperature during on-board diagnostic.	DTC set — Vehicle cold or overheated.	Warm or cool vehicle to normal operating temperature. Refer to Pinpoint Test B.
P0713	TFT	-40°C (-40°F) indicated TFT sensor circuit open.	Voltage drop across TFT sensor exceeds scale set for temperature -40°C (-40°F)	Firm shift feel.	Refer to Pinpoint Test B.
P0712	TFT	157°C (315°F) indicated TFT sensor circuit grounded.	Voltage drop across TFT sensor exceeds scale set for temperature of 157°C (315°F)	Firm shift feel.	Refer to Pinpoint Test B.
P0715	TSS	Insufficient input from Turbine Shaft Speed Sensor.	PCM detected a loss of TSS signal during operation.	Harsh shifts, abnormal shift schedule, no torque converter clutch activation.	Refer to Pinpoint Test F.
P0743*	TCC	TCC solenoid circuit failure during on-board diagnostic.	TCC solenoid circuit fails to provide voltage drop across solenoid. Circuit	Short circuit — Engine stalls in second (OD, 2 range) at low idle speeds with brake applied. Open circuit —	Refer to Pinpoint Test A.

tomsn048@gmail.com

			open or shorted or PCM drive failure during on-board diagnostic.	Torque converter clutch never engages.	
P1783	TFT	Transmission overtemp condition indicated.	Transmission fluid temperature exceeded 127℃ (270°F).	Increase in EPC pressure.	Refer to Pinpoint Test B.
P0705	DTR	DTR circuit failure.	DTR sensor, circuit or PCM shorted or grounded.	Increase in EPC pressure.	Refer to Pinpoint Test D.
P0708	DTR	DTR circuit above maximum voltage — open.	DTR sensor, circuit or PCM indicates open.	Increase in EPC pressure.	Refer to Pinpoint Test D.
P0751**	SS1	Shift solenoid No. 1 functional failure.	Mechanical or hydraulic failure of the shift solenoid.	Improper gear selection depending on failure mode and manual lever position.	Refer to Solenoid On/Off Charts. Refer to Pinpoint Test A.
P0756**	SS2	Shift solenoid No. 2 functional failure.	Mechanical or hydraulic failure of the shift solenoid.	Improper gear selection depending on failure mode and manual lever position.	Refer to Solenoid On/Off Chart. Refer to Pinpoint Test A.
P1781	4x4L	4x4 low switch failure.	Switch closed or shorted during KOEO.	Early or delayed shifts.	Refer to Section 07-07A.
P1729	4x4L	4x4 low switch failure.	Circuit open/shorted.	Early or delayed shifts.	Refer to Section 07-07A.
P0761**	SS3	Shift solenoid No. 3 functional failure.	Mechanical or hydraulic failure of the shift solenoid.	Improper gear selection depending on failure mode and manual lever position.	Refer to Solenoid On/Off Charts. Refer to Pinpoint Test A.
P0760*	SS3	SS3 solenoid circuit failure.	SS3 circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Improper gear selection depending on condition mode and manual lever position. See Solenoid On/Off chart.	Refer to Pinpoint Test A.
P1746**	EPC	EPC solenoid circuit open.	Voltage through EPC solenoid is checked. Error is noted if tolerance is exceeded.	Open Circuit — Causes maximum EPC pressure, harsh engagements and shifts.	Refer to Pinpoint Test E.

tomsn048@gmail.com

P1701	Transmission	Reverse engagement error.	EPC pressure is low, no drop in TSS rpm, DTR indicates reverse	EPC pressure low, SS1 is off, engine lacks power.	Diagnosis by symptom.
P1714	SS1	SS1 malfunction.	Mechanical failure of the solenoid detected.	Improper gear selection depending on condition, mode and manual lever position. See Solenoid Operation Chart.	Pinpoint Test H.
P1715	SS2	SS2 malfunction.	Mechanical failure of the solenoid detected.	Improper gear selection depending on condition, mode and manual lever position. See Solenoid Operation Chart.	Pinpoint Test H.
P1716	SS3	SS3 malfunction.	Mechanical failure of the solenoid detected.	Improper gear selection depending on condition, mode and manual lever position. See Solenoid Operation Chart.	Pinpoint Test H.
P1717	SS4	SS4 malfunction.	Mechanical failure of the solenoid detected.	Improper gear selection depending on condition, mode and manual lever position. See Solenoid Operation Chart.	Pinpoint Test H.
P0735	SS1, SS2, SS3, SS4 or internal parts	5th gear error	No 5th gear.	Improper gear selection depending on failure mode or manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material etc.).	Refer to Solenoid On/Off Charts. Refer to Pinpoint Test A.
P1719	ODS	Insufficient input from ODS sensor.	PCM detected a loss of ODS signal during operation.	Harsh or flairing 2-1, 2-3 or 5-4 shift.	Refer to Pinpoint Test F.
P0765	SS4	SS4 solenoid circuit failure.	SS4 circuit failed to provide voltage drop across solenoid. Circuit open, shorted or PCM driver circuit failure during on-board diagnostics.	Improper gear selection depending on condition, mode and manual lever position. See Solenoid On/Off charts.	Refer to Pinpoint Test A.
P1762	Transmission	SS3/SS4/OD band failure.	Failure or SS3, SS4 or the front band.	No 2nd or 5th gear.	Diagnosis by symptom.
P0743	TCC	TCC solenoid circuit failure	TCC solenoid circuit fails to	Short circuit: engine stalls in O/D or 2	Pinpoint Test A.

tomsn048@gmail.com

		during OBD Test.	provide voltage drop across solenoid. Circuit open, shorted or PCM driver failure during OBD Test.	position at low idle with brake applied. Open circuit: torque converter never engages.	
P1740	TCC	TCC Malfunction.	Mechanical failure of the solenoid detected.	Failed ON — Engine stalls in 2nd (O/D, Manual 2 ranges) at low idle speeds with brake applied. Failed OFF — Torque converter never applies.	Pinpoint Test H.
P0720	OSS	Insufficient input from OSS sensor.	PCM detected a loss of OSS signal during operation.	Harsh shifts, abnormal shift schedule, no torque converter clutch engagement.	Refer to Pinpoint Test F.
P0721	OSS	Output shaft speed sensor signal noisy.	PCM has detected an erratic OSS signal.	Harsh shifts, abnormal shift schedule, no torque converter clutch engagement.	Pinpoint Test F.

[1] Can be purchased as a separate item.

tomsn048@gmail.com

Rotunda Transmission Tester

Use Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit), Rotunda Transmission Range (TR) Sensor Cable "E" 007-00111 with Digital TR Overlay 007-00131 or equivalent to diagnose electronically controlled transmissions (7003). The following instructions outline the set up and use of this tester in the Pinpoint Tests for the 5R55E.

tomsn048@gmail.com

Transmission Tester

- BENCH MODE: acts as shift solenoid selector for click testing.
- DRIVE MODE: acts as forward gear selector in place of vehicle's powertrain control module (PCM) (12A650) controlled shifting. Hydraulic safety mechanisms and overrides are built into the transmission (7003).
- OHMS CHECK: allows technician to measure ohms and to check for presence of diode on specific solenoids.

Tester Jacks

1. **VPWR Pin Jacks (red):** Vehicle Power (VPWR) test points for solenoid circuits.
2. **Solenoid Signal Line Pin Jacks (black):** Signal line test points for solenoid circuits.
3. **BAT + (red) and BAT - (black) Pin Jacks:** Battery reference points when measuring circuits for shorts.
4. **TFT Pin Jacks:** Test points for transmission fluid temperature sensor.
5. **TSS Jack:** Test points for TSS sensor.

LEDs and Controls

- LED turns **RED** when solenoid activates and **OFF** when solenoid deactivates.
- LED turns **GREEN** if an activated solenoid/harness is shorted.
- LED remains **OFF** if an activated solenoid/harness is shorted to ground or no continuity.

Digital Transmission Range (DTR) Sensor Testing

Introduction

The Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and TR Testing Cable "E" 007-00111 with Digital TR Sensor Overlay 007-00131 or equivalent allows a technician to test the DTR sensor independent of vehicle electronics. DTR sensor testing is divided into four steps:

1. Preliminary diagnosis and testing.
2. Installing the Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and TR Testing Cable "E" 007-00111 with Digital TR Sensor Overlay 007-00131 or equivalent.
3. Testing the digital transmission range (DTR) sensor.
4. Testing the park/neutral, backup and optional circuits.

Preliminary Testing and Diagnosis

tomsn048@gmail.com

Before any diagnostic testing is done on a vehicle some preliminary checks must be performed. Be sure to write down any findings, especially any DTCs, for future reference.

1. Know and understand customer's concern.
2. Verify that DTR sensor is properly adjusted in NEUTRAL.
3. Verify customer concern:
    - Upshift
    - Downshift
    - Coasting
    - Engagement

If concern involves noise or vibration, does it relate to any of the following?

- Rpm
- Vehicle speed
- Shift
- Gear
- Range
- Temperature

4. Vehicle must be at normal operating temperature.
5. Check transmission fluid level and condition.
6. Check for the following items:
    - Vehicle modifications
    - Electronic add-on items
    - Leaks
    - Linkage adjustments
7. Check TSBs and OASIS for related information.
8. Perform complete On-Board Diagnostics (OBD) for both KOEO and KOER.
9. Record all DTCs.
10. Repair all non-transmission DTCs.

Installation Procedures

Installing the Rotunda Transmission Tester 007-00130 (part of Rotunda Transmission Tester Kit) and TR Testing Cable "E" 007-00111 with Digital TR Sensor Overlay 007-00131 at the transmission connector allows separation of the DTR sensor electronics from the vehicle electronics.

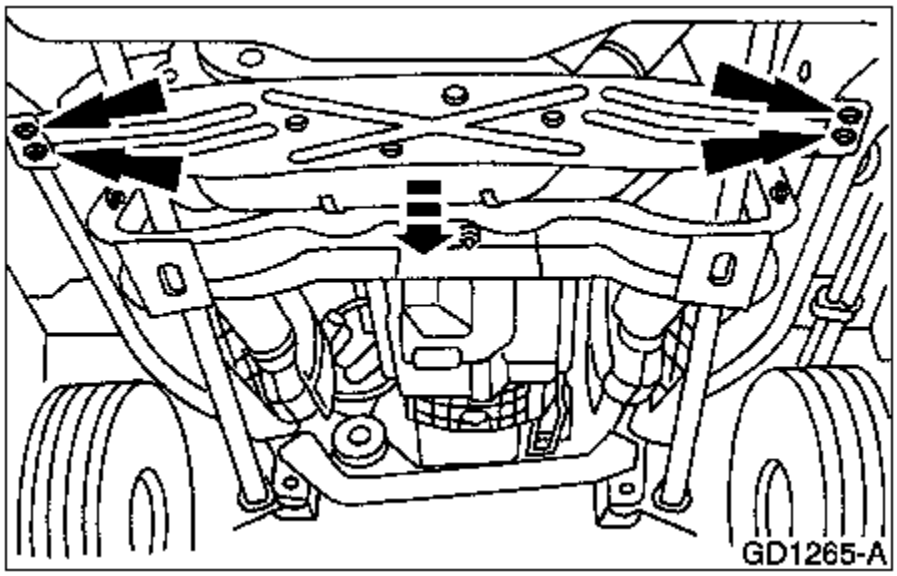
Testing may cause additional fault codes to be set. Therefore, it is important that all DTCs are erased whenever repairs are made. To verify elimination of all codes, rerun OBD test.

tomsn048@gmail.com

The following manuals will assist in diagnosis of electronically controlled transmissions:

- Powertrain Control/Emissions Diagnosis Manual

1. For proper Digital TR Sensor Diagnosis follow Pinpoint Test D .
2. Disconnect vehicle harness at digital transmission DTR sensor.
3. Set the two-way switch in the down position. (This switch will stay in the same position for all DTR sensor testing.)
4. Attach the Digital TR Sensor Overlay 007-00131 to the transmission tester.

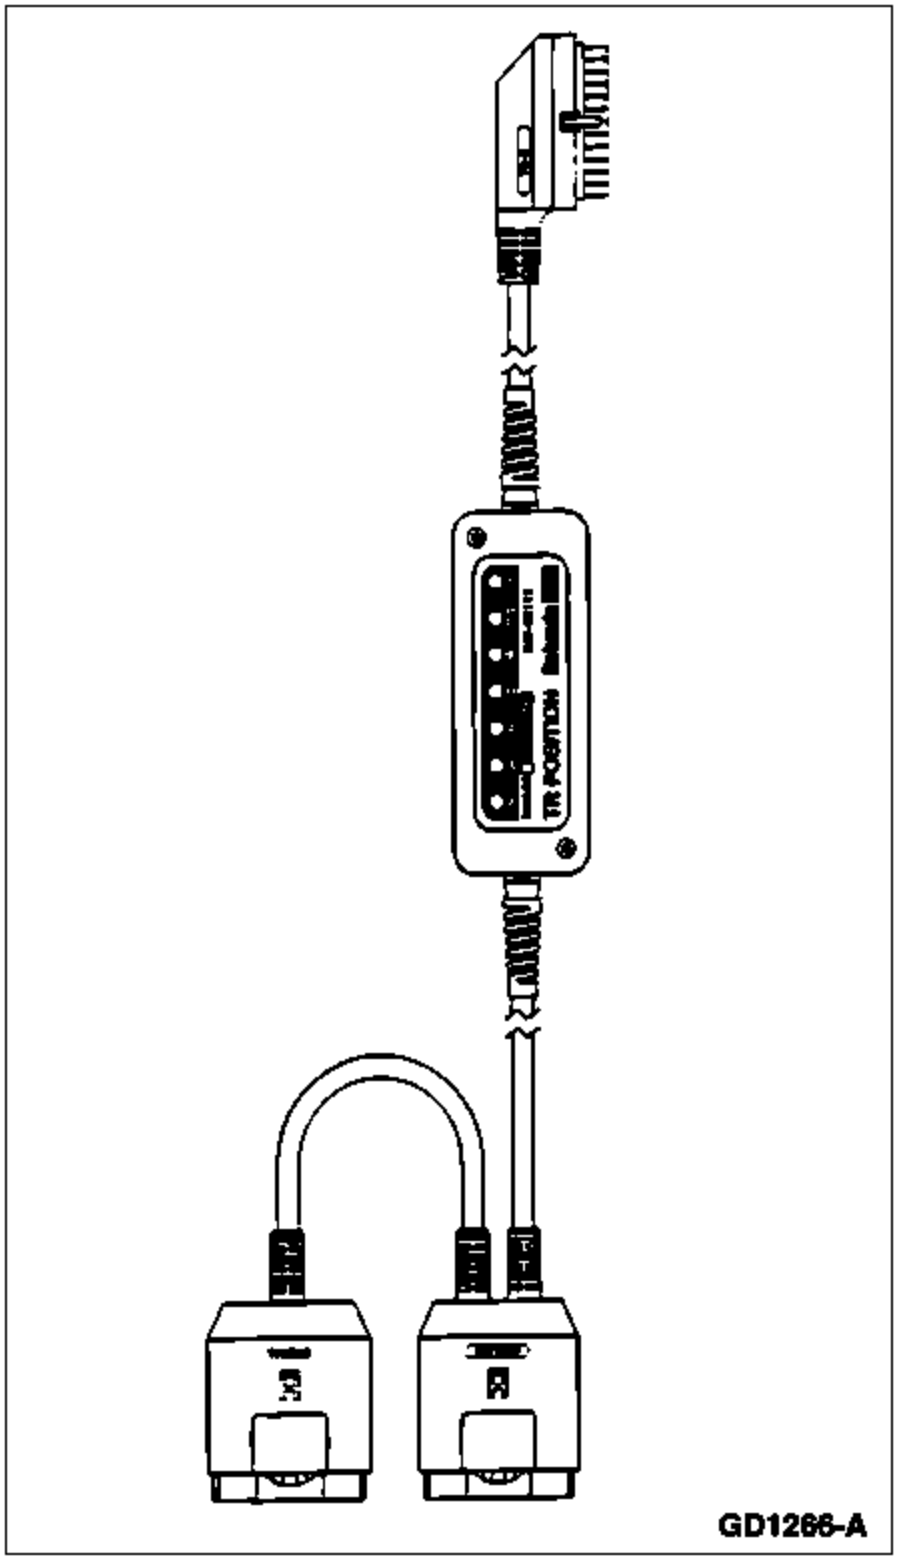


Affixing the overlay will immobilize the two-way switch (set in Step 2) so it cannot be accidentally moved to an incorrect setting during testing.

5. Select and connect interface cable "E" 007-00111 to the tester and then black connector (digital) to DTR sensor.

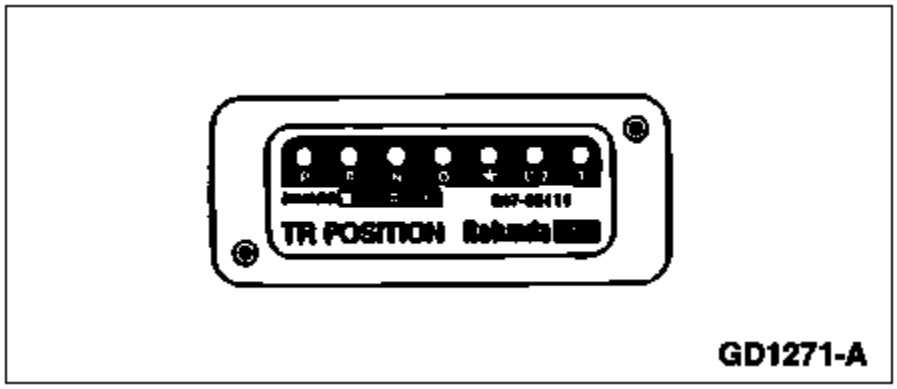
Transmission	Model Year	Cable
5R55E	1997-Up	E

tomsn048@gmail.com



6. Set Analog/Digital Switch on TR-E Cable to Digital.

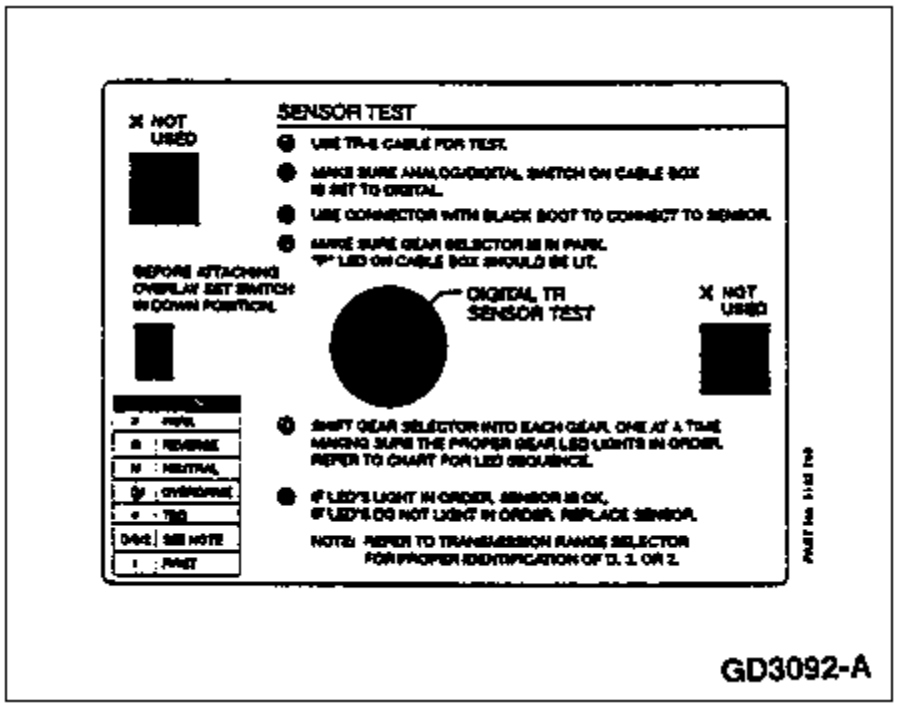
tomsn048@gmail.com



CAUTION: Route all cables away from heat sources to prevent damage to cables during testing.

Use the transmission tester extender cable when running tests with the transmission on the vehicle.

7. Turn large dial to DIGITAL TR SENSOR TEST.



8. Plug transmission tester power cable into cigar lighter socket.

All LEDs should light for a short period and then turn off. This is the Tester's internal circuit check.

CAUTION: For resistance checks, be sure that the tester selector switch is set to the TR SENSOR TEST position or damage to the ohmmeter may result.

Sensor Test

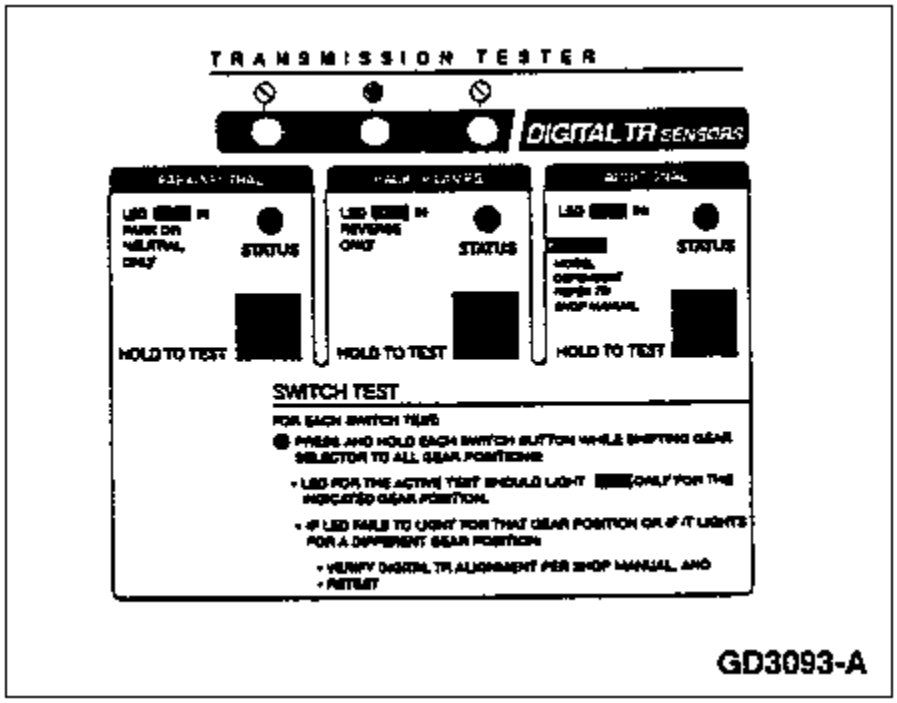
tomsn048@gmail.com

CAUTION: Be sure that the DIGITAL 12 pin sensor cable connector (black) is used. If the wrong connection is made or the slide switch is in the wrong position, the LEDs on the TR cable will give false or no response during testing. This will cause the replacement of good parts.

1. Place transmission range selector lever into PARK.
2. Ensure that the "E" cable ANALOG/DIGITAL switch is set to DIGITAL.
3. Move the transmission range selector lever through all ranges.
4. Monitor the LEDs, located on the "E" cable, in each gear position. The LED should illuminate RED for the appropriate range selected.
5. If the LED for the applicable gear range position fails to illuminate RED or if it lights for a position other than the gear selected:
    - Verify test cable connections at sensor and tester.
    - Verify transmission shift linkage for proper adjustment.
    - Verify DTR sensor for proper adjustment.
    - Retest.
6. If the sensor still fails to illuminate the LED RED for the selected gear range or indicates incorrect gear position, replace it.

Switch Tests — Park/Neutral, Backup Lamp and Optional Circuits

NOTE: LED lights red when circuit is closed.



tomsn048@gmail.com

LED turns off when circuit is open.

1. Press and hold each test button while moving the transmission range selector lever to each gear position.
2. Monitor each STATUS LED:

   The LED in the appropriate gear position being testing should light red.

   If the LED for the applicable gear position fails to light red, or if it lights for a position other than the gear selected:

   - Verify DTR alignment. Refer to the Assembly procedure in this section.
   - Retest.
3. If the DTR sensor fails, replace it.

   After testing is finished, follow the Disconnecting The Tester procedure in this section.

Disconnecting The Tester

1. **CAUTION: Do not attempt to pry off connectors with a screwdriver. This will damage the connector and could result in a transmission concern.**

   Disconnect transmission tester from the DTR sensor connector.
2. Reinstall vehicle wiring harness. Verify connection by pulling up on the harness.
3. Reinstall all heat shields that were previously removed.
4. Disconnect transmission tester power lead from vehicle.
5. Erase all DTCs using the procedures in the Powertrain Control/Emissions Diagnosis Manual.
6. Rerun On-Board Diagnostic Tests to receive a pass code.
7. Verify that the customer concern has been eliminated.

Digital Transmission Range (DTR) Sensor Vehicle Harness Connector

tomsn048@gmail.com

Pinpoint Tests

PINPOINT TEST A: SHIFT SOLENOIDS (SS1, SS2, SS3, SS4) AND TORQUE CONVERTER CLUTCH (TCC) SOLENOID

Solenoid Operation Chart

The following chart shows normal solenoid operation for given operating modes.

SOLENOID APPLICATION CHART — 5R55E

Transmission Range Selector Lever Position	Powertrain Control Module (PCM) Commanded Gear	5R55E Solenoid States				
		SS1	SS2	SS3	SS4	Engine Braking
P/N	P/N	On	Off	Off	Off	No
R	R	On	Off	Off	O/W [1]	Yes
(D) (Overdrive)	1	On	Off	Off	Off	No
(D)	2 [G]	On	Off	On	Off	No
(D)	3	On	On	Off	Off	No
(D)	4	Off	Off	Off	Off	No
(D)	5	Off	Off	On	Off	Yes
(D) Off [1]	1	On	Off	Off	Off	No
	2 [G]	On	Off	On	Off	No
	3	On	On	Off	On	Yes
	4	Off	Off	Off	On	Yes
2	2	On	On	Off	On	Yes
1	1	On	Off	Off	On	Yes

[1] O/W=TCS "ON"
[G] Shift scheduled by PCM calibration.

Shift Solenoid Failure Mode Charts

NOTE: 2nd and 4th gear in O/D position can only be obtained with sufficient EPC pressure (i.e., no short in EPC circuit can be present).

Shift Solenoid Failure "Always On"

tomsn048@gmail.com

Shift Solenoid failed in the OFF mode due to PCM and/or vehicle wiring concerns; solenoid electrically or mechanically stuck in the ON mode.

	Transmission Range Selector Lever Position		
SS1 Always "ON":	**OD**	**2**	**1**
PCM Gear Commanded	**Actual Gear Obtained**		
1	1	3	1
2	2	Ratio 1.1	2
3	3	3	3
4	1	3	1
5	2	Ratio 1.1	2

	Transmission Range Selector Lever Position		
SS2 Always "ON":	**OD**	**2**	**1**
PCM Gear Commanded	**Actual Gear Obtained**

3	3	3	3
4	4	3	3
5	5	Ratio 1.1	Ratio 1.1

NOTE: Read and record all DTCs. All DTR sensor and VSS DTCs must be repaired before entering Output State Control (OCS).

A1 ELECTRONIC DIAGNOSTICS

- Turn the ignition switch to the OFF position.
- Place the transmission range selector lever in PARK.
- Check to make sure the transmission harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding.
- Connect New Generation STAR (NGS) 007-00500 Tester.
- Turn the ignition switch to the ON position.
- Select Diagnostic Data Link.
- Select PCM.
- Select Active Command Modes.
- Select Output State Control (OSC).
- Select Trans — Bench Mode.

Does vehicle enter Trans — Bench Mode?

Yes	No
REMAIN in Trans — Bench Mode. GO to **A2** .	REPEAT procedure to enter Trans — Bench Mode. If vehicle did not enter Trans — Bench Mode, REFER to Powertrain Control/Emissions Diagnosis Manual for diagnosis of PCM or NGS.

A2 WIGGLE TEST

- Remain in Trans — Bench Mode.
- Select PIDS to be monitored:

PID Command	PID Actual
SSA	SS1F
SSB	SS2F
SSC	SS3F
SSD	CCSF
TCC	TCCF

tomsn048@gmail.com

- Select "ON" to turn suspect solenoid ON.
- Press "SEND".
- Wiggle all wiring and connectors to the transmission. Monitor the Solenoid State for changes.
- Select "OFF" to turn solenoid OFF.
- Press "SEND".

Does the suspect solenoid(s) fault state change?

Yes	No
REPAIR open or short in the vehicle harness or connector.	GO to **A3** .

A3 SOLENOID FUNCTIONAL CHECK

- Monitor each solenoid state.
- Turn each solenoid "ON" and "OFF".

Does the solenoid turn "ON" and "OFF" when commanded and can solenoid activation be heard?

Yes	No
GO to **A4** .	GO to **A5** .

A4 OSC TRANS — DRIVE MODE (GR_CM OR TCC)

- Perform OSC Trans — Drive Mode.
- Select GR_CM for shift solenoids. Follow procedures for GR_CM as listed in this section.
- Select TCC for torque converter clutch solenoids. Follow procedures for TCC in drive mode as listed in this section.

Does the transmission upshift and downshift or torque converter engage/disengage when commanded?

Yes	No
CLEAR all DTCs. Road test to verify if concern is still present. If concern is still present, REFER to Diagnosis by Symptom to diagnosis shift or torque converter concern.	GO to **A5** .

A5 CHECK FOR BATTERY VOLTAGE

- Remove transmission fluid pan.
- Visually inspect all wires and connectors for damage.
- Turn the ignition switch to the ON position.
- Connect DVOM positive lead to VPWR solenoid terminal and negative lead to a good ground.

tomsn048@gmail.com

Is the battery voltage present?

Yes	No
GO to **A6** .	CHECK for open or short circuit in harness or solenoid.

A6 ELECTRICAL SIGNAL CHECK

- Leave positive lead connected to VPWR solenoid terminal and connect negative lead to the signal terminal of the appropriate solenoid.
- Select Trans — Bench Mode.
- Select parameter SS1, SS2, SS3, SS4, or TCC.
- Select "ON".
- Press "SEND".
- Turn the solenoids "ON" and "OFF" while monitoring the voltage reading on the DVOM, solenoid state on the NGS (ON and OFF), listen for the solenoid to activate (click).
- Select "OFF".
- Press "SEND".

Does the voltage and solenoid state change?

Yes	No
GO to **A7** .	CHECK for open or short circuit in harness, solenoid or a PCM concern.

A7 CHECK SOLENOID RESISTANCE AT SOLENOID

- Disconnect the appropriate solenoid connector at the solenoid.
- Check solenoid resistance by connecting an ohmmeter at the terminals of the solenoid.
- Measure and record the resistance for each solenoid. (SS1, SS2,SS3,SS4 or TCC).

Solenoid	Resistance (ohms)
SS1	22-48
SS2	22-48
SS3	22-48
SS4	22-48
TCC	8.9-16

Is the resistance within specification?

Yes	No
GO to **A8** .	REPLACE the solenoid.

A8 CHECK SOLENOID FOR SHORT TO GROUND

tomsn048@gmail.com

- Check for continuity between engine ground and appropriate shift solenoid terminal with ohmmeter or other low current tester (less than 200 milliamps).

Solenoid	Terminal
SS1	+/-
SS2	+/-
SS3	+/-
SS4	+/-
TCC	+/-

- Connection should show infinite resistance (no continuity).

Is there continuity?

Yes	No
REPLACE the solenoid.	REFER to Diagnosis by Symptom Charts for diagnosis of shift or torque converter concerns.

PINPOINT TEST B: TRANSMISSION FLUID TEMPERATURE (TFT) SENSOR

B1 ELECTRONIC DIAGNOSTICS

- Check to make sure the transmission harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding.
- Connect NGS (007-00500) tester.
- Turn the ignition switch to the ON position.
- Select Diagnostic Data Link.
- Select PCM.
- Select PID/Data Monitor and Record.
- Select the following PIDs:
  - TFT.
  - TFTV.

Does vehicle enter PID/Data Monitor and Record?

Yes	No
REMAIN in PID/Data Control. GO to **B2** .	REPEAT procedure to enter PID. If vehicle did not enter PID, REFER to Powertrain Control/Emissions Diagnosis Manual for diagnosis of PCM or NGS.

B2 WARM-UP/COOL-DOWN CYCLE

- While monitoring the TFT PIDs, perform the following test: If transmission is cold, run transmission to

tomsn048@gmail.com

warm it up. If transmission is warm, allow transmission to cool down.

Do the TFT PIDs increase as the transmission is warmed or decrease as the transmission is cooled or does the TFT or TFTV drop in and out of range?

Yes	No
If the TFT PIDs increase as the transmission is warmed or decrease as the transmission is cooled, CLEAR all DTCs. Road test to verify if concern is still present. If concern is still present, REFER to Diagnosis by Symptom to diagnose transmission overheating. If the TFT or TFTV drop in and out of range, INSPECT for intermittent concern in the internal/external harness, sensor or connector.	GO to **B3** .

B3 ELECTRICAL SIGNAL CHECK

- Remove transmission fluid pan.
- Visually inspect all wires and connectors for damage.
- Connect DVOM positive lead to +TFT at sensor terminal and negative lead to a good ground.

Is voltage present?

Yes	No
GO to **B4** .	CHECK for open or short circuit in vehicle harness, internal harness or a PCM concern.

B4 CHECK RESISTANCE OF TFT SENSOR

- Disconnect vehicle harness from transmission.
- Connect DVOM across +TFT and -TFT terminals at transmission connector.
- Record the resistance.
- Resistance should be approximately in the following ranges:

Transmission Fluid Temperature

℃	℉	Resistance (Ohms)
-40 to -20	-40 to -4	967k-284k
-19 - -1	-3-31	248k-100k
0-20	32-68	100k-37k
21-40	69-104	37k-16k
41-70	105-158	16k-5k
71-90	159-194	5k-2.7k
91-110	195-230	2.7k-1.5k
111-130	231-266	1.5k-0.8k

tomsn048@gmail.com

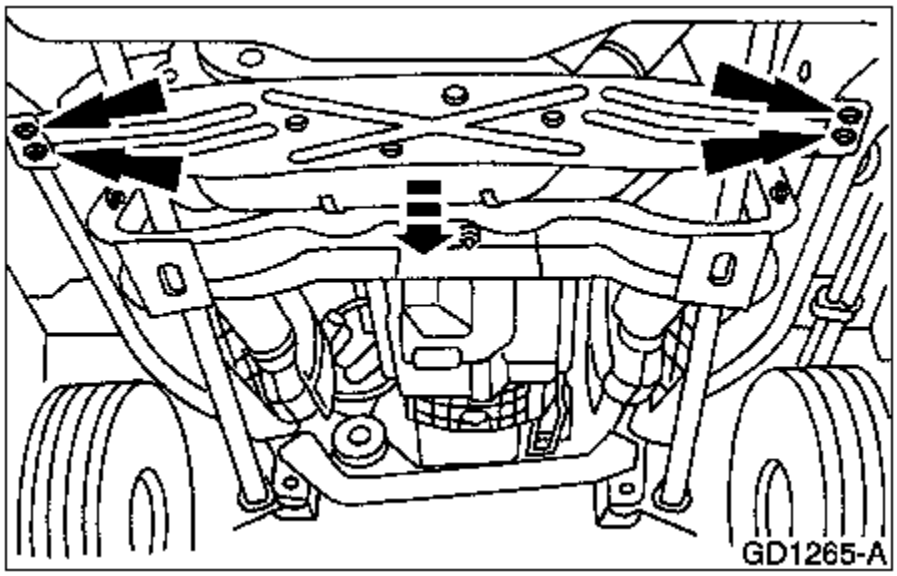
131-150	267-302	0.8k-0.54k

Is the resistance in range?

Yes	No
REFER to Diagnosis by Symptom chart to diagnose an overheating concern.	REPLACE internal harness (sensor is part of harness).

PINPOINT TEST D: DIGITAL TRANSMISSION RANGE (DTR) SENSOR

Digital TR Sensor Overlay



D1 VERIFY DIGITAL TRANSMISSION RANGE SENSOR ALIGNMENT

- Turn ignition switch OFF.
- Place transmission range selector lever in PARK.
- Check to make sure the DTR sensor harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding.
- Apply the parking brake.
- Place transmission range selector lever in OVERDRIVE.
- Verify the shift linkage is adjusted in the OVERDRIVE (O/D) position.
- Place transmission range selector lever in NEUTRAL.
- Verify that the Digital TR Sensor Alignment Tool (T97L-70010-A) fits in the appropriate slots.

Is the DTR sensor properly adjusted?

Yes	No

tomsn048@gmail.com

GO to **D2** .	ADJUST the DTR sensor as outlined under Assembly . PLACE transmission range selector lever into PARK and CLEAR DTCs. RERUN OBD tests.

D2 CHECK ELECTRICAL SIGNAL OPERATION

- Place transmission range selector lever in PARK.

CAUTION: Do not pry on connector. This will damage the connector and result in a transmission concern.

- Press button and pull out on DTR harness connector.
- Inspect both ends of the connector for damage or pushed out pins, corrosion, loose wires and missing or damaged seals.

Is there damage to the connector, pins or harness?

Yes	No
REPAIR as required. CLEAR DTCs and RERUN OBD tests.	If diagnosing a DTC, GO to **D3** . If diagnosing a starting concern, a backup lamp concern, or 4x4 low engagement concern, GO to **D8** .

D3 CHECK ELECTRICAL SYSTEM OPERATION (DTR AND PCM)

- Turn ignition switch OFF.
- Connect the New Generation STAR (NGS) tester.
- Reconnect DTR connector.
- Turn ignition switch ON.
- Select TR PIDs TR and TR_D on the NGS tester.
- Move transmission range selector lever into each gear and stop.
- Observe the PIDs, TR and TR_D, while wiggling harness and tapping on sensor.
- Compare the PIDs to the chart below:

Selector Position	TR	TR_D
Park	P/N	0000
Reverse	REV	1100
Neutral	NTRL	0110
Drive	O/D *	1111
Man 2	MAN2	1001
Man 1	MAN1	0011

* Will read DRIVE if O/D cancel switch is ON.

tomsn048@gmail.com

Do the PIDs TR and TR_D match the above chart, and does the TR_D PID remain steady when the harness is wiggled or when the sensor is tapped upon?

Yes	No
The problem is not in the DTR sensor system. REFER to Diagnosis by Symptom for further diagnosis.	GO to **D4**. **NOTE: If TR_D changes when wiggling harness or tapping on the sensor, problem may be intermittent.**

D4 CHECK DIGITAL TRANSMISSION RANGE SENSOR OPERATION

- Disconnect DTR Sensor Connector.
- Connect TR-E Cable (007-00111) to Transmission Tester (007-00130).
- Connect TR-E Cable (007-00111) to DTR Sensor.
- Place the DIGITAL TR Overlay (007-00131) onto transmission tester (007-00130).
- Perform SENSOR TEST as instructed on the DTR overlay.

Does the status lamp on the tester TR-E cable match the selected gear positions?

Yes	No
Concern is not in the DTR sensor, GO to **D5**.	REPLACE the DTR sensor and ADJUST as outlined. REFER to Assembly for procedures. CLEAR DTCs and RERUN OBD tests.

D5 CHECK PCM HARNESS CIRCUITS FOR OPENS

NOTE: Refer to schematic diagram and illustration preceding the Pinpoint Tests.

- Turn ignition switch OFF.
- Disconnect powertrain control module (PCM) connector. Inspect for damaged or pushed out pins, corrosion or loose wires.

CAUTION: Do not pry connector. This will damage the connector and result in a transmission concern.

- Press button and pull out DTR connector.
- Install 104 Pin Breakout Box (014-00950).
- Measure resistance between PCM test pin 91 at the breakout box and signal return circuit pin at vehicle harness connector pin 2.
- Measure resistance between PCM test pin 3 at breakout box and TR1 circuit pin at vehicle harness connector pin 4.
- Measure resistance between PCM test pin 49 at breakout box and TR2 circuit pin at vehicle harness connector pin 5.
- Measure resistance between PCM test pin 50 at breakout box and TR4 circuit pin at vehicle harness connector pin 6.
- Measure resistance between PCM test pin 64 at breakout box and TR3A circuit pin at vehicle harness connector pin 3.

tomsn048@gmail.com

Are all resistances less than 5 ohms?

Yes	No
GO to **D6** .	REPAIR open circuit(s). RECONNECT all components. CLEAR DTCs. RERUN OBD tests.

D6 CHECK PCM HARNESS CIRCUITS FOR SHORT TO GROUND OR POWER

- Measure resistance between PCM test pin 91 and test pins 71/97 at breakout box.
- Measure resistance between PCM test pin 3 and test pins 77, 97, 51, 76, 77, 103, and 91 at breakout box.
- Measure resistance between PCM test pin 49 and test pins 77, 97, 51, 76, 77, 103, and 91 at breakout box.
- Measure resistance between PCM test pin 50 and test pins 77, 97, 51, 76, 77, 103, and 91 at breakout box.
- Measure resistance between PCM test pin 64 and test pins 77, 97, 51, 76, 77, 103, and 91 at breakout box.

Are all resistances greater than 10,000 ohms?

Yes	No
GO to **D7** .	REPAIR short circuit(s). RECONNECT all components. CLEAR DTCs. RERUN OBD tests.

D7 CHECK FOR SHORT BETWEEN TR/PCM INPUT SIGNAL CIRCUITS

- Measure resistance between test pin 3 and pins 49, 50 and 64 at the breakout box.
- Measure the resistance between test pin 49 and pins 3, 50 and 64 at the breakout box.
- Measure the resistance between test pin 50 and pins 3, 49 and 64 at the breakout box.
- Measure the resistance between test pin 64 and pins 3, 49 and 50 at the breakout box.

Are all resistances greater than 10,000 ohms?

Yes	No
REPLACE PCM. RECONNECT all components. CLEAR DTCs and RERUN OBD tests.	REPAIR shorts on circuits having less than 10,000 ohms between other TR/PCM input signal circuits. RECONNECT all components. CLEAR DTCs and RERUN OBD tests.

D8 CHECK THE NON PCM INTERNAL CIRCUITS OF SENSOR

- Connect TR-E Cable (007-00111) to Transmission Tester (007-00130).
- Connect TR-E Cable (007-00111) to DTR sensor.
- Place the DIGITAL TR Overlay (007-00131) onto transmission tester (007-00130).
- Perform SWITCH TEST as instructed on the DTR overlay.

Does the status lamp on the tester indicate RED for the correct gear position?

tomsn048@gmail.com

Yes	No
Concern is not in the DTR sensor. For START SYSTEM concerns, GO to Section 03-06 . For Backup Lamp concerns, GO to Section 17-01 . For Optional Circuits: 4x4 Low Neutral Sense; REFER to Powertrain Control/Emissions Diagnosis Manual and Workshop Manual Section 07-07A for diagnosis.	REPLACE DTR sensor and ADJUST as outlined. REFER to Assembly for procedures. CLEAR DTCs and RERUN OBD tests.

PINPOINT TEST E: ELECTRICAL PRESSURE CONTROL (EPC) SOLENOID

NOTE: Read and record all DTCs. All DTR sensor and VSS DTCs must be repaired before entering Output State Control (OCS).

E1 ELECTRONIC DIAGNOSTICS

- Turn the ignition switch to the OFF position.
- Place the transmission range selector lever in PARK.
- Check to make sure transmission harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding.
- Connect NGS (007-00500) tester.
- Turn the ignition switch to the ON position.
- Select Diagnostic Data Link.
- Select PCM.
- Select Active Command Modes.
- Select Output State Control (OSC).
- Select Trans — Bench Mode.

Does vehicle enter Trans — Bench Mode.?

Yes	No
REMAIN in Trans — Bench Mode, GO to **E2** .	REPEAT procedure to enter Trans — Bench Mode. If vehicle did not enter Trans — Bench Mode, REFER to Powertrain Control/Emissions Diagnosis Manual for diagnosis of PCM or NGS.

E2 SOLENOID FUNCTIONAL CHECK

- Install 300 psi pressure gauge into EPC tap.
- Monitor pressure gauge.
- Select parameter — EPC.
- Select value 15, 30, 45, 60, 70, or 90 PSI.
- Press "SEND".
- Select another value "0-90 psi".

tomsn048@gmail.com

- Press "SEND".
- Select "XXX".
- Press "SEND".

Does the pressure reading match the commanded pressure?

Yes	No
CLEAR DTCs.	GO to **E3** .

E3 CHECK FOR BATTERY VOLTAGE

- Remove transmission fluid pan.
- Visually inspect all wires and connectors for damage.
- Turn the ignition switch to the ON position.
- Connect DVOM positive lead to VPWR solenoid terminal and negative lead to a good ground.

Is the battery voltage present?

Yes	No
GO to **E4** .	CHECK for open or short circuit in harness.

E4 ELECTRICAL SIGNAL CHECK

- Leave positive lead connected to VPWR solenoid terminal and connect negative lead to the signal terminal of the EPC solenoid.
- Turn the solenoids ON and OFF while monitoring the voltage reading on the DVOM, solenoid state on the NGS (ON and OFF), listen for the solenoid to activate (click).
- Select Trans — Bench Mode.
- Select parameter — EPC.
- Select a value "0-90 psi".
- Press "SEND".
- Select another value "0-90 psi".
- Press "SEND".
- Select "XXX".
- Press "SEND".

Does the voltage and solenoid state change?

Yes	No
GO to **E5** .	CHECK for open or short circuit in harness or PCM.

E5 CHECK SOLENOID RESISTANCE AT SOLENOID

- Disconnect vehicle harness from transmission.

tomsn048@gmail.com

- Check solenoid resistance by connecting an ohmmeter at the terminals of the solenoid.
- Measure and record the resistance of the EPC solenoid.
- Resistance should be between 3.10-5.7 ohms.

Is the resistance within specification?

Yes	No
GO to **E6** .	REPLACE the solenoid.

E6 CHECK SOLENOID FOR SHORT TO GROUND

- Check for continuity between engine ground and the EPC solenoid terminals with ohmmeter or other low current tester (less than 200 milliamps).

Solenoid	Terminal
EPC	+/-

- Connection should show infinite resistance (no continuity).

Is there continuity?

Yes	No
REPLACE the solenoid.	REFER to Diagnosis by Symptom Charts for diagnosis of pressure concerns.

PINPOINT TEST F: TURBINE SHAFT SPEED (TSS), AND OUTPUT SHAFT SPEED (OSS) SENSORS

F1 ELECTRONIC DIAGNOSTICS

- Check to make sure transmission harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding.
- Connect NGS (007-00500) tester.
- Turn the ignition switch to the ON position.
- Select Diagnostic Data Link.
- Select PCM.
- Select PID/Data Monitor and Record.
- Select the following PIDs:
  - TSS.
  - ODS.
  - OSS.

Does vehicle enter PID/Data Monitor and Record?

Yes	No

tomsn048@gmail.com

REMAIN in PID/Data, GO to **F2** .	REPEAT procedure to enter PID. If vehicle did not enter PID, REFER to Powertrain Control/Emissions Diagnosis Manual for diagnosis of PCM or NGS.

F2 DRIVE CYCLE TEST

- While monitoring the appropriate sensor PID, drive the vehicle so that the transmission upshifts and downshifts through all gears.

Does the TSS or OSS Speed PID increase and decrease with engine and vehicle speed or is the sensor signal erratic (drop to zero or near zero and return to normal operation)?

Yes	No
If the TSS or OSS Speed PID increase and decrease with engine and vehicle speed, CLEAR all DTCs. Road test to verify if concern is still present. If concern is still present, REFER to Diagnosis by Symptom charts for diagnosis. If the sensor signal is erratic, INSPECT for intermittent concern in the internal/external harness, sensor, or connector.	If the TSS or OSS Speed PID does not increase and decrease with engine and vehicle speed, INSPECT for open or short in vehicle harness, sensor, a PCM concern, or internal hardware concern. If the sensor signal is steady, GO to **F3** .

F3 CHECK RESISTANCE OF TSS OR OSS SENSOR

- Disconnect the appropriate vehicle harness connector from the OSS sensor. For the TSS sensor disconnect the vehicle harness connector from the transmission.
- For OSS: connect ohmmeter negative lead to one pin of the sensor and the positive lead to the other pin on the sensor.
- For TSS: connect ohmmeter negative lead to the signal return pin and the positive lead to the TSS signal at the transmission connector.
- Record resistance.
- Resistance should be as follows:

Sensor	Resistance (Ohms)
TSS	64-126
OSS	305-735

Is the resistance within specification for the appropriate sensor?

Yes	No
REFER to Diagnosis by Symptom charts for concern diagnosis.	For OSS, REPLACE sensor. For TSS, GO to Workshop Manual for repair and hardware diagnosis.

PINPOINT TEST H: SOLENOID MECHANICAL FAILURE

tomsn048@gmail.com

NOTE: Repair all other DTCs before repairing the following DTCs: P1714, P1715, P1716, P1717, P1740.

H1 ELECTRONIC DIAGNOSTICS

- Connect the New Generation STAR (NGS) 007-00500 Tester.
- Place the transmission range selector lever in PARK.
- Turn the ignition switch to the ON position.
- Perform KOEO test until continuous DTCs have been displayed.
- If any of the following DTCs are present continue with test: P1714, P1715, P1716, P1717, P1740.

Are other DTCs present for TFT or shift solenoids?

Yes	No
REPAIR the DTCs for TFT or shift solenoids first. CLEAR DTCs and PERFORM Transmission Drive Cycle Test . RERUN Quick Test.	REPLACE the appropriate solenoid and/or body. REFER to the DTC Chart for code description. GO to **H2** .

H2 TRANSMISSION DRIVE CYCLE TEST

- Perform Transmission Drive Cycle Test as listed in this section.

Does the vehicle upshift and/or downshift OK?

Yes	No
GO to **H3** .	REFER to Diagnosis by Symptom to diagnose shift concerns.

H3 RETRIEVE DTCs

- Connect the New Generation STAR (NGS) 007-00500 Tester.
- Place transmission range selector lever in PARK.
- Turn the ignition switch to the ON position.
- Perform KOEO test until continuous DTCs have been displayed.

Are DTCs P1714, P1715, P1716, P1717, P1740 still present?

Yes	No
REPLACE PCM. Road test and RERUN Quick test.	Testing completed. If a concern still exists, REFER to the Diagnosis by Symptom chart for concern diagnosis.

tomsn048@gmail.com

Special Testing Procedures

Engine Idle Speed Check

Refer to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the engine idle speed.

Line Pressure Test

CAUTION: The Transmission Tester must be removed and the vehicle harness installed when verifying these pressures.

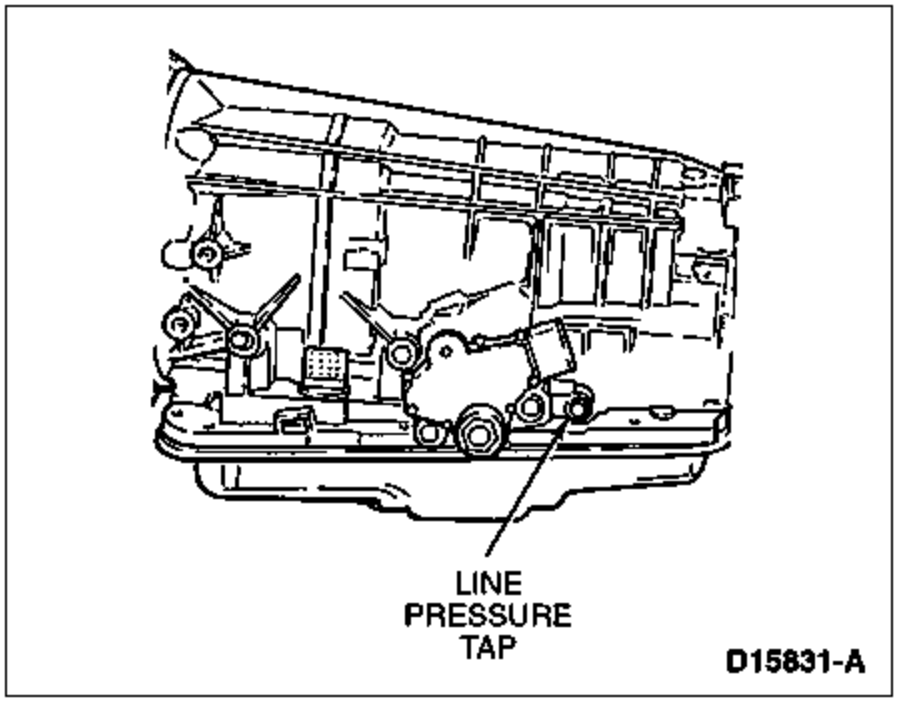
CAUTION: Perform Line Pressure Test prior to performing Stall Speed Test. If line pressure is low at stall, do not perform Stall Speed Test or further transmission damage will occur. Do not maintain wide open throttle in any gear range for more than five (5) seconds.

NOTE: Certain sensor failures may cause high EPC, FMEM (Failure Mode Effect Management) actions. Be sure that self test and electrical repairs have been performed, or test results may be incorrect.

This test verifies that the line pressure is within specifications.

1. Connect 0-2758 kPa (0-400 psi) pressure gauge to the line pressure tap.

tomsn048@gmail.com



2. Start engine and check line pressures. Refer to the following Line Pressure Specifications No. 401 chart to determine if line pressure is within specifications.

CAUTION: Do not install Transmission Tester when verifying these pressures.

NOTE: Vehicle harness must be installed at transmission connector to verify these pressures.

REFERENCE: LINE PRESSURE SPECIFICATIONS No. 401

Trans.	Transmission Model/Application	Range	Idle		WOT Stall	
			EPC	Line	EPC	Line
	4.0L Aerostar	R	57-67	100-130	112-134	282-350
	4x2, AWD	N	26-36	82-112		
5R55E		(D), 2, 1	25-35	80-110	112-134	228-263
	4.0L Ranger	R	52-62	138-168	112-134	282-350
5R55E	4x2, 4x4	N	32-42	95-125		
		(D), 2, 1	25-35	80-110	112-134	228-263

3. If line pressure is not within specifications, perform On-Board Diagnostics, Pinpoint Test E . Perform Air Pressure Test and repair main control or pump assembly as required.

4. If line pressure is not within specifications after mechanical checks and there are no DTCs, electronic pressure control (EPC) solenoid may be mechanically malfunctioning. Refer to the Line Pressure Diagnosis Chart for symptom diagnosis.

tomsn048@gmail.com

LINE PRESSURE DIAGNOSIS CHART

Test Results	Possible Source
High at Idle — All Ranges	• Wiring Harnesses • EPC Boost Valve • EPC Solenoid • Main Regulator Valve
Low at Idle — All Ranges	• Low Fluid Level • Fluid Inlet Filter/Seal • Main Control Body • Cross Leaks • Gaskets • Pump • Separator Plate
Low — All Forward Ranges	• Forward Clutch • Main Control • O/D Servo
Low in Park Only	• Valve Body
Low in Reverse Only	• Separator Plate • Rear Servo Piston, Cover Seal • Reverse Clutch • O/D Servo • Valve Body • Forward Clutch
Low in Neutral Only	• Valve Body • O/D Servo
Low in Overdrive Only	• Forward Clutch • O/D Servo • Valve Body
Low in Drive Only (O/D Cancelled)	• Forward Clutch • O/D Servo • Valve Body
Low in 1st Position Only	• Forward Clutch • Valve Body
Low in 2nd Position Only	• Intermediate Servo • O/D Servo • Forward Clutch

Stall Speed Test

This test checks operation of the following items:

- Torque converter clutch
- Forward clutch
- Low one way clutch (OWC) assembly
- Engine performance

tomsn048@gmail.com

WARNING: APPLY THE PARKING BRAKE FIRMLY WHILE PERFORMING EACH STALL TEST.

CAUTION: Always perform Line Pressure Test procedures prior to performing the Stall Speed Test. If line pressure is low at stall, do not perform Stall Speed Test or further transmission damage will occur.

NOTE: The Stall Speed Test should be performed with the engine and transmission at normal operating temperatures.

1. Connect tachometer to the engine.

2. **CAUTION: After testing each of the following ranges (D), 2, 1, and R, move the transmission range selector lever to N (NEUTRAL) and run engine at 1000 rpm for about 15 seconds to allow the torque converter to cool before testing the next range.**

   CAUTION: Do not maintain wide open throttle in any range for more than five (5) seconds.

   CAUTION: If the engine rpm recorded by the tachometer exceeds maximum specified rpm, release the accelerator pedal immediately. Clutch or band slippage is indicated.

   NOTE: Prolonged use of this procedure may set Diagnostic Trouble Code P0712, P1783. After performing Stall Speed Test run OBD Test and clear DTCs from memory.

   Press accelerator pedal to floor (WOT) in each range. Record rpm reached in each range. Stall speeds should be as follows:

Vehicle	Engine	Rpm
Ranger	4.0	2405-2800
Aerostar	4.0	2454-2833

If stall speeds were too high, refer to the following Stall Speed Diagnosis Chart. If stall speeds were too low, first check the engine idle speed. If engine idle is OK, remove torque converter and check the torque converter clutch for slippage.

STALL SPEED DIAGNOSIS CHART

Transmission Range Selector Lever Position	Stall Speeds High	Stall Speeds Low
(D)Overdrive, D, and 1	Overdrive One-Way Clutch, Rear One-Way Clutch	—
D, 2 and 1	Forward Clutch, O/D One-Way Clutch	—
(D)Overdrive	Forward Clutch, O/D One-Way Clutch	—

tomsn048@gmail.com

(D)Overdrive, D, 2, 1 and R	General Pressure Concerns, Forward Clutch, O/D One-Way Clutch	Converter One-Way Clutch or Engine Performance
R Only	High/Reverse and High Clutch and Low and Reverse Band/Servo	—
2 Only	Intermediate Band/Servo	—
1 Only	Low/Reverse Band/Servo	—

Air Pressure Tests

A no drive condition can exist, even with correct transmission fluid pressure, because of inoperative clutches or bands. An erratic shift can be located through a series of checks by substituting air pressure for fluid pressure to determine the location of the malfunction.

When the transmission range selector lever is in a forward gear range ((D) , 2, 1), a no drive condition may be caused by an inoperative forward clutch, or an overrunning one-way clutch.

Failure to drive in R (REVERSE) could be caused by a malfunctioning reverse clutch, reverse servo, or band.

Follow the procedure to determine the location of the inoperative clutch or band by introducing air pressure into the various test plate passages.

Test Procedures

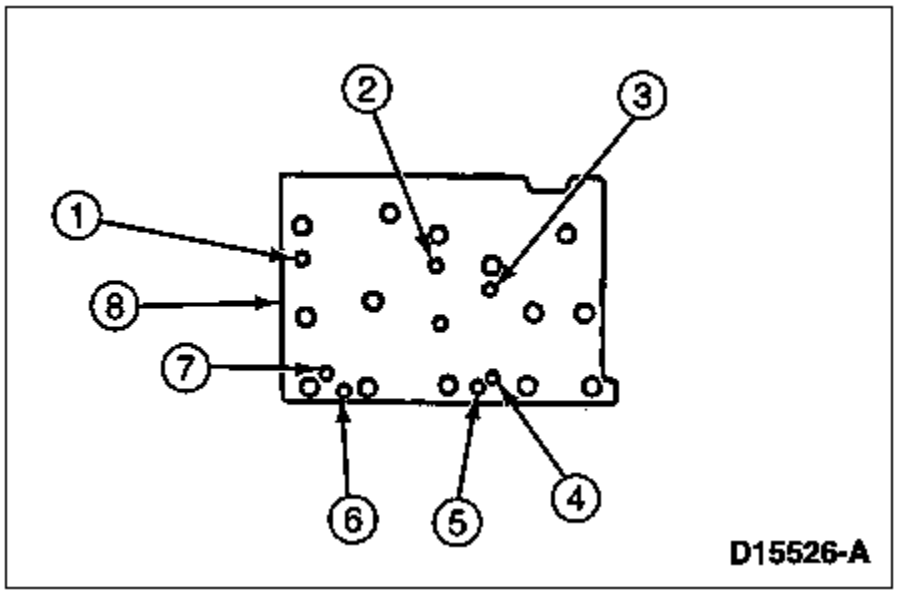
NOTE: Cover vent in test plate with a clean, lint-free shop towel to prevent spray when air is applied. Plugging vent hole during testing will result in inaccurate results.

NOTE: Use only dry regulated air pressure 276kPa (40 psi) max. A dull thud should be heard when the clutch or band applies. There should be no hissing sound when band or clutch applies.

1. Drain transmission fluid and remove transmission oil pan.
2. Remove filter and seal assembly and main control valve body.
3. Install 4R44E/5R55E Transmission Test Plate T95L-77000-AH and Transmission Test Plate Gasket T95L-77000-AH1.
4. **CAUTION: Do not apply air to test the vent.**

   Apply air pressure to appropriate clutch port (refer to diagram). A dull thud may be heard or movement felt when clutch is applied or released. If clutch seals or check balls are leaking a hissing sound may be heard.

tomsn048@gmail.com



Item	Part Number	Description
1	—	Coast Clutch Apply
2	—	Direct Clutch Apply
3	—	Forward Clutch Apply
4	—	Intermediate Servo Release
5	—	Intermediate Servo Apply
6	—	Front Servo Release
7	—	Front Servo Apply
8	T95L-77000-AH	4R44E/5R55E Transmission Test Plate
—	T95L-77000-AH1	Transmission Test Plate Gasket

Test Results

If test results find that the servos do not operate, disassemble, clean and inspect them to locate the source of the concern.

If air pressure applied to the clutch passages fails to operate a clutch, or operates another clutch simultaneously, disassemble and use air pressure to check the fluid passages in the center support and clutches to detect obstructions.

tomsn048@gmail.com

tomsn048@gmail.com

Leakage Inspection

CAUTION: Do not try to stop the fluid leak by increasing the torque beyond specifications. This may cause damage to the case threads.

Check the vehicle speed sensor (VSS) and the speedometer cable connection at the transmission. Replace rubber seal if necessary.

Leakage at the transmission fluid pan to case gasket often can be stopped by tightening the attaching bolts to 13-15 Nm (115-133 lb-in). If necessary, replace the oil pan case gasket.

Check the fluid filler tube connection at the transmission case. If leakage is found here, install a new grommet.

Check fluid lines and fittings between the transmission and the cooler in the radiator tank for looseness, wear, or damage. If leakage cannot be stopped by tightening a fluid tube nut, replace the damaged parts. When fluid is found leaking between the case and cooler line fitting, check for missing or damaged O-ring, then tighten the fitting to maximum specification.

If the leak continues, replace cooler line fitting and tighten to specification. The same procedure should be followed for fluid leaks between the radiator cooler and the cooler line fittings in this section. Refer to Transmission Cooler Line Replacement for procedures.

Check the engine coolant in the radiator. If transmission fluid is present in the coolant, the cooler in the radiator is probably leaking.

The cooler can be further checked for leaks by disconnecting the lines for the cooler fittings and applying no more than 345 kPa (50 psi) air pressure to the fittings. Remove the radiator cap to relieve the pressure buildup at the exterior of the oil cooler tank. If the cooler is leaking and/or will not hold pressure, replace the cooler.

If leakage is found at the transmission range selector lever, replace the seal.

If leakage is found at the transmission internal harness connector, replace O-ring.

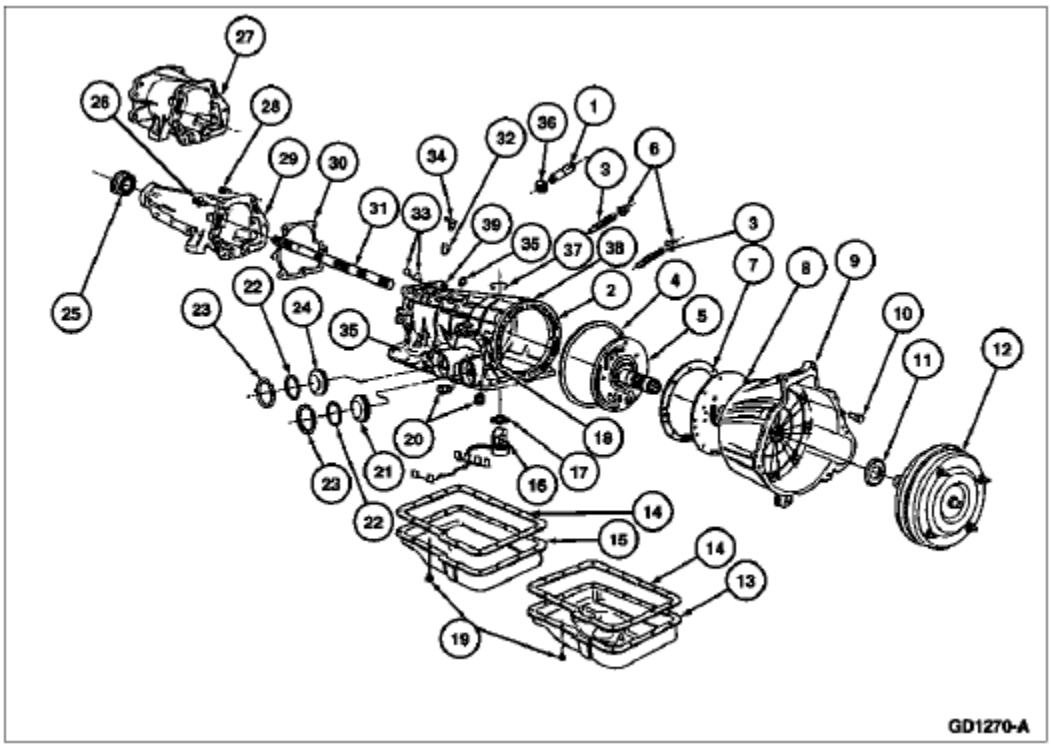
External Sealing

The 5R55E transmission has the following parts to prevent external fluid leakage:

- Gaskets
- Lip-type seals
- O-ring seals
- Seal rings
- Seal grommets
- Thread sealant

tomsn048@gmail.com

External Sealing



Item	Part Number	Description
1	7A308	Shaft (Manual Valve Outer to Inner Levers)
2	7005	Case Assembly
3	7C492	Screw (Intermediate and O/D Band) Adjuster/Lock (2 Req'd)

37	84280020	Spring (Retains 16-Pin Connector in Case)
38	W702981-S300	O-Ring (Overdrive Drum Speed Sensor to Case)
39	W702981-S300	O-Ring (Output Shaft Speed Sensor to Case)

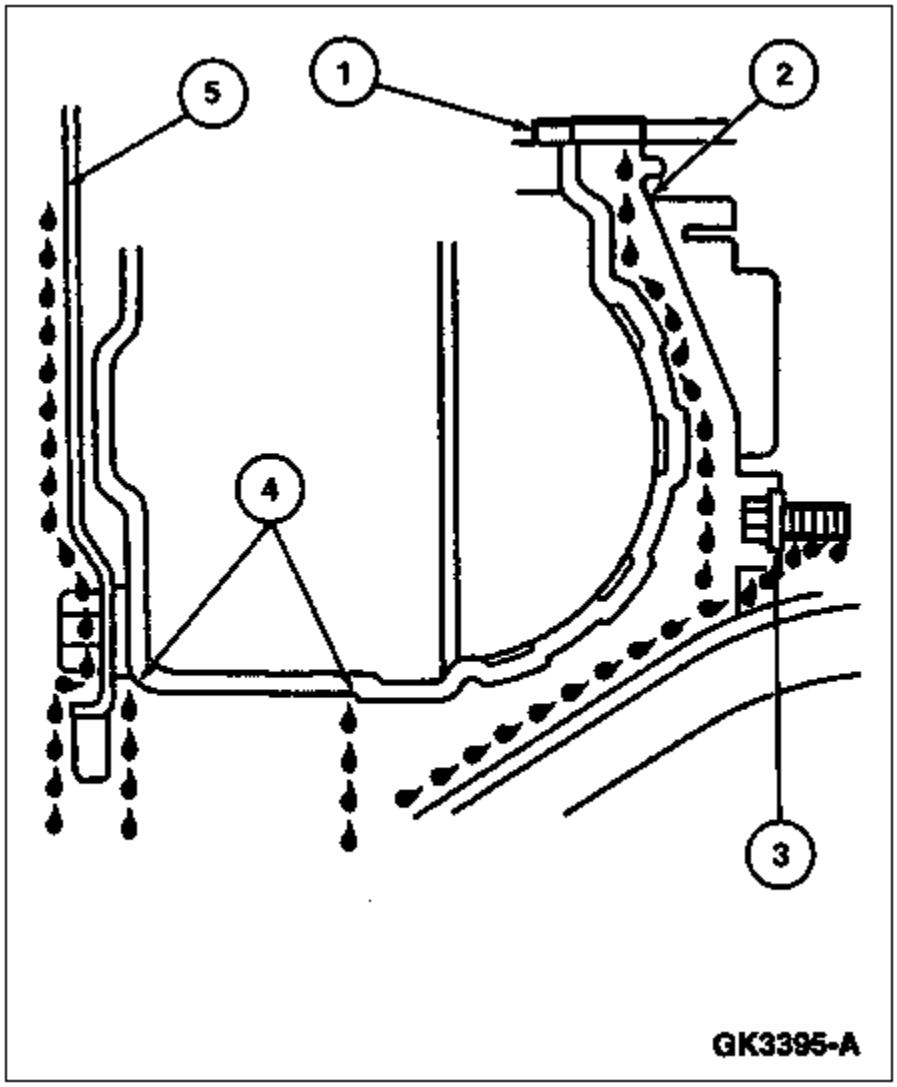
Fluid Leakage in Torque Converter Area

In diagnosing and correcting fluid leaks in the torque converter (7902) area, use the following procedures to

tomsn048@gmail.com

locate the exact cause of the leakage. Leakage at the front of the transmission, as evidenced by fluid around the converter housing, may have several sources. By careful observation it is possible to pinpoint the source of the leak before removing the transmission from the vehicle. The paths which the fluid can take to reach the bottom of the converter housing are as follows:

Torque Converter Area Leak Points



1. Fluid leaking by the front pump seal lip will tend to move along the impeller hub and onto the back of the impeller housing. Except in case of a total seal failure, fluid leakage by the lip of the seal will be deposited on the inside of the torque converter housing only, near the outside diameter of the housing.

2. Fluid leakage by the outside diameter of the front pump seal and front pump body will follow the same path that leaks by the inside diameter of the front pump seal follow.

3. Fluid that leaks by a front pump to case bolt or pump gasket will be deposited on the inside of the torque converter housing only. Fluid will not be deposited on the back of the torque converter.

4. Fluid leakage from the converter seal weld or converter to flywheel stud weld will appear at the outside diameter of the torque converter on the back face of the flywheel (6375), and in the converter

tomsn048@gmail.com

housing only near the flywheel. Fluid leaks from the torque converter will leave a ring of fluid around the inside of the torque converter housing.

5. **NOTE: White facial tissue paper may aid in determining the color (red is transmission fluid) and source of the leakage fluid.**

   Engine oil leaks are sometimes improperly diagnosed as transmission pump gasket leaks. The following areas of possible leakage should also be checked to determine if engine oil leakage is causing the concern.

   a. Leakage at the valve cover gasket (6584) may allow oil to flow over the torque converter housing or seep down between the torque converter housing and cylinder blocks (6010) causing oil to be present in or at the bottom of the torque converter housing.
   b. Oil galley plug leaks will allow oil to flow down the rear face of the cylinder blocks to the bottom of the torque converter housing.
   c. Leakage at the crankshaft rear oil seal (6701) will work back to the flywheel, and then into the torque converter housing.
   d. Leakage at oil pressure sensor (9278).

Leak Check Test

The following procedures should be used to determine the cause of the leakage before service is made.

1. Remove the fluid level indicator (7A020) and note the color of the fluid. Original factory fill fluid is dyed red to aid in determining if leakage is from the engine or transmission. Unless a considerable amount of makeup fluid has been added or the fluid has been changed, the red color should assist in pinpointing the leak.

2. Remove the converter housing access cover. Clean off any fluid from the top and bottom of the converter housing, front of the transmission case, and rear face of the engine and pan. Clean the converter area by washing with suitable nonflammable solvent, and blow dry with compressed air.

3. Wash out converter housing and the front of the flywheel. The converter housing may be washed out using clean solvent and a squirt-type fluid can. Blow dry all washed areas with compressed air.

4. Start and run the engine until the transmission reaches its normal operating temperature. Observe the back of the block and top of the converter housing for evidence of fluid leakage. Raise the vehicle on a hoist and position suitable safety stands under vehicle. Run the engine at fast idle, then at engine idle, occasionally shifting to the drive and reverse ranges to increase pressure within the transmission. Observe the front of the flywheel, back of the block (in as far as possible), and inside the converter housing and front of the transmission case. Run the engine until fluid leakage is evident and the probable source of leakage can be determined.

Leak Check Test With Black Light

Fluid soluble aniline or fluorescent dyes premixed at the rate of 2.5ml (1/2 teaspoon) of dye powder to 0.24L (1/2 pint) of automatic transmission fluid have proven helpful in locating the source of fluid leakage. Such dyes may be used to determine whether an engine fluid or transmission fluid leak is present, or if the fluid in the transmission fluid cooler hose leaks into the engine coolant system. An ultraviolet light must be used to detect the fluorescent dye solution.

---

tomsn048@gmail.com

tomsn048@gmail.com

Transmission Fluid Cooler

The following procedures will assist in diagnosing the transmission cooling system. Refer to Section 07-02 for specific transmission cooling system diagnosis and testing procedures.

Transmission Fluid Cooler Flow Test

NOTE: The transmission linkage/cable adjustment, fluid level, and line pressure must be within specification before performing this test. Refer to repair procedures in this section.

1. Remove fluid level indicator (7A020) from fluid filler tube.
2. Place funnel in fluid filler tube.
3. Raise vehicle on hoist and position suitable safety stands under vehicle.
4. Remove cooler return line (rear fitting) from fitting on transmission case. Refer to removal and installation of the transmission fluid cooler line in Section 07-02 .
5. Connect one end of a hose to the cooler return line and route the other end of the hose to a point where it can be inserted into the funnel at the fluid filler tube.
6. Remove safety stands and lower vehicle. Insert end of hose into funnel.
7. Start engine and run at idle with transmission in neutral range.
8. When fluid flowing from hose is all liquid, an adequate amount of fluid should be observed (approximately 1.0 liter [1.05 quart] delivered in 30 seconds). If adequate flow is observed, test is completed.
9. If the flow is not adequate, stop engine. Disconnect hose from cooler return line and connect it to converter out line fitting (front fitting) on transmission case.
10. Repeat Steps 7 and 8. If flow is now adequate, refer to Section 07-02 for diagnosis of transmission fluid cooler (7A095). If flow is not adequate, repair pump and/or converter assembly, and main control.

Transmission Fluid Cooler — Backflush/Cleaning

CAUTION: Whenever a transmission has been disassembled to replace worn or damaged parts or because the valve body sticks from foreign material, the transmission fluid cooler must be cleaned using the Torque Converter/Fluid Cooler Cleaner 014-00028 or equivalent. Under no circumstances should torque converters be cleaned by hand agitation with solvent.

When internal wear or damage has occurred in the transmission, metal particles, clutch plate material, or band material may have been carried into the transmission cooler. These contaminants

tomsn048@gmail.com

are a major cause of reoccurring transmission concerns and must be removed from the system before the transmission is put back into service.

1. Conduct backflushing with a Torque Converter/Transmission Fluid Cooler Cleaner 014-00028 or equivalent. Test the equipment to make sure that a vigorous fluid flow is present before proceeding. Replace the system filter if flow is weak or contaminated.

2. To aid in attaching the cleaner to the transmission steel cooler lines, connect two additional rubber hoses to the transmission end of the steel transmission cooler lines as described.

    - Connect the cleaner tank pressure line to the steel transmission cooler return line (longest line).
    - Connect a tank return hose to the steel transmission cooler pressure line (shorter line). Place the outlet end of this hose in the solvent tank reservoir.

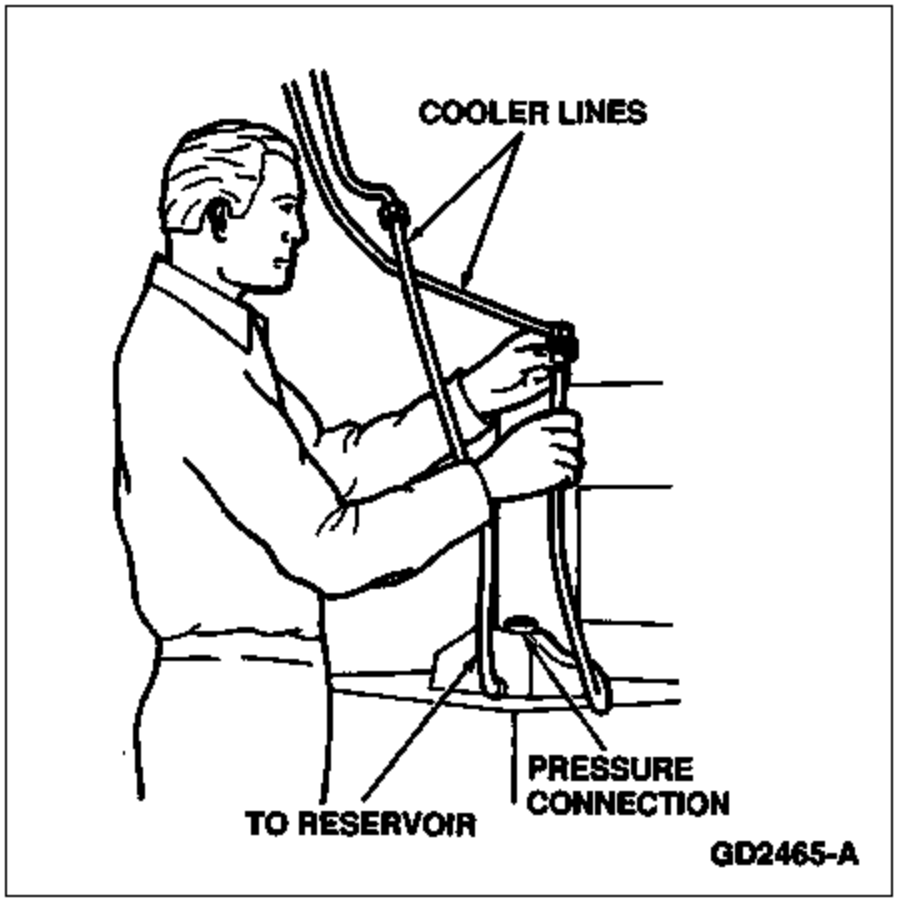
3. Turn on solvent pump and allow the solvent to circulate a minimum of 5 minutes (cycling switch on and off will help dislodge contaminants in cooler system).

4. Switch off the solvent pump and disconnect the solvent pressure hose from the transmission cooler return line.

5. Use compressed air to blow out the cooler(s) and lines (blow air into the transmission cooler return line) until all solvent is removed.

6. Remove the rubber return hose from the remaining steel cooler line.

tomsn048@gmail.com



Transmission Fluid Cooler Tube Replacement

When fluid leakage is found at the transmission fluid cooler, the transmission fluid cooler must be replaced. Refer to Section 03-03 .

When transmission fluid cooler steel lines must be replaced, each replacement line must be fabricated from the same size inside diameter and length steel line as the original line.

Using the old line as a guide, bend the new line as required. Add the necessary fittings, and install the line.

After the fittings have been tightened, check and add fluid as necessary. Check for fluid leaks.

tomsn048@gmail.com

tomsn048@gmail.com

Diagnosis by Symptom

The Diagnosis by Symptom Index gives the technician diagnostic information, direction and suggests possible components, using a symptom as a starting point.

The Diagnosis by Symptom Index is divided into two categories: Electrical Routines, indicated by 200 series numbers, and Hydraulic/Mechanical Routines, indicated by 300 series numbers. The Electrical Routines list the possible electrical components that could cause or contribute to the symptom described. The Hydraulic/Mechanical Routines list the possible hydraulic or mechanical components that could cause or contribute to the symptom described.

Diagnosis by Symptom Chart — Directions

1. Using the Diagnosis by Symptom Index, select the Symptom/Concern that best describes the condition.

2. Turn to the Routine indicated in the Diagnosis by Symptom Index.

3. Always begin diagnosis of a symptom by using the following:

    a. Preliminary inspections
    b. Verification of condition
    c. Check the fluid level
    d. Perform other test procedures as directed

4. Then begin with the Electrical Routine, if indicated. Follow the reference or action required statements. Always perform the On-Board Diagnostic Tests as required. Never skip steps. Service as required. If the concern is still present after electrical diagnosis then proceed to the Hydraulic/Mechanical Routine listed.

CAUTION: Not all concerns and conditions with electrical components will set a Diagnostic Trouble Code (DTC). Be aware that the components listed may still be the cause. Verify proper function of those components prior to proceeding to the Hydraulic/Mechanical Routine listed.

5. The Hydraulic/Mechanical Routines list possible hydraulic or mechanical components that could cause the concern. These components are listed in the removal sequence and by most likely concern. All components listed must be inspected to ensure proper repair.

Diagnostic Routines

Engagement Concerns: No Forward Only

Possible Component	Reference/Action
201 — ELECTRICAL ROUTINE	
No Electrical Concerns	
301 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
• Improper level	• Adjust to proper level.
Shift Linkage (Internal/External)	
• Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Repair all damaged components. After repairing linkage, readjust DTR sensor.
Improper Pressures	
• Improper band/clutch application pressure, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low, check the following possible components: main control, filter/seal, pump assembly.
Filter and Seal Assembly	
• Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gaskets damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• Forward modulator valve/EPC boost valve (207), forward engagement control valve (209), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Pump Assembly	
• Pump damaged, leaking	• Inspect for damage. Repair or replace as required.
• Screws out of torque specification	• Tighten screws to specification.
Center Support Assembly	
• Forward clutch support seal rings leaking	• Perform air pressure check. If OK, go to forward clutch assembly. Repair as required.
Forward Clutch Assembly	
• Forward clutch assembly burnt/damaged/leaking. Check ball in cylinder/leaking piston seal rings	• Perform air pressure check. Repair as required.
Rear One-Way Clutch Assembly	
• Rear one-way clutch damaged, worn	• Replace rear one-way clutch and case.

tomsn048@gmail.com

Engagement Concerns: No Reverse Only

Possible Component	Reference/Action
202 — ELECTRICAL ROUTINE	
No Electrical Concerns	
302 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
• Improper level	• Adjust to proper level.
Shift Linkages (Internal/External)	
• Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Repair all damaged components. After repairing linkages, readjust DTR sensor.
Improper Pressures	
• Improper band/clutch application pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low, check the following possible components: reverse clutch.
Filter and Seal Assembly	
• Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• 2-3 shift valve (203), 3-4 shift valve (204), reverse modulator valve (205), spring damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Pump Assembly	
• Screws out of torque specification • Pump damaged, leaking	• Tighten screws to specifications. • Inspect for damage. Repair as required.
Direct/Reverse Clutch/Reverse Band	
• Reverse clutch assembly burnt/worn/leaking check ball in clutch piston/leaking piston seal rings, cover gasket damaged	• Perform air pressure test. • Inspect for damage. Repair as required.
• Direct/reverse servo piston seal cut/leaking	• Check and replace piston seal. Check and replace low/reverse band.

Engagement Concerns: Harsh Reverse Only

203 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harness, PCM, TP, VSS, RPM, EPC, SS1 (off)	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Tests: A, E. Repair as required. Clear codes, road test and rerun on-board diagnostics.
303 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures • Improper band/clutch application pressures, line pressure high	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high, check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• EPC, SS1, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• Reverse modulator valves (205), pressure boost valve/main regulator valve (208), check ball B, springs, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong components used in rebuild	• Verify that proper components were used.
Direct/Reverse Clutch Assembly • Assembly • Seals damaged, missing • Center support hub/seal ring damaged • Check ball damaged • Friction elements damaged or missing	• Air check clutch assembly as outlined in this manual. • Inspect direct clutch assembly for damage. Repair as required.

[1] Can be purchased as a separate item.

Engagement Concerns: Harsh Forward Only

Possible Component	Reference/Action
204 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harness, PCM, TP, RPM, VSS, EPC	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Test: E. Repair as required. Clear codes, road test and rerun on-board diagnostics.
304 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures	

tomsn048@gmail.com

• Improper band/clutch application pressures, line pressure high	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• Reverse modulator valves (205), forward modulator valve/EPC boost valve (207), forward engagement control valve (209), spring, damaged, missing, misassembled, stuck bore damage	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Forward Clutch Assembly	
• Assembly	• Air check clutch assembly as outlined in this manual.
• Plates burnt, missing; check ball missing, damaged; hub damaged	• Inspect for damage. Repair as required.

[1] Can be purchased as a separate item.

Engagement Concerns: Delay/Soft Reverse

Possible Component	Reference/Action
205 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harness, PCM, TP, RPM, VSS, EPC	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Test: E. Repair as required. Clear codes, road test and rerun on-board diagnostics.
305 — HYDRAULIC/MECHANICAL ROUTINE	
Engine Driveline	
• Looseness in the driveshaft, U-joints or engine mounts	• Repair as required.
• Contamination blockage in cooler lines, in-tank radiator or auxiliary transmission oil cooler	• Perform transmission fluid cooler flow check.
Fluid	
• Improper level	• Adjust to proper level.
• Fluid contaminated	• Inspect fluid for contamination. If contaminated, locate source of contamination. If burnt, inspect mechanical band, clutches. Repair as required.
Shift Linkages (Internal/External)	
• Transmission shift cable and bracket	• Inspect for damage. Readjust as required. Repair all

tomsn048@gmail.com

damaged or misadjusted. DTR sensor out of adjustment	damaged components. After repairing linkages, readjust DTR sensor.
Improper Pressures	
• Improper band/clutch application pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low, check the following possible components: main control.
Filter and Seal Assembly	
• Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• Reverse modulator valves (205), forward modulator valve/EPC boost valve (207), forward engagement control valve (209), spring damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Front One-Way Clutch Assembly	
• One-way clutch damaged	• Determine cause of condition. Repair as required.
Center Support Assembly	
• Direct/reverse clutch center support seal rings/ring grooves worn/damaged	• Determine cause of condition. Repair as required.
Reverse Clutch Drum	
• Rear reverse clutch drum bushing, one-way clutch damaged	• Air pressure test. Determine cause of condition. Visually inspect seal rings and pistons. Repair as required.
Reverse Clutch Assembly	
• Assembly	• Perform air pressure check.
• Reverse clutch piston seals cut/worn	• Inspect for damage. Repair as required.
• Reverse servo piston damaged/worn	• Inspect for damage. Repair as required.
Reverse Band Assembly	
• Reverse band out of adjustment or damaged	• Inspect and readjust per procedures.
• Reverse band servo piston and rod damaged	• Inspect for damage. Repair as required.
• Servo band cover gasket damaged	• Inspect gasket and replace.

206 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harness, PCM, TP, RPM, VSS, EPC	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Test: E. Repair as required. Clear codes, road test and rerun on-board diagnostics.
306 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid • Improper level	• Adjust to proper level.
Shift Linkages (Internal/External) • Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Repair all damaged components. After repairing linkages, readjust DTR sensor.
Improper Pressures • Improper band/clutch application pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low, check the following possible components: main control.
Filter and Seal Assembly • Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• Forward modulator valve/EPC boost valve (207), forward engagement control valve (209), valve, spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Extension housing lube orifice plugged, missing	• Inspect for damage. Repair as required.
• Wrong component used in rebuild	• Verify that proper components were used.
Front One-Way Clutch Assembly • Overdrive one-way clutch damaged	• Replace as required.
Forward Clutch Assembly	
• Forward clutch piston check ball not seating/leaking	• Replace forward clutch piston. Repair transmission as required.
• Forward hub seal rings damaged	• Inspect for damage. Repair as required.
• Forward clutch piston seals cut/worn	• Replace seal and repair as required.

tomsn048@gmail.com

Rear One-Way Clutch • Rear one-way clutch damaged/worn	• Determine cause of condition. Repair as required.

Engagement Concerns: No Forward And No Reverse

Possible Component	Reference/Action
207A — ELECTRICAL ROUTINE	
No Electrical Concerns	
307A — HYDRAULIC/MECHANICAL ROUTINE	
Fluid • Improper level	• Adjust to proper level.
Improper Pressures • Improper band/clutch application pressures, line pressure low, EPC pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible components: main control.
Filter and Seal Assembly • Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• EPC blow-off valve, spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Pump Assembly	
• Screws out of torque specification	• Tighten screws to specification.
• Pump gears damaged, cracked	• Inspect for damage. If damaged, replace pump.
Front One-Way Clutch Assembly • Overdrive one-way clutch damaged	• Inspect for damage. Repair as required.

tomsn048@gmail.com

Engagement Concerns: No Forward In (D) Position And No Reverse

Possible Component	Reference/Action
207B — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harness, PCM, TP, RPM, VSS, EPC	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Test: E. Repair as required. Clear codes, road test and rerun on-board diagnostics.
307B — HYDRAULIC/MECHANICAL ROUTINE	
Fluid • Improper level	• Adjust to proper level.
Improper Pressures • Improper band/clutch application pressures, line pressure low, EPC pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible components: main control, pump assembly.
Filter and Seal Assembly • Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• Forward modulator valve/EPC boost valve (207), pressure boost valve (208), EPC blow off valve, spring, damaged, missing, misassembled, stuck bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Pump Assembly	
• Screws out of torque specification	• Tighten screws to specification.
• Gears damaged, cracked	• Inspect for damage. If damaged, replace pump.
Front One-Way Clutch Assembly • Front one-way clutch damaged	• Determine cause of condition. Repair as required.
Mechanical • Mechanical damage	• Check splines on turbine input shaft and overdrive carrier, overdrive one-way clutch, center shaft, forward clutch, forward carrier and output shaft.

[1] Can be purchased as a separate item.

tomsn048@gmail.com

Engagement Concerns: Harsh Forward And Reverse

Possible Component	Reference/Action
208 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harness, internal transmission wiring harness, PCM, EPC, TSS, TFT, VSS, DTR, TCC, TP and MAF NOTE: Refer to FMEM — Routine 265 for additional information.	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Tests: A, B, D, E, F. Repair as required, clear codes, road test and rerun on-board diagnostics.
308 — HYDRAULIC/MECHANICAL ROUTINE	
Engine/Driveline	
• Loose in the driveshaft, U-joints or engine mounts	• Repair as required.
• Engine idle speed too high	• Check engine idle speed. Refer to the Powertrain Control/Emissions Diagnosis Manual [a] .
Fluid	
• Improper level	• Adjust to proper level.
Improper Pressures	
• Improper band/clutch application pressures, line pressure high	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high, check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• TCC, EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• Forward modulator valve/EPC boost valve (207), pressure boost valve/main regulator or valve (208), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.

Possible Component	Reference/Action
209 — ELECTRICAL ROUTINE	
No Electrical Concerns	

tomsn048@gmail.com

309 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
• Improper level • Fluid contaminated	• Adjust to proper level. • Inspect fluid for contamination. If contaminated, locate source of contamination. If burnt, inspect mechanical band, clutches. Repair as required.
Improper Pressures • Improper band/clutch application pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low, check the following possible components: main control, pump assembly.
Filter and Seal Assembly • Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• Forward modulator valve/EPC boost valve (207), pressure boost valve/main regulator valve (208), EPC blow-off valve, spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Pump Assembly	
• Screws out of torque specification	• Tighten screws to specification.
• Inner gears damaged, cracked	• Inspect for damage. Repair as required.

Shift Concerns: Some Or All Shifts Missing

Possible Component	Reference/Action
210 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harness, PCM, TP, RPM, DTR, OSS, SS1, SS2, SS3, SS4, TCS, TSS, EPC	• Perform shift point test. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Tests: A, D, E, F. Repair as required. Clear codes, road test and rerun on-board diagnostics.
310 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
• Improper level • Fluid contaminated	• Adjust to proper level. • Inspect fluid for contamination. If contaminated, locate source of contamination. If burnt, inspect

tomsn048@gmail.com

	mechanical band, clutches. Repair as required.
Shift Linkages (Internal/External) • Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Repair all damaged components. After repairing linkages, readjust DTR sensor.
Improper Pressures • Improper band/clutch application pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low, check the following possible components: main control, pump, EPC solenoid.
Filter and Seal Assembly • Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• SS1, SS2, SS3, SS4, EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• Forward modulator valve/EPC boost valve (207), pressure boost valve/main regulator valve (208), extension housing lube orifice, check ball C damaged, spring, damaged, missing, misassembled, stuck, bore damaged • Wrong components used in rebuild	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage. • Verify that proper components were used.
Front Band	
• Not adjusted properly • Piston seals damaged	• Readjust to proper specification. • Inspect for damage. Repair as required.
Intermediate Band	
• Not adjusted properly • Servo, piston and seals damaged	• Readjust to proper specification. • Inspect for damage. Repair as required.
For diagnosis related to a specific shift, refer to Reference/Action.	• To diagnose specific No Shift, refer to the appropriate shift routine. **No Shift** 1-2, **Routine** 220/320 **No Shift** 2-3, **Routine** 221/321 **No Shift** 3-4, **Routine** 222/322 **No Shift** 4-5, **Routine** 270/370 **No Shift** 5-4, **Routine** 271/371

[1] Can be purchased as a separate item.

Shift Concerns: Timing — Early/Late (Some/All)

Possible Component	Reference/Action
211 — ELECTRICAL ROUTINE	

tomsn048@gmail.com

Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harness, PCM, TP, TFT, EPC, OSS, SS1, SS2, SS3, SS4, RPM	• Perform shift point test. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Tests: A, B, E. Repair as required, clear codes, road test and rerun on-board diagnostics.
Other Electrical Concerns • No power to PCM, Keep Alive Memory erased from PCM	• Inspect EEC power relay. Repair as required. • Restore memory by performing drive cycle test.
311 — HYDRAULIC/MECHANICAL ROUTINE	
Power/Engine Performance • Poor vehicle performance	• Refer to Routine No. 253A, 253B, 353A, 353B.
Other • Tire size change • Axle ratio change • Speedometer gear change	• Refer to the specifications decal on door panel and verify that vehicle has original equipment. Changes in tire size or axle ratio will affect shift timing.
Improper Pressures • Improper band/clutch application pressures, line pressure low (late shifts)	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low, check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• SS1, SS2, SS3, SS4, EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• Wrong component used in rebuild	• Verify that proper components were used.
For diagnosis related to a specific shift or if all above are OK, refer to Reference/Action.	• To diagnose specific shift-timing concern, refer to the appropriate shift routine. **Soft/Slipping Shift** 1-2, **Routine** 226/326 **Soft/Slipping Shift** 2-3, **Routine** 227/327 **Soft/Slipping Shift** 3-4, **Routine** 228/328 **Soft/Slipping Shift** 4-5, **Routine** 272/372 **Soft/Slipping Shift** 5-4, **Routine** 273/373 **Soft/Slipping Shift** 4-3, **Routine** 229/329

[1] Can be purchased as a separate item.

Shift Concerns: Timing — Erratic/Hunting (Some/All)

Possible Component	Reference/Action
212 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harness, internal transmission wiring harness, PCM, TP, RPM, EPC,	• Perform shift point and TCC tests. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the

tomsn048@gmail.com

TFT, SS1, SS2, SS3, SS4, DTR, TCC, OSS	following Pinpoint Tests: A, B, D, E, F. Repair as required. Clear codes, road test and rerun on-board diagnostics.
312 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
• Improper level • Fluid contaminated	• Adjust to proper level. • Inspect fluid for contamination. If contaminated, locate source of contamination. If burnt, inspect mechanical band, clutches. Repair as required.
Filter and Seal Assembly • Filter damaged, plugged; seal damaged, cut or missing	• Inspect for damage and replace.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• SS1, SS2, SS3, SS4, EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• Wrong component used in rebuild	• Verify that proper components were used.
Torque Converter Clutch Assembly	• Refer to converter cycling routine No. 342.
Further Diagnosis	
• For further diagnosis for timing issues, refer to Reference/Action.	• For specific shift diagnosis, refer to the following application chart.

Shift Concerns: No 1st Gear In Drive, Engages In High-Gear

Possible Component	Reference/Action
215 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, SS1, SS2, SS3, SS4, DTR, EPC	• Perform shift point and TCC tests. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Tests: A, D, E. Repair as required. Clear codes, road test and rerun on-board diagnostics.
315 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkages (Internal/External) • Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Repair all damaged components. After repairing linkage, readjust DTR sensor.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.

tomsn048@gmail.com

• SS1, SS2, SS3, SS4, EPC, solenoid stuck, damaged, O-ring damaged or out of bore • Wrong components used in rebuild	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required. • Verify that proper components were used.
Mechanical • Clutches damaged	• Refer to disassembly and assembly of transmission in this section.
For diagnosis related to a specific gear, use transmission tester to determine gear	• Refer to the following routines: **Shift** 1-2, **Routine** 220/320 **Shift** 2-3, **Routine** 221/321 **Shift** 3-4, **Routine** 222/322 **Shift** 4-5, **Routine** 270/370

[1] Can be purchased as a separate item.

Shift Concerns: No First Gear In Man 1st Position

Possible Component	Reference/Action
216 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, SS1, SS2	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Test: A. Repair as required. Clear codes, road test and rerun on-board diagnostics.
316 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures • Improper band/clutch application (no engine braking), pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• SS1, SS2, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• Check ball A damaged	• Inspect for damage. Repair as required.
Low/Reverse One-Way Clutch Assembly • Rear one-way clutch damaged	• Repair as required.

[1] Can be purchased as a separate item.

Shift Concerns: No Manual 3rd Gear In 2nd Position

Possible Component	Reference/Action

tomsn048@gmail.com

217 — ELECTRICAL ROUTINE	
No Electrical Concerns	
317 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures • Improper band/clutch application pressures, line pressure high/low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• Check ball A damaged • Wrong component used in rebuild	• Inspect for damage. Repair as required. • Verify that proper components were used.
Intermediate Band	
• Intermediate band out of adjustment	• Adjust intermediate band.
• Damaged or worn intermediate servo piston, lever, strut or internal leaks • Polished, glazed intermediate band or drum	• Perform air pressure test. • Replace or repair as required.

Shift Concerns: No 1-2 Shift (Automatic)

Possible Component	Reference/Action
220 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TP, OSS, SS1, SS2, EPC, SS3, SS4, DTR	• Perform shift point test. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Tests: A, E, D, Repair as required, clear codes, road test and rerun on-board diagnostics.
320 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage (Internal/External) • Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Repair all damaged components. After repairing linkages, readjust DTR sensor.
Improper Pressures • Improper band/clutch application pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low check the following possible components: main control.

tomsn048@gmail.com

Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• SS1, SS2, SS3, SS4, EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• 1-2 shift valve (215), forward modulator valve/EPC boost valve (207), spring, damaged, missing, misassembled, stuck, bore damaged • Wrong component used in rebuild	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage. • Verify that proper components were used.
Front Band Assembly	
• Band adjustment incorrect	• Inspect and readjust as required.
• Seals, piston, cover damaged	• Inspect for damage. Repair as required.
• Friction elements worn, missing, damaged, misassembled	• Inspect for damage. Repair as required.
• Return spring damaged	• Inspect for damage. Repair as required.
• Case bore damaged, leaking	• Inspect for damage. Repair as required.

[1] Can be purchased as a separate item.

Shift Concerns: No 2-3 Shift (Automatic)

Possible Component	Reference/Action
221 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TP, OSS, SS1, SS2, EPC, SS3, SS4, DTR	• Perform shift point test. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Tests: A, D, E. Repair as required, clear codes, road test and rerun on-board diagnostics.
321 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures • Improper band/clutch application pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low, check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damages, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• SS1, SS2, SS3, SS4, EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.

tomsn048@gmail.com

• 1-2 shift valve (203), forward modulator valve/EPC boost valve (207), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file, or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Intermediate Band Assembly	
• Band adjustment incorrect	• Inspect and readjust as required.
• Seals, piston, cover damaged	• Inspect for damage. Repair as required.
• Friction elements worn, missing, damaged, misassembled	• Inspect for damage. Repair as required.
• Return spring damaged	• Inspect for damage. Repair as required.
• Case bore damaged, leaking	• Inspect for damage. Repair as required.

Shift Concerns: No 3-4 Shift (Automatic)

Possible Component	Reference/Action
222 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TP, OSS, SS1, SS2, SS3, SS4	• Perform shift point test. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Test: A. Repair as required, clear codes, road test and rerun on-board diagnostics.
322 — HYDRAULIC/MECHANICAL ROUTINE	
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• SS1, SS2, SS3, SS4 solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• 1-2 shift valve (203), 3-4 shift valve (204), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage, If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong components used in rebuild	• Verify that proper components were used.
Center Support Assembly	
• Screws not tightened to specification	• Inspect, install new and retighten to specification.
• Seal rings and bearings damaged	• Inspect for damage. Repair as required.

tomsn048@gmail.com

• Outside diameter of casebore or center support damaged or leaking	• Inspect for damage. Repair as required.
Direct Clutch Assembly	
• Assembly	• Air check assembly as outlined in this manual.
• Seals, piston, cylinder damaged	• Inspect for damage. Repair as required.
• Friction elements missing or damaged	• Inspect for damage. Repair as required.
• Check ball missing, damaged	• Inspect for damage. Repair as required.

[1] Can be purchased as a separate item.

Shift Concerns: No 4-5 Shift (Automatic)

Possible Component	Reference/Action
270 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TP, OSS, SS3, SS4, EPC, TCS	• Perform shift point test. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Tests: A, E, F. Repair as required, clear codes, road test and rerun on-board diagnostics.
370 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures • Improper band/clutch application pressures, line pressure high/low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• SS3, SS4, EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• Forward modulator valve/EPC boost valve (207), pressure boost valve/main regulator valve (208), SS3 solenoid/4-5 shift valve (215), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong components used in rebuild	• Verify that proper components were used.
Front Band Assembly	
• Band adjustment incorrect	• Inspect and readjust as required.
• Band friction plates burnt, missing	• Inspect for damage. Repair as required.
• Cylinder damaged, leaking seals damaged	• Inspect for damage. Repair as required.
• Piston cover seal, strut, lever	• Inspect for damage. Repair as required.

tomsn048@gmail.com

damaged	
Front Planetary Assembly • Damaged	• Inspect for damage. Repair as required.

[1] Can be purchased as a separate item.

Shift Concerns: No 5-4 Shift (Manual)

Possible Component	Reference/Action
271 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TP, OSS, TCS	• Perform shift point test. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use Transmission Tester to perform transmission static and dynamic tests. Perform the following Pinpoint Test: A. Repair as required, clear codes, road test and rerun on-board diagnostics.
371 — HYDRAULIC/MECHANICAL ROUTINE	
No hydraulic/mechanical components	

[1] Can be purchased as a separate item.

Shift Concerns: Soft/Slipping 1-2 Only (Automatic)

Possible Component	Reference/Action
226 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TP, MAF, EPC	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Test: E. Repair as required, clear codes, road test and rerun on-board diagnostics.
326 — HYDRAULIC/MECHANICAL ROUTINE	
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• EPC solenoid/1-2 shift valve (215), 2-3 shift valve (203), forward modulator valve/EPC boost valve (207), pressure boost valve/main regulator valve (208), EPC blow-off valve, extension housing lube orifice, spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.

tomsn048@gmail.com

Front Band Assembly	
• Band adjustment incorrect	• Inspect and adjust as required.
• Seals or piston, strut, lever, damaged	• Inspect for damage. Repair as required.
• Friction elements worn, damaged, misassembled	• Inspect for damage. Repair as required.
• Return spring wrong, damaged	• Inspect for damage. Repair as required.
• Case bore damaged, leaking	• Inspect for damage. Repair as required.

[1] Can be purchased as a separate item.

Shift Concerns: Soft/Slipping 2-3 Only (Automatic)

Possible Component	Reference/Action
227 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TP, MAF, EPC, SS4	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [24] . Use NGS to perform the following Pinpoint Test: A, E. Repair as required, clear codes, road test and rerun on-board diagnostics.
327 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures • Improper band/clutch application pressures, line pressure low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is low check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten and replace gasket
• Gasket damaged, off location	• Inspect and replace gasket
• Separator plate damaged	• Inspect for damage. Repair as required.
• SS1, SS2, SS3, SS4, EPC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required
• 1-2 shift valve (203), forward modulator valve/EPC boost valve (207), spring, damaged, missing, misassembled, stuck bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Intermediate Band Assembly	
• Band adjustment incorrect	• Inspect and readjust as required.
• Seals, piston, cover damaged	• Inspect for damage. Repair as required.
• Friction elements worn, missing, damaged, misassembled	• Inspect for damage. Repair as required.
• Return spring damaged	• Inspect for damage. Repair as required.
• Case bore damaged, leaking	• Inspect for damage. Repair as required.

Shift Concerns: Harsh 4-3 Only (Automatic)

Possible Component	Reference/Action
235 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TCC,	• Perform shift point and TCC tests. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Tests: E. Repair as required. Clear codes, road test and rerun on-board diagnostics.
335 — HYDRAULIC/MECHANICAL ROUTINE	
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• TCC, EPC, SS3, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• Torque converter clutch (200), forward modulator valve/EPC boost valve (207), pressure boost valve/main regulator valve (208), 4-3 kickdown valve (211), manual low valve (212), 4-3 torque demand valve (213), thermostat bypass valve/cooler limit valve (216), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.

tomsn048@gmail.com

Direct Clutch Drum • Damaged	• Inspect for damage. Repair as required.
Intermediate Band • Misadjusted	• Readjust band to proper specification.
Intermediate Servo Assembly • Piston, servo, spring, damage, wrong part used in rebuild	• Inspect for damage. Repair as required.
Torque Converter Clutch Assembly	• Refer to routines 241/341.

[1] Can be purchased as a separate item.

Shift Concerns: Harsh 3-2 Only (Automatic)

Possible Component	Reference/Action
235 — ELECTRICAL ROUTINE	
Powertrain Control System • No electrical concerns	
335 — HYDRAULIC/MECHANICAL ROUTINE	
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• 1-2 shift valve (203), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild.	• Verify that proper components were used.
Intermediate Band Assembly	
• Band adjustment incorrect	• Inspect and readjust as required.
• Seal or piston damaged	• Inspect for damage. Repair as required.
• Friction element, lever rod, damaged or misassembled return to spring	• Inspect for damage. Repair as required.
Direct Clutch • Drum damaged, outer diameter out of specification	• Inspect for damage. Repair as required.

Torque Converter Clutch Operation Concerns: No Clutch Apply

Possible Component	Reference/Action

tomsn048@gmail.com

240 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, ECT, TSS, TCC NOTE: Also refer to Routine No. 265.	• Perform TCC tests. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Tests: A, F. Repair as required. Clear codes, road test and rerun on-board diagnostics.
340 — HYDRAULIC/MECHANICAL ROUTINE	
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• Converter clutch control valve (201), thermostat bypass valve/cooler limit valve (216), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• TCC solenoid and valve (200), stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• Wrong component used in rebuild	• Verify that proper components were used.
Pump Assembly	
• Front pump seal worn or damaged	• Inspect for damage. Repair as required.
• Screws out of torque specification	• Retorque screws to specification.
Torque Converter Clutch Assembly • Torque converter internal malfunction preventing lockup, piston application	• Remove transmission. Inspect for damage. Replace torque converter if required.

[1] Can be purchased as a separate item.

Torque Converter Clutch Operation Concerns: Clutch Always Applies/Stalls Vehicle

Possible Component	Reference/Action
241 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Low engine idle	• Verify engine idle speed is within specification.
• Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TCC	• Perform TCC tests. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] for diagnosis. Use NGS to perform the following Pinpoint Test: A. Repair as required, clear codes, road test and rerun on-board diagnostics.
341 — HYDRAULIC/MECHANICAL ROUTINE	
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.

tomsn048@gmail.com

• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• TCC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• TCC solenoid and valve (200), TCC control valve (201), spring, damaged, missing, misassembled, stuck, bore damaged • Wrong components used in rebuild	• Inspect for damage. If damaged, replace main control, If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and result in further main control or transmission damage. • Verify that proper components were used.
Torque Converter Clutch Assembly • Torque converter internal malfunction preventing lockup piston application	• Remove transmission. Inspect for damage. Replace torque converter if required.

[1] Can be purchased as a separate item.

Torque Converter Clutch Operation Concerns: Cycling/Shudder/Chatter

Possible Component	Reference/Action
242 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TCC, BOO, TP, RPM, TSS, OSS	• Perform TCC tests. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Tests: A. Repair as required. Clear codes, road test and rerun on-board diagnostics.
• Speed control equipped vehicles	• Evaluate with speed control off.
342 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid • Fluid contaminated	• Inspect fluid for contamination. If contaminated, locate source of contamination. If burnt, inspect mechanical band, clutches. Repair as required.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• TCC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• TCC solenoid and valve (200), converter clutch control valve (201), thermostat bypass valve/cooler limit valve (216), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
Pump Assembly	
• Screws out of torque specification	• Tighten screws to specification.

tomsn048@gmail.com

• Cross leaks	• Inspect for damage. Repair as required.
• Front pump seal damage • Seal on inner pump gear damaged	• Inspect for damage. Repair as required. • Inspect for damage. Repair as required.
Torque Converter Clutch Assembly • End clearance (excessive), internal leakage, clutch material damage	• Perform end play check. Inspect and repair as required.

[1] Can be purchased as a separate item.

Other Concerns: Shift Lever Efforts High

Possible Component	Reference/Action
251 — ELECTRICAL ROUTINE	
No Electrical Concerns	
351 — HYDRAULIC/MECHANICAL ROUTINE	
Brake Shift Interlock • System, solenoid damaged	• Refer to brake section or steering column section in the Workshop Manual.
Shift Linkages (Internal/External) • Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Repair all damaged components. After repairing linkages, readjust DTR sensor.
Case	
• Manual control outer lever damaged. Manual valve inner lever pin bent, damaged. Manual valve inner lever, spring rod damaged • Manual valve lever shaft retaining pin damaged	• Adjust linkage and install manual valve lever shaft retaining pin.

Other Concerns: External Leaks

Possible Component	Reference/Action
252 — ELECTRICAL ROUTINE	
No Electrical Concerns	
352 — HYDRAULIC/MECHANICAL ROUTINE	
Case • Case vent	• Check the vent for free breathing. Repair as required.
Seals/Gaskets • Leakage at gaskets, seals, etc. Refer to leakage diagram for potential leak locations	• Remove all traces of lubricant on exposed surfaces of transmission. Check the vent for free breathing. Operate transmission at normal temperatures and perform fluid leakage check. Repair as required.

Other Concerns: Poor Vehicle Performance

tomsn048@gmail.com

Possible Component	Reference/Action
253A — ELECTRICAL ROUTINE	
Powertrain Control System	
• Poor engine performance	• Check engine tune-up. Refer to Section 4A in the Powertrain Control/Emissions Diagnosis Manual [1] for diagnosis and testing of the automatic transmission.
• Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TCC	• Perform shift point tests in O/D with the TCS off. Refer to shift point specification if out of specifications. Run on-board diagnostic and check for shift error codes. Perform shift point and TCC tests. Re-run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Tests: A. Repair as required. Clear codes, road test and rerun on-board diagnostics.
353A — HYDRAULIC/MECHANICAL ROUTINE	
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• TCC solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• 3-4 shift valve (215), spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used
Torque Converter Clutch Assembly	
• Torque converter one-way clutch slipping	• Inspect one-way clutch. Replace torque converter.
• Incorrect TCC used in rebuild	• Inspect for correct TCC assembly. Replace as required.

[1] Can be purchased as a separate item.

Other Concerns: Poor Vehicle Performance/Wrong Gear Ratio In D, 2nd, And 1st Positions

Possible Component	Reference/Action
253B — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, SS1, SS2, SS3, SS4	• Perform shift point and TCC tests. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Test: A. Repair as required. Clear codes, road test and rerun on-board diagnostics.

tomsn048@gmail.com

353B — HYDRAULIC/MECHANICAL ROUTINE	
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• SS1, SS2, SS3, SS4, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• SS3 solenoid and valve (215), spring, damaged, missing, misassembled, stuck, bore damaged SS1 (210), SS2 (202), SS4 (201) • Wrong component used in rebuild	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and result in further main control or transmission damage. • Verify that proper components were used.

[1] Can be purchased as a separate item.

Other Concerns: Noise/Vibration — Forward Or Reverse

Possible Component	Reference/Action
254 — ELECTRICAL ROUTINE	
No Electrical Concerns	
354 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid • Improper level	• Adjust to proper level.
Shift Linkages (Internal/External) • Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Repair all damaged components. After repairing linkages, readjust DTR sensor.
Improper Pressures • Improper band/clutch application pressures, line pressure high/low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible components: pump assembly.
Pump Assembly	
• Internal leakage, cavitation • Screws out of torque specification	• Inspect and repair as required. • Tighten screws to specification.
Front One-Way Clutch Assembly • One-way clutch damaged, worn, misassembled	• Repair one-way clutch.
Rear One-Way Clutch Assembly • One-way clutch damaged, worn, misassembled	• Repair one-way clutch.
Other	

tomsn048@gmail.com

• Transmission oil cooler lines, fill tube grounding	• Relocate transmission oil cooler lines or fill tube properly.
Gear • Gear noise	• Repair planetary gear assemblies.
Torque Converter Clutch Assembly	• Refer to routines 242/342.

Other Concerns: Engine Will Not Crank

Possible Component	Reference/Action
255 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, DTR sensor	• Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] for diagnosis. Use NGS to perform the following Pinpoint Test: D. Repair as required. Clear codes, road test and rerun on-board diagnostics.
355 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkages (Internal/External) • Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Repair all damaged components. After repairing linkages, readjust DTR sensor.
Pump Assembly • Seized	• Refer to disassembly of transmission. Inspect for damage. Repair or replace as required.
Flywheel • Damaged	• Inspect for damage. Repair as required.

[1] Can be purchased as a separate item.

Other Concerns: No Park Range

Possible Component	Reference/Action
256 — ELECTRICAL ROUTINE	
No Electrical Concerns	
356 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkages (Internal/External) • Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Repair all damaged components. After repairing linkages, readjust DTR sensor.
Park Mechanism	
• Park gear, parking pawl, parking pawl return spring, park or guide plate, parking pawl shaft, parking pawl actuating rod, manual lever, manual lever detent spring damaged, misassembled	• Inspect for damage. Repair as required.

tomsn048@gmail.com

• Transfer case and linkages damaged	• Refer to Workshop Manual for transfer case and linkage diagnosis.
4x4 Applications • Transfer case and linkage damaged	• Refer to Workshop Manual for transfer case and linkage diagnosis.

Other Concerns: Transmission Overheating

Possible Component	Reference/Action
257 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, TFT, TCC	• Perform shift point and TCC test. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1]. Use NGS to perform the following Pinpoint Tests: A, B. Repair as required. Clear codes, road test and rerun on-board diagnostics.
357 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid • Improper level	• Adjust to proper level.
Improper Pressures • Improper band/clutch application pressures, line pressure high/low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible components: main control, TCC.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• TCC, solenoid stuck, damaged, O-ring damaged or out of bore	• Inspect for damage. Perform solenoid function test as listed in electrical routine. Repair as required.
• Thermostat bypass valve/cooler limit valve (216), spring, damaged, missing misassembled, stuck, bore damaged • Wrong component used in rebuild	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage. • Verify that proper components were used.
Torque Converter Clutch Assembly	
• Seized torque converter one-way clutch • Excessive slip detected	• Refer to routines 240/340. • Inspect torque converter one-way clutch. • Replace torque converter as required. • Run on-board diagnostics.
Other	

tomsn048@gmail.com

• Restriction in transmission oil cooler or tubes	• Repair transmission oil cooler or tubes.

[1] Can be purchased as a separate item.

Other Concerns: No Engine Braking In 2nd Position

Possible Component	Reference/Action
258 — ELECTRICAL ROUTINE	
No Electrical Concerns	
358 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures • Improper band/clutch application pressures, line pressure high/low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible components: main control, coast clutch assembly.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• Extension housing lube orifice, check ball A and C not seating or damaged, spring, damaged, missing misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong part used in rebuild	• Repair as required.
Coast Clutch Assembly	
• Coast clutch damaged	• Replace as required.
• Seal ring damaged	• Inspect for damage. Repair as required.
Intermediate Band	
• Intermediate band out of adjustment	• Adjust intermediate band.
• Intermediate servo leaking	• Perform air pressure test to determine if intermediate servo is leaking. Repair as required.
• Glazed intermediate band	• Repair or replace as required.

Other Concerns: No Engine Braking In 1st Position

Possible Component	Reference/Action
259 — ELECTRICAL ROUTINE	
No Electrical Concerns	
359 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid • Improper level	• Adjust to proper level.

tomsn048@gmail.com

Shift Linkages (Internal/External)	
• Transmission shift cable and bracket damaged or misadjusted. DTR sensor out of adjustment	• Inspect for damage. Readjust as required. Repair all damaged components. After repairing linkages, readjust DTR sensor.
Improper Pressures	
• Improper band/clutch application pressures, line pressure high/low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• Manual low valve (212), check ball E not seating properly, spring, damaged, missing, misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong part used in rebuild	• Inspect for correct part. Repair as required.
Coast Clutch Assembly	
• Wrong part used in rebuild	• Inspect parts. Repair as required.
• Overdrive clutch damaged • Seal rings damaged	• Replace as required.
Reverse Clutch/Band	
• Reverse servo or piston or gasket seal leaking	• Perform air pressure test. Check and replace piston seal as required.
• Reverse band burnt, worn or damaged	• Replace as required.
• Polished or glazed low reverse clutch band or drum	• Repair or replace as required.
Rear One-Way Clutch Assembly	
• Rear one-way clutch damaged	• Replace as required.

Other Concerns: No Engine Braking With Overdrive Cancelled In 3rd And 4th)

Possible Component	Reference/Action
260 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, SS3, SS4	• Perform shift point tests. Run on-board diagnostics. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Tests: A. Repair as required. Clear codes, road test and rerun on-board diagnostics. Also check for engine braking in 1 and 2 positions.

tomsn048@gmail.com

	NOTE: No engine braking in O/D position with the TCS off, 1st gear is a normal function.
360 — HYDRAULIC/MECHANICAL ROUTINE	
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• Coast clutch solenoid and valve/converter clutch control valve (201), SS3 solenoid/3-4 shift solenoid (215), spring, damaged, missing misassembled, stuck, bore damaged	• Inspect for damage. If damaged, replace main control. If parts are missing, replace missing parts or main control. If misassembled, reassemble properly. Do not stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Wrong component used in rebuild	• Verify that proper components were used.
Coast Clutch Assembly	
• Wrong part used in rebuild	• Verify that proper components were used.
• Overdrive clutch damaged	• Replace as required.
• Seal rings damaged	• Inspect for damage. Repair as required.

[1] Can be purchased as a separate item.

Other Concerns: Fluid Venting/Foaming

Possible Component	Reference/Action
261 — ELECTRICAL ROUTINE	
No Electrical Concerns	
361 — HYDRAULIC/MECHANICAL ROUTINE	
• Vent blocked or damaged	• Check vent for damage or blockage. Repair as required.
• Overfilled transmission	• Check level and adjust as required.
• Fluid contaminated (antifreeze, water)	• Check for contamination, locate source of contamination. Repair as required.
• Overheating	• Refer to routines 257/357.
• Filter and seal assembly damaged or misassembled	• Inspect filter and seal assembly for damage. Repair as required.

Other Concerns: Slips/Chatters In 1st Position

Possible Component	Reference/Action
263 — ELECTRICAL ROUTINE	
No Electrical Concerns	
363 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures	
• Improper band/clutch application pressures, line	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If

tomsn048@gmail.com

pressure high/low	pressure is high/low, check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• Wrong components used in rebuild	• Verify that proper components were used.
• Dirty or sticking main control valve body	• Clean, repair or replace main control valve body.
Rear One-Way Clutch Assembly	
• Low/reverse one-way clutch damaged	• Replace rear one-way clutch and case.

Other Concerns: Slips/Chatters In 2nd Position

Possible Component	Reference/Action
264 — ELECTRICAL ROUTINE	
No Electrical Concerns	
364 — HYDRAULIC/MECHANICAL ROUTINE	
Improper Pressures	
• Improper band/clutch application pressures, line pressure high/low	• Check line pressure at tap. Perform line pressure and stall speed tests. Refer to pressure chart No. 401 for specifications. If pressure is high/low, check the following possible components: main control.
Main Control Assembly	
• Screw out of torque specification	• Tighten to specification.
• Gasket damaged, off location	• Inspect and replace gasket.
• Separator plate damaged	• Inspect for damage. Repair as required.
• Wrong components used in rebuild	• Verify that proper components were used.
• Dirty or sticking main control valve body	• Clean, repair or replace main control valve body.
Intermediate Band	
• Intermediate band out of adjustment	• Adjust intermediate band [1] .
• Damaged or worn intermediate servo piston, lever, strut, or internal leaks	• Perform air pressure test. Inspect for damage. Repair as required.
• Polished, glazed low and intermediate band or drum	• Replace or repair as required.

tomsn048@gmail.com

[1] See also 2-3 slip.

Other Concerns: FMEM — Harsh Engagements And Shifts

Possible Component	Reference/Action
265 — ELECTRICAL ROUTINE	
Powertrain Control System • Operating in FMEM strategy. Electrical inputs/outputs, vehicle wiring harnesses, internal transmission wiring harnesses, PCM, EPC, OSS, DTR, TCC, transmission overtemp (TFT), TP and MAF, shift error detected (shift solenoid, TSS, OSS and internal hardware)	• Run on-board diagnostics. Repair as required. Clear codes, road test and rerun self test. Refer to Powertrain Control/Emissions Diagnosis Manual [1] . Use NGS to perform the following Pinpoint Test A , B, D, E, F. Repair as required, clear codes, road test and rerun on-board diagnostics.
365 — HYDRAULIC/MECHANICAL ROUTINE	
No Hydraulic/Mechanical Concerns	

[1] Can be purchased as a separate item.

Transmission Fluid Drain and Refill

Intervals for drain and refill, due to in-vehicle service or major service operation, are as follows:

- Normal Maintenance
  - Not required with normal use.
- Severe Duty Maintenance
  - Change fluid at 80,450 km (50,000 mile) intervals using MERCON V® XT-5-QM or equivalent.

CAUTION: Use only MERCON V® XT-5-QM Service Fluid as the use of any other fluids may result in a transmission malfunction or failure.

Maintenance Procedure

1. Loosen, then remove the transmission fluid pan-to-case screws to drain the fluid.
2. Remove and discard old pan gasket.
3. Thoroughly clean the fluid pan and the transmission case fluid pan rail surface.
4. Install new pan gasket onto pan and install fluid pan to case with screws. Tighten screws to 13-15 Nm (115-133 lb-in).
5. Add 2.8 liters (3 quarts) of MERCON V® XT-5-QM.
6. Start engine. Move transmission range selector lever through all gear ranges, checking for engagements.
7. Check and adjust transmission fluid in 0.25 liter (1/2 pint) increments to proper level (cross-hatched area of fluid level indicator at normal operating temperatures).

Major Service/Overhaul

1. Loosen, then remove the transmission fluid pan screws to drain fluid.
2. Remove and discard old pan gasket.
3. Perform required internal repair and cleaning as required.
4. Thoroughly flush torque converter, cooler lines and transmission in-tank radiator cooler and auxiliary cooler (if equipped).
5. Replace with new fluid filter and O-rings assembly.

tomsn048@gmail.com

6. Install cleaned fluid pan and new pan gasket with fluid pan-to-case screws. Tighten fluid pan-to-case screws to 13-15 Nm (115-133 lb-in).

7. Add 3.7 liters (4 quarts) of MERCON V® XT-5-QM or equivalent MERCON® approved fluid into fluid filler tube.

8. Start engine. Move the transmission range selector lever through all gear ranges, checking for engagements.

9. Check and adjust the transmission fluid level in 0.25 liter (1/2 pint) increments to the proper level (cross-hatched area of the fluid level indicator at normal operating temperatures).

tomsn048@gmail.com

Extension Housing Seal and Bushing

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Impact Slide Hammer	T50T-100-A
Extension Housing Bushing Remover	T77L-7697-E
Extension Housing Bushing Replacer	T77L-7697-F
Extension Housing Seal Replacer	T74P-77052-A

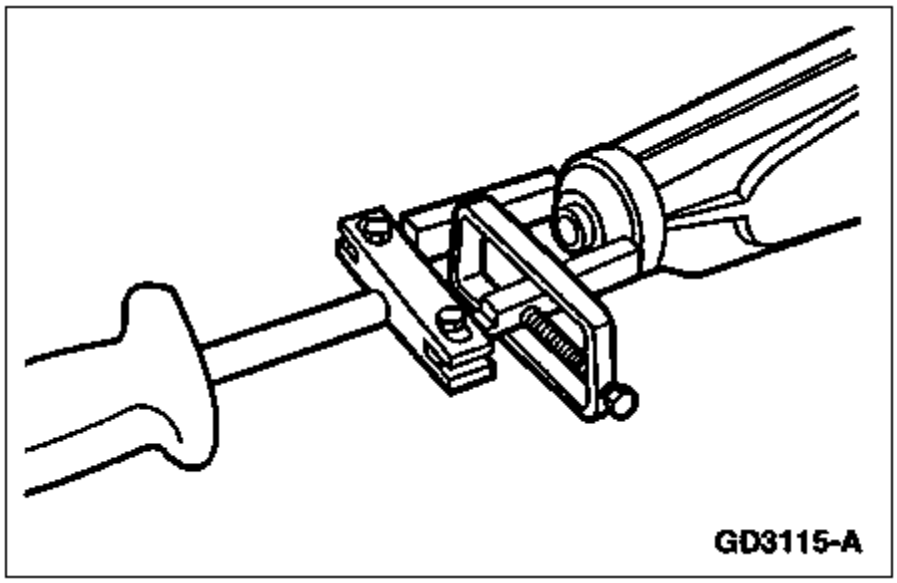
SPECIAL SERVICE TOOLS DESIRED

Tool Number	Description
Seal Remover	T94P-77001-BH

Removal

1. Raise vehicle on a hoist and position suitable safety stands under vehicle.
2. Remove rear driveshaft. Refer to Section 05-01 .
3. Remove output shaft and extension housing seal using Seal Remover T94P-77001-BH and Impact Slide Hammer T50T-100-A.

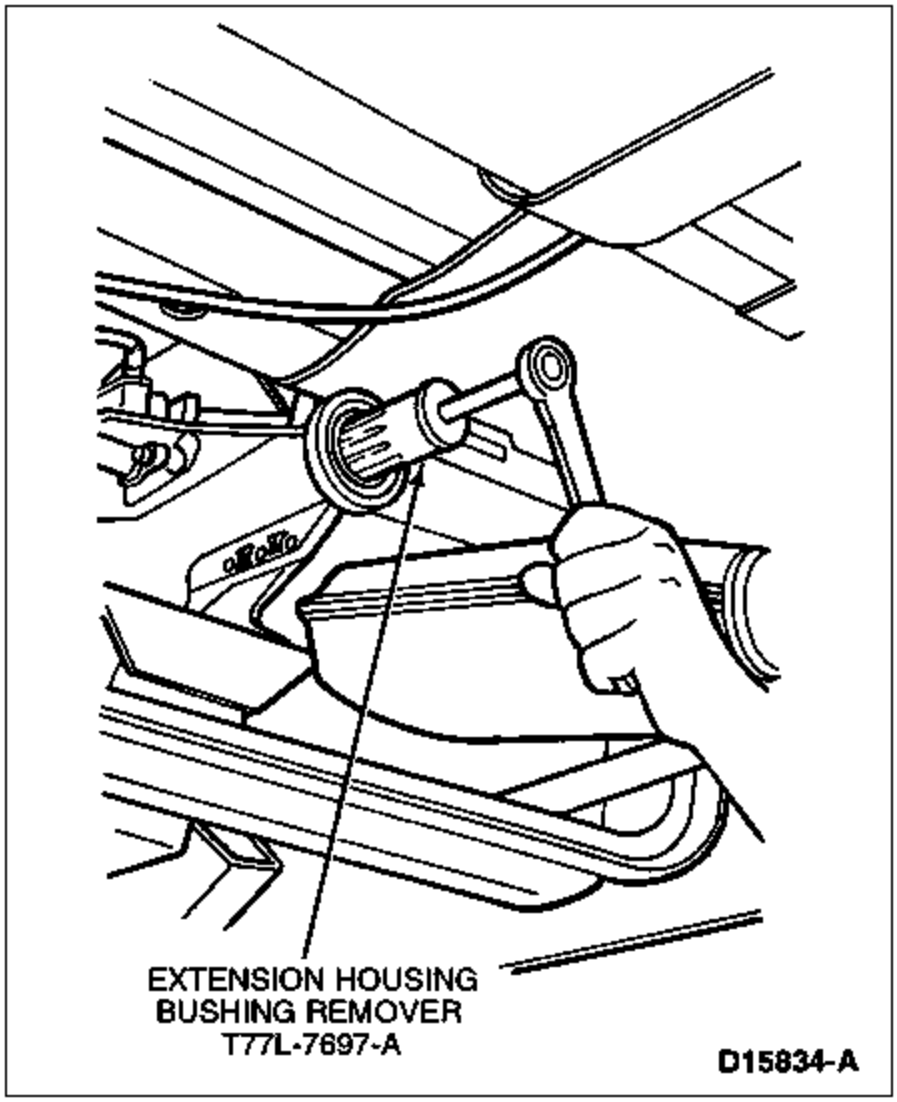
tomsn048@gmail.com



4. **CAUTION: Use the extension housing bushing remover carefully so that the seal area is not damaged.**

   Remove the bushing using Extension Housing Bushing Remover T77L-7697-E.

tomsn048@gmail.com



Installation

1. Inspect the counterbore of the extension housing for burrs. If necessary, remove burrs with an oil stone.

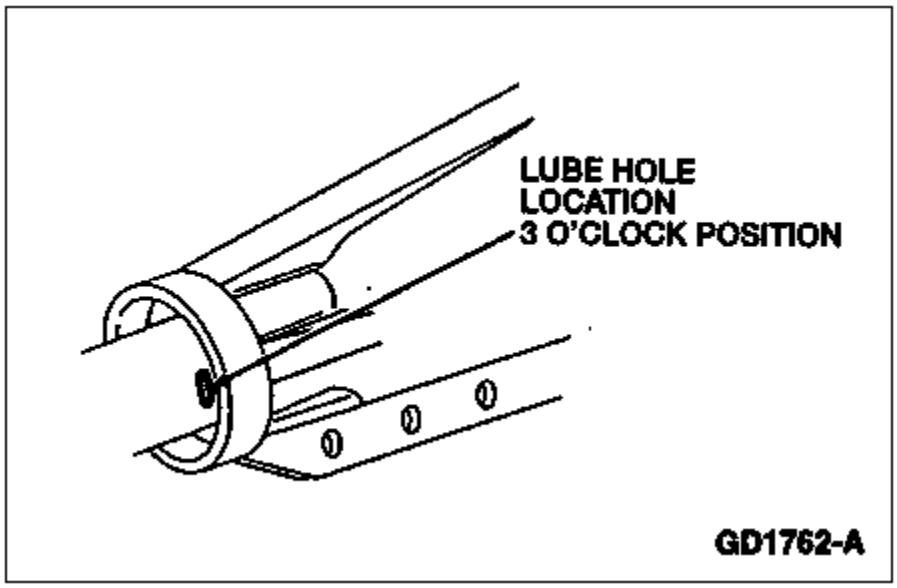
2. **CAUTION: The lube hole in the bushing must be aligned with the lube groove in the extension housing, located 90°(3 o'clock position) from top when viewed from rear.**

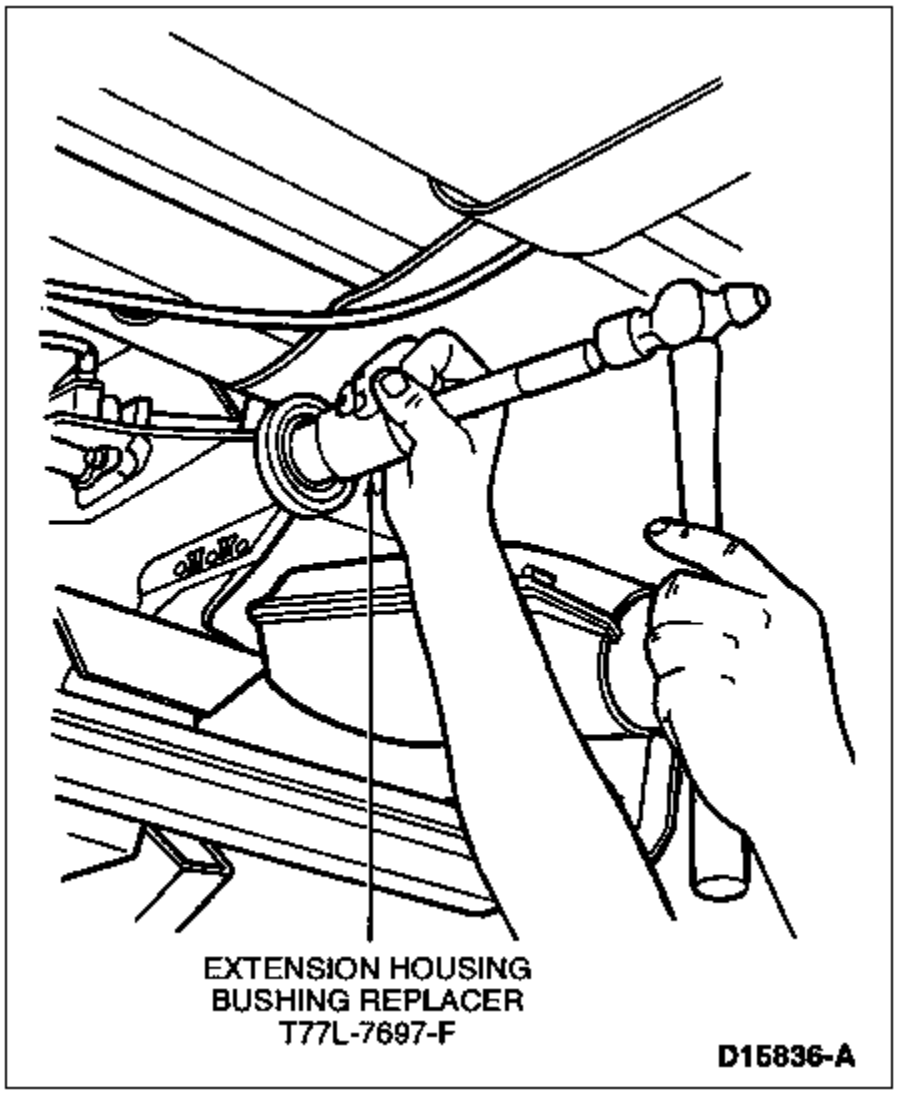
   CAUTION: Tool will bottom when bushing is in the proper position.

   NOTE: Install the extension housing bushing if it was removed.

   Install the extension housing bushing using Extension Housing Bushing Replacer T77L-7697-F.

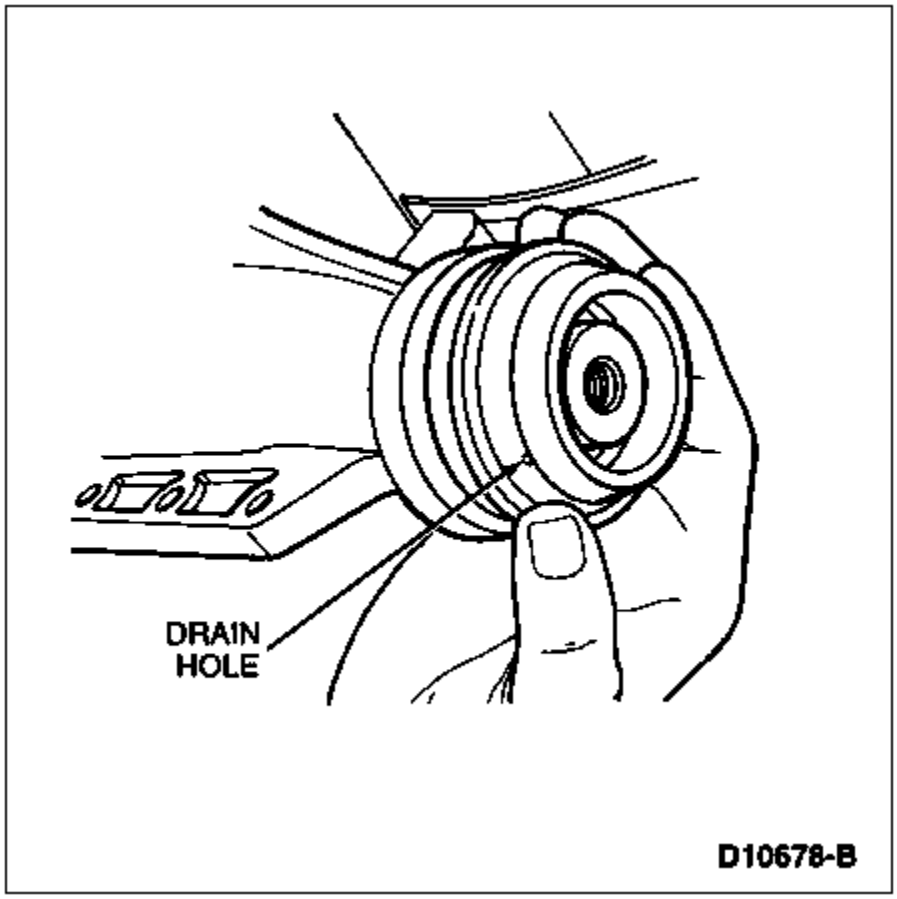
tomsn048@gmail.com





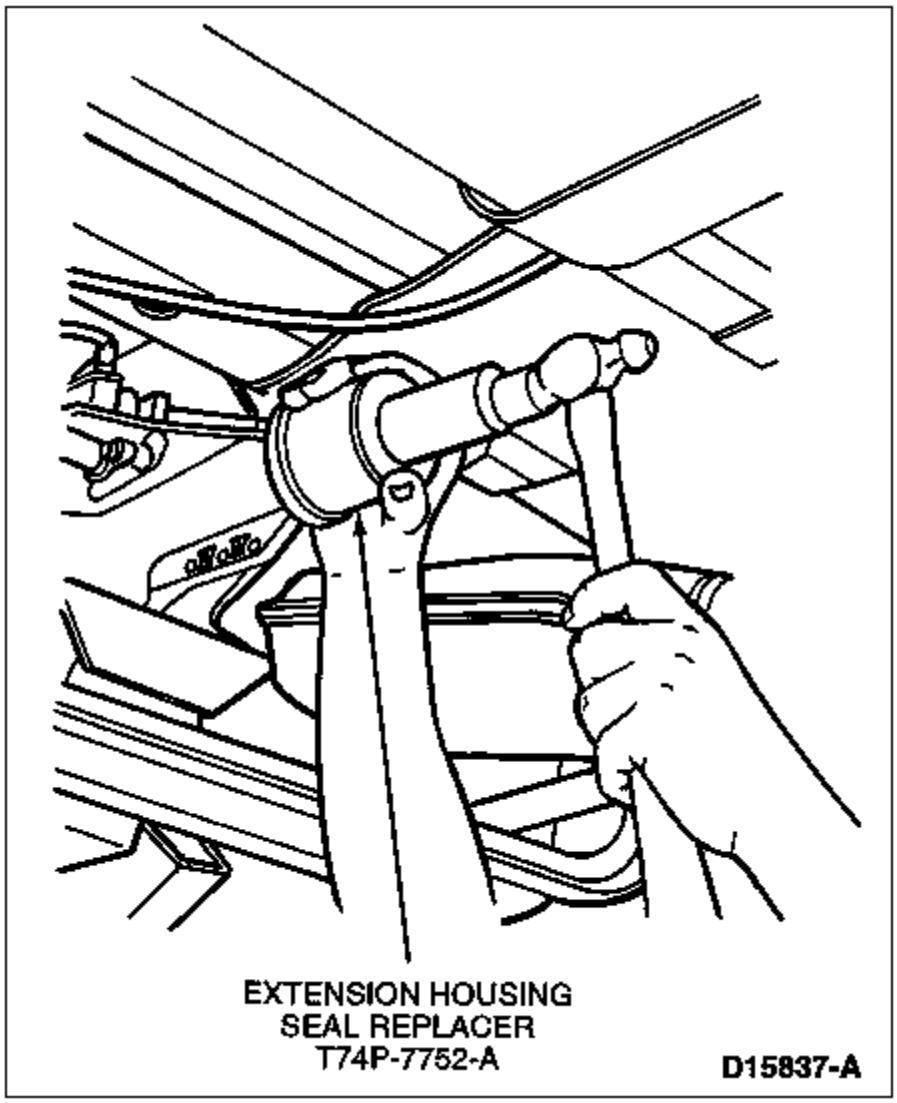
tomsn048@gmail.com

3. Position new output shaft and extension housing seal with drain hole positioned facing downward (6 o'clock position).



4. Seat seal using Extension Housing Seal Replacer T74P-77052-A.

tomsn048@gmail.com



5. Inspect driveshaft slip-yoke. Replace if damaged or worn.
6. Install driveshaft. Refer to Section 05-01 .
7. Remove safety stands and lower vehicle.
8. Fill the transmission to the proper level. Refer to specifications at the end of this section.

tomsn048@gmail.com

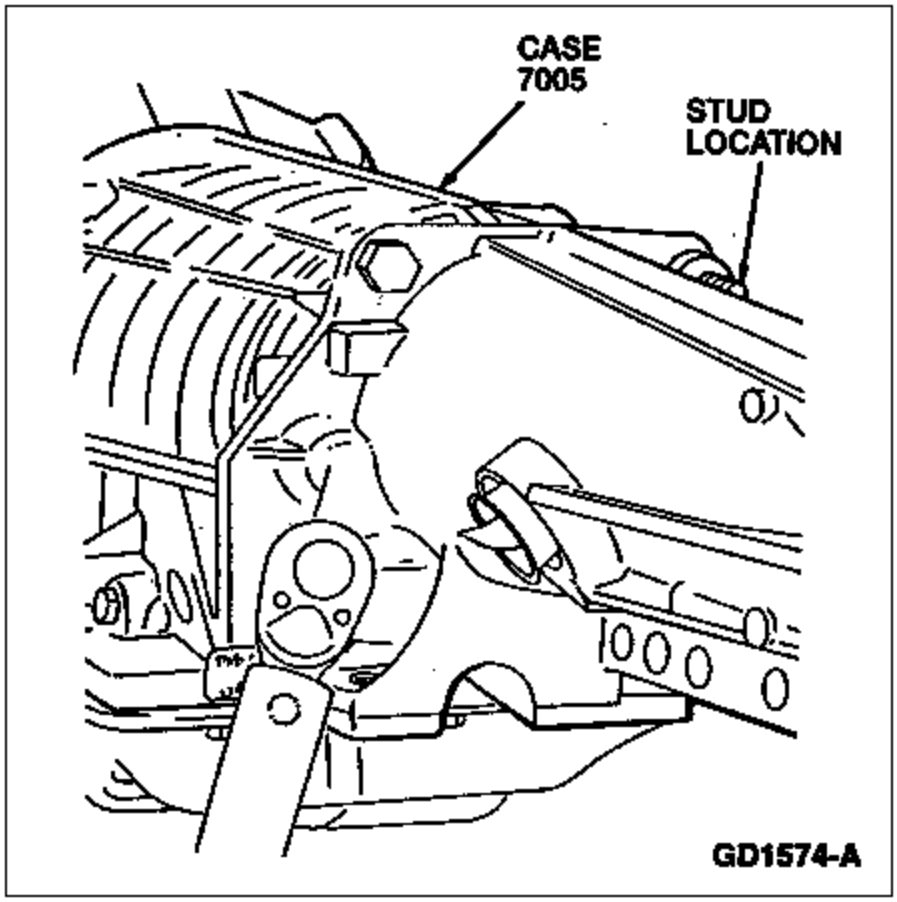
tomsn048@gmail.com

Extension Housing Gasket

Removal

1. Raise vehicle on hoist and position suitable safety stands under vehicle.
2. Remove front (4x4 only) and rear driveshaft. Refer to Section 05-01 .
3. Remove transfer case assembly (4x4 only). Refer to Section 07-07A or Section 07-07B .
4. Remove transmission mounting pad nuts and bolts. Refer to the Transmission Removal procedures in this section.
5. Carefully remove wire harness locators from extension housing wire bracket.
6. Position jack under transmission and raise transmission.
7. Remove five extension housing screws, one stud and wiring bracket using a 17mm socket.

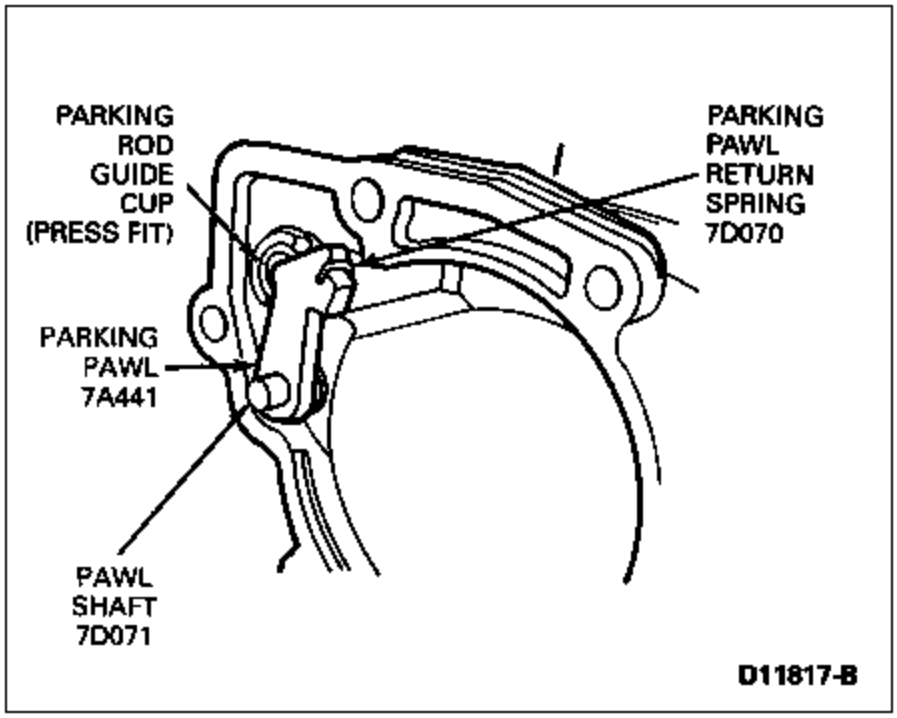
tomsn048@gmail.com



8. **CAUTION: The parking pawl, parking pawl return spring and parking pawl shaft could fall out during removal of the extension housing.**

   Carefully remove extension housing.

tomsn048@gmail.com



9. Remove and discard extension housing gasket (7086) from extension housing and mating surfaces.

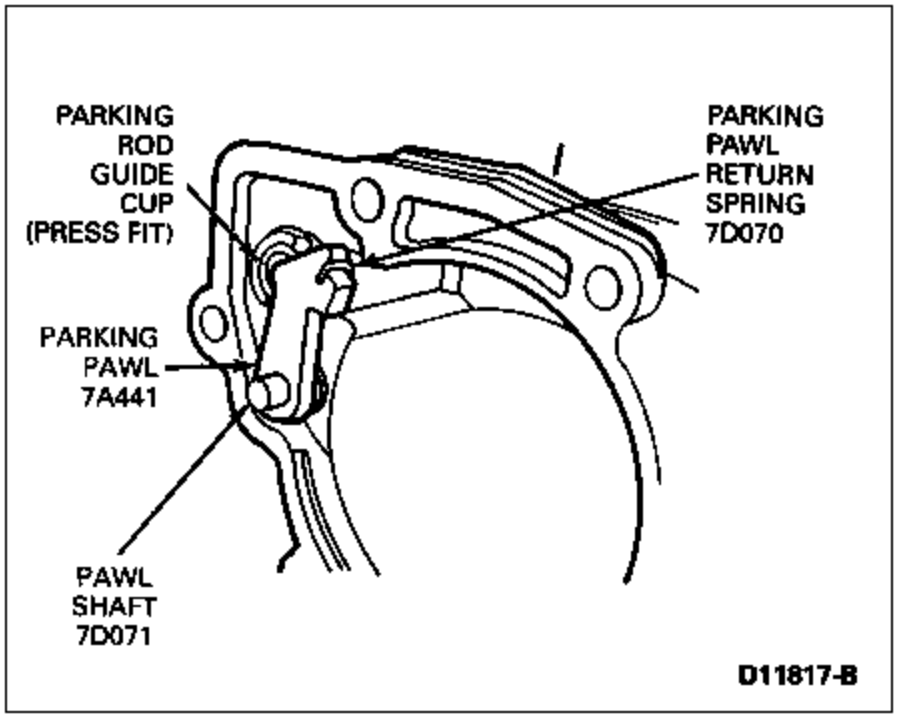
Installation

1. Clean extension housing and transmission mating surfaces. Place a light film of petroleum jelly on the extension housing gasket and position gasket on the transmission case.

2. **NOTE: The guide cup is press-fit into the extension housing and is not serviced separately.**

   Install the parking pawl, pawl return spring and pawl shaft into the extension housing.

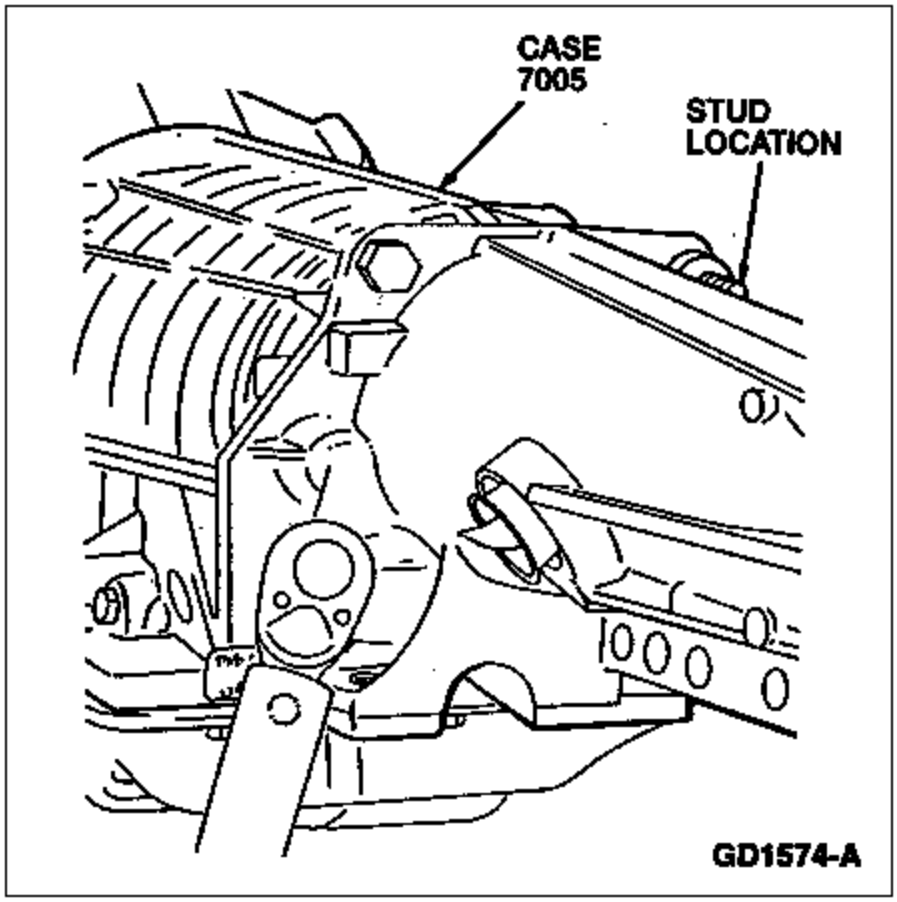
tomsn048@gmail.com



3. **CAUTION: Make sure the parking lever actuating rod is correctly seated into the case parking rod guide cup.**

   Install the extension housing. Install the five M10 x 30mm extension housing screws and one stud. Tighten the extension housing-to-case stud and screws to 36-52 Nm (27-39 lb-ft).

tomsn048@gmail.com



4. On 4x4 models only, install transfer case. Refer to Section 07-07A or Section 07-07B .
5. On 4x4 models only, attach transfer case vent hose to attaching plate. Refer to Section 07-07A or Section 07-07B .
6. Install four-wheel drive connector, if equipped.
7. Install new wire harness locator into extension housing wire bracket.
8. Install transmission mounting pad nuts and bolts and tighten to 68-95 Nm (50-70 lb-ft).
9. On Ranger vehicles, install the two crossmember-to-frame through bolts and nuts and tighten to 88-115 Nm (65-85 lb-ft).
10. On Aerostar vehicles, install the two crossmember-to-frame through bolts and nuts and tighten to 37-52 Nm (28-38 lb-ft).
11. Remove universal high lift transmission jack.
12. Install front (4x4 only) and rear driveshaft. Refer to Section 05-01 .
13. Fill the transmission to the proper level. Refer to Preliminary Testing procedure in this section.

tomsn048@gmail.com

tomsn048@gmail.com

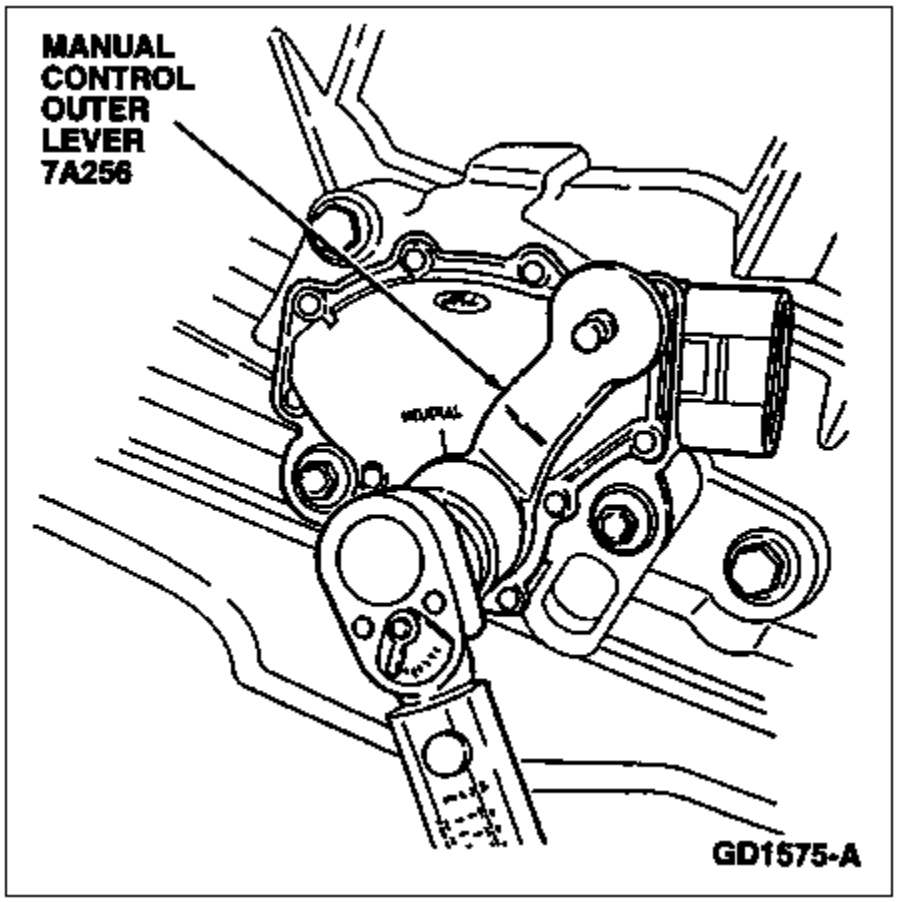
Digital Transmission Range (DTR) Sensor

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Digital TR Sensor Alignment Tool	T97L-70010-A

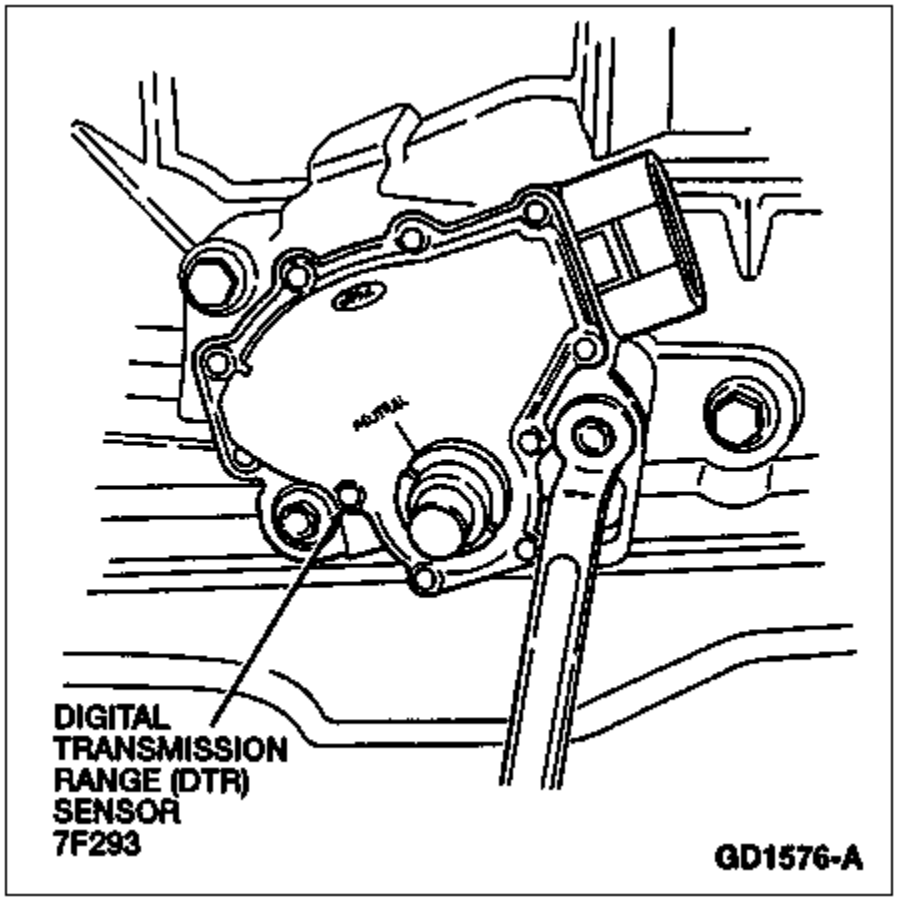
Removal

1. Use a screwdriver to remove the shift cable and fitting from the transmission lever ball stud.
2. Disconnect vehicle harness connector from digital transmission range (DTR) sensor by depressing tab.
3. Remove the manual control outer lever nut and manual control outer lever.



tomsn048@gmail.com

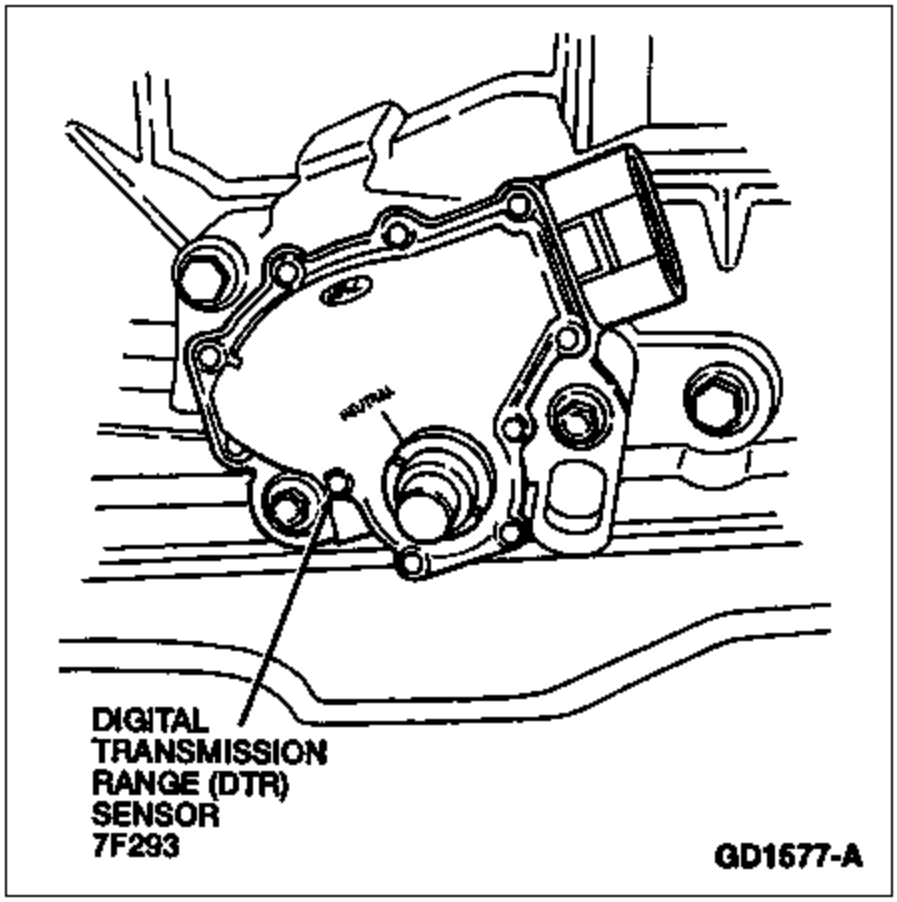
4. Remove the two M6 x 25 TR sensor screws and remove the DTR sensor.



Installation

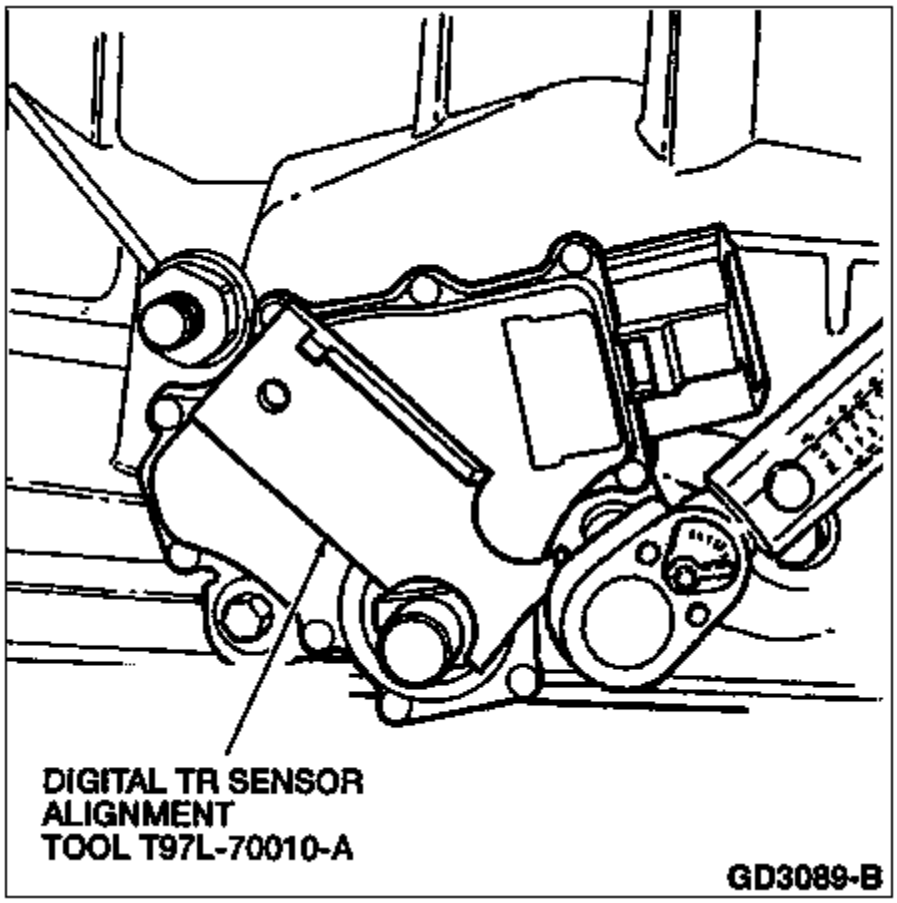
1. Install the DTR sensor on the manual lever. Install the two TR sensor screws and finger tighten. Rotate the manual lever to the neutral position (two detents rearward).

tomsn048@gmail.com



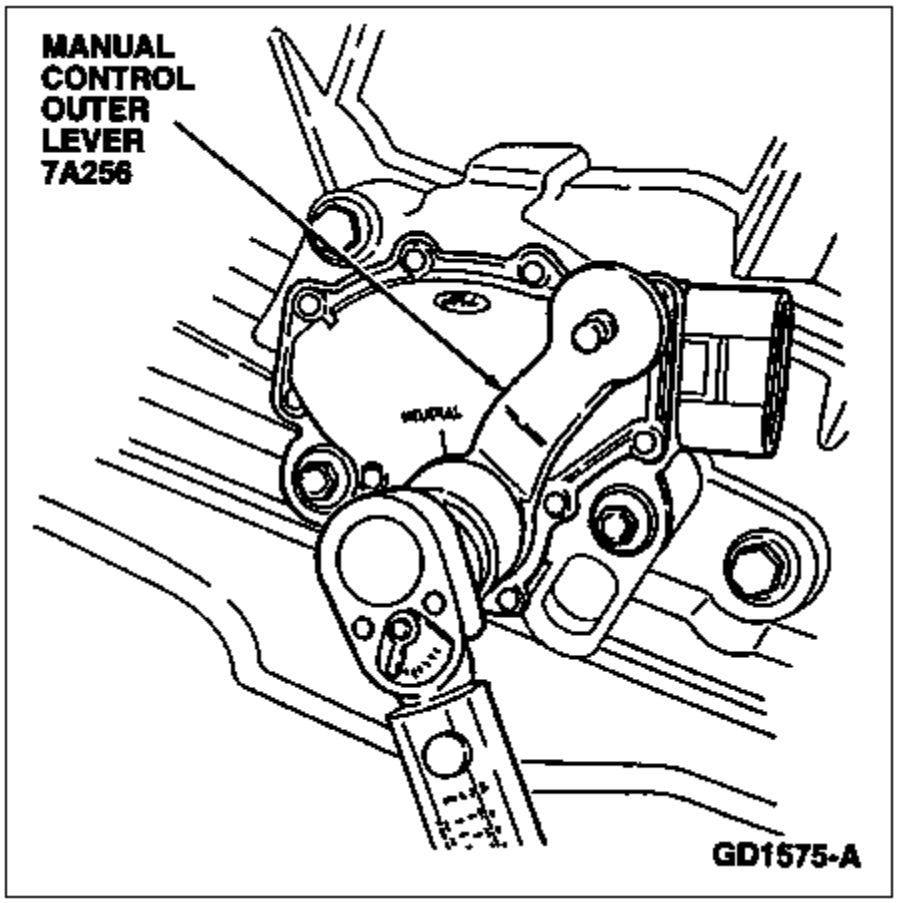
2. Install Digital TR Sensor Alignment Tool T97L-70010-A into the three slots on the DTR sensor. Tighten the TR sensor-to-case screws to 8-11 Nm (71-97 lb-in). Remove the alignment tool.

tomsn048@gmail.com



3. Install the manual control outer lever and manual control outer lever nut. Tighten the manual control outer lever nut to 41-54 Nm (30-40 lb-ft).

tomsn048@gmail.com



4. Install shift cable or linkage from manual control lever (7A256). Use a screwdriver to remove the cable and fitting from the transmission lever ball stud.

5. Adjust shift cable. Refer to adjustments in Section 07-05 .

6. Reconnect vehicle harness connector to DTR sensor.

---

tomsn048@gmail.com

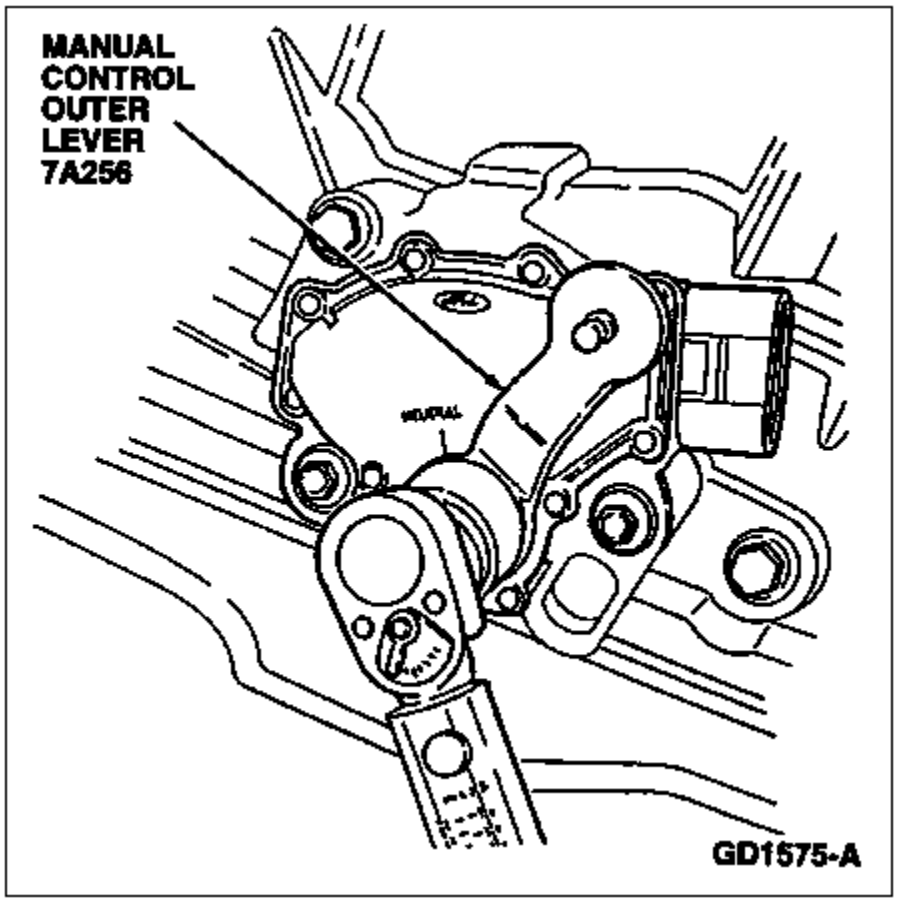
tomsn048@gmail.com

Digital Transmission Range (DTR) Sensor Adjustment

SPECIAL SERVICE TOOL(S) REQUIRED

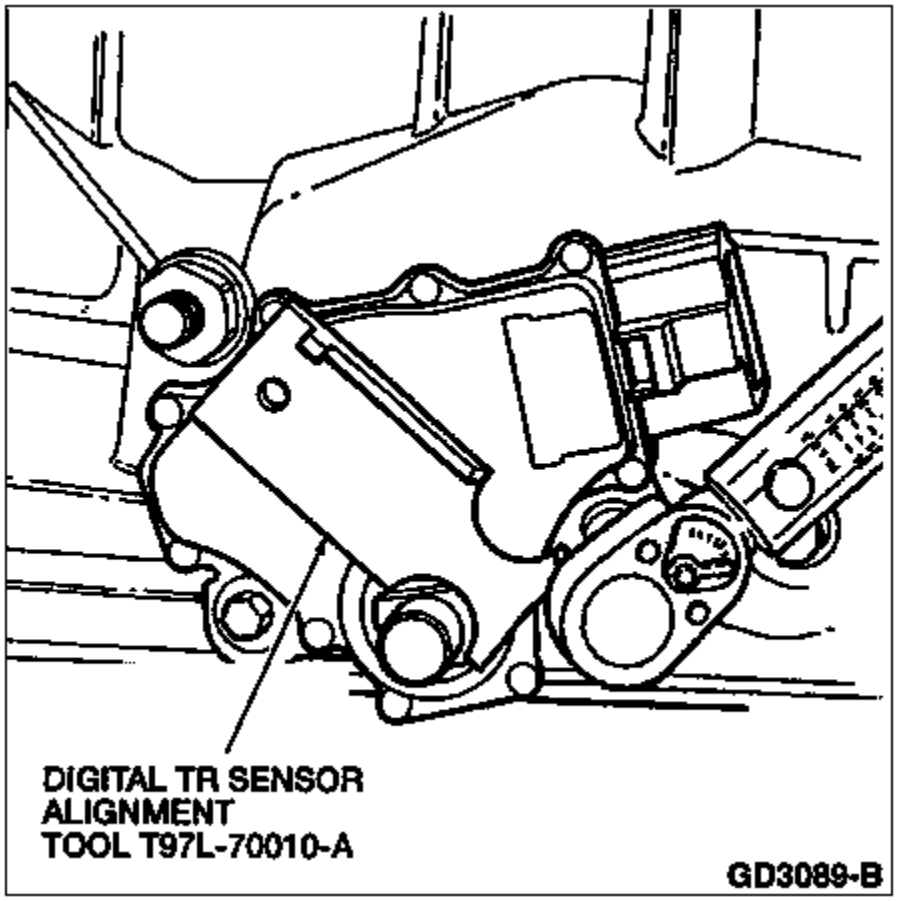
Description	Tool Number
Digital TR Sensor Alignment Tool	T97L-70010-A

1. Use a screwdriver to remove the shift cable and fitting from the transmission lever ball stud.
2. Disconnect vehicle harness connector from digital transmission range (DTR) sensor by depressing tab.
3. Remove the manual control outer lever nut and manual control outer lever.



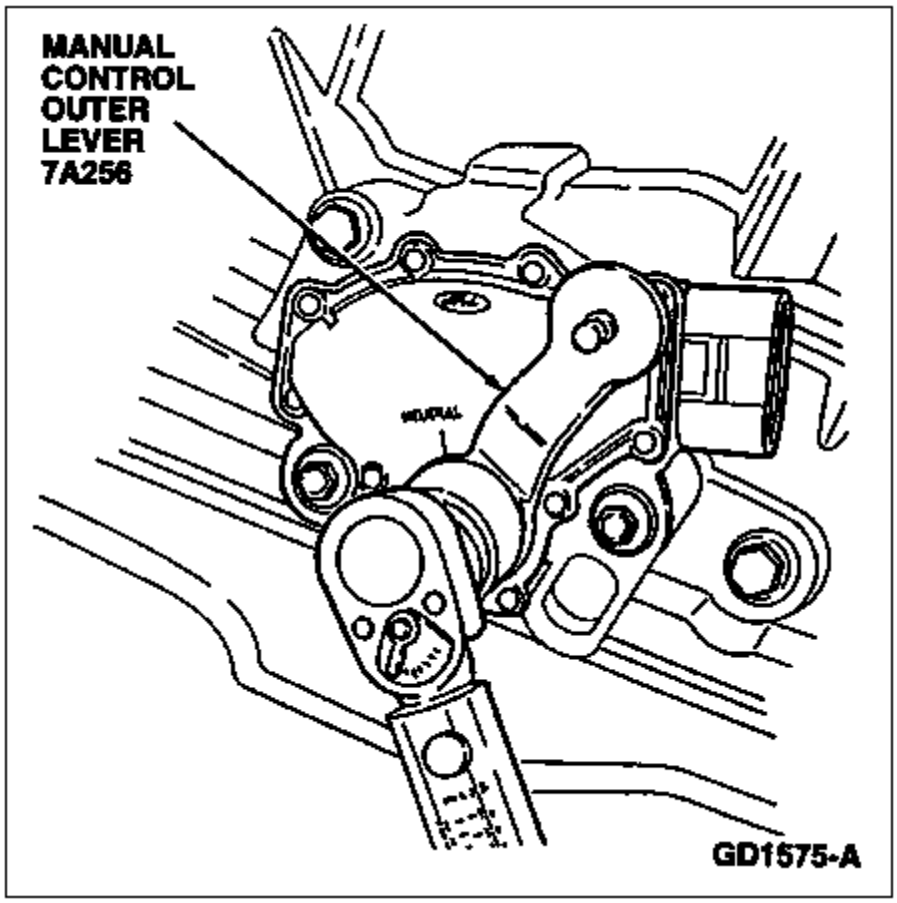
4. Loosen the two M6 x 25 TR sensor screws.
5. Install Digital TR Sensor Alignment Tool T97L-70010-A into the three slots on the DTR sensor. Tighten the TR sensor-to-case screws to 8-11 Nm (71-97 lb-in). Remove the alignment tool.

tomsn048@gmail.com



6. Install the manual control outer lever and manual control outer lever nut. Tighten the manual control outer lever nut to 41-54 Nm (30-40 lb-ft).

tomsn048@gmail.com



7. Install shift cable or linkage from manual control lever (7A256). Use a screwdriver to remove the cable and fitting from the transmission lever ball stud.

8. Adjust shift cable. Refer to adjustments in Section 07-05 .

9. Reconnect vehicle harness connector to DTR sensor.

---

tomsn048@gmail.com

tomsn048@gmail.com

Heat Shield

Removal

1. **NOTE: A transmission heat shield is on all 4.0L vehicles.**

   Remove the M6 x 1.0 transmission heat shield nut from the studded screw.

2. Carefully pry the transmission heat shield off the fluid pan rail.

Installation

1. **NOTE: A heat shield is on all 4.0L vehicles.**

   Align heat shield retaining clips over fluid pan rail and install the heat shield on the fluid pan rail.

2. Install the heat shield nut. Tighten the heat shield nut to 8-11 Nm (71-97 lb-in).

tomsn048@gmail.com

Fluid Pan, Gasket and Filter

Removal

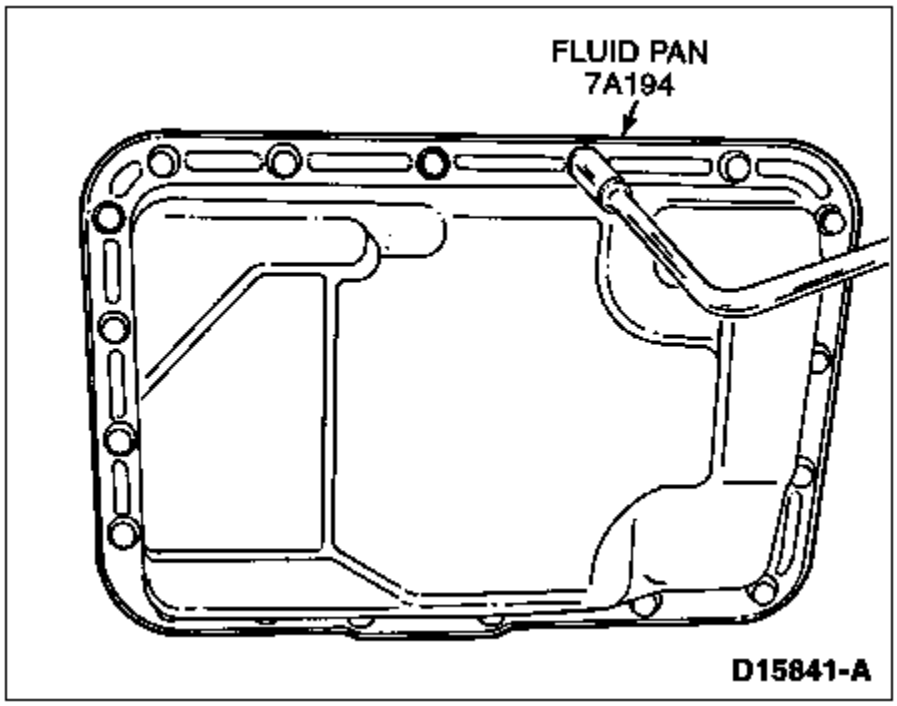
1. **NOTE: A transmission heat shield is on all 4.0L vehicles.**

   Remove the M6 x 1.0 transmission heat shield nut from the studded screw.

2. Carefully pry the transmission heat shield off the fluid pan rail.

3. **NOTE: Heat shield does not have to be removed from vehicle for fluid pan removal.**

   Using a 13mm socket, remove all M8 x 16mm fluid pan screws, except for two in the front. Loosen two front screws only.



4. Pry the rear of the pan down and allow fluid to drain.

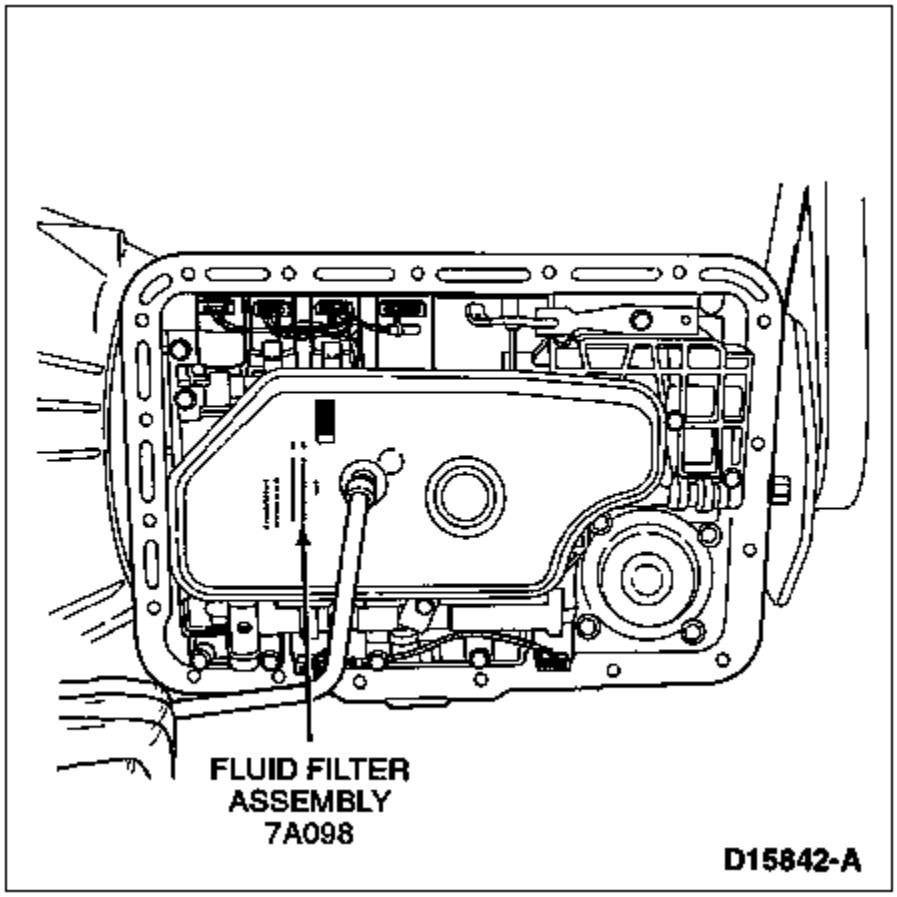
5. Support fluid pan and remove two remaining screws.

6. Remove fluid pan and discard old gasket.

7. Use a 10mm socket to remove the M6 x 55mm fluid filter assembly screw. Remove the fluid filter

tomsn048@gmail.com

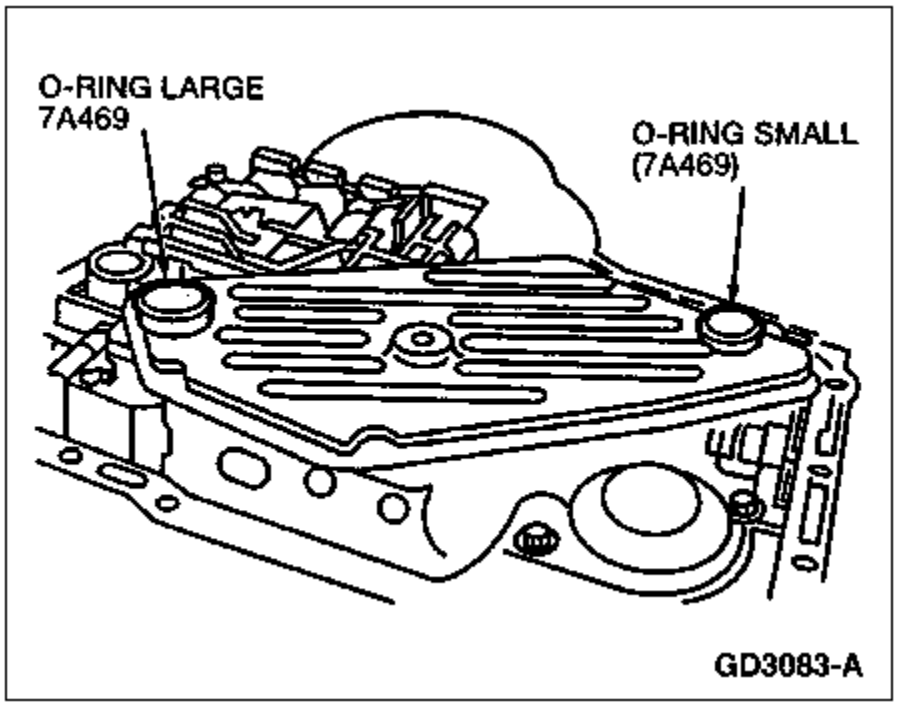
assembly and discard.



Installation

1. Clean all mating surfaces, making sure they are free from debris and oil.
2. Install new fluid pan gasket on fluid pan and align holes.
3. Lube and install new O-rings onto filter assembly.
4. Install new filter onto main control assembly.
5. Make sure that both O-rings are properly installed on filter prior to installation.

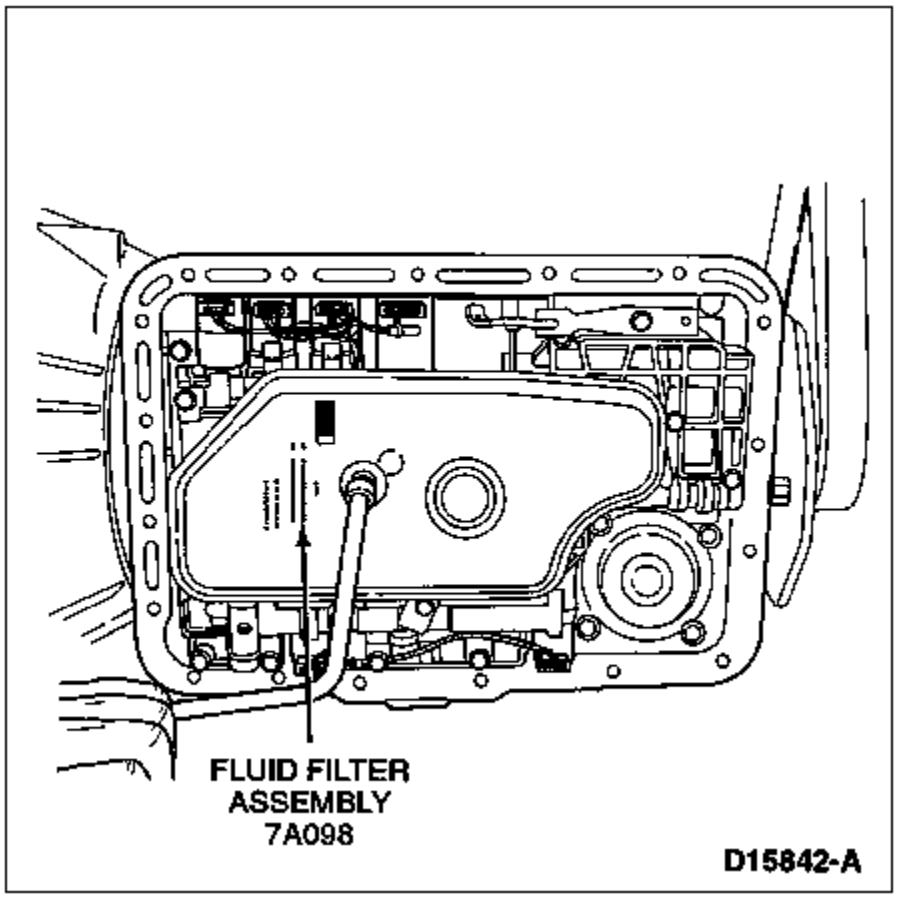
tomsn048@gmail.com



6. **CAUTION: Make sure wire harness is not pinched under filter.**

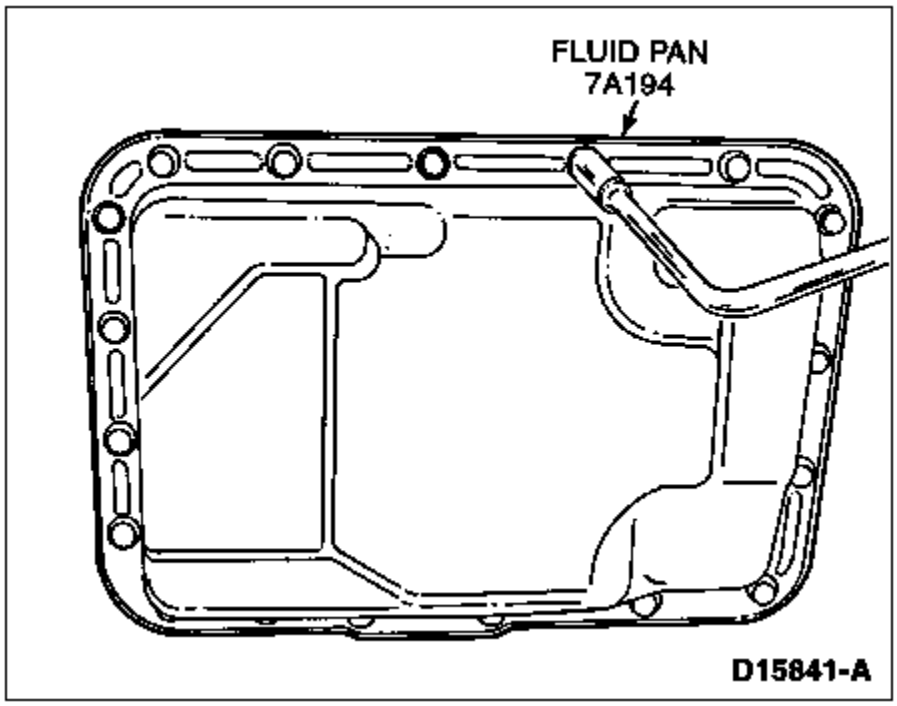
   Install one M6 x 55mm fluid filter assembly-to-main control assembly screw using a 10mm socket as shown. Tighten to 8-11 Nm (71-97 lb-in).

tomsn048@gmail.com



7. Install fluid pan and gasket onto transmission and install eighteen M8 x 16mm fluid pan-to-case screws. Tighten to 13-15 Nm (115-133 lb-in) using a crisscross sequence.

tomsn048@gmail.com



8. **NOTE: A heat shield is on all 4.0L vehicles.**

   Align heat shield retaining clips over fluid pan rail and install the heat shield on the fluid pan rail. Install the heat shield nut. Tighten the heat shield nut to 8-11 Nm (71-97 lb-in).

9. Fill the transmission to the proper level. Refer to the procedure in this section.

---

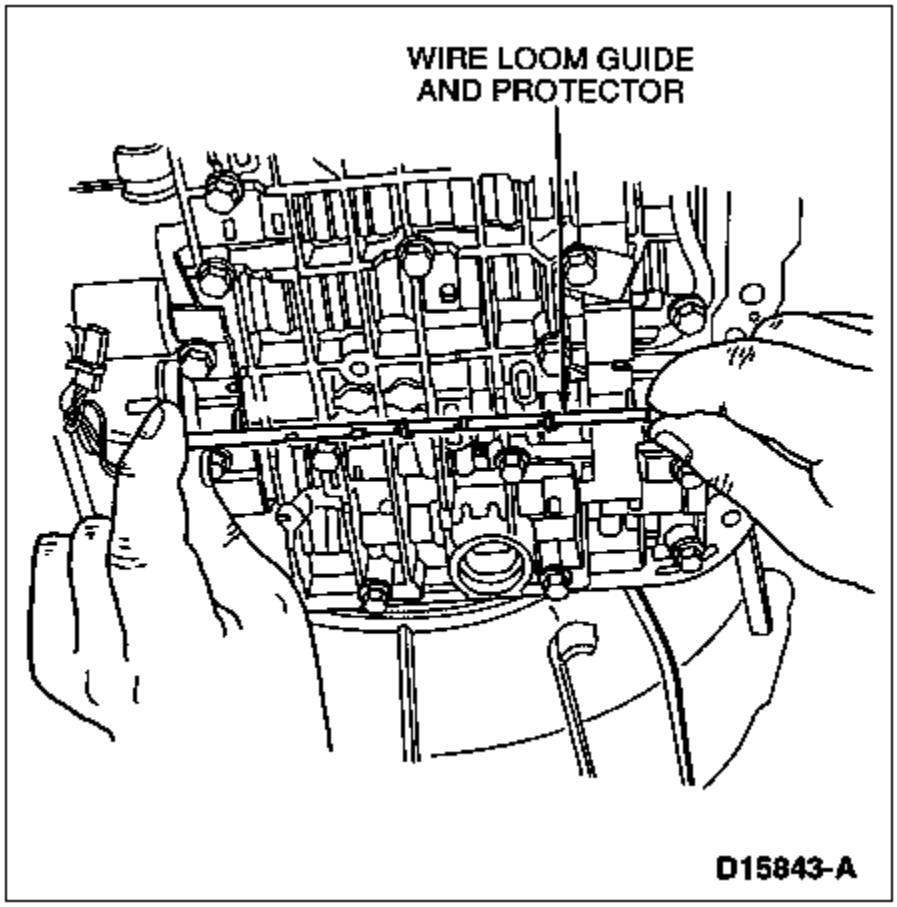
tomsn048@gmail.com

Solenoid Service

Removal

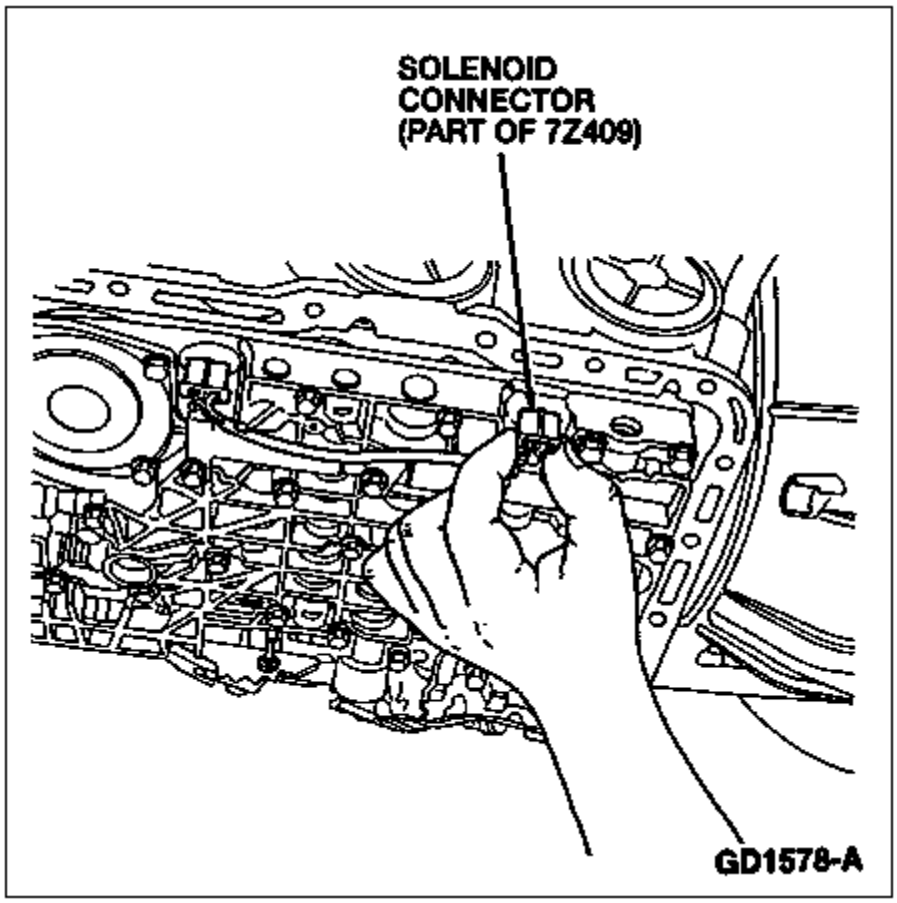
NOTE: Main control assembly does not need to be removed for solenoid service.

1. Remove fluid pan gasket and filter as described in this section.
2. Carefully lift up on the wire loom guide and protector. Disengage the retaining pins from the solenoid brackets.



3. Disconnect the appropriate solenoid connector(s) from the solenoid(s) by carefully pulling downward and wiggling side to side.

tomsn048@gmail.com

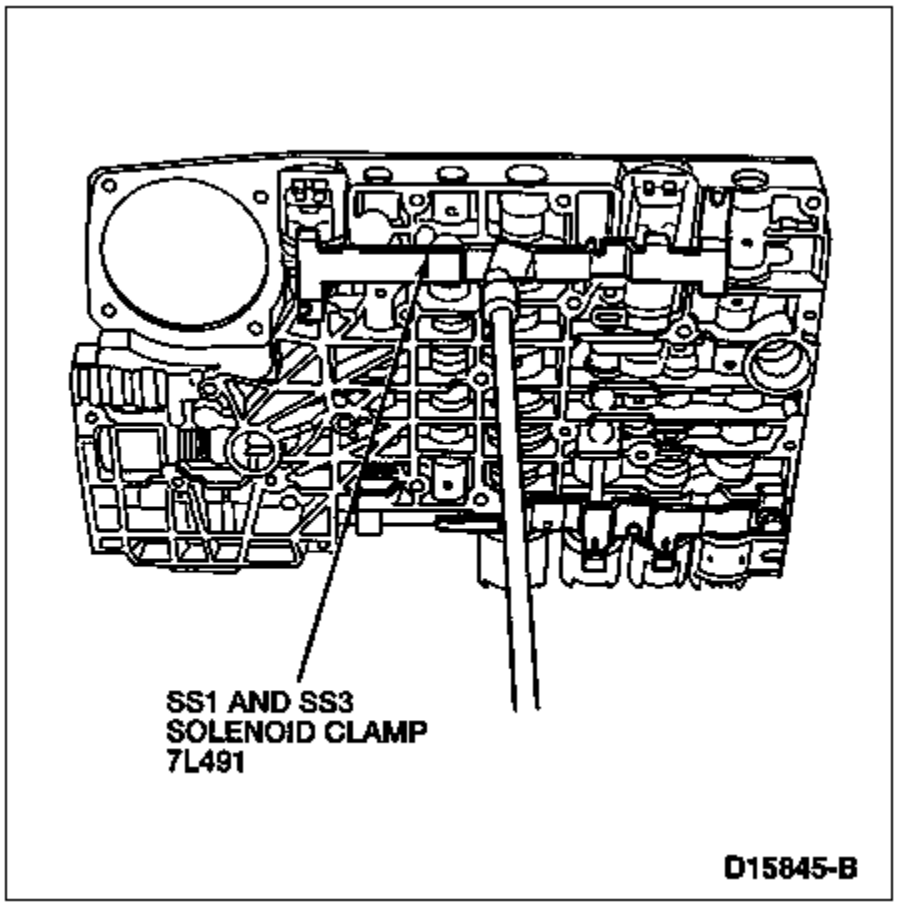


4. **CAUTION: SS3 may pop out of its bore. This may damage the solenoid.**

   NOTE: Steps 4, 5 and 6 refer to SS1 and SS3 solenoids only.

   Use a 10mm socket to remove the SS1 and SS3 solenoid clamp screws. Remove the solenoid clamp.

tomsn048@gmail.com



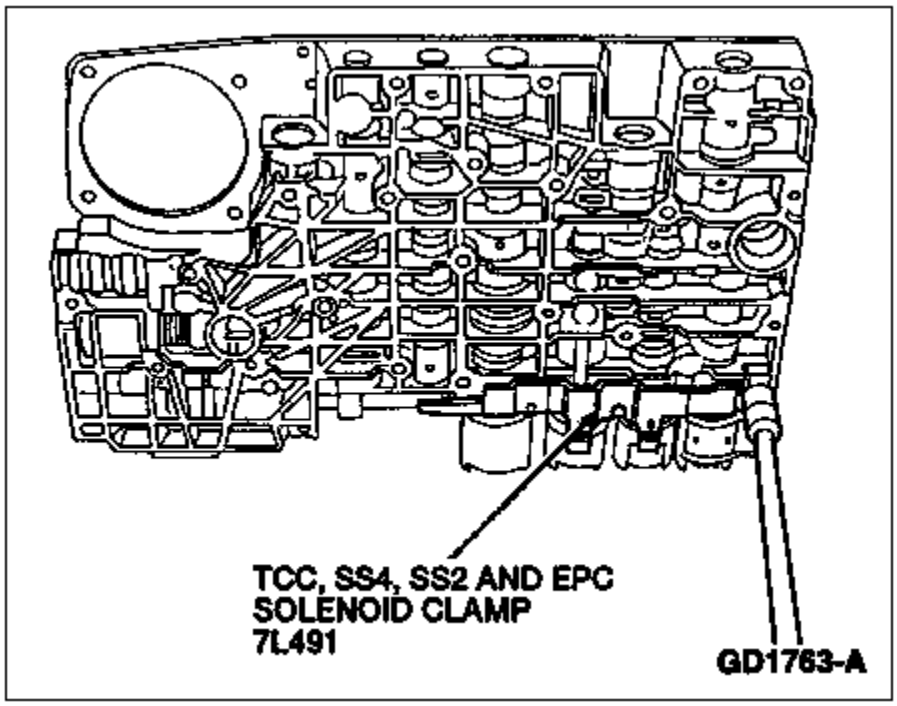
5. Remove SS1 and SS3 and service as required.

6. **CAUTION: The TCC solenoid may pop out of its bore. The converter modulator valve may come out after the TCC solenoid has been removed. This may damage the solenoid or converter modulator valve.**

   NOTE: Steps 6-8 refer to TCC, SS4, SS2 and EPC solenoids only.

   Remove the TCC, SS4, SS2 and EPC solenoid clamp screws.

tomsn048@gmail.com



7. Remove the solenoid clamp.

tomsn048@gmail.com

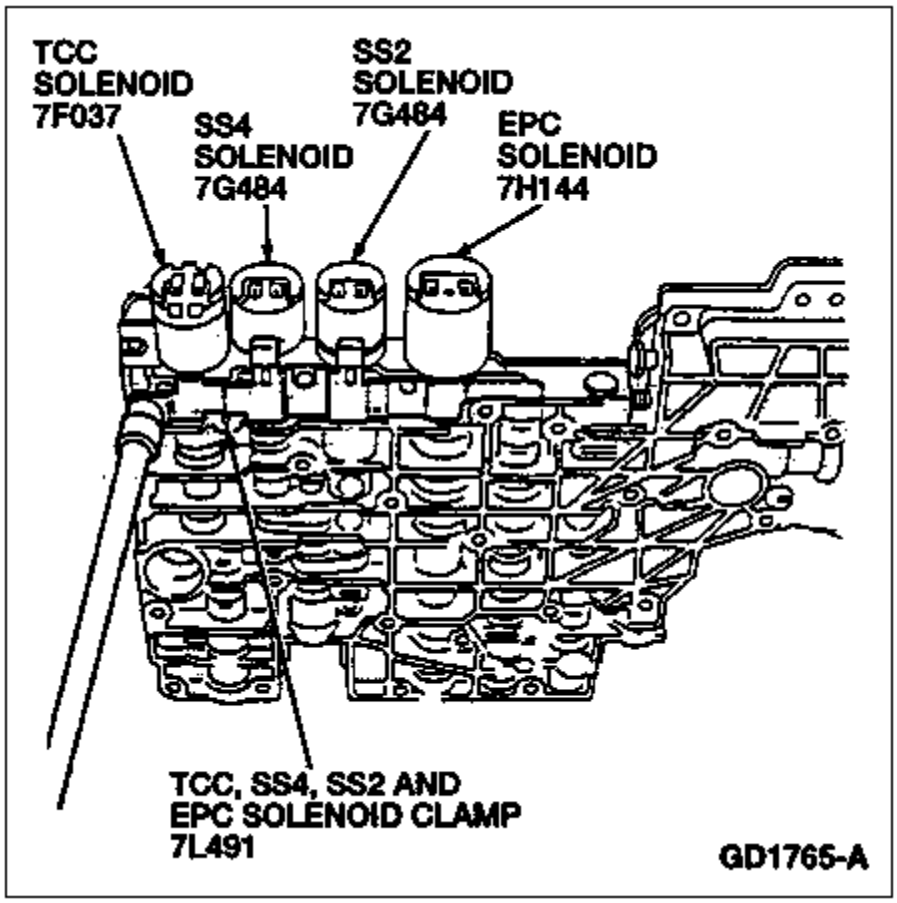
8. Remove solenoids and service as required.

Installation

1. **CAUTION: The solenoid clamp must be installed in the TCC and EPC solenoid grooves, shift solenoid pockets and the No. 204 plug.**

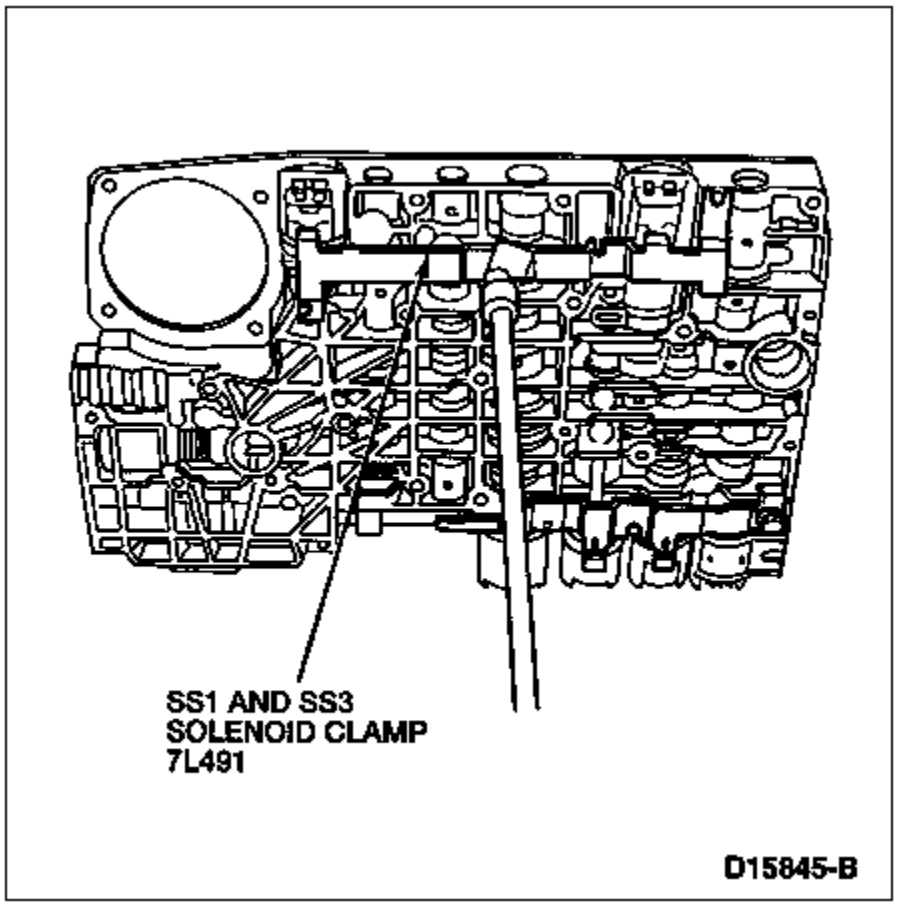
   Install the TCC, SS4, SS2, EPC solenoids, solenoid clamp and screws. Tighten to 6-8 Nm (53-71 lb-in).

tomsn048@gmail.com



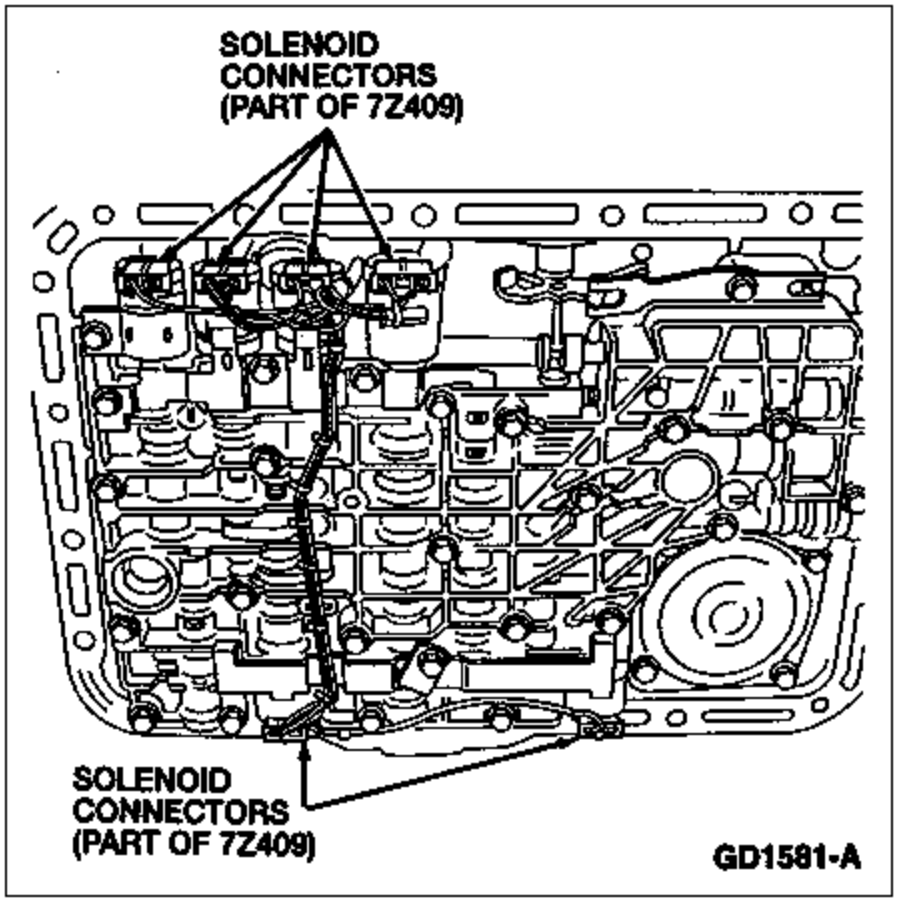
2. Install the SS1 and SS3 solenoids, solenoid clamp and screws. Tighten to 8-11 Nm (71-97 lb-in).

tomsn048@gmail.com



3. Carefully press down to install the solenoid connectors on the solenoids as shown.

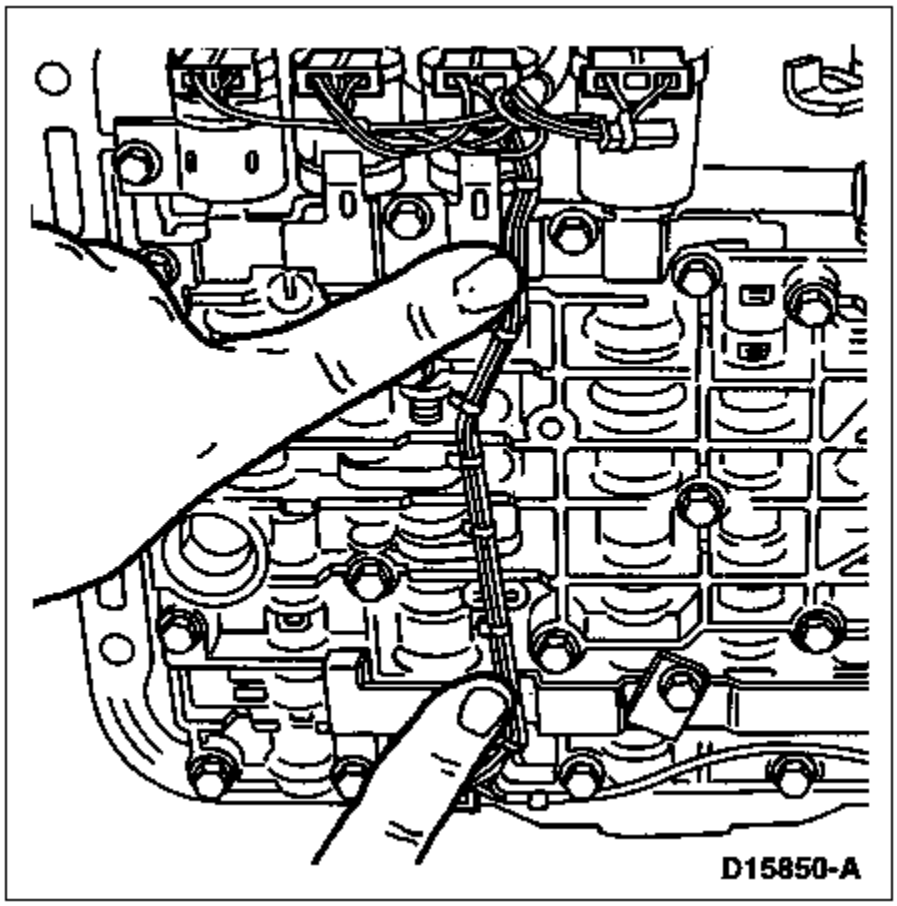
tomsn048@gmail.com



4. **CAUTION: Excessive pressure may break the locating pins.**

   Install the wiring loom protector and guide. Align the pins in the holes of the solenoid clamps and gently push down.

tomsn048@gmail.com



5. Install new fluid pan gasket and filter as described in this section.
6. Fill the transmission to the proper level. Refer to the procedure in this section.

---

tomsn048@gmail.com

Internal Harness Service

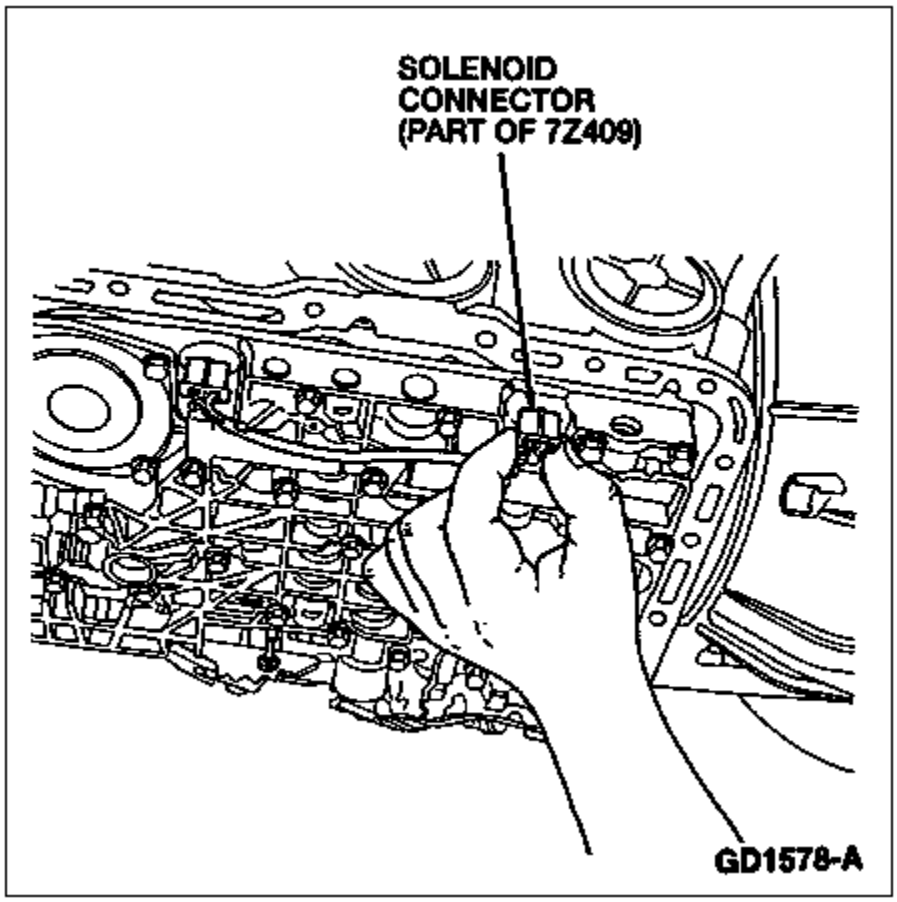
16-Pin Connectors

Removal

NOTE: The main control assembly does not need to be removed.

1. Remove fluid, pan, gasket and filter as described in this section. Discard filter.
2. **NOTE: Only EPC and SS2 solenoid connectors need to be removed.**

   Disconnect the solenoid connectors from the solenoids by carefully pulling downward and wiggling side to side.

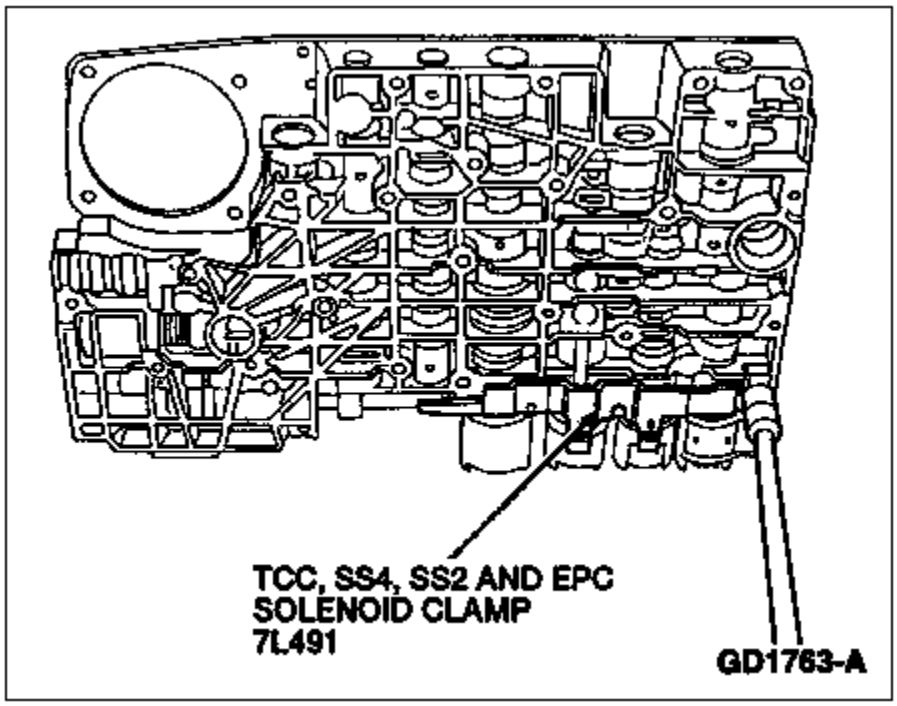


3. **CAUTION: The TCC solenoid may pop out of its bore. The converter modulator valve may**

tomsn048@gmail.com

come out after the TCC solenoid clamp has been removed. This may damage the solenoid or converter modulator valve.

Remove the TCC, SS4, SS2 and EPC solenoid clamp screws.



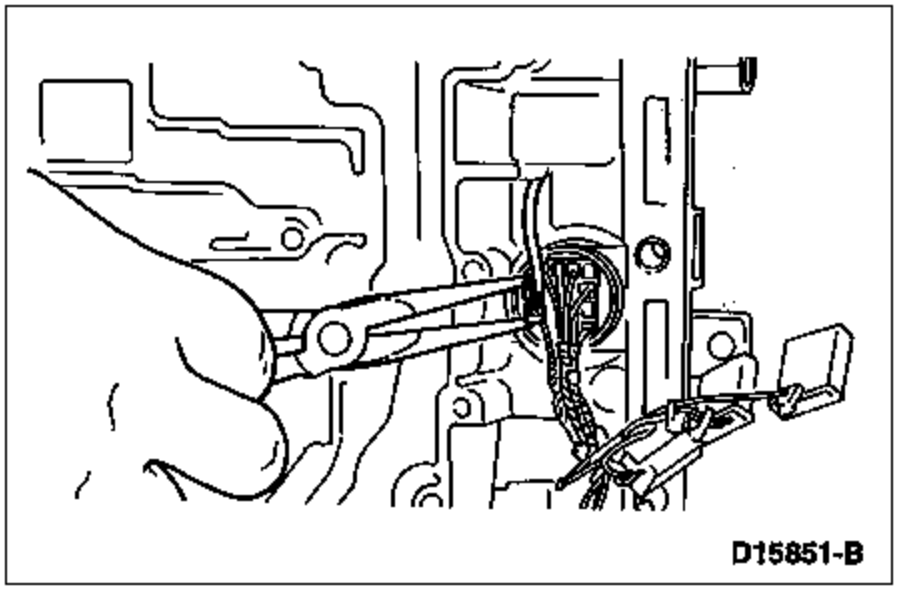
4. Remove the solenoid clamp and EPC and SS2 solenoids.

tomsn048@gmail.com

5. **CAUTION: Do not pry on other wires or damage the connector case surface.**

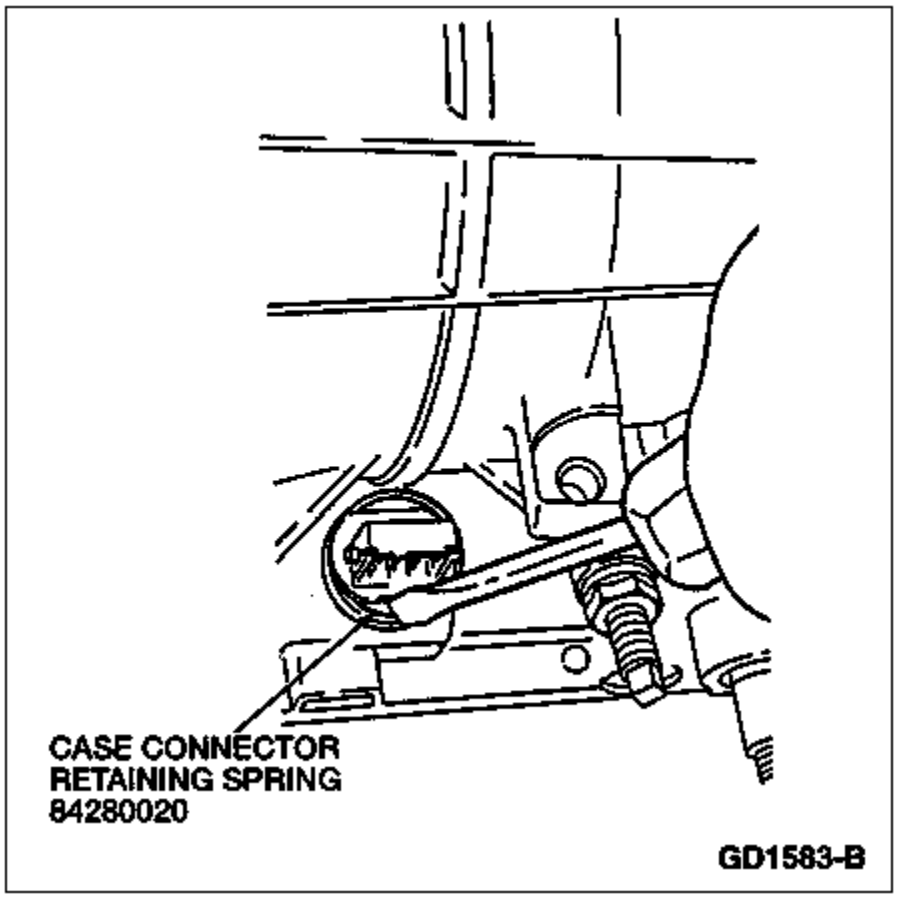
   Carefully disconnect the turbine shaft speed (TSS) sensor connector from the 16-pin case connector.

tomsn048@gmail.com



6. **CAUTION: Do not overstretch the case connector retaining ring.**

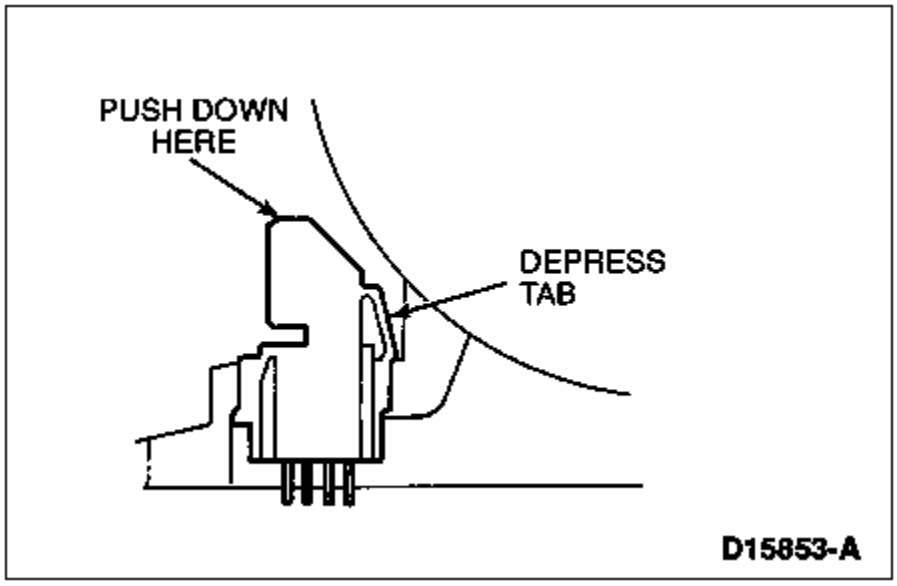
Use a screwdriver to carefully remove the case connector retaining spring.



tomsn048@gmail.com

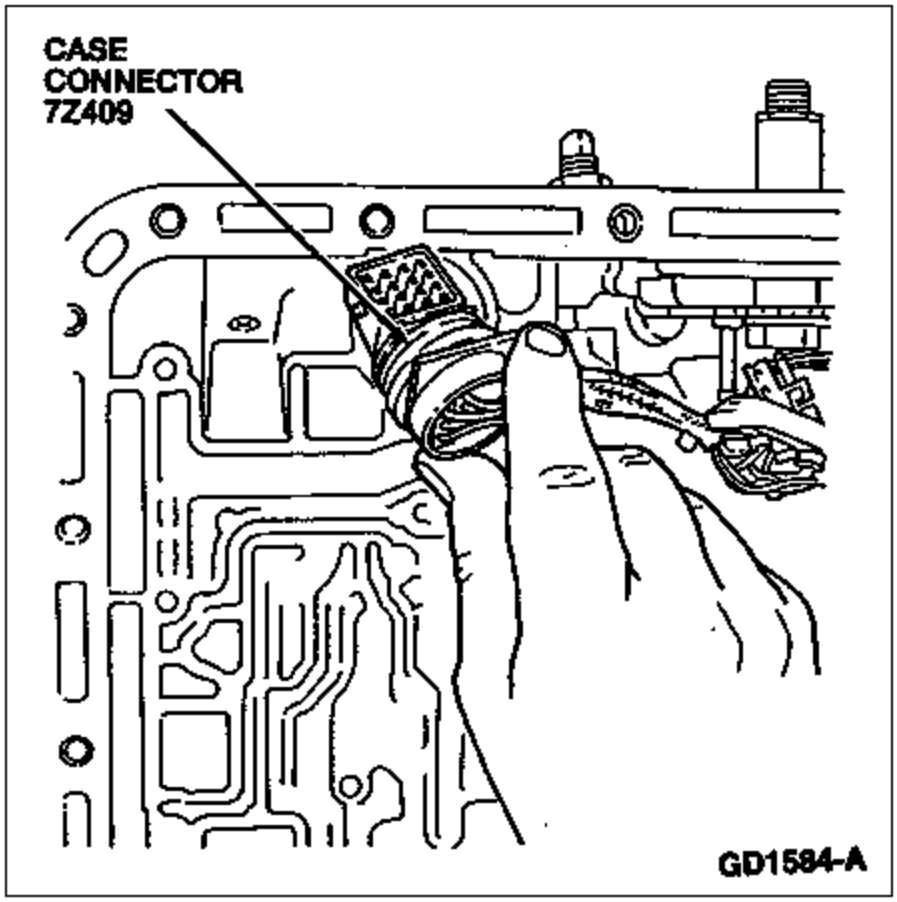
7. **CAUTION: Do not damage the connector or harness.**

   Carefully push down on the top of the connector until it stops. Depress the tab on the back side of the connector and push down on the connector.



8. Remove the connector and harness through the bottom of the case.

tomsn048@gmail.com

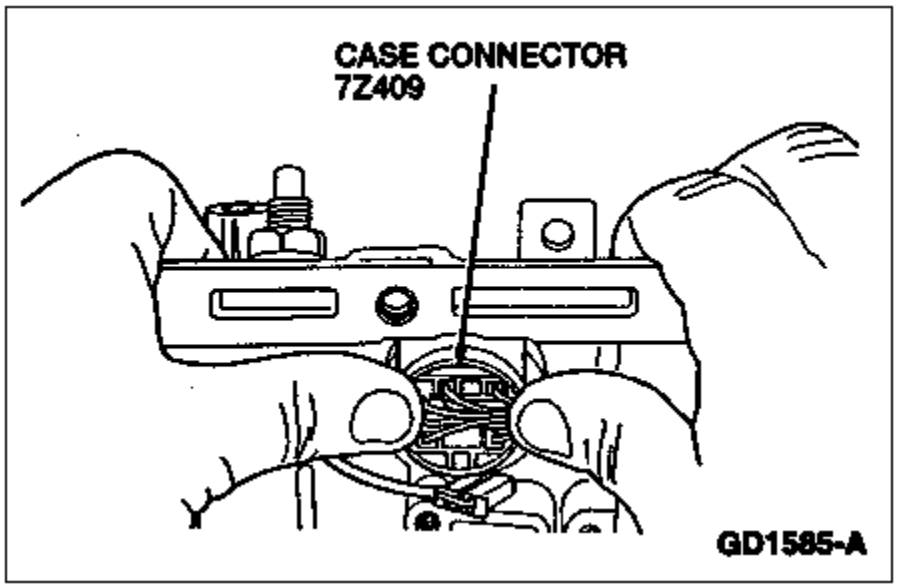


Installation

1. Replace O-rings (W703015-S300) on connector.
2. **NOTE: Make sure the tab is in the lock position.**

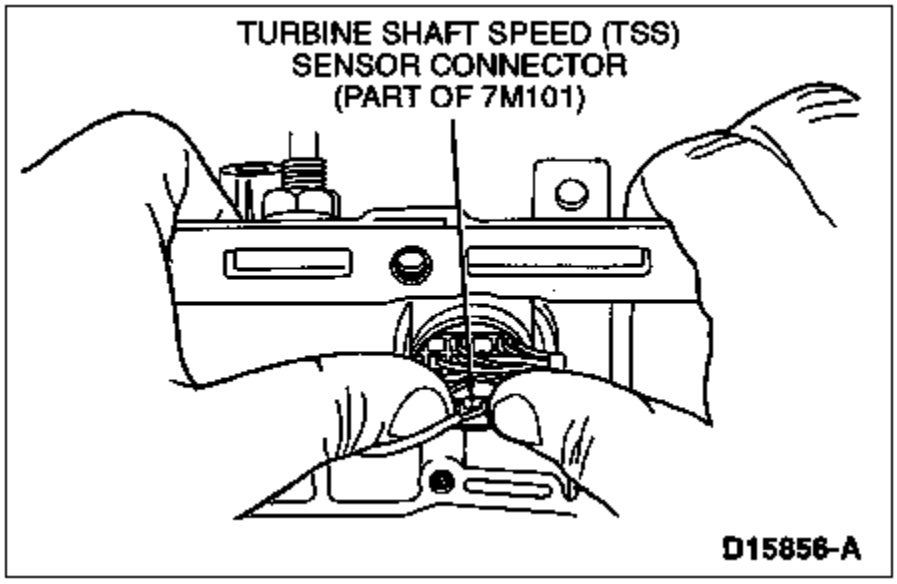
   Install the case 16-pin connector through the case until a click is heard.

tomsn048@gmail.com



3. **NOTE: Align the slot on the TSS connector with the slot on the 16-pin case connector.**

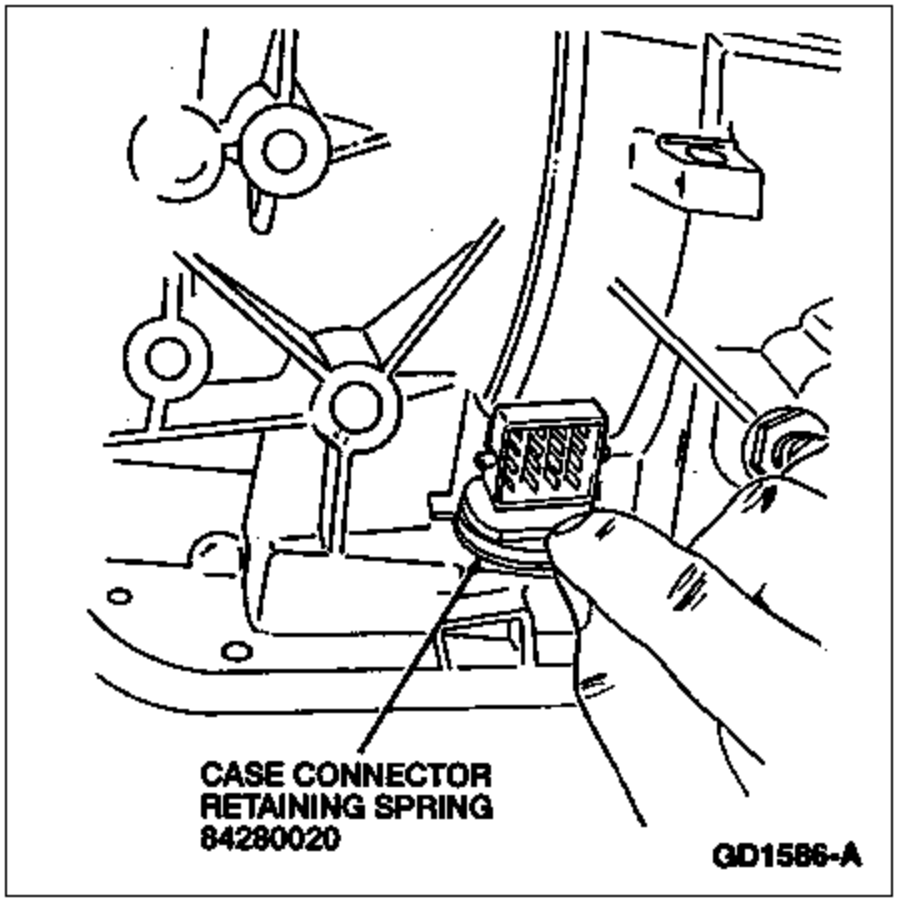
   Carefully install the TSS connector into the 16-pin case connector.



4. **CAUTION: Do not overstretch the retaining spring.**

   Install the case connector retaining spring.

tomsn048@gmail.com



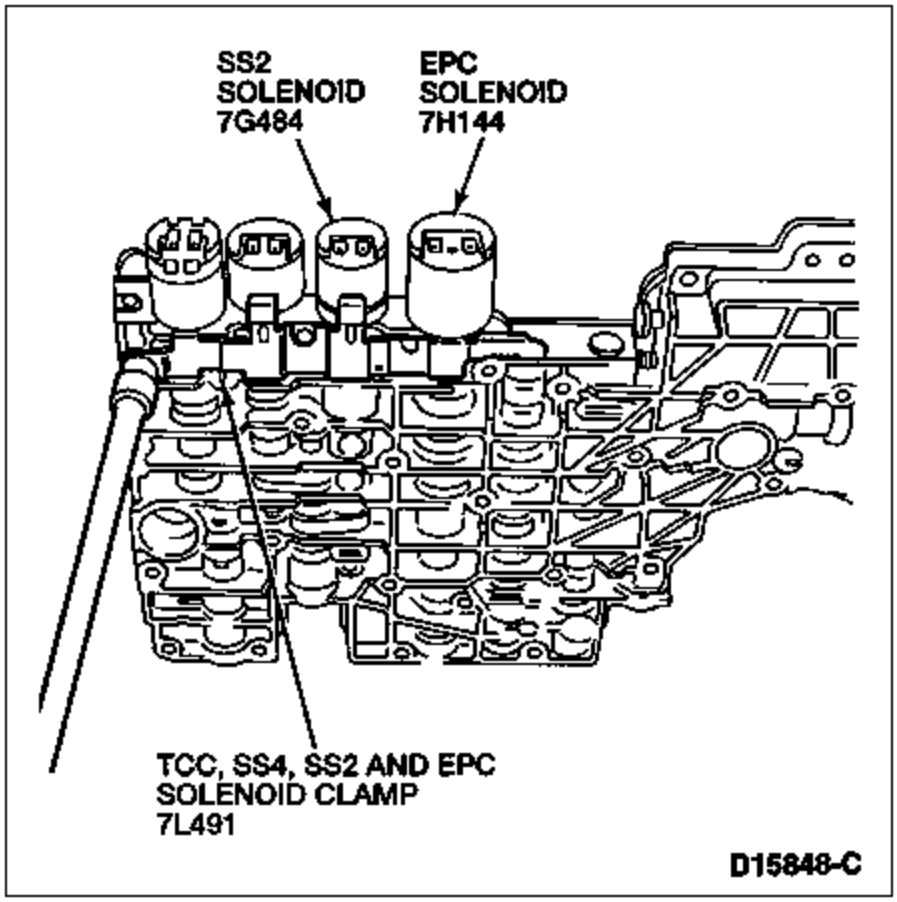
5. Install SS2 and EPC solenoids.

tomsn048@gmail.com

6. **CAUTION: The solenoid bracket must be installed in the TCC and EPC solenoid grooves, shift solenoid pockets and the No. 204 plug.**

   Install the solenoid clamp with solenoid clamps-to-main control screws. Tighten to 6-8 Nm (53-71 lb-in).

tomsn048@gmail.com



7. Install connectors on solenoids.
8. Install filter.
9. Install new fluid pan gasket onto pan.
10. Install pan.
11. Fill the transmission to the proper level. Refer to the procedure in this section.

---

tomsn048@gmail.com

tomsn048@gmail.com

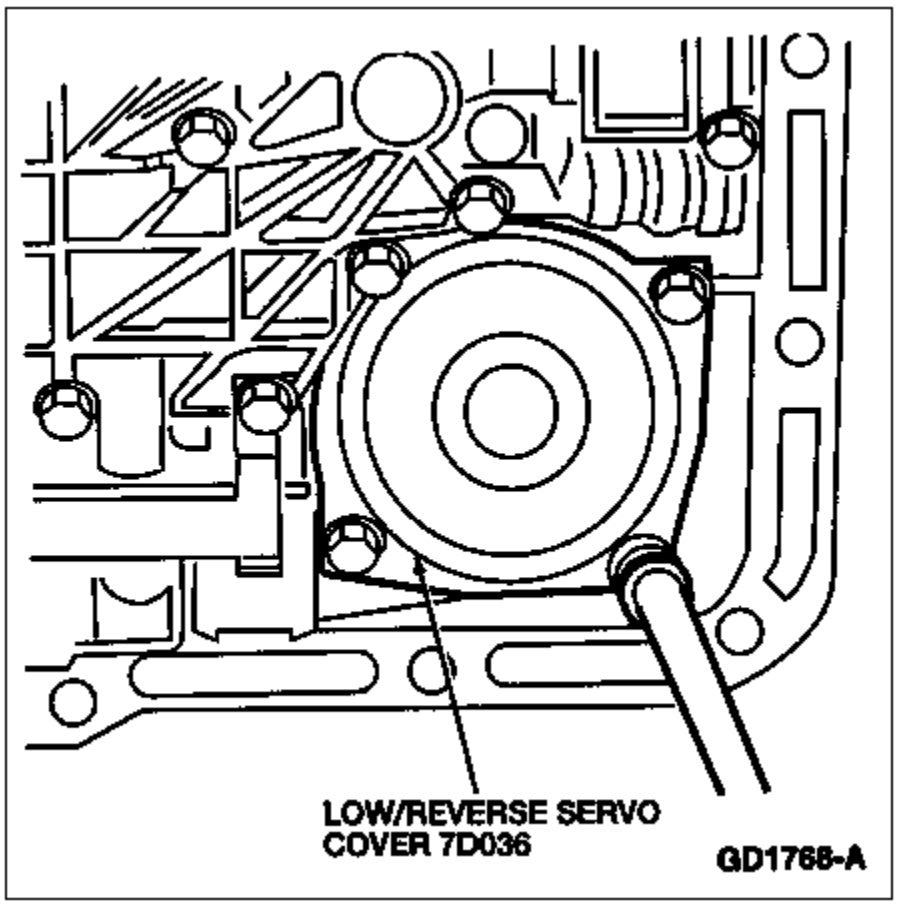
Low/Reverse Servo Assembly

SPECIAL SERVICE TOOL(S) REQUIRED

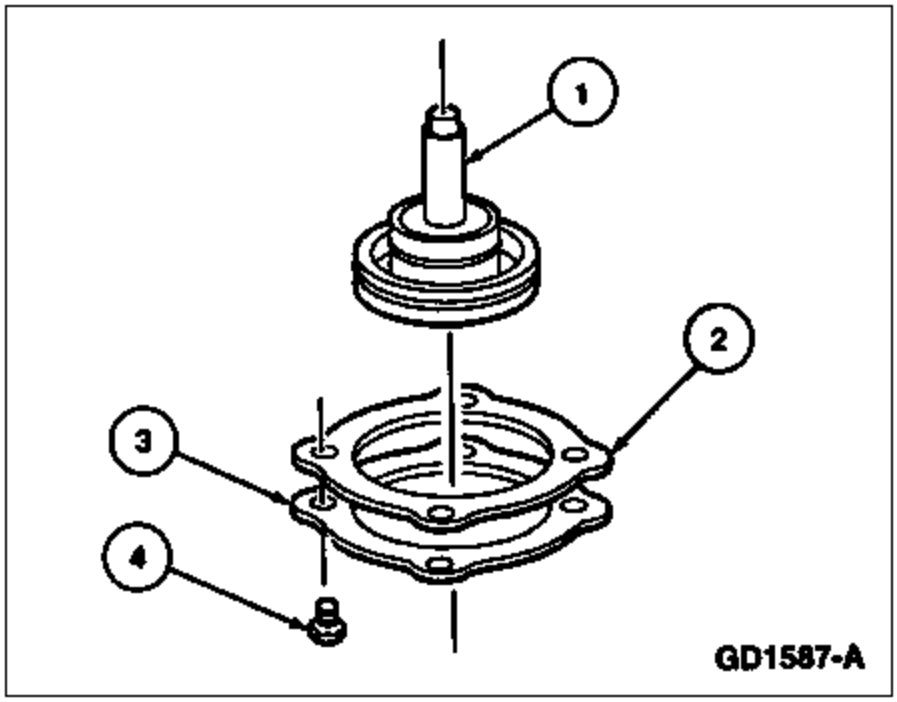
Description	Tool Number
Servo Red Selecting Gauge	T74P-77190-A

Removal

1. Remove fluid pan and filter as described in this section.
2. Use a 10mm socket to remove the four M6 x 20mm low/reverse servo cover screws. Remove the low/reverse servo cover, gasket and the servo piston and rod assembly.



tomsn048@gmail.com



Item	Part Number	Description
1	7D189	Low/Reverse Servo and Rod Assembly
2	7L173	Low/Reverse Servo Cover-to-Case Gasket
3	7D036	Low/Reverse Servo Cover
4	E800156-S	Low/Reverse Servo Cover-to-Case Screw (4 Req'd)

3. Clean and inspect servo bore, piston and rod assembly. Service as required.

Installation

1. **NOTE: An A4LD Reverse Servo Return Spring D4ZZ-7D031-A is to be used only as a test spring.**

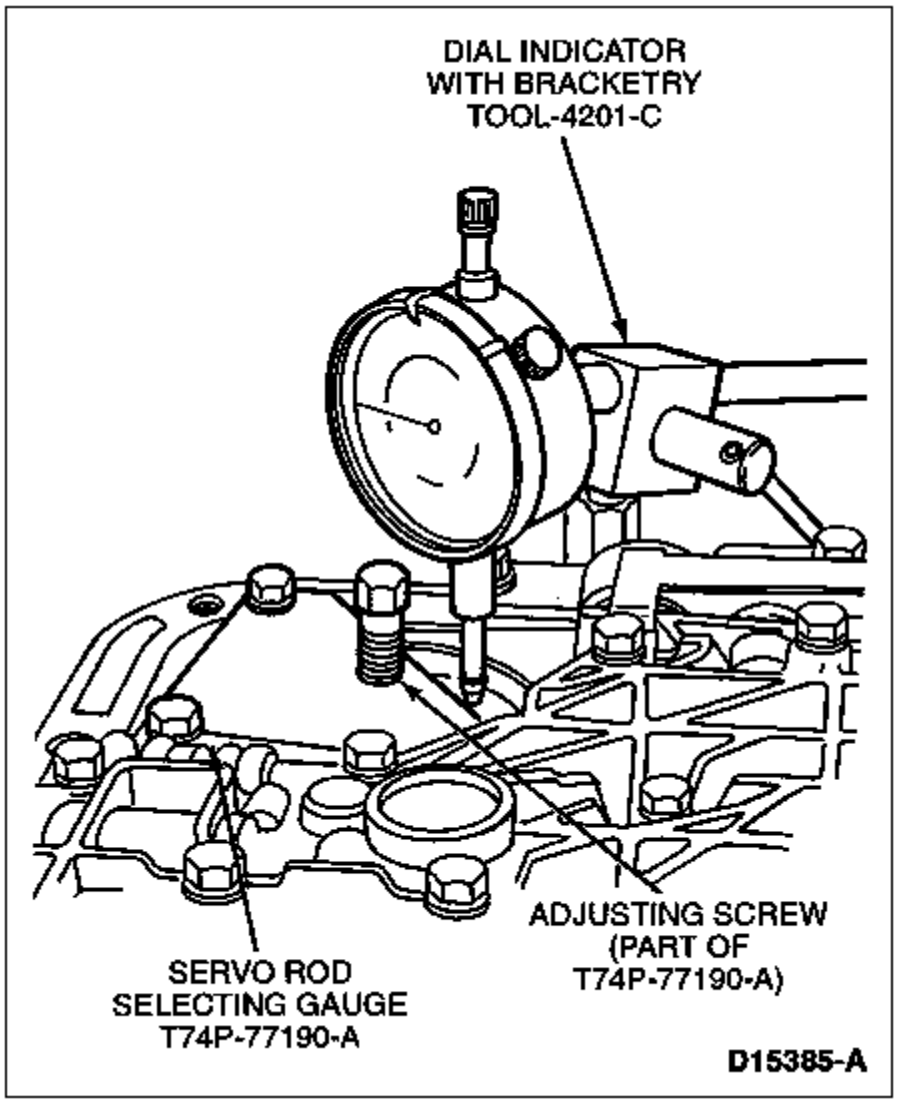
   Install the low/reverse servo piston and rod into the servo bore along with a D4ZZ-7D031-A reverse servo return spring.

2. Install a new low/reverse servo separator plate cover gasket. Install Servo Rod Selecting Gauge T74P-77190-A and tighten with the three screws.

3. Tighten the servo gauge adjusting screw to 4 Nm (35.5 lb-in).

4. Install Dial Indicator with Bracketry TOOL-4201-C or equivalent on the transmission case. Position the indicator on the piston pad. Set the dial indicator to zero.

tomsn048@gmail.com



5. **NOTE: If the piston travel in this step is 3-5.6mm (0.120-0.220 inch), it is within specification. If the piston travel is greater than 5.6mm (0.220 inch), use the next longer piston and rod. If the piston travel is less than 3mm (0.120 inch), use the next shorter piston and rod.**

   Back out the servo gauge adjusting screw until it bottoms out on the tool. Record the distance the servo piston traveled.

6. **CAUTION: Make sure the test spring is removed after this step.**

   Use the above procedure to check the piston travel with the newly selected reverse band servo piston and rod (if required) to make sure that the piston travel is 3-5.6mm (0.120-0.220 inch).

   Remove the servo gauge and the reverse band servo return spring.

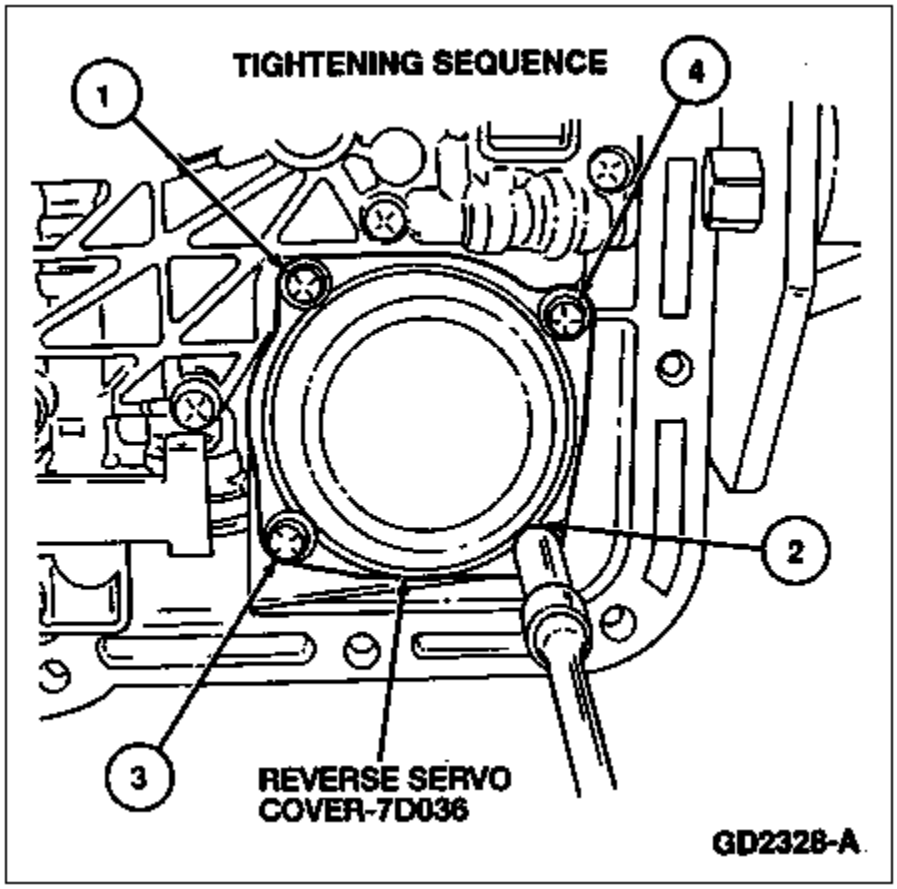
NOTE: Grooves are located on reverse servo rod.

tomsn048@gmail.com

Length — mm	Length — Inches	I.D.
54/53	2.112/2.085	1 Groove
51/50	2.014/1.986	No Groove
49/48	1.915/1.888	2 Grooves

7. Install the low/reverse servo and rod assembly into the case.

8. Install the low/reverse servo cover, new gasket and the four low/reverse servo cover-to-case screws. Tighten cover-to-case screws in sequence as shown to 12-14 Nm (106-124 lb-in).



9. Install pan, new gasket and filter as described in this section.

10. Refill transmission.

tomsn048@gmail.com

tomsn048@gmail.com

Manual Control Lever Shaft Seal

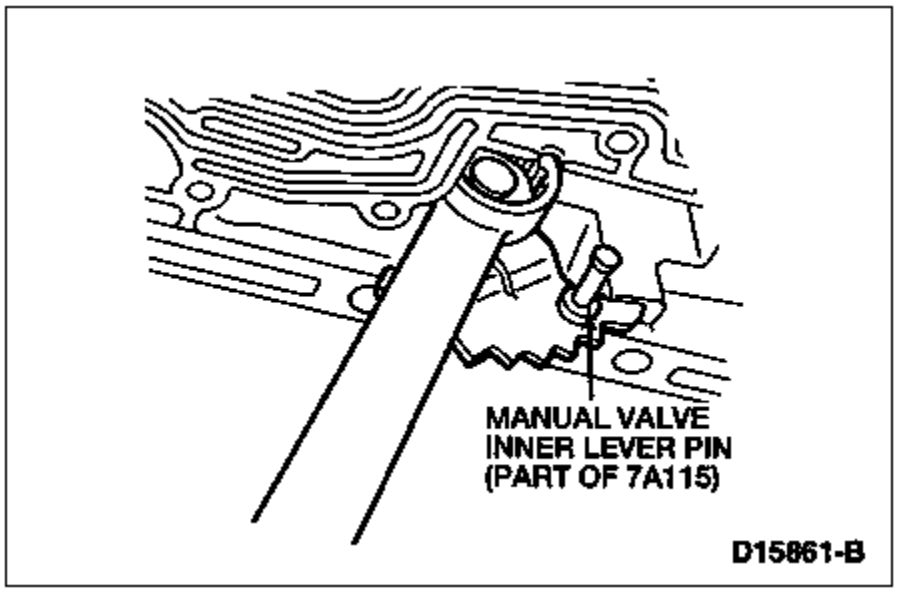
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Shift Lever Seal Replacer	T74P-77498-A

Removal

1. Remove linkage and digital transmission range (DTR) sensor as described in this section.
2. Remove fluid pan. Filter does not need to be removed.
3. **CAUTION: Do not damage the manual valve inner lever pin.**

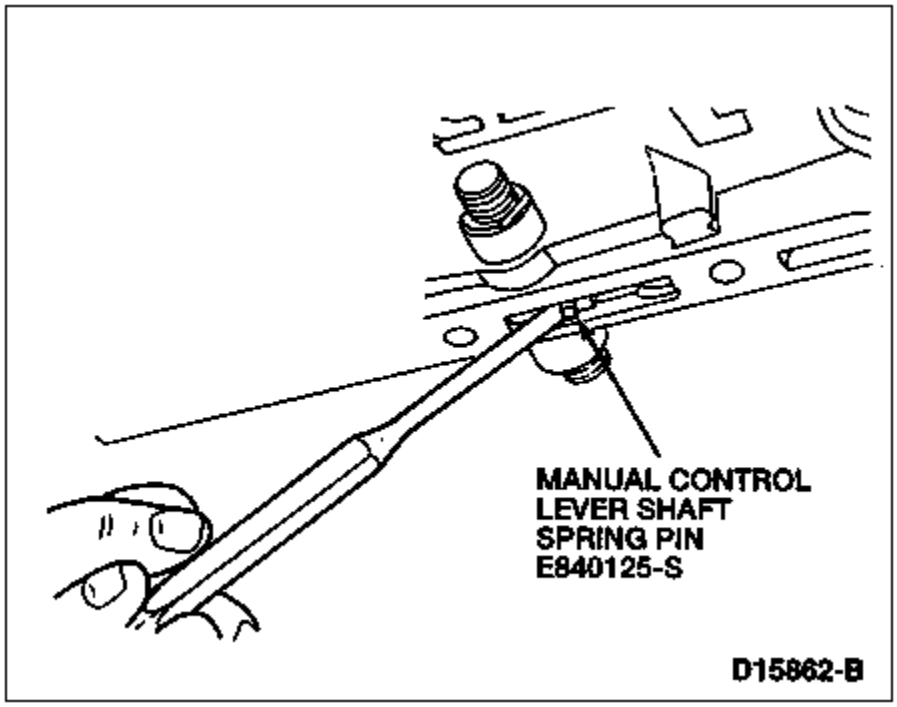
   Remove the manual valve inner lever nut. Support inner manual valve lever and park rod assembly.



4. **CAUTION: Do not damage the case fluid pan rail.**

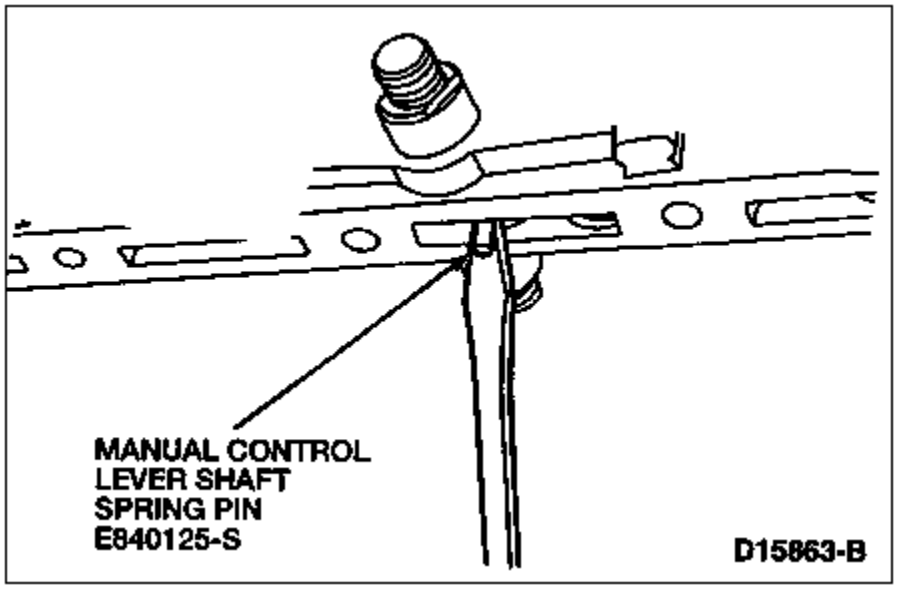
   Use a small hammer and drift punch to tap lightly on each side of the manual control lever shaft spring pin (two or three times). This will loosen the pin prior to removal.

tomsn048@gmail.com



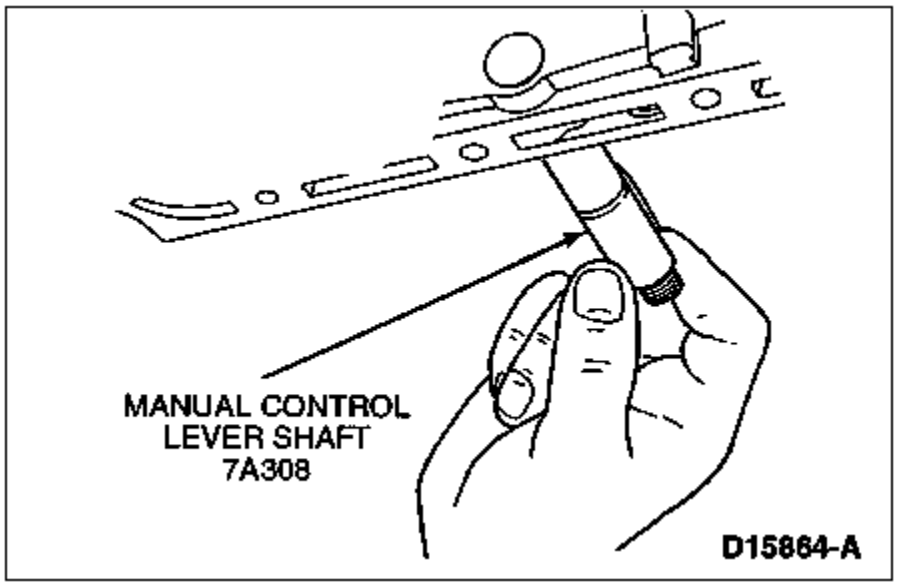
5. **CAUTION: Do not damage the case fluid pan rail.**

   Remove the manual control lever shaft spring pin with a narrow, sharp-edged screwdriver from the side as shown.



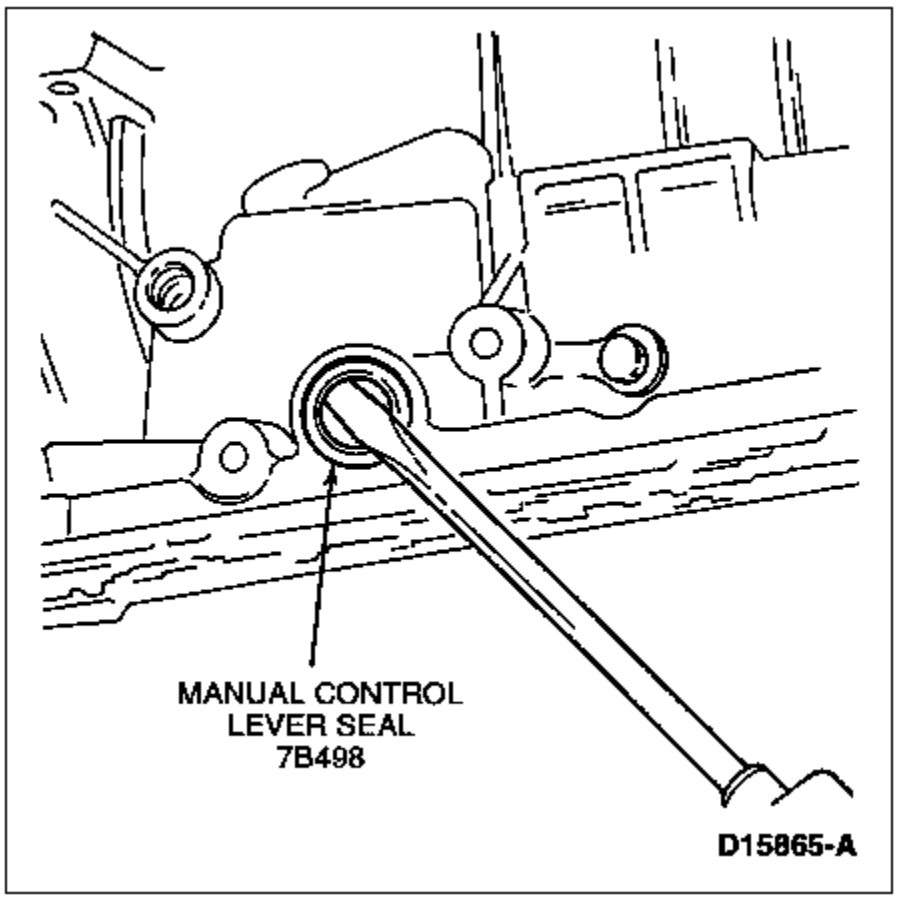
6. Remove the manual control lever shaft.

tomsn048@gmail.com



7. **CAUTION: Do not damage the bore.**

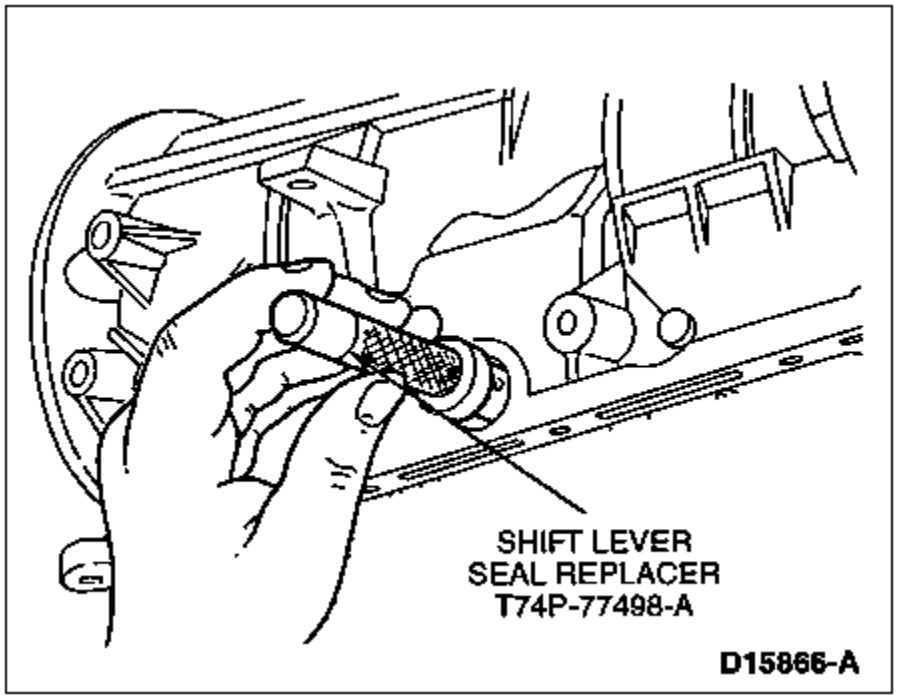
   Remove the manual control lever seal.



tomsn048@gmail.com

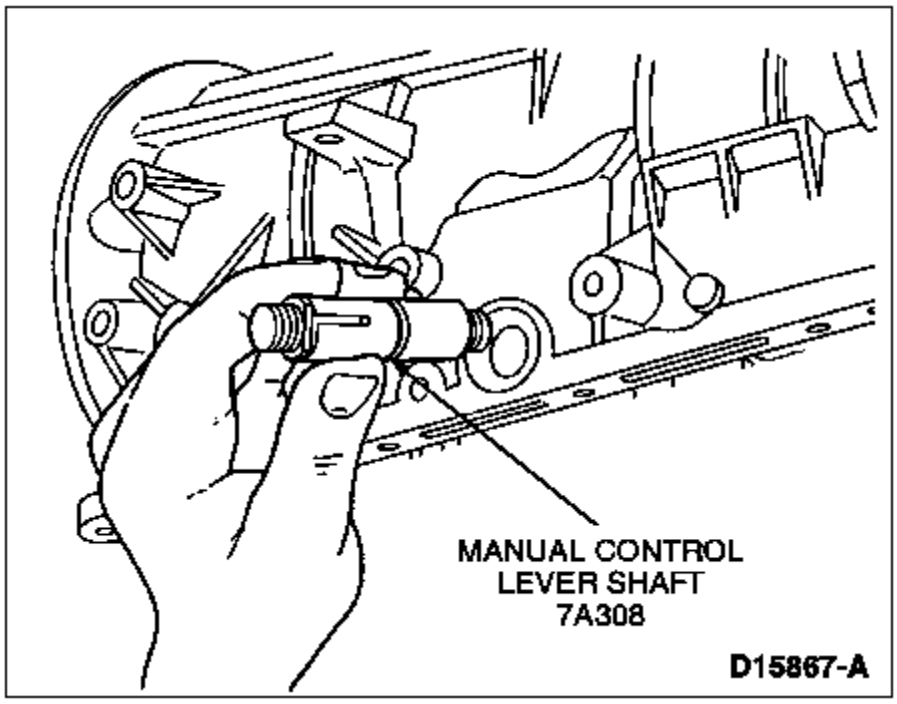
Installation

1. Lubricate and install the main control lever seal using Shift Lever Seal Replacer T74P-77498-A.



2. Install the manual control lever shaft into the case.

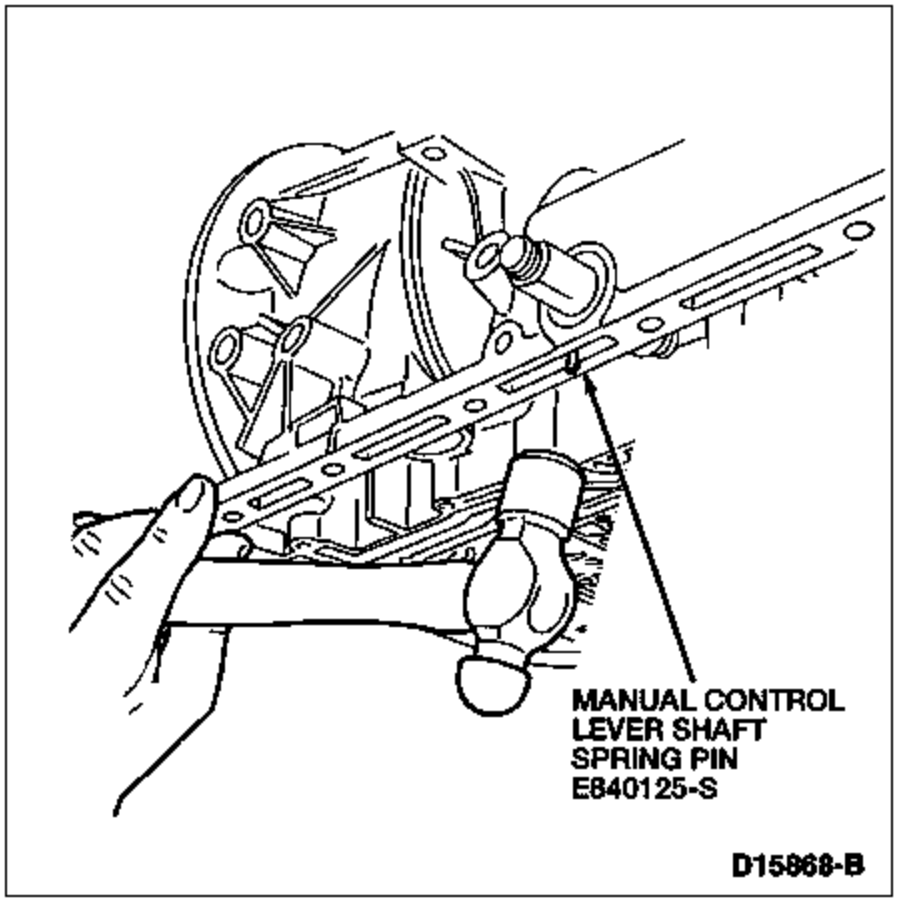
tomsn048@gmail.com



3. **CAUTION: Use care not to damage the fluid pan rail surface when installing the retaining pin.**

   Align the manual control lever shaft with the manual control lever shaft spring pin. Install the retaining pin.

tomsn048@gmail.com

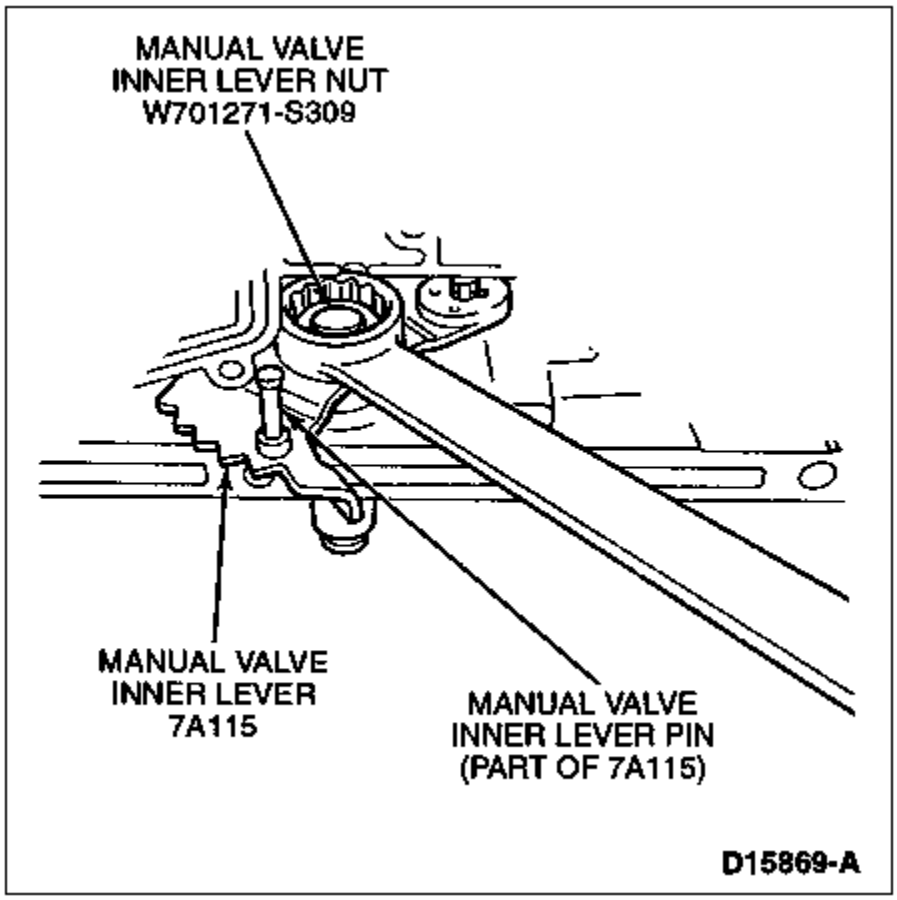


4. Align the flats of the manual valve inner lever with the flats on the manual control lever shaft.

5. **CAUTION: Do not bend the manual valve inner lever pin.**

   Install manual valve inner lever nut and tighten to 41-54 Nm (30-44 lb-ft).

tomsn048@gmail.com



6. **CAUTION: Park pawl actuating rod must be properly installed into parking pawl and guide cup located in extension housing. Verify park linkage function.**

   Verify that the output shaft is locked in the PARK position.

7. Install new gasket and install pan.

8. Install DTR sensor and linkage.

9. Fill the transmission to the proper level. Refer to the procedure in this section.

---

tomsn048@gmail.com

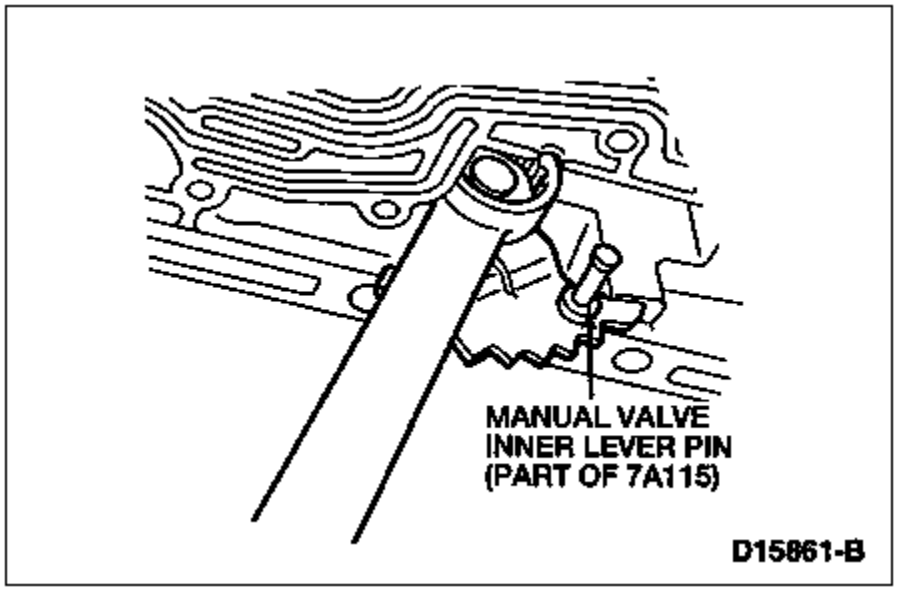
tomsn048@gmail.com

Park System

Removal

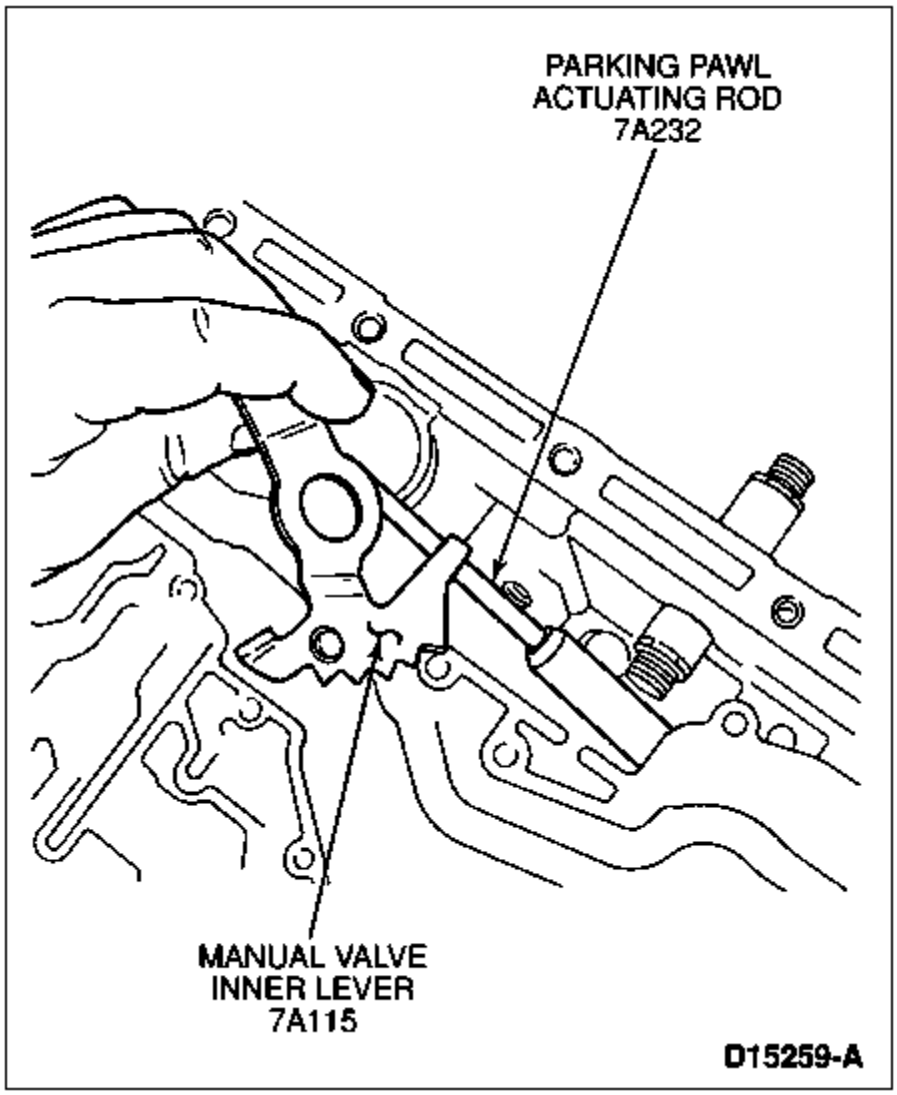
1. Remove fluid pan. Remove fluid filter.
2. Remove EPC, SS2 and SS4 solenoids. Remove case connector as described in this section.
3. **CAUTION: To avoid damage, make sure the wrench does not strike the manual valve inner lever pin.**

   Remove the manual valve inner lever nut.



4. Remove the manual valve inner lever and parking pawl actuating rod assembly.

tomsn048@gmail.com



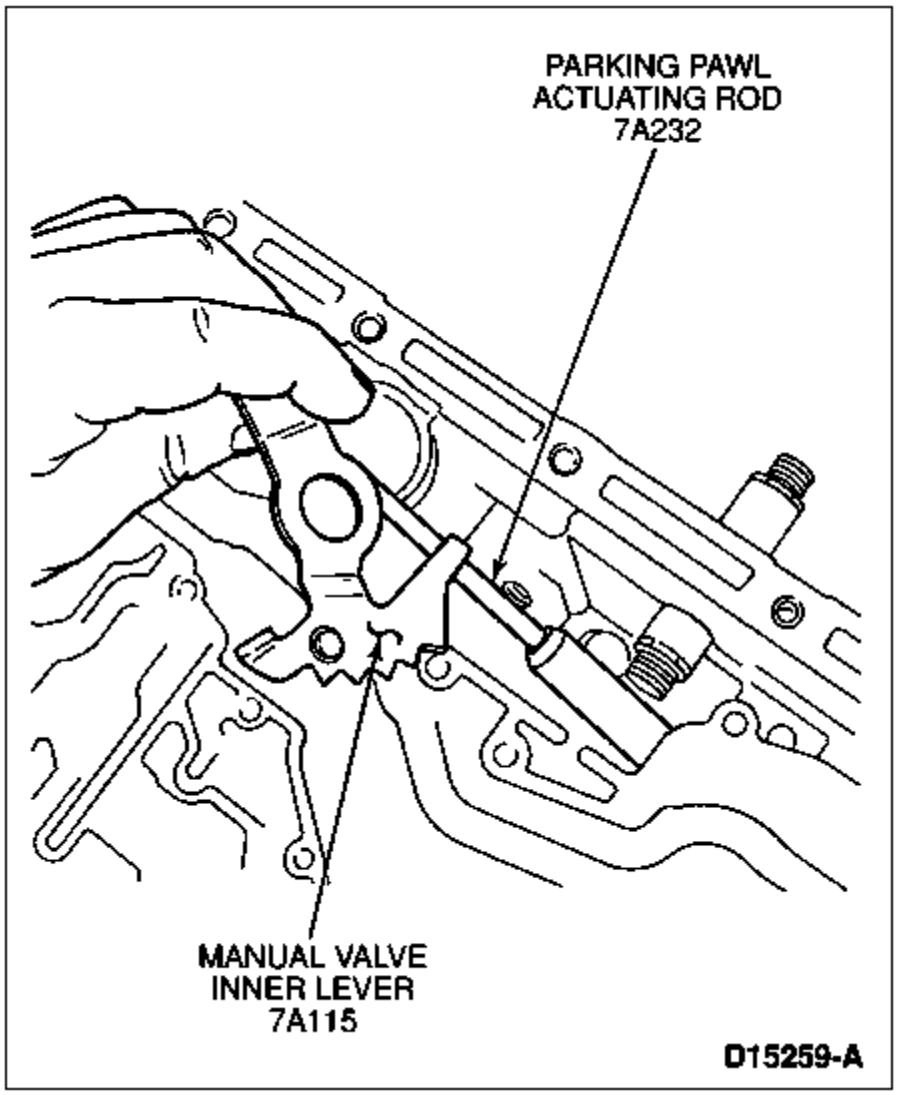
5. Remove extension housing as described in this section.

6. Inspect park pawl spring and shaft. Inspect park pawl actuating rod. Service as required.

Installation

1. Install the manual valve inner lever and parking pawl actuating rod into the case. Align the flats of the manual valve inner lever with the flats on the manual control lever shaft.

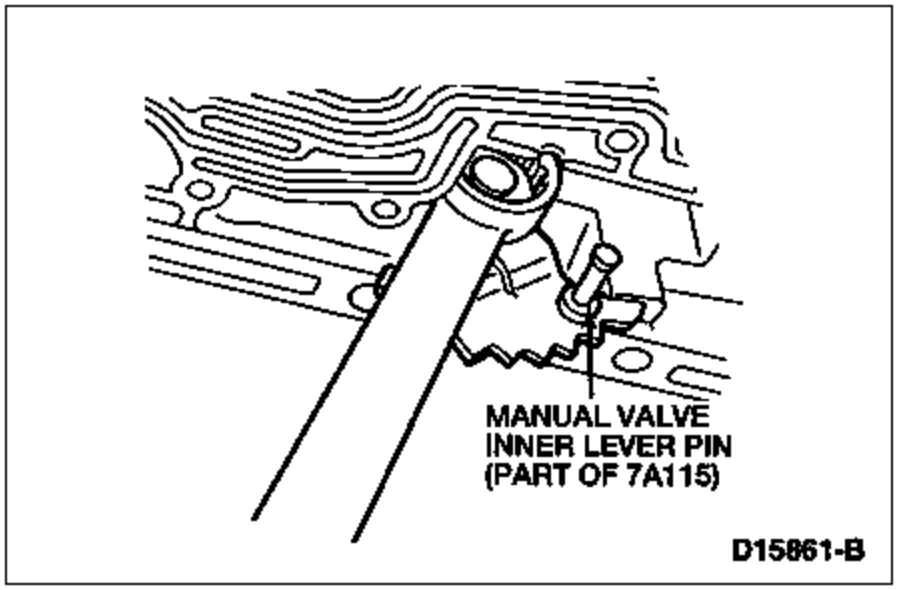
tomsn048@gmail.com



2. **CAUTION: Do not bend the manual valve inner lever pin.**

   Install manual valve inner lever nut and tighten to 41-54 Nm (30-44 lb-ft).

tomsn048@gmail.com



3. Install extension housing as described in this section, noting all cautions and notes.
4. Install EPC, SS2 and SS4 solenoids and 16-pin case connector as described in this section.
5. Install fluid filter, fluid pan and new pan gasket with fluid pan-to-case screws. Tighten fluid pan-to-case screws to 13-15 Nm (115-133 lb-in).

---

tomsn048@gmail.com

Main Control Valve Body

NOTE: If a transmission has been disassembled to replace worn or damaged parts and the valves in the main control valve body (7A100) stick repeatedly from foreign material, the torque converter must be removed and cleaned by using a mechanically agitated cleaner, such as Rotunda Torque Converter/Fluid Cooler Cleaner 014-00028 or equivalent.

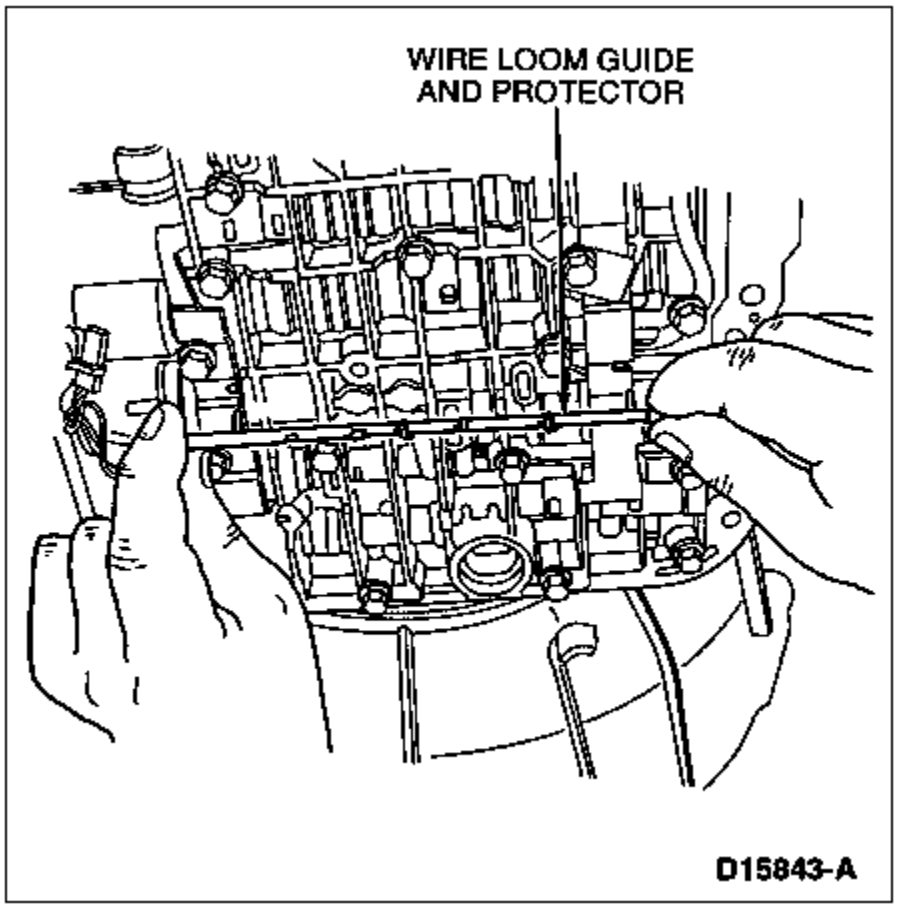
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Valve Body Guide Pin (.235)	T95L-70010-B
Valve Body Guide Pin (.248)	T95L-70010-C

Removal

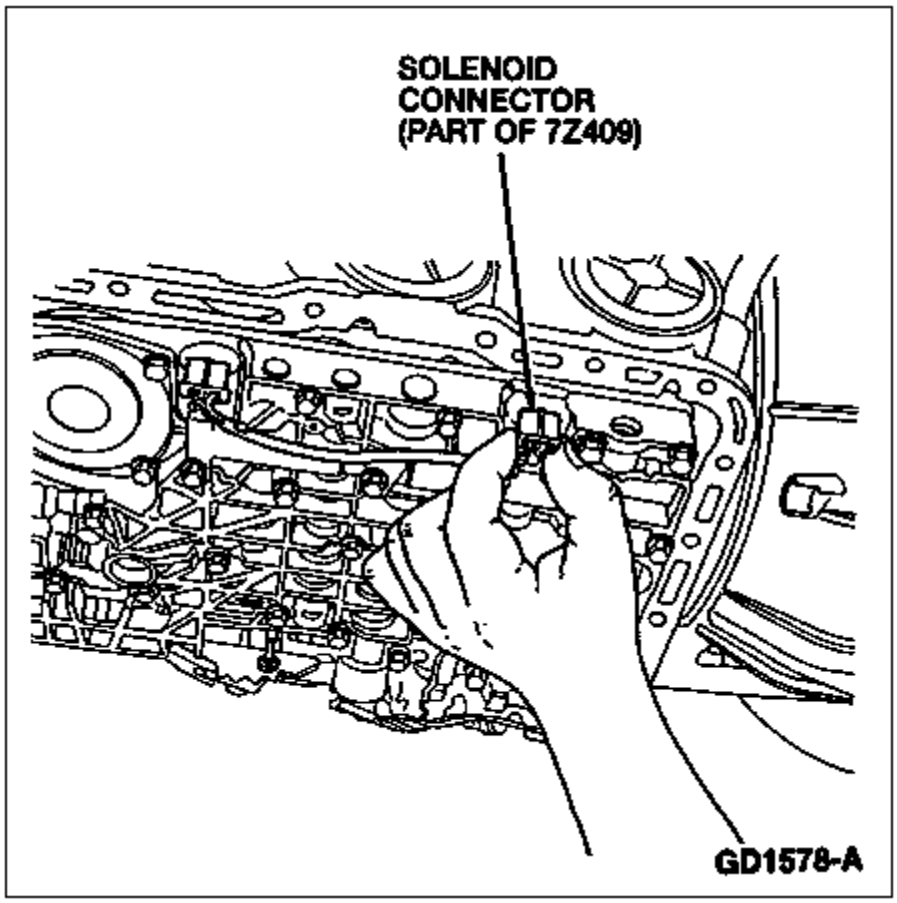
1. Remove fluid pan.
2. Carefully lift up on the wire loom guide and protector. Disengage the retaining pins from the solenoid clamps.

tomsn048@gmail.com



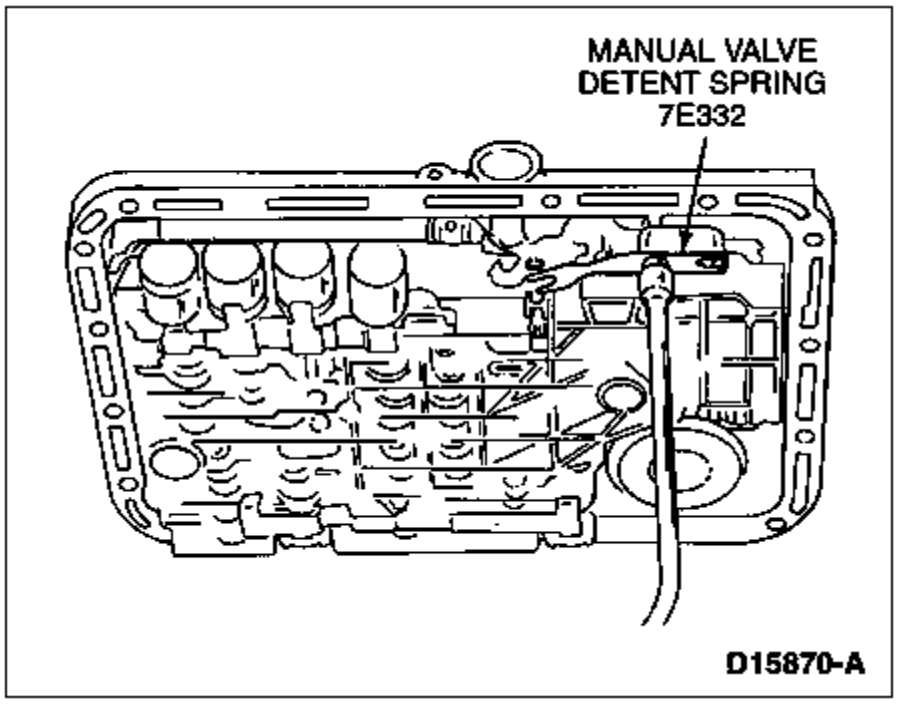
3. Disconnect the six solenoid connectors from the solenoids by carefully pulling downward and wiggling side to side.

tomsn048@gmail.com



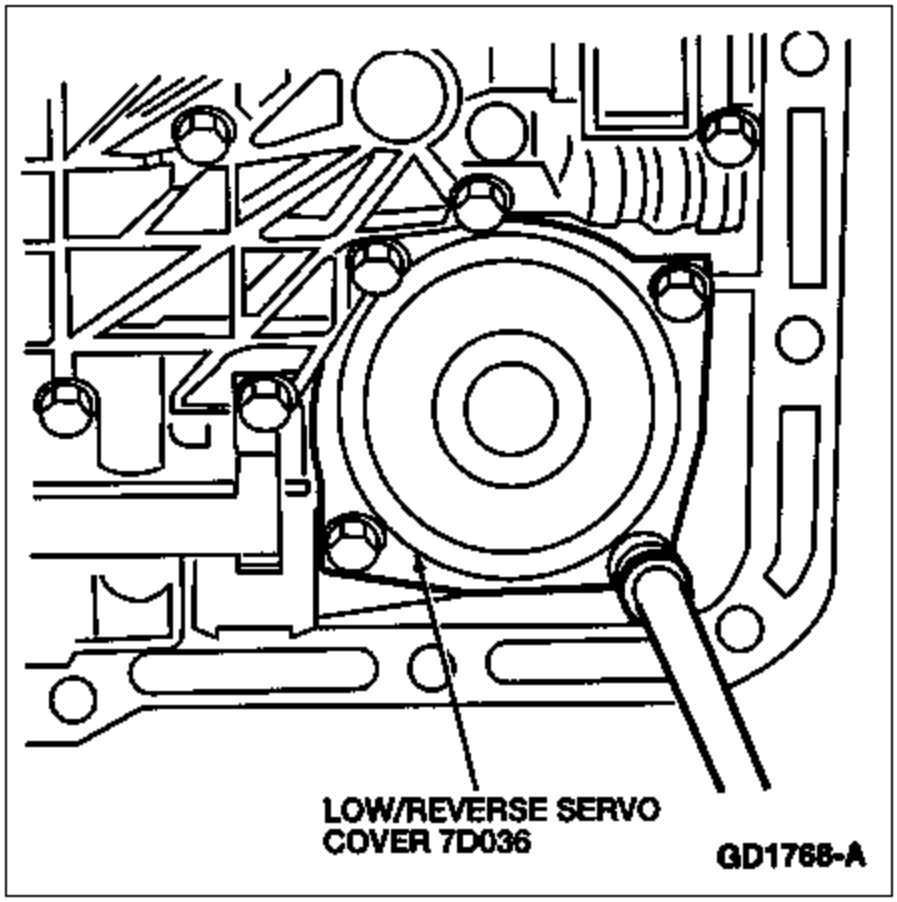
4. Use a 10mm socket to remove the M6 x 30mm manual valve detent spring screw. Remove the manual valve detent spring.

tomsn048@gmail.com



5. Use a 10mm socket to remove the four M6 x 20mm low/reverse servo cover screws. Remove the low/reverse servo cover, gasket and the servo piston and rod assembly.

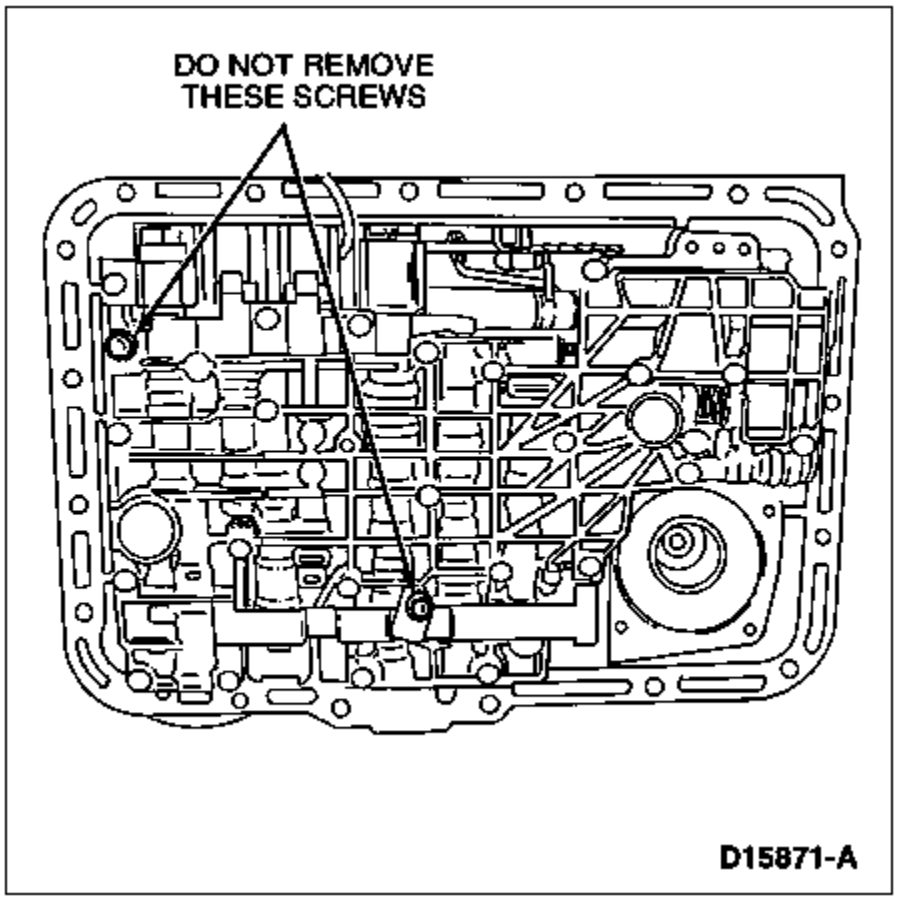
tomsn048@gmail.com



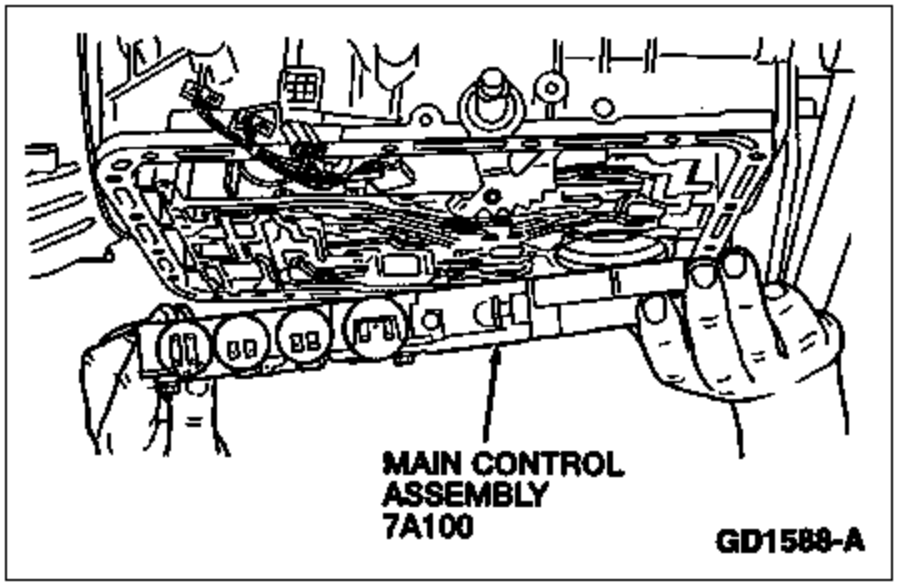
6. **CAUTION: Support main control valve body.**

   Use a 10mm socket to remove the sixteen M6 x 40mm, four M6 x 45mm, two M6 x 35mm and one M6 x 30mm main control valve body screws.

tomsn048@gmail.com

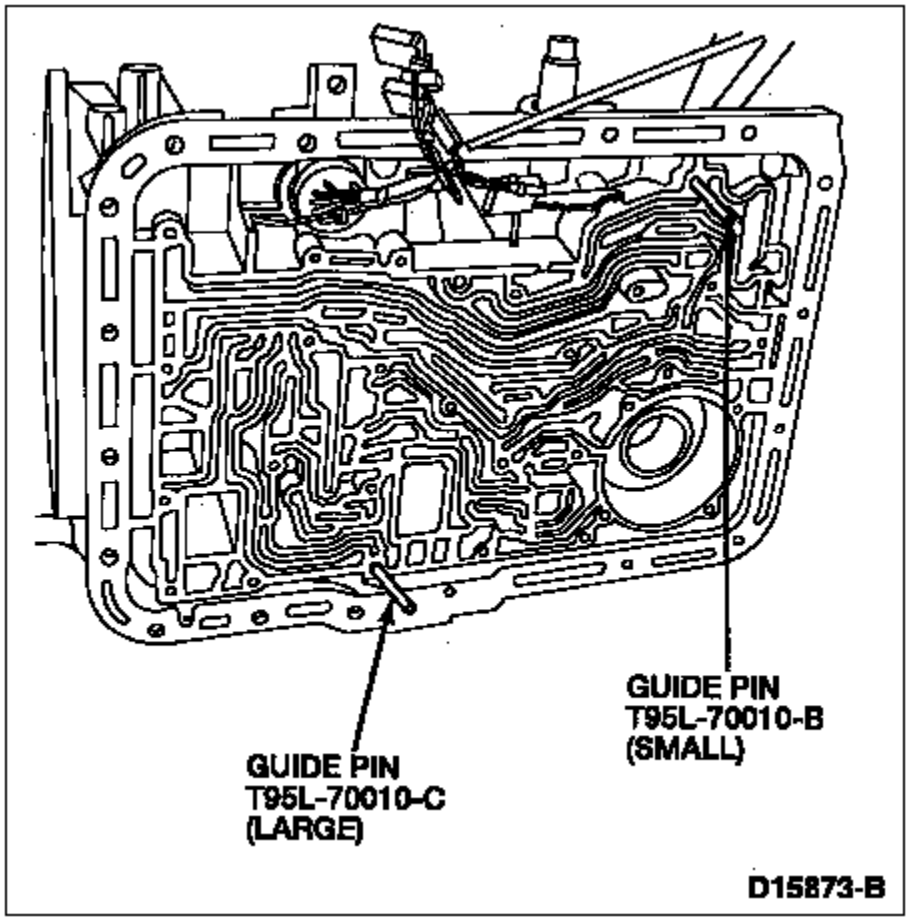


7. Remove the main control assembly.



8. Install the guide pins into the case in the positions shown.

tomsn048@gmail.com

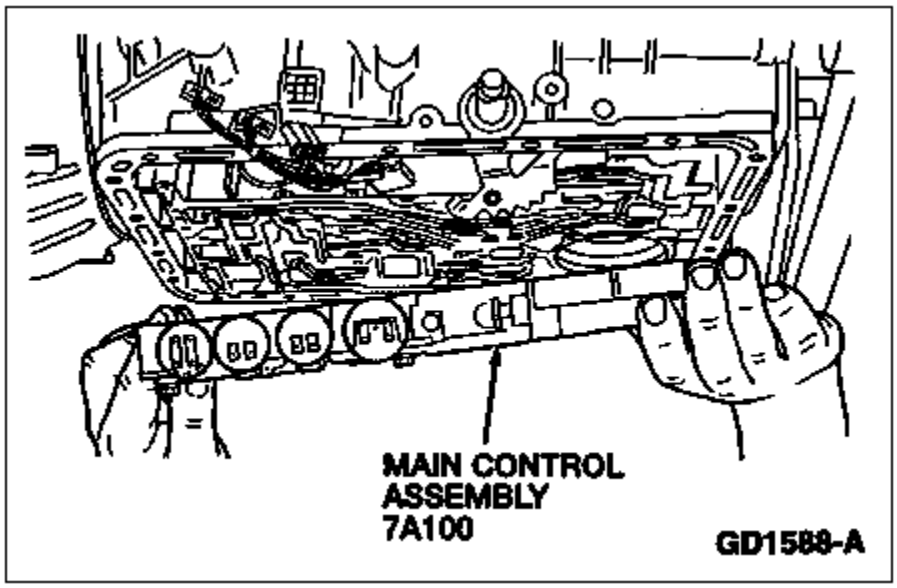


9. Install new separator to case gasket.

10. **NOTE: Make sure main control assembly gasket is properly aligned.**

    Install the main control assembly on the case. Align the manual valve with the manual valve inner lever pin as shown.

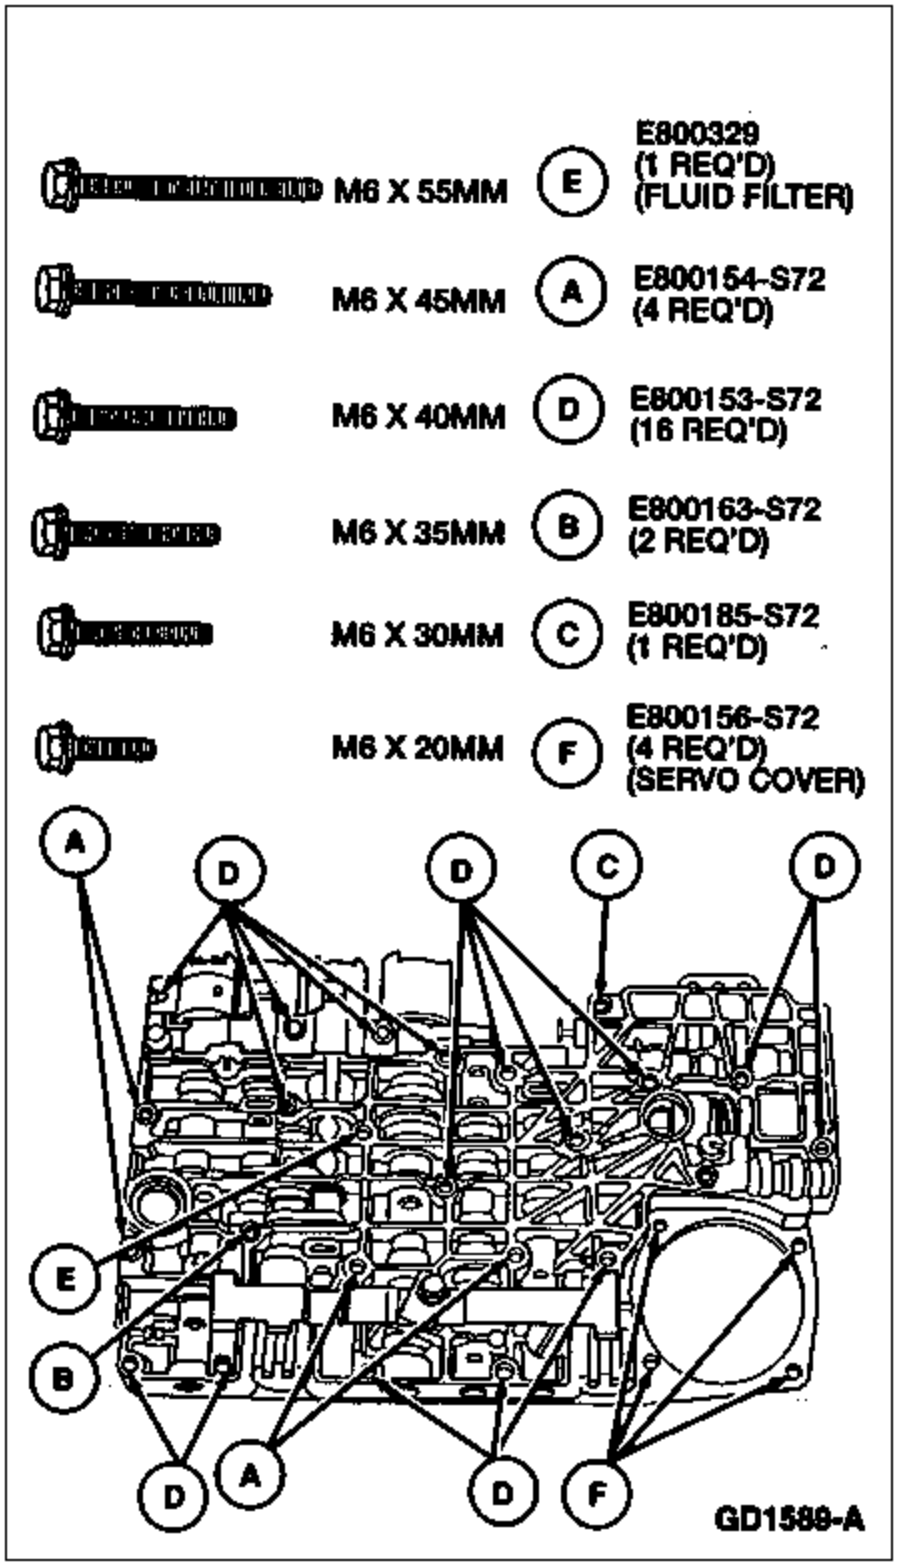
tomsn048@gmail.com



11. Install four M6 x 45mm screws in locations A. Finger tighten.
12. Install two M6 x 35mm main control assembly-to-case screws in locations B. Finger tighten.
13. Install one M6 x 30mm main control assembly-to-case screws in location C. Finger tighten.
14. Remove both valve body guide pins T95L-70010-B and T95L-70010-C.
15. Install sixteen M6 x 40mm main control assembly-to-case screws in locations D. Finger tighten.
16. Tighten all main control assembly-to-case screws to 8-11 Nm (71-97 lb-in) in sequence shown, using a 10mm socket.

Main Control Assembly Screws and Locations

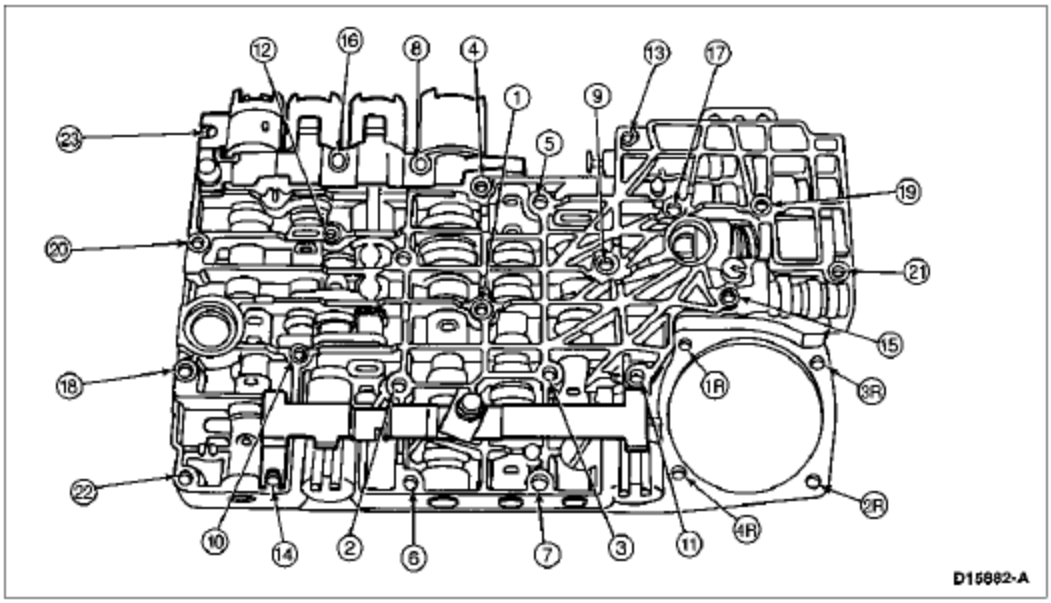
tomsn048@gmail.com



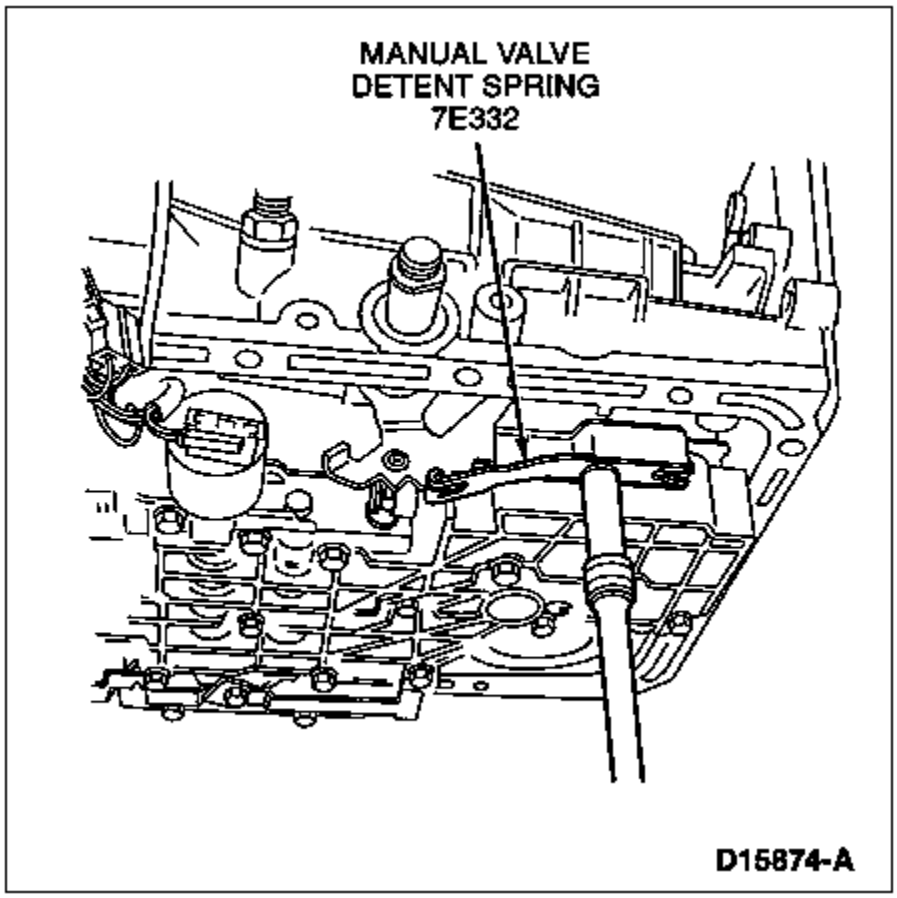
Refer to the tightening sequence (1R, 2R, 3R, 4R) for reverse servo cover installation also.

Tightening Sequence

tomsn048@gmail.com



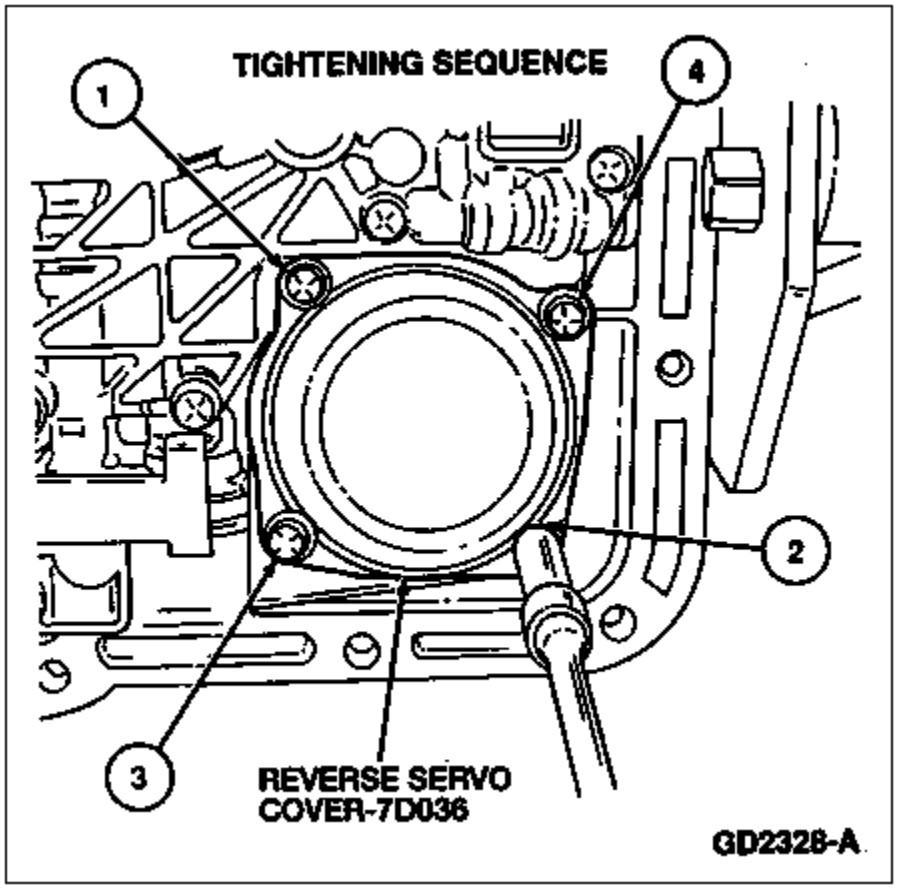
17. Install the manual valve detent spring. Install the manual valve detent spring screw and tighten to 8-11 Nm (71-97 lb-in).



18. Install the low/reverse servo assembly into the case.

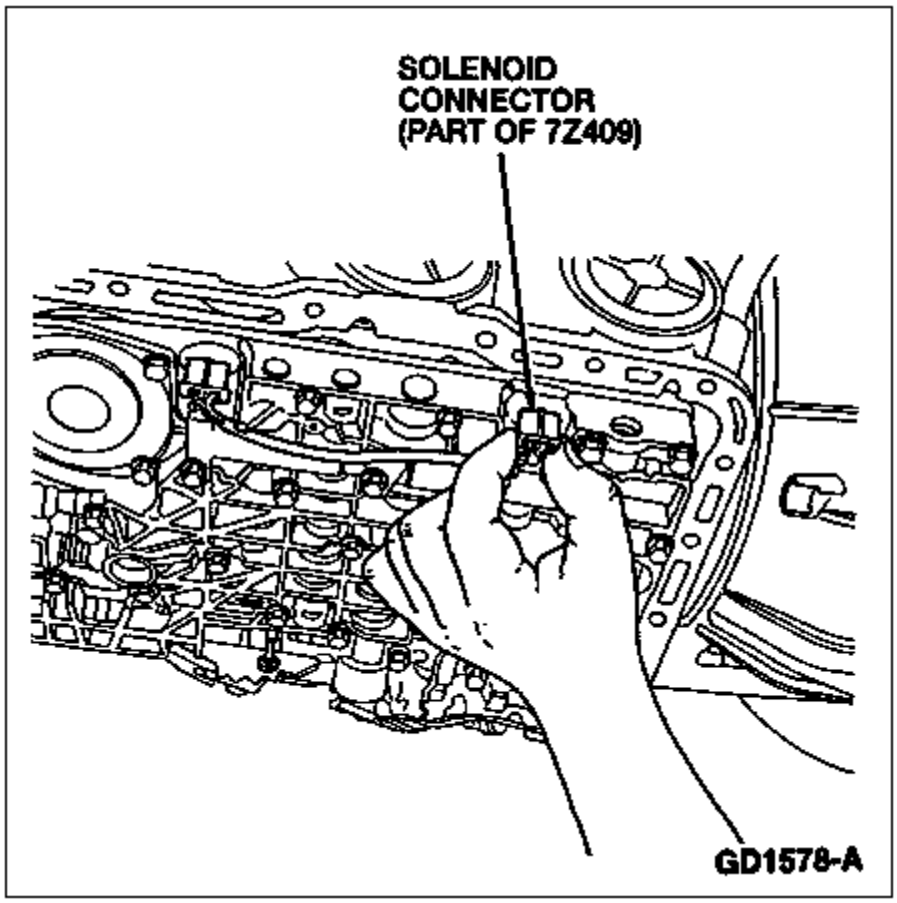
tomsn048@gmail.com

19. Install the low/reverse servo and rod assembly cover, new gasket and the four servo cover-to-case screws. Tighten the screws in sequence as shown to 12-14 Nm (106-124 lb-in).



20. Carefully press down to install the solenoid connectors on the solenoid.

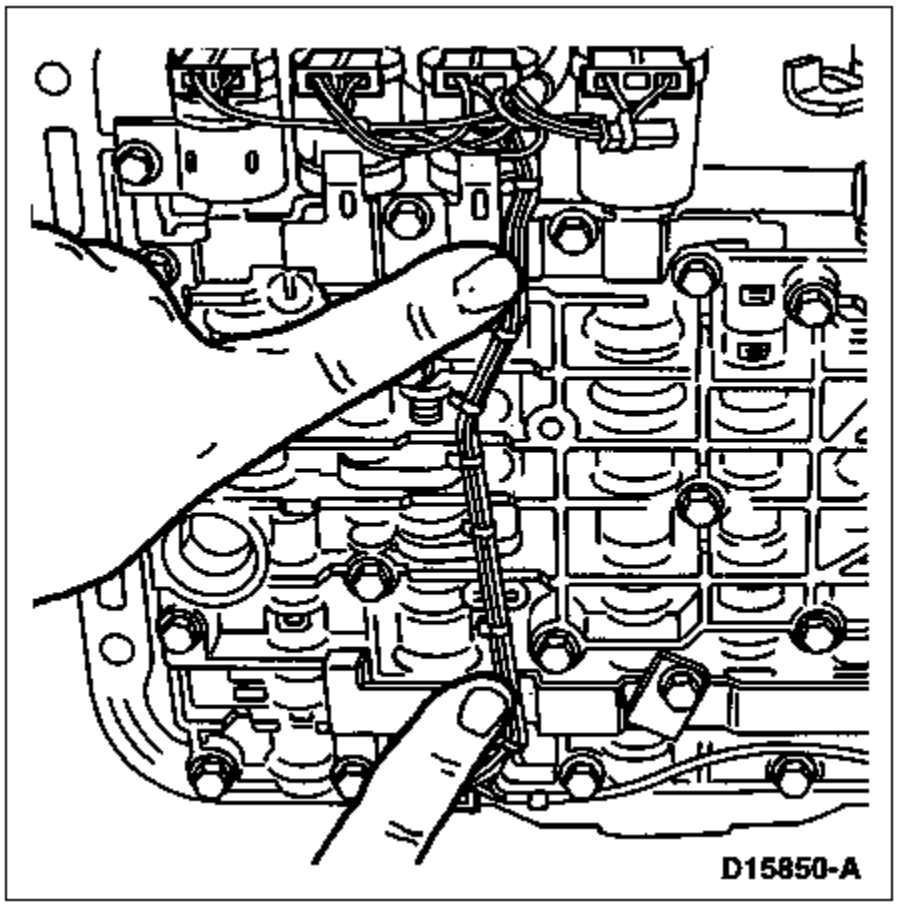
tomsn048@gmail.com



21. **CAUTION: Excessive pressure may break the locating pins.**

Install the wiring loom protector and guide. Align the pins in the holes of the solenoid clamps and gently push down.

tomsn048@gmail.com



22. Install filter, new gasket and fluid pan.

23. Fill the transmission to the proper level. Refer to the procedure in this section.

---

tomsn048@gmail.com

Intermediate and Front Servos

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Servo Cover Compressor	T95L-77028-A
Servo Removal Tool	T97T-7D021

Removal

NOTE: Procedures are the same for both front and intermediate servos.

1. **NOTE: Catalytic converter(s) may have to be removed.**

   Remove heat shield, if equipped.

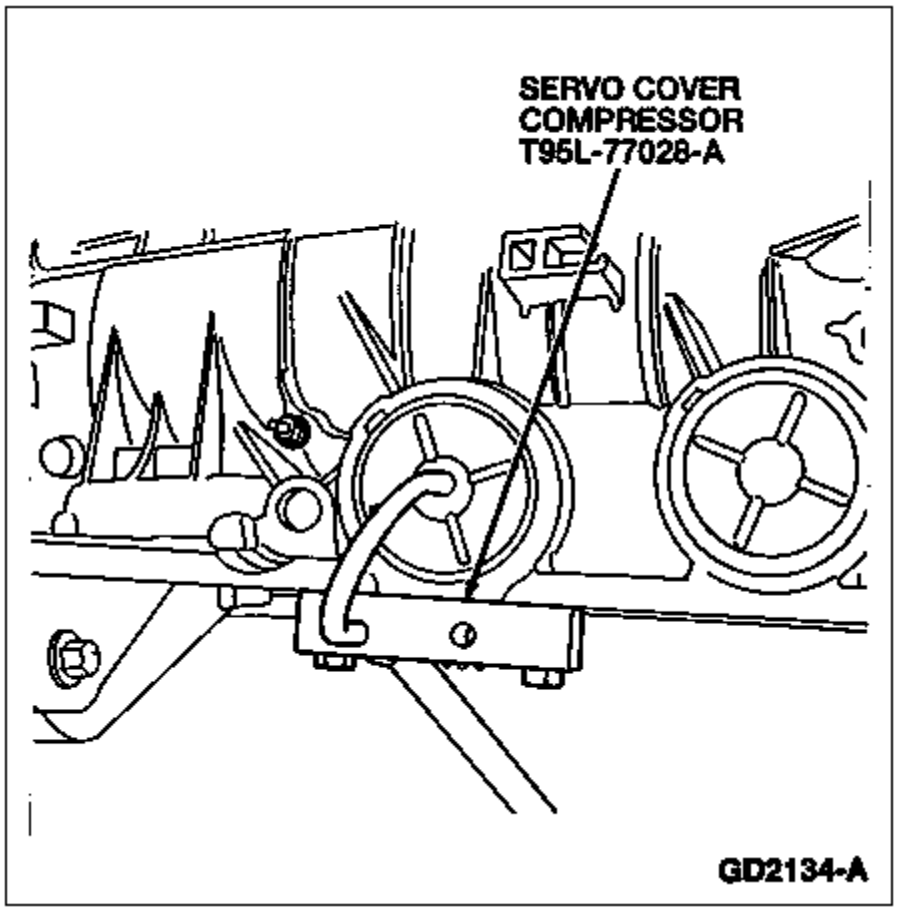
2. **CAUTION: Servo is under spring tension. Use caution when removing.**

   NOTE: The J-hook must be in the appropriate hole for the servo being removed.

   Install Servo Cover Compressor T95L-77028-A over the intermediate servo cover at the fluid pan rail with tool stamping facing up. Tighten the screws.

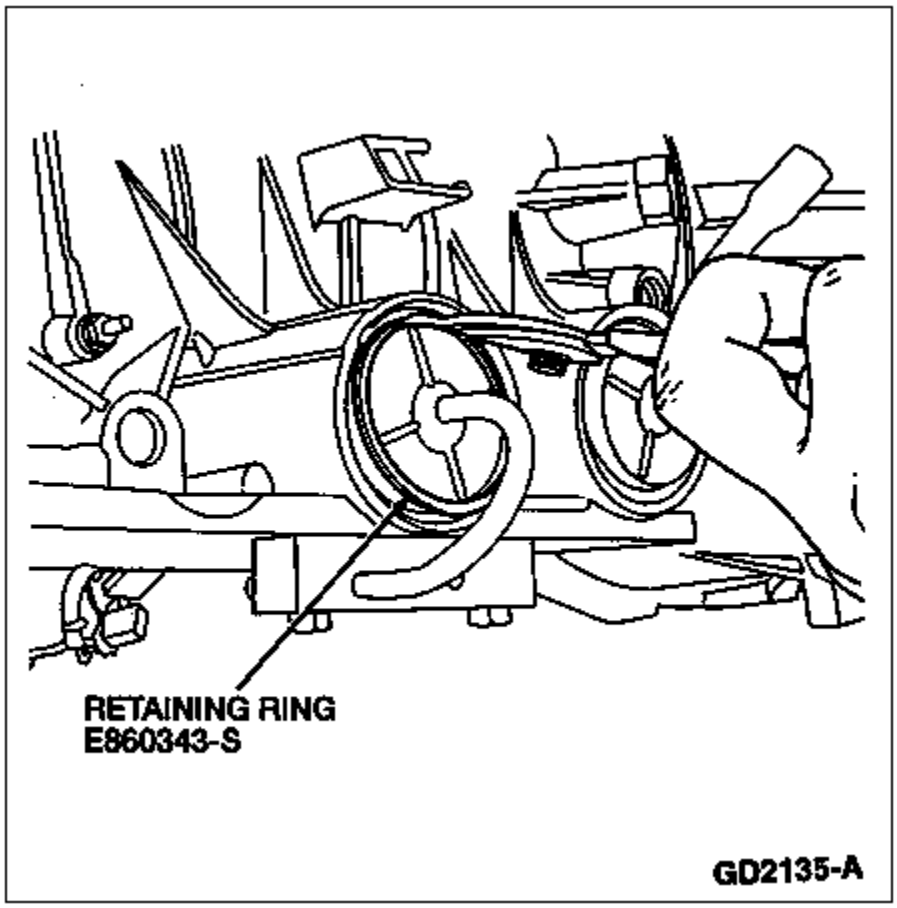
3. Using a 1/2-inch wrench, tighten the nut on the J-hook until there is a gap between the servo cover and the snap ring.

tomsn048@gmail.com



4. Carefully remove the servo cover retaining ring.

tomsn048@gmail.com

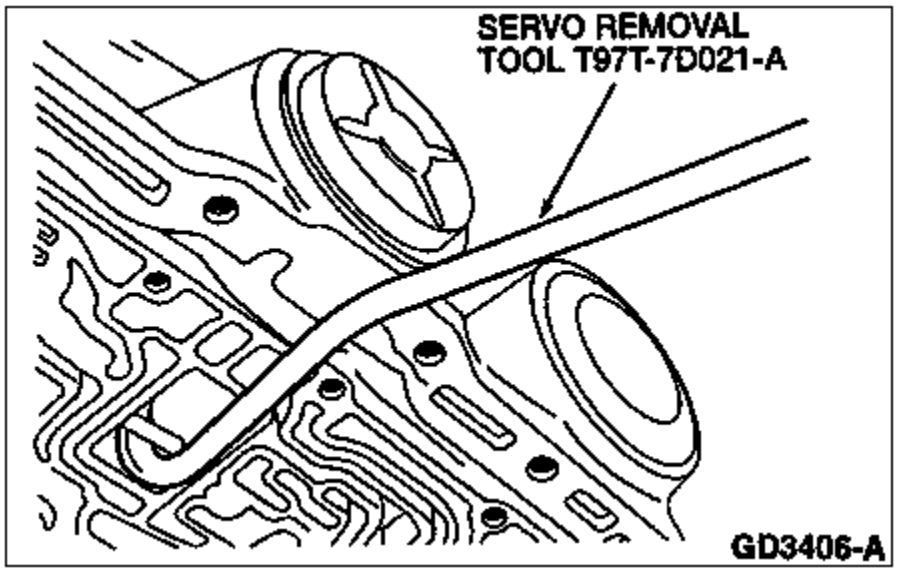


5. **CAUTION: The servo cover is under spring tension.**

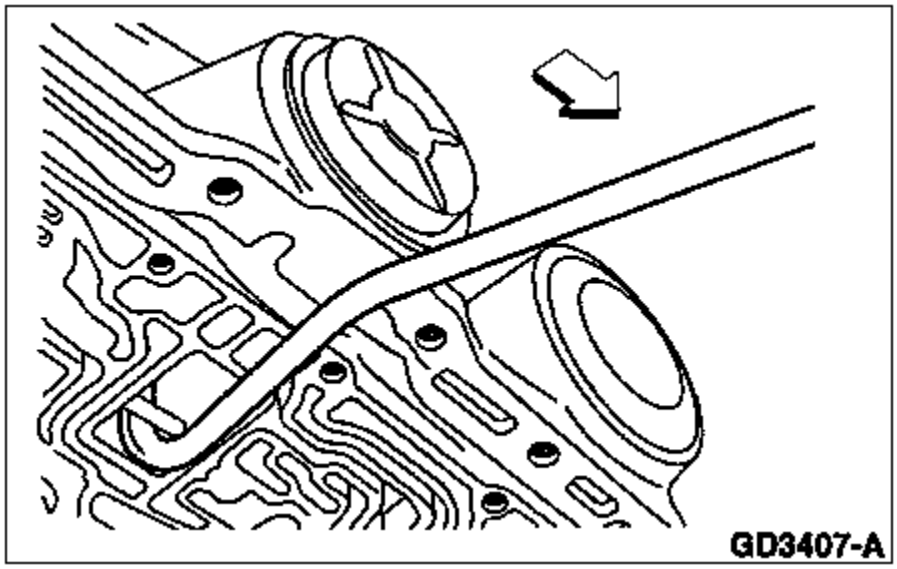
   Carefully back off the nut on the J-hook until the servo spring is unloaded.

6. Insert Servo Removal Tool T97T-7D021-A into case and locate on servo rod.

tomsn048@gmail.com



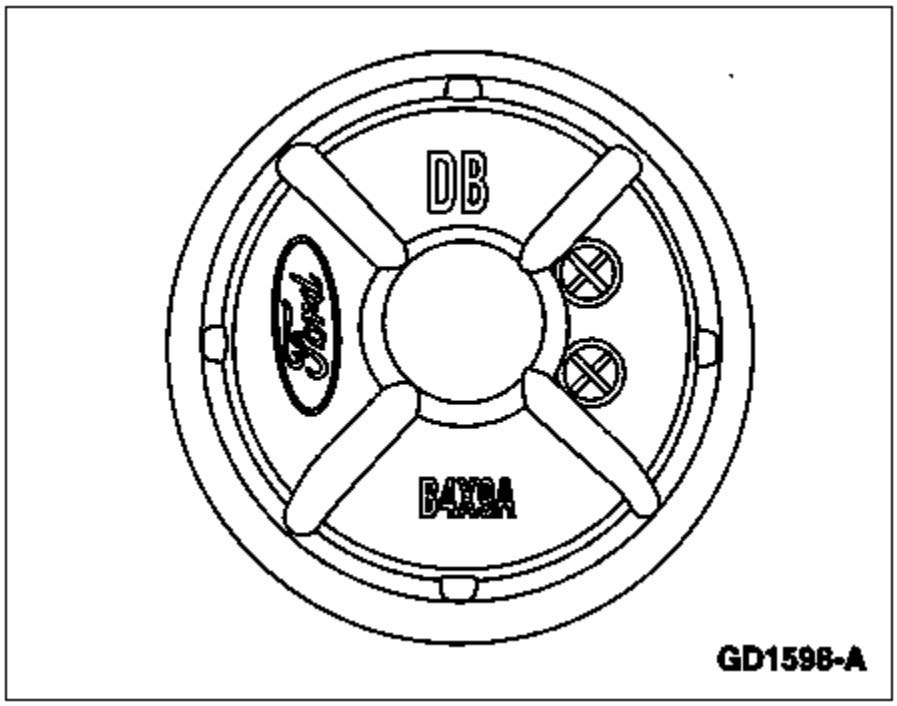
7. Gently push on Servo Removal Tool T97T-7D021-A to remove front servo cover, piston and spring.



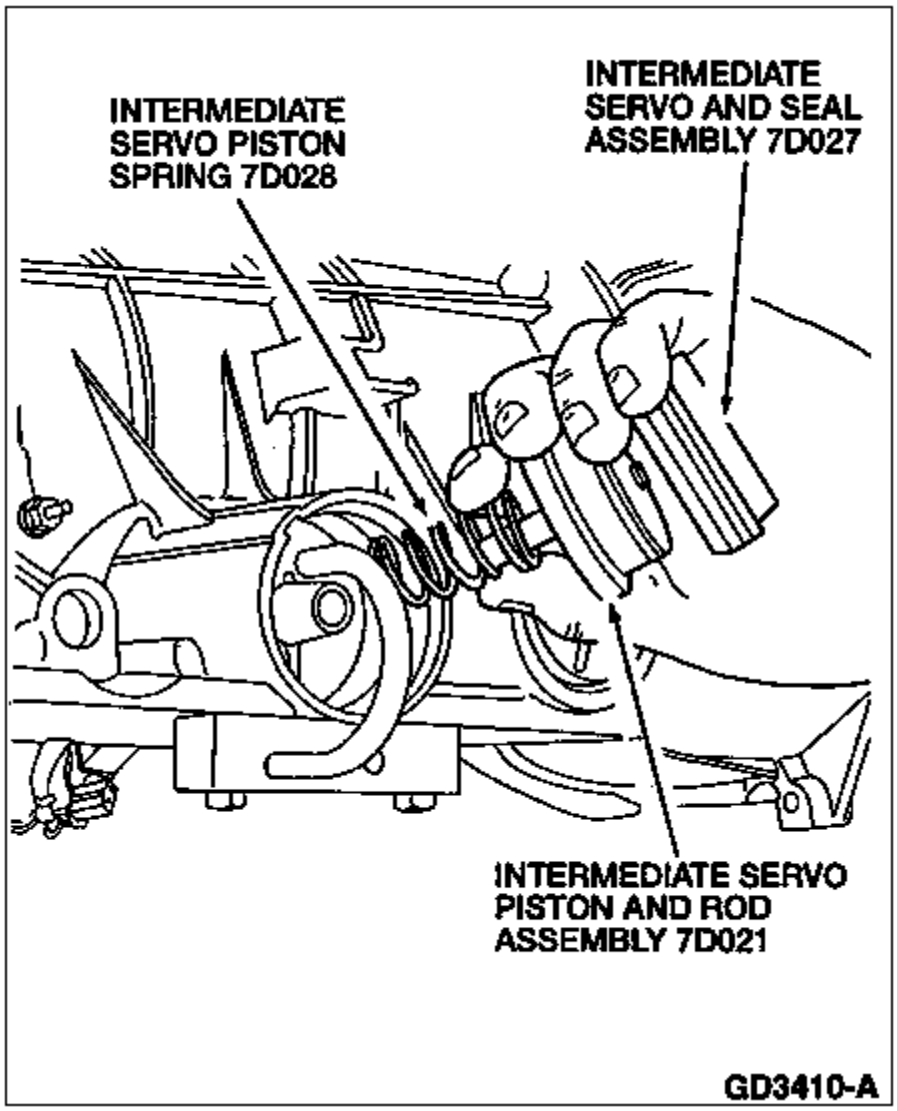
8. **NOTE: Tag the spring, piston and cover assembly. Label accordingly for assembly. The covers have letters cast on the outer surface for identification.**

   Remove the intermediate servo cover, piston and spring.

tomsn048@gmail.com



tomsn048@gmail.com



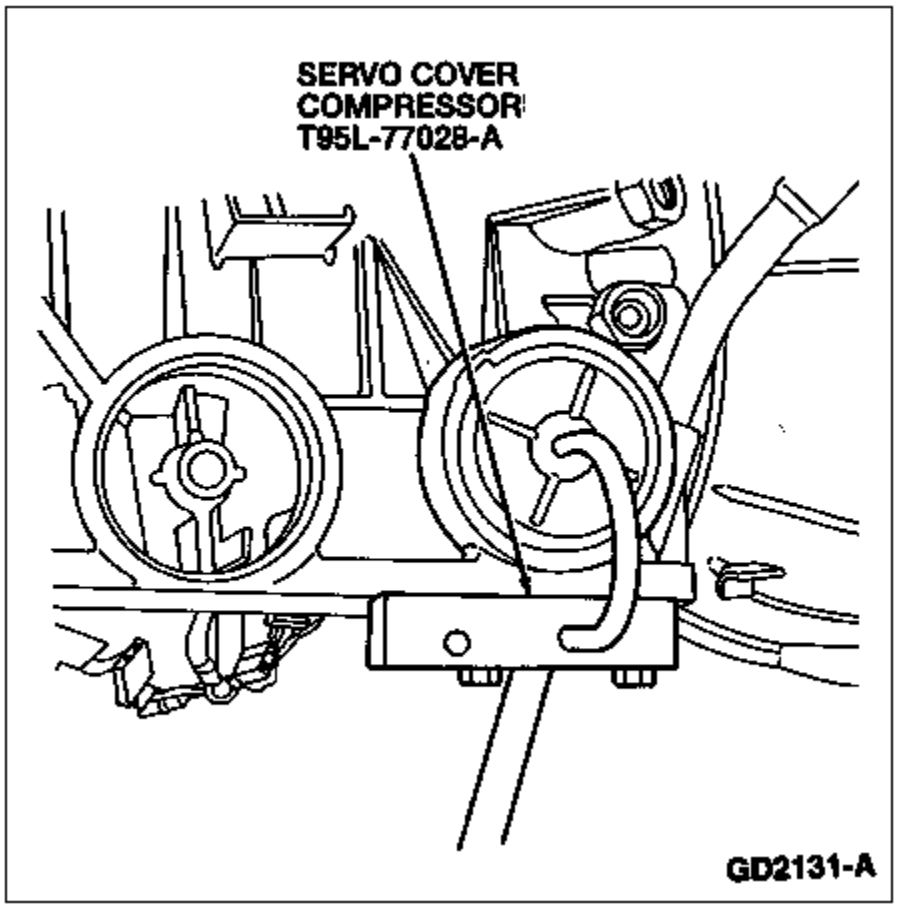
9. Remove Servo Cover Compressor T95L-77028-A.

10. **NOTE: The J-hook must be in the appropriate hole for the servo being removed.**

    Install Servo Cover Compressor T95L-77028-A over the front servo cover at the fluid pan rail. Tighten the screws.

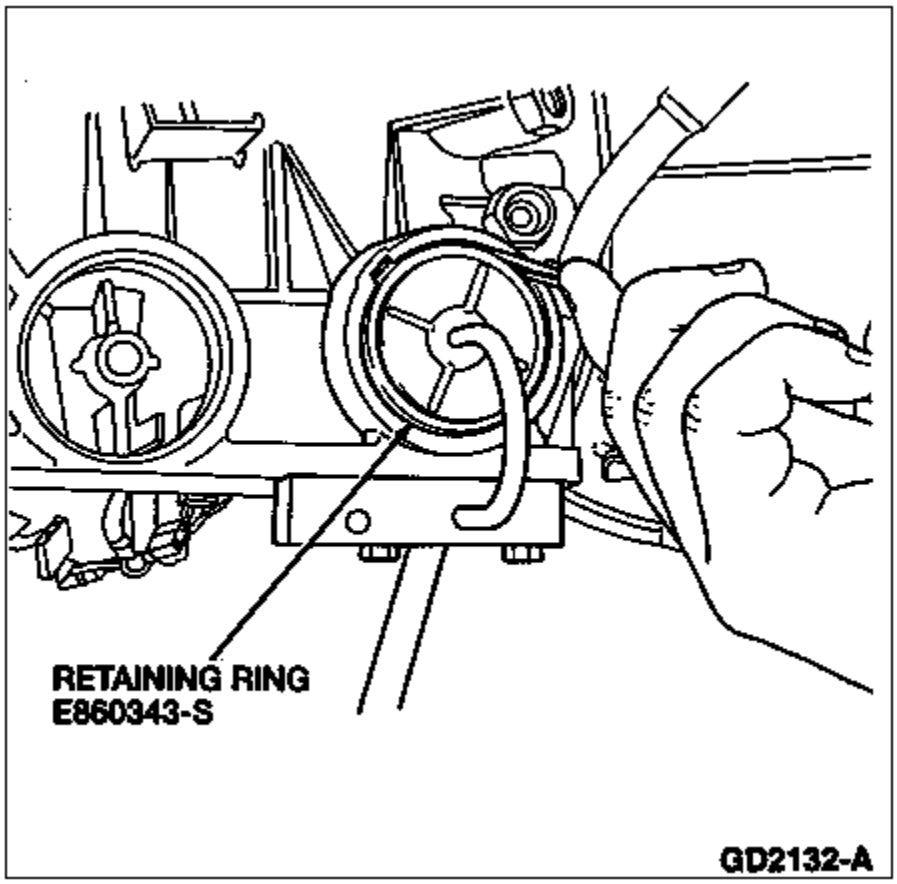
11. Using a 1/2-inch wrench, tighten the nut on the J-hook until there is a gap between the servo cover and the retaining ring.

tomsn048@gmail.com



12. Carefully remove the servo cover retaining ring.

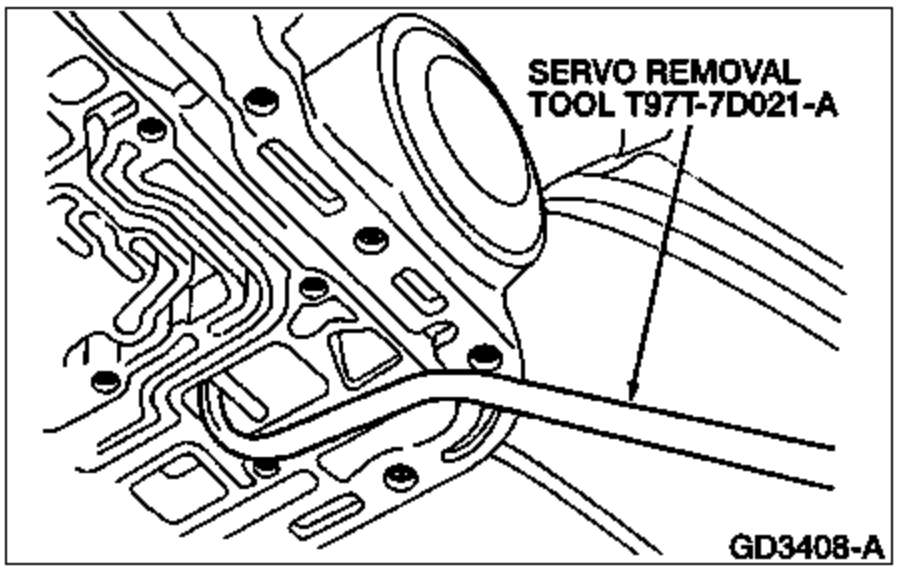
tomsn048@gmail.com



13. **CAUTION: The servo cover is under spring tension.**

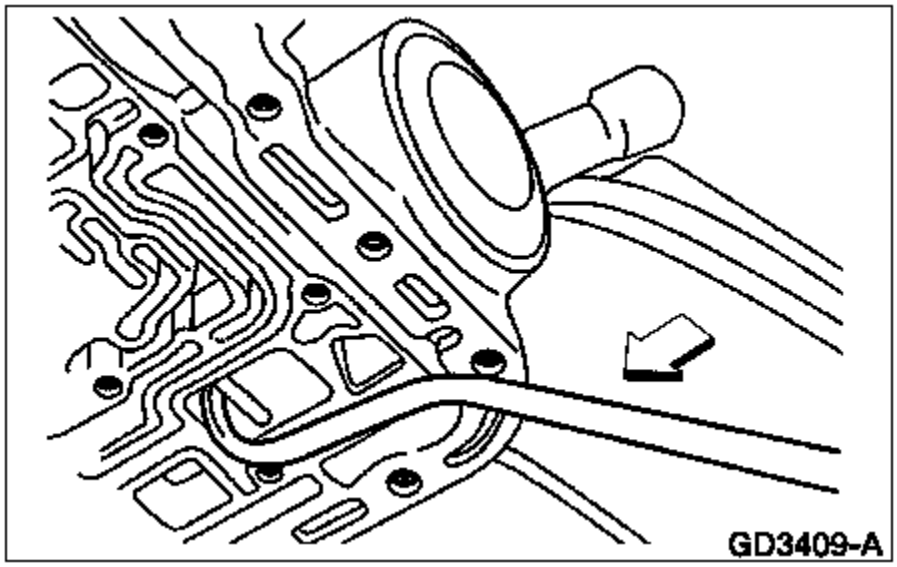
    Carefully back off the nut on the J-hook until the servo spring is unloaded.

14. Insert Servo Removal Tool T97T-7D021-A into case and locate on servo rod.



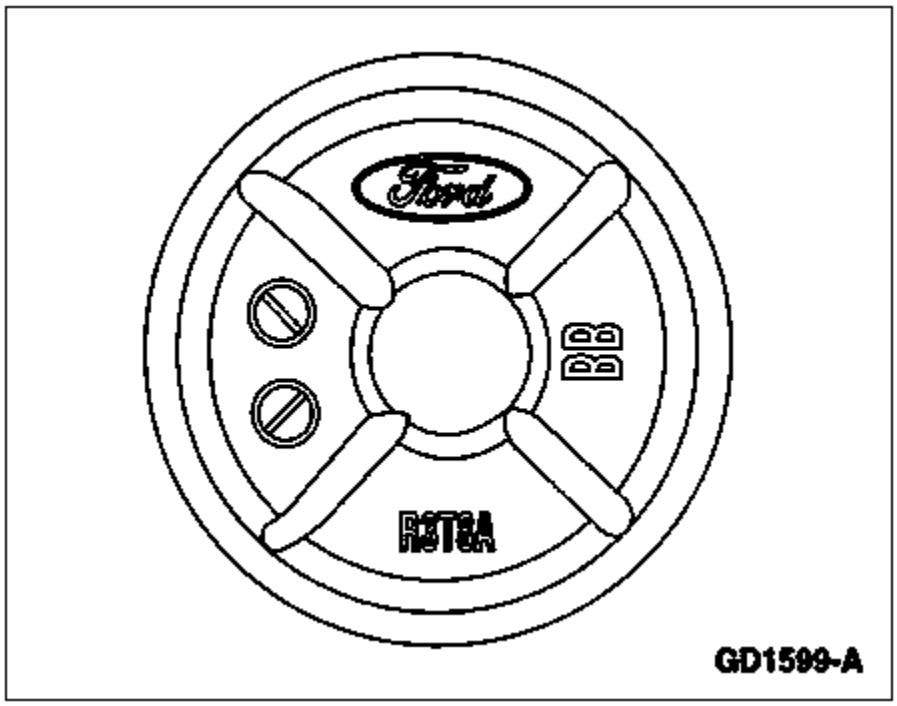
tomsn048@gmail.com

15. Gently push on Servo Removal Tool T97T-7D021-A to remove front servo cover piston and spring.

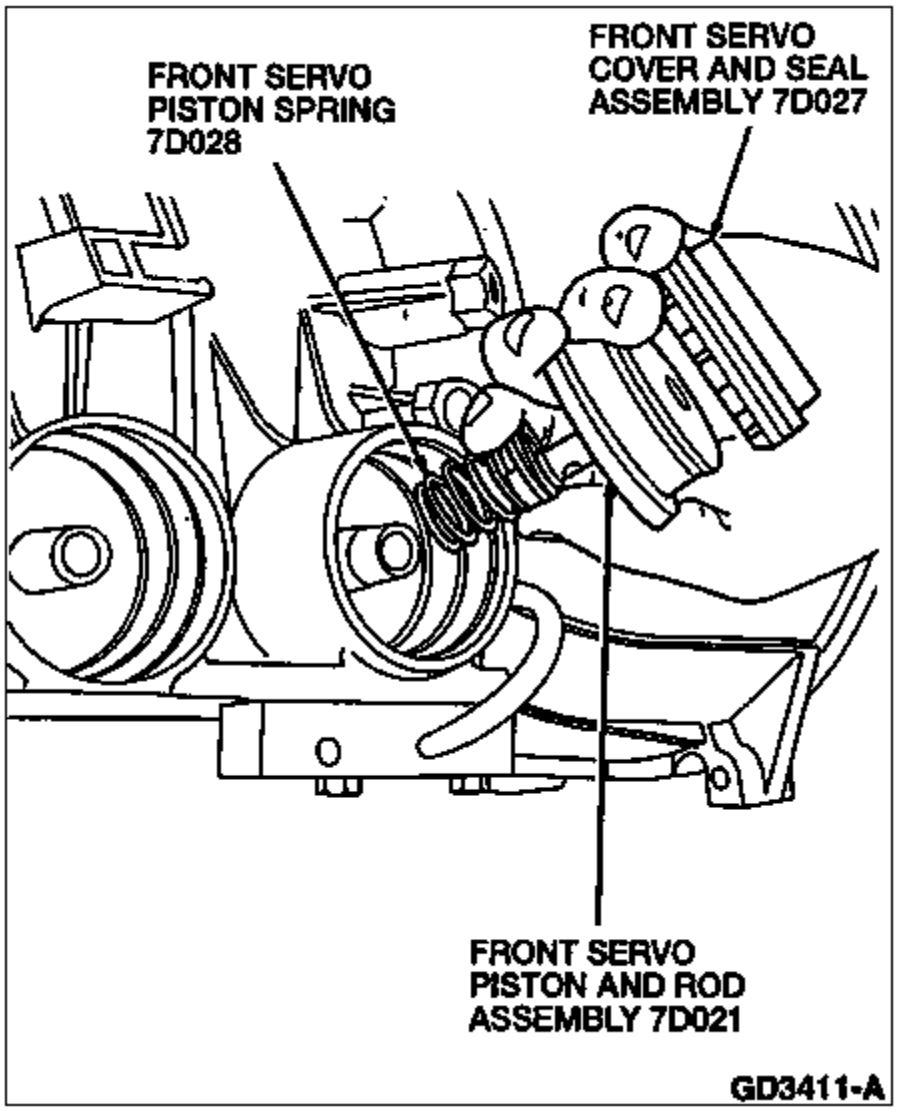


16. **NOTE: Tag the spring, piston and cover assembly. Label accordingly for assembly. The covers have letters cast on the outer surface for identification.**

    Remove the front servo cover, piston and spring.



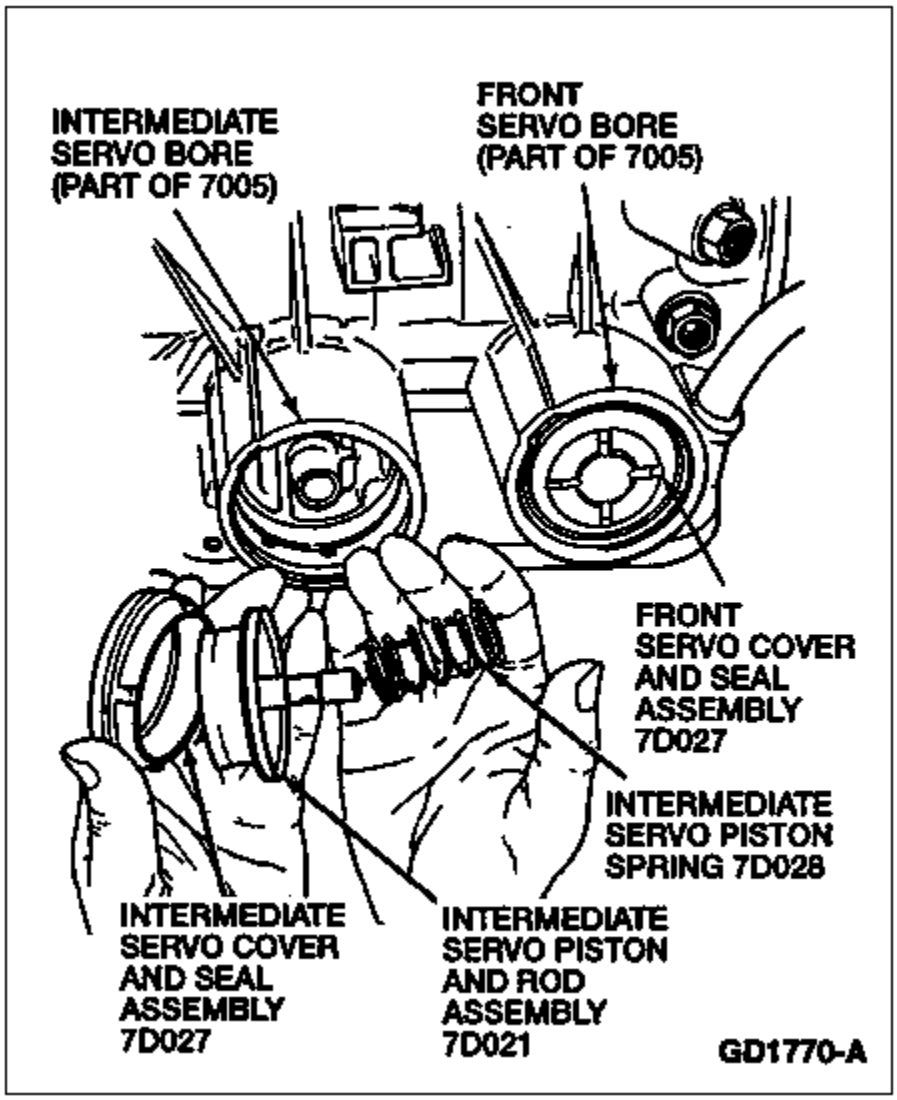
tomsn048@gmail.com



17. Remove Servo Cover Compressor T95L-77028-A.

18. Service as required.

tomsn048@gmail.com

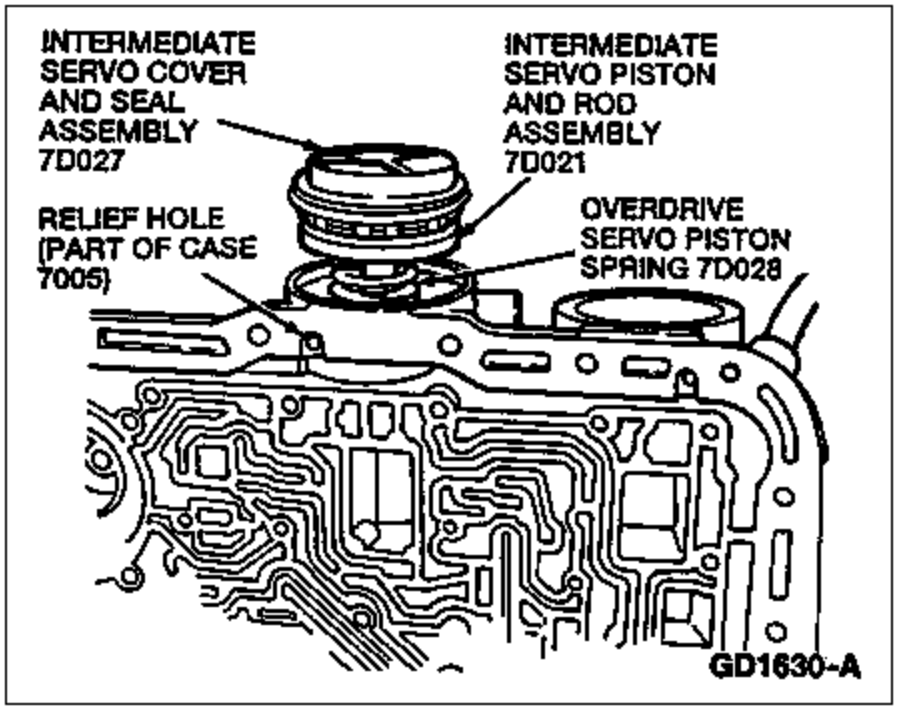


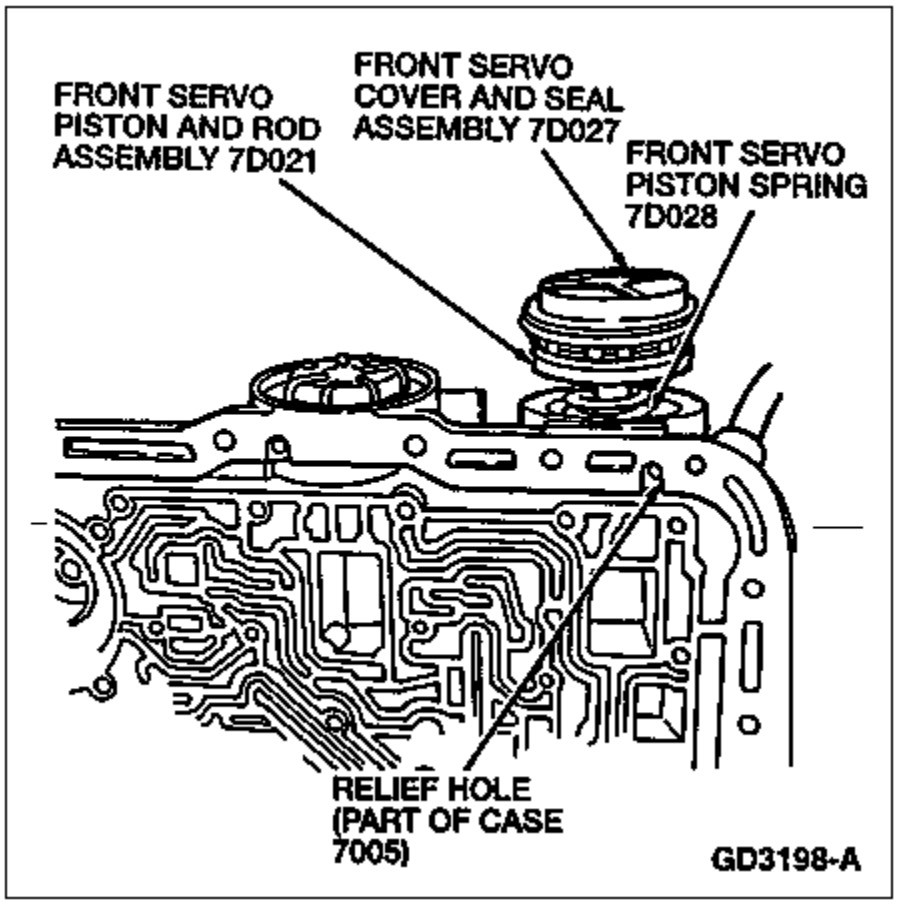
Installation

1. **CAUTION: Do not damage O-ring during installation. Do not press servo cover and O-ring past relief hole in case, or O-ring damage may occur.**

   Install servo assembly.

tomsn048@gmail.com





2. Carefully compress servo cover and install retaining ring.

tomsn048@gmail.com

3. Install heat shield, if equipped.
4. Install catalytic converter if removed.

Band Adjustments

SPECIAL SERVICE TOOL(S) REQUIRED

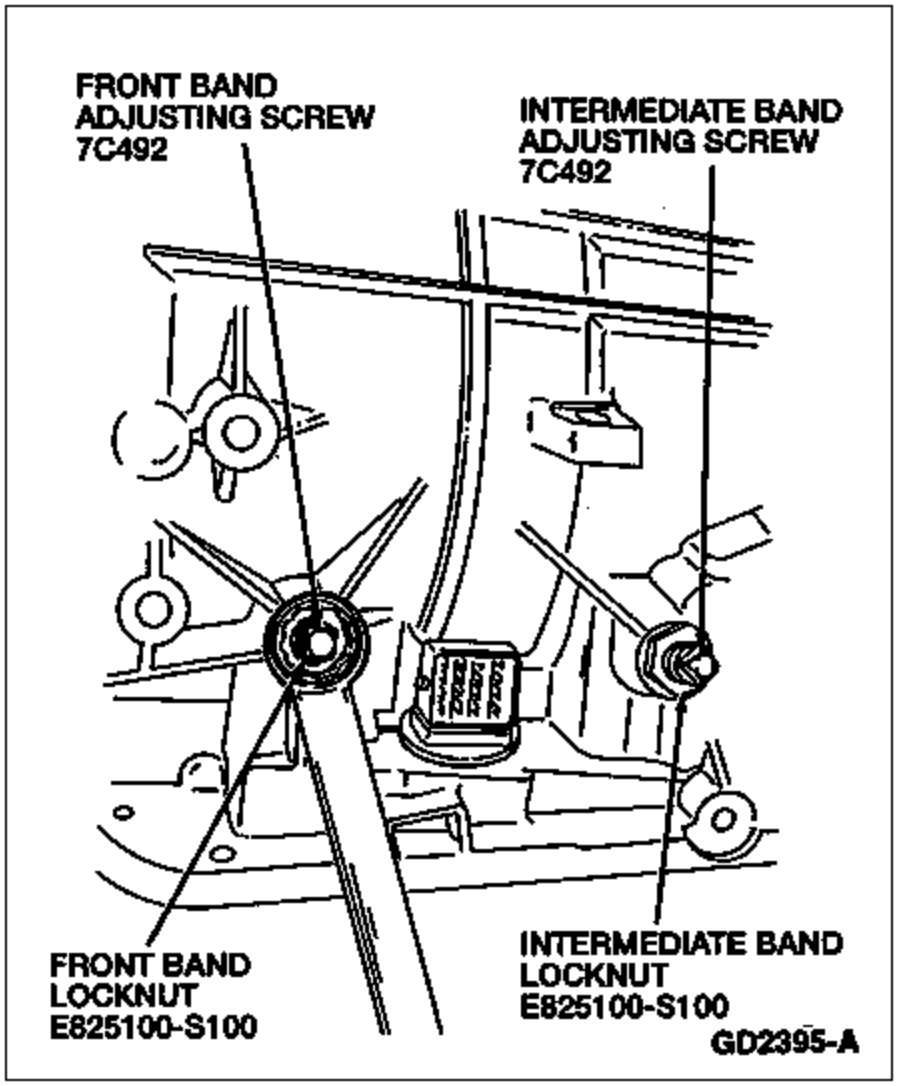
Description	Tool Number
Band Adjustment Torque Wrench Set	T71P-77370-A

1. **CAUTION: Do not allow adjustment screw to back out. Band strut could fall in transmission assembly.**

   CAUTION: Throw the locknuts away. The locknuts are not reusable for assembly.

   Remove the front and intermediate band locknuts and discard, then back off the band adjusting screws.

tomsn048@gmail.com



2. **CAUTION: Install, but do not tighten, a new locknut on the band adjusting screw. Apply petroleum jelly to the locknut seal.**

   CAUTION: Servos must be installed prior to band adjustment.

   Install two (2) new locknuts.

   Tighten the band adjusting screws using Band Adjustment Torque Wrench Set T71P-77370-A. The wrench will click at 14 Nm (10 lb-ft). Back off the band adjusting screw exactly two and one-half (2 1/2) turns for the intermediate band and two (2) turns for the front band and hold that position. Tighten the front and intermediate band locknut-to-case adjusting screws to 47-61 Nm (35-45 lb-ft) using a 19mm wrench.

Intermediate Band Adjustment

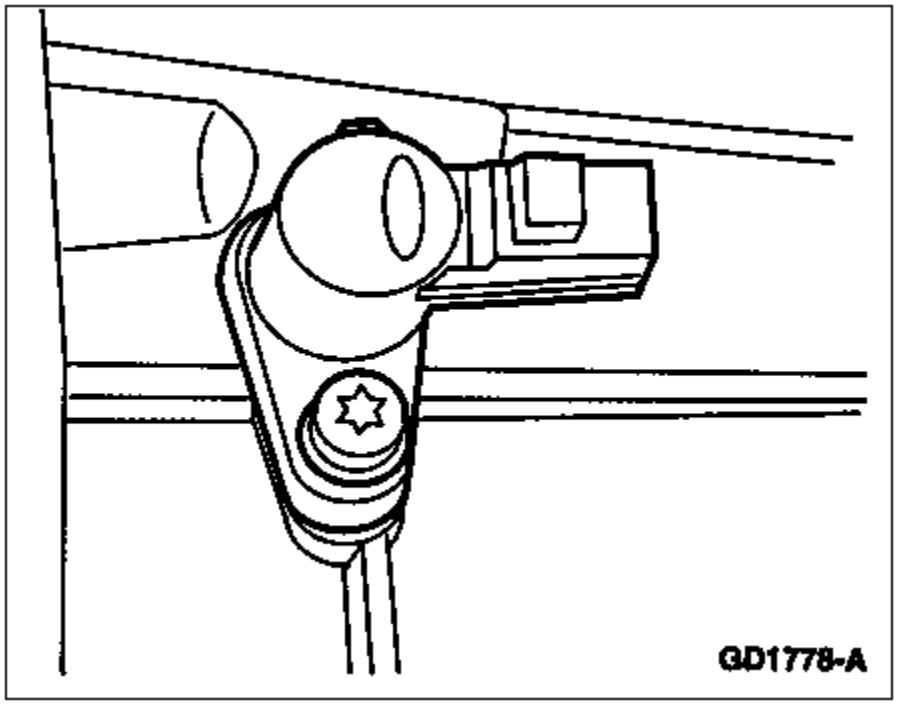
Overdrive Drum Speed Sensor

Removal

1. Disconnect vehicle harness from overdrive drum speed (ODS) (7M183) sensor.
2. Use a T30 torx socket to remove attaching bolt.
3. Remove ODS sensor from case.

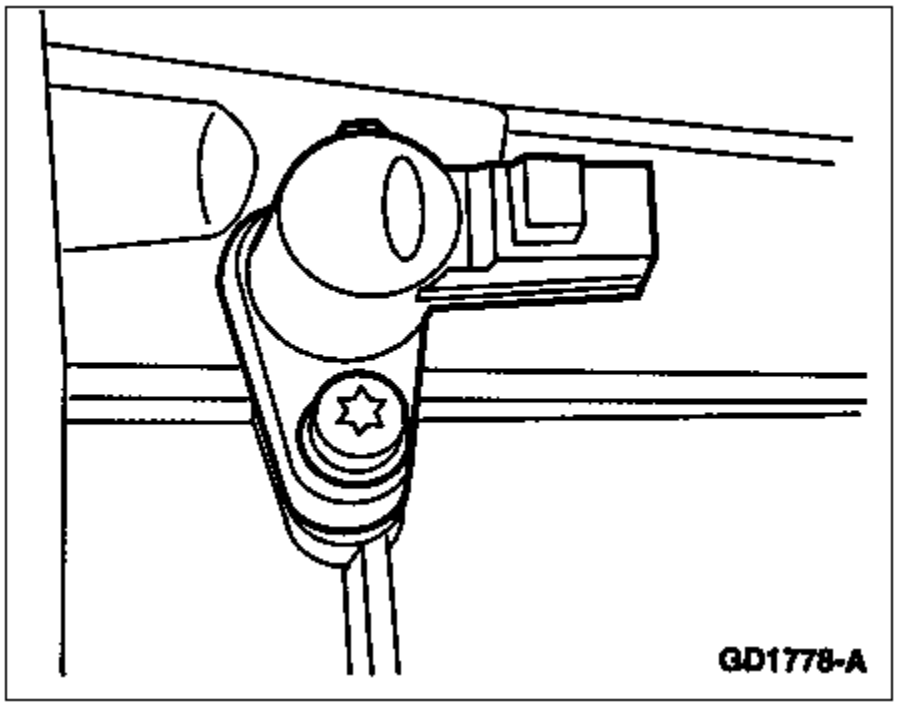


Installation

1. Inspect the O-ring for damage.
2. Lubricate the O-ring on the sensor with petroleum jelly.
3. Install overdrive drum speed sensor (7M183) into case.
4. Install attaching bolt and tighten to 8-11 Nm (71-97 lb-in).

tomsn048@gmail.com

5. Connect vehicle harness to sensor.

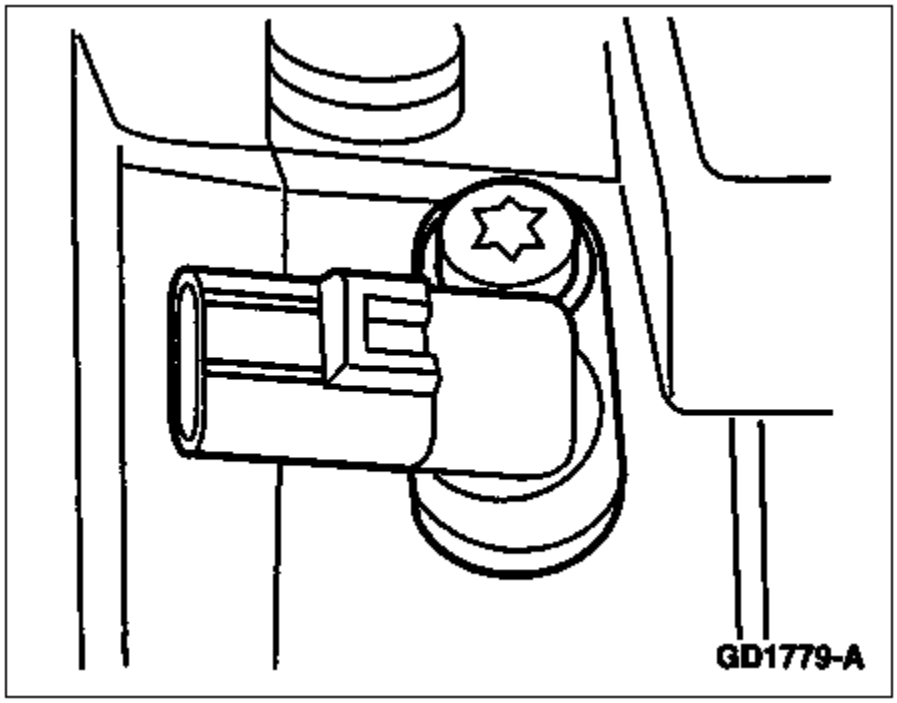


tomsn048@gmail.com

Output Shaft Speed Sensor

Removal

1. Disconnect vehicle harness from output shaft speed (OSS) (7H103) sensor.
2. Use a T30 torx socket to remove attaching bolt.
3. Remove OSS sensor from case.

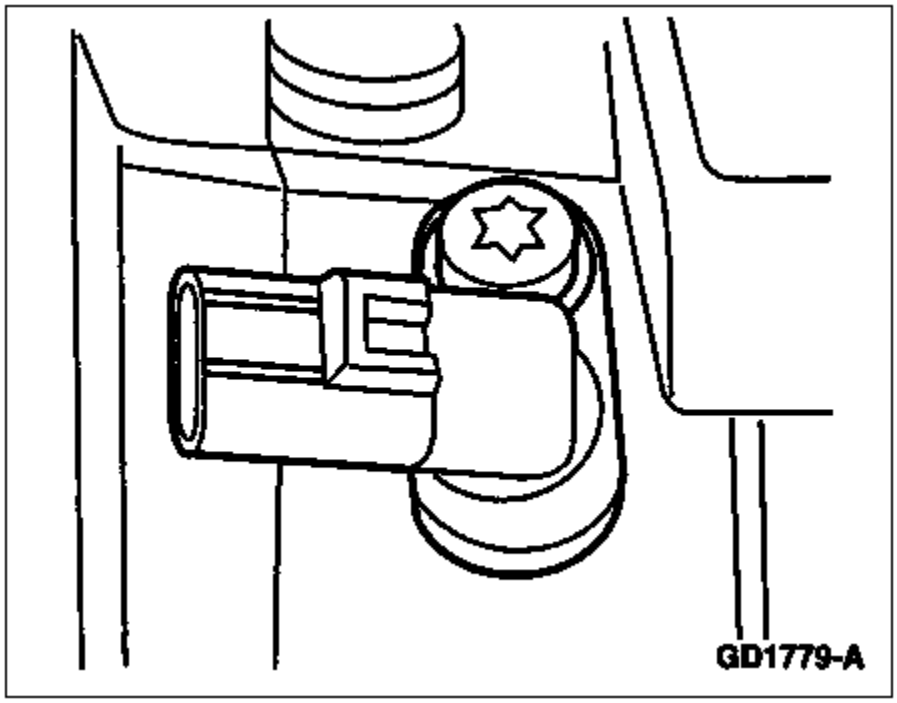


Installation

1. Inspect the O-ring for damage.
2. Lubricate the O-ring on the sensor with petroleum jelly.
3. Install output shaft speed (7H103) sensor into case.
4. Install attaching bolt and tighten to 8-11 Nm (71-97 lb-in).

tomsn048@gmail.com

5. Connect vehicle harness to sensor.



tomsn048@gmail.com

Transmission — 4x2

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Extension Housing Seal Replacer	T74P-77052-A
Torque Converter Holding Tool	T97T-7902-A

CAUTION: Disconnect the battery ground cable.

1. **NOTE: If the transmission is to be removed for a period of time, support the engine with a safety stand and a wood block.**

   Remove the transmission fluid level indicator.

2. Raise the vehicle on a hoist.

3. Drain the transmission. Refer to the procedure in this section.

4. **NOTE: On 4.0L engines, the converter-to-flexplate attaching nuts are accessed through the starter motor mounting hole.**

   Remove the starter-to-converter housing screws and position the starter motor out of the way.

5. Mark and index the converter stud to flexplate.

6. **NOTE: Flexplate-to-converter attaching nuts are not reusable.**
